STEWART, Charles, an American naval officer, born in Philadelphia, July 28, 1778, died in Bordentown, N. J., Nov. 7, 1869. He entered the merchant service at the age of 13 as cabin boy, and rose to the command of an Indiaman. In March, 1798, he entered the navy as lieutenant in the frigate United States, employed in the West Indies against French privateers. In July, 1800, he was appointed to the command of the schooner Experiment, of 12 guns. On Sept. 1 he captured, after an action of 10 minutes, the French schooner Deux Amis, of 8 guns; and soon after, near the island of Barbuda, the French schooner Diana, of 14 guns. He also recaptured several American vessels which had been taken by French privateers. As commander of the brig Siren he participated in the naval operations of 1804 against Tripoli, and aided in the destruction of the frigate Philadelphia. He became captain in 1806. In the summer of 1813 he took command of the Constitution, and in December sailed from Boston upon a cruise to the coasts of Guiana and the Windward islands, which resulted in the capture of the British schooner of war Picton, of 14 guns, a letter of marque under her convoy, and several merchant vessels. About the middle of December, 1814, he sailed in the same ship upon a second cruise, and on Feb. 20, 1815, captured, after an action of 40 minutes fought at night, H. B. M. ship Cyane, mounting 34 guns, with 185 men, and the sloop of war Levant, of 21 guns and 156 men. The Constitution mounted 52 guns with 470 men. Her loss was 9 killed and 13 wounded, while the total loss of the British ships has been stated at 41. The Levant was re-captured by a British squadron. From 1816 to 1820 Com. Stewart commanded a squadron in the Mediterranean, and from 1821 to 1823 in the Pacific. He afterward served on the board of navy commissioners, and as commander of the home squadron and the naval station at Philadelphia. In 1837 he was placed on the retired list, but resumed service in 1859 as commander of the Philadelphia navy yard, under a new commission as senior flag officer; and on July 16, 1862, he was made a rear admiral on the retired list.

STEWART, Dugald, a Scottish metaphysician, born in Edinburgh, Nov. 22, 1753, died there, June 11, 1828. His father was the Rev. Dr. Matthew Stewart (1717-85), professor of mathematics in the university of Edinburgh, and author of several mathematical works. He was educated at the high school and university of his native city, heard the lectures of Reid at Glasgow during one term (1771-2), was recalled to Edinburgh to act as his father’s substitute in the charge of the mathematical classes, and was formally elected conjoint professor in 1775. For several years he was prominent in the weekly debates of the speculative society, before which he also read essays on philosophical subjects. He was elected professor of moral philosophy in 1785, and lectured in this department during the next 24 years. His aim was always moral and practical more than speculative, to portray ideal perfection and advance the harmonious culture of all the faculties, intellectual, moral, and sensitive, rather than to teach definite solutions of intellectual problems; and his lectures therefore proceeded from psychology to theories of character and manners, life and literature, taste, and the arts, politics and natural theology. The prominence which he assigned to the last subject, as the highest branch of metaphysics, was designed, as he explained, to resist the prevalent skeptical tendencies of the era of the French revolution. From the beginning he gave lectures on the theory of government as a part of the course on moral philosophy, and in 1800 he first delivered a special course on the new science of political economy. He published the first volume of “Elements of the Philosophy of the Human Mind” in 1792. In the following year he published his “Outlines of Moral Philosophy” and read before the royal society an account of the life and writings of Adam Smith, which was printed in the “Transactions,” and was followed by his biographies of Dr. Robertson (1796) and Dr. Reid (1809). Nothing else appeared from his pen till 1810, though in this interval he prepared the matter of all his other writings, with a single exception. In 1806 the sincere office of gazette writer of Scotland was created for him. He accompanied in that year Lord Lauderdale on his mission to Paris. In 1810 he retired, on account of failing health, from active duty as a professor, and published his “Philosophical Essays.” He had in the mean time removed to Kinnell house, on the shore of the frith of Forth, 20 m. from Edinburgh, where he passed the remainder of his life. His later publications are: “Elements of the Philosophy of the Human Mind,” vol. ii. (1814), and vol. iii. (1827); a preliminary dissertation to the supplement of the “Encyclopaedia Britannica,” entitled “A General View of the Progress of Metaphysical, Ethical, and Political Science since the Revival of Letters” (part i., 1815; part ii., 1821); and “The Philosophy of the Active and Moral Powers” (1828), which was completed only a few weeks before his death. In 1829 paralysis deprived him of the power of speech and of the use of his right hand, but by the aid of his daughter as an amanuensis he continued his studies until disabled by a fresh paralytic shock, which soon terminated fatally.—His collected works were edited by Sir William Hamilton (10 vols. 8vo, Edinburgh, 1854-8; supplement, 1860). His lectures on political economy published in this edition. The 10th volume contains a memoir by John Veitch, with selections from his correspondence.
STEWART, John, an English traveller, born in London about 1740, died there in 1822. He went to Madras in 1763, in the civil service of the East India company, but at the end of two years resigned his office and began a series of pedestrian tours through Hindostan, Persia, Nubia, and Abyssinia, in the course of which he was at different times in the service of the nawab of Arcot and of Hyder Ali. He next walked to Europe by the way of the Arabian desert; and having perambulated every part of Great Britain, he crossed the Atlantic and visited on foot many parts of the United States. He was commonly called "walking Stewart." His writings were printed in three volumes in 1810, mainly for private distribution. An account of his life and adventures was published after his death (London, 1822).

STEWART, Robert Henry, marquis of Londonderry. See Castleeragh.

STEWART ISLAND. See New Zealand.

STEYER, Steier, or Steyr, a town of Upper Austria, between the Steyer and the Enns, at their junction, 19 m. S. E. of Linz; pop. in 1870, 13,392. It is united with its suburbs Ennsdorf and Steyerdorf by two bridges. There are extensive manufactures of hardware and cutlery in the town and surrounding villages. It was once the capital of a county, and till 1192 belonged to Styria, which from it derived its name (Ger. Steyermark).

STICKLEBACK, the popular name of the anachthoropterous fishes of the mailed-cheeked family or scarabogeneridae, and genus gasterosteus (Linn.). They are also called bansticks, and are the épinanches of the French. Most of the species are found in fresh water, and are from 3 to 3 in. long; the sides are more or less protected by bony plates, the other parts being without scales; very small and crowded teeth on the jaws, none on the palate; branchiostegal rays three; tail keeled on both sides; ventral abdominal, reduced to a strong spine, used as a weapon, and one or two soft rays; free spines, from 3 to 15 in front of the dorsal, which is supported by soft rays; bones of the pelvis large, forming an abdominal sternum. They feed on aquatic insects and worms, and the fry of fish; their pugnacity exceeds that of any other fish, and their voracity and fearlessness make it easy to capture them by the simplest means; they are very active, and sometimes spring entirely out of water. They breed in summer, in nests built by the males, which at this season have the throat carmine red and the eyes brilliant bluish green, the other parts above being ashy green and the abdomen silvery and translucent. The nest is made of delicate vegetable fibres, matted into an irregular circular mass cemented by mucus from the body, an inch or more in diameter, attached to water plants, with one or two openings near the centre; when the nest is prepared the female is enticed or driven in, and there deposits her eggs, which are fecundated by the male; the latter remains constant on guard, swimming in the neighborhood, driving away intruders with great ferocity, frequently putting in his head to see if all is right, and fanning the water with the pectorals and caudal to secure free circulation and ventilation for the eggs; he is frequently seen shaking up the eggs, and carrying away impurities in the mouth. The young are hatched in two or three weeks, and grow very slowly; any of the small fry getting outside of the nest are instantly seized in the mouth of the parent and put back. There are about 40 young to a nest.—The common European species (G. aculeatus, Linn.); since separated into three by Cuvier) has three spines in front of the dorsal, and is found in almost every pool and rivulet in Great Britain. The G. spinachius (Linn.) has 14 or 15 free spinous rays on the back, and has an elongated head and body; it is a marine species, found in the southern seas of Europe. The best known of the many species in the United States are the two-spined stickleback (G. bicuatuus, Mitch.), which is found from Labrador to New York, 2 in. long, olive-green above, yellowish green on sides, with two distant spines on the back and a third near the dorsal; and the four-spined stickleback (G. quadraetus, Mitch.), of the Massachusetts and New York coasts. Other species have eight to ten spines, and the males in all assume the red tint in the breeding season, both in salt and fresh water.

STICKNEY, Sarah. See Ellis, William.

STIEGLITZ, I. Christian Ludwig, a German author, born in Leipsic, Dec. 12, 1756, died there, July 17, 1836. He was an architect, held important local offices, and published poetical and other works, but is chiefly known by his Encyklopadie der Baukunst der Alten (5 vols., Leipsic, 1792-'98) and Geschichte der Baukunst vom fruhesten Alterthum bis in die neueren Zeiten (Nuremberg, 1827; 2d ed., 1830).

II. Heinrich, a German poet, nephew of the preceding, born in Arlons, Feb. 22, 1803, died in Venice, Aug. 24, 1849. He was librarian and teacher at Berlin from 1825 to 1833, when to cure his melancholy he started on a journey with his wife. The latter in 1844 killed herself in the hope that the sudden shock might restore his mental vigor. Her correspondence and diary were edited by Mundt: Charlotte Stieglitz, ein Denkmal (1835). Her husband subsequently led a wandering life. His works include Bilder des Oriënts (4 vols., Leipsic, 1831-'3), Stimmen der Zeit in Liedern (1832), and his posthumous Selbstbiographie and Erinnerungen an Charlotte (1865).
STIEGLITZ, Ludwig von, a Russian banker, born in Arolsen, Germany, of Jewish parents, in 1778, died in St. Petersburg, March 18, 1845. He was a brother of the medical writer Johann Stieglita, and in early life went to St. Petersburg. He was poor, but gradually became rich and influential, and at his death left a colossal fortune. He was made a baron in 1825. His brothers Nikolaus and Bernhard also became rich, and one of the latter's sons was made councillor of the ministry of the interior. The son of Ludwig, the baron Alexander, continued the father's business till 1858, when he assumed the direction of the new government bank, retiring in 1866.

STIGMARIA, See COAL PLANTS.

STILES, Ezra, an American clergyman, born at North Haven, Conn., Dec. 16, 1727, died in New Haven, May 12, 1795. He graduated at Yale college in 1746, and was a tutor there from 1749 to 1755. He studied theology, and began preaching in June, 1749. He afterward studied law, was admitted to the bar in 1758, and practised at New Haven. In 1755 he became pastor of the second church in Newport, R. I., where, in addition to his professional duties, he engaged in oriental, linguistic, literary, and scientific investigations. His congregation at Newport being broken up by the British occupation of the place in May, 1777, he was removed to Portsmouth, N. H., to become pastor of the North church. In September of the same year he was elected president of Yale college, and shortly after professor of ecclesiastical history, and from 1780 was also professor of divinity. He published an "Account of the Settlement of Bristol" (1785), and "History of three of the Judges of Charles I." (1795); and he left an unfinished church history of New England, besides more than 40 volumes of manuscripts. His life has been written by James L. Kingsley, in Sparks's "American Biography," 2d ed., vol. vi.

STILicho, Flavius, a Roman general, beheaded Aug. 28, A. D. 408. He was the son of a Vandal officer of the cavalry under the emperor Valens. For his services as an envoy to Persia in 384 Theodosius gave him the hand of Serena, his niece and adopted daughter. Stilicho shortly became master general of the army in the western parts of the empire, and gained several victories over the barbarians. Jealousy between him and Rufinus, whom Theodosius made governor of the East, soon ripened into intense hatred. In 394 Stilicho became governor of the West, as guardian of Honorius, whom Theodosius had proclaimed Augustus. Theodosius died in 395, leaving to Honorius the empire of the West, and to Arcadius that of the East. After crossing the Alps and establishing a firm peace on the border, Stilicho turned toward the East, ostensibly against Alaric, but really to break the power of Rufinus. He was stopped near Thessalonica by a message from the Byzantine court, but engaged Gainas, the leader of the Gothic allies of Arcadius, to put Rufinus to death, which he accomplished, Nov. 27, 395. In 396 Stilicho, without being asked for aid by Arcadius, sailed from Italy against the barbarians, who were ravaging northern Greece and the Padoponesus; but Alaric escaped into Epirus, of which he took possession. Arcadius ordered Stilicho to leave his territory, and made Alaric master general of the province of Illyricum. In 398 a marriage was celebrated between Stilicho's daughter Maria and Honorius. In 402 Alaric invaded Italy, and Stilicho, collecting his scattered troops from Rhetia, Gaul, and Germany, defeated him at Pollentia (403), and again soon after under the walls of Verona. Alaric then departed, and Stilicho in 404 received the honor of a triumph in Rome. He now formed an alliance with his late enemy against the emperor in the East, promising to pay him a large annual subsidy. In 405 Italy was invaded by Radagaisus, at the head of a multitude of Vandals, Suevi, Burgundians, Alans, and Goths. While they besieged Florence, Stilicho cut off their communications and forced them to capitulate (406). Radagaisus was put to death, and his men were sold as slaves; but the other portion of this horde, which had not entered Italy, ravaged Gaul, from which Stilicho had been obliged to withdraw the garrisons. A large party were ignominious at Stilicho's supposed partiality for the barbarians, and especially at the decline of the authority of Rome over Britain, Gaul, and Spain. His power at court was also secretly undermined by the enmity of Honorius, whom he himself had introduced into the imperial palace. The latter represented to Honorius that he was without authority in his own kingdom, and that his death was meditated by Stilicho, who designed placing the imperial crown upon the head of his son Eucherius. While Honorius was at Pavia in 408, through the agency of Olympia, the friends of Stilicho, some of the most illustrious officers of the empire, were murdered. Stilicho was in the camp of the barbarian allies at Bologna, and his friends demanded to be led against the murderers. He hesitated, and his friends left him to his fate. An attempt to assassinate him was made by Sarus, a Goth, but Stilicho escaped and took refuge in a church in Ravenna. From this sanctuary he was led out by Count Heraclian and instantly slain.

STILLÉ, Alfred, an American physician, born in Philadelphia, Oct. 30, 1813. He graduated at the University of Pennsylvania in 1832, and was resident physician of the Philadelphia hospital in 1836, and of the Pennsylvania hospital in 1839-41, having employed the interval in attending medical lectures in Paris and other capitals of Europe. He became lecturer on pathology and practice of medicine to the Philadelphia association for medical instruction in 1844, physician to St. Joseph's hospital in 1849, and afterward professor of the theory and practice of medicine in the Pennsylvania
medical college, and since June, 1864, in the university of Pennsylvania. He has published "Medical Instruction in the United States" (Philadelphia, 1845); "Elements of General Pathology" (1843); "Report on Medical Literature" (1850); "The Unity of Medicine" (1856); "Humboldt's Life and Character" (1859); and "Therapeutics and Materia Medica" (2 vols. 8vo, 1860; revised and enlarged, 1864; 4th ed., 1874).—His brother Moreton (born Oct. 27, 1822, died Aug. 20, 1853), resident physician of the Pennsylvania hospital in 1848-'9, and afterward lecturer to the Philadelphia association for medical instruction, published with Francis Wharton a "Treatise on Medical Jurisprudence" (Philadelphia, 1855; 2d ed., with medical part revised and enlarged by Dr. Alfred Stillé, 1860).

STILLINGFLEET, Edward, an English bishop, born in Cranborne, Dorset, April 17, 1635, died in London, March 27, 1699. He was educated at Cambridge, at the age of 18 obtained a fellowship, and in 1657 was presented to the rectory of Sutton. Subsequently he became chaplain in ordinary to Charles II. and dean of St. Paul's, and in 1689 bishop of Worcester. He published "Irenicum, or the Divine Right of particular Forms of Church Government Examined" (1659), manifesting much more toleration than his later works; "A Rational Account of the Grounds of Protestant Religion" (fol., 1664); "Discourse concerning the Idolatry practised in the Church of Rome" (1671); a sermon against the nonconformists entitled "The Mischief of Separation," to the criticisms upon which he replied in a volume entitled "The Unreasonableness of Separation" (4to, 1681); and tracts against Roman Catholics and Socinians. He is best known by his "Origines Sacrae, or Rational Account of the Grounds of Natural and Revealed Religion" (4to, 1692), and his "Origines Britannicae, or the Antiquities of the British Churches" (1685). When James II. revived the court of ecclesiastical commission, Stillingfleet refused to be a member of it, and after the revolution of 1688 he published a discourse concerning the illegality of the commission. In the latter part of his life he engaged in a sharp controversy with Locke on the latter's definition of substance and theory of ideas in general. His works were printed in 1710 in 6 vols. fol., to which was added in 1735 a volume of his miscellaneous writings.

STILLWATER, N. Y. See SARATOGA, BATTLE OF.

STILLWATER, a city and the county seat of Washington co., Minnesota, on the W. bank of the St. Croix river, 25 m. N. of its junction with the Mississippi, and 16 m. E. N. E. of St. Paul, with which it is connected by two lines of railroad; pop. in 1870, 4,124; in 1875, 5,760. It is the centre of the lumber trade of the St. Croix valley, and contains seven saw mills, a flouring mill, two planing mills, an extensive cooperage and cabinet factory, two national banks, two large public school buildings, the state prison, a public library, three weekly newspapers, and nine churches.

STILT, a wading bird of the avocet family, and genus himantopus (Briss.). The bill is long, straight, slender, and pointed, with a groove on each side to the middle; wings long and pointed, first quill much the longest; tail short and nearly even; legs very thin and long, with scaled tarsi; toes moderate, joined at the base, with a wide membrane between the outer and middle toes; hind toe wanting; claws small and sharp; neck long. Half a dozen species are found in various parts of the world. The black-necked stilt (H. nigricollis, Vieill.) is about 14 in. long, black above, with forehead, lower parts, rump, and tail white; bill black, and legs red. It is found as far N. as the middle states in spring, frequenting salt marshes in small flocks, and going S. beyond the limits of the United States in autumn; the nests are built in company, at first upon the ground, from which they are gradually raised by successive additions; the eggs are usually four, of a pale yellowish clay color, with large irregular blotches and lines of brownish black; the flight is rapid and regular, the legs extending behind; the flesh is indifferent eating. The white stilt (H. melanopterus, Meyer) is of about the same size, and white, with the back and wings shining greenish black, and legs red; it prefers the edges of fresh-water streams, and is found in S. E. Europe, Asia, and Africa; the bill is 8 in. and tarsus 4 in.

STIMPSON, William, an American naturalist, born in Roxbury, Mass., Feb. 14, 1832, died at Ilchester Mills, Howard co., Md., May 26, 1872. He studied under Agassiz, and in 1849 engaged in dredging off the coast of New England. In 1852 he accompanied Agassiz to Norfolk, Va., to investigate the marine fauna of that region. In 1852-6 he was naturalist to the North Pacific exploring expedition, and in December, 1864, became curator
of the Chicago academy of sciences, and afterward secretary and director of the museum. The great fire of October, 1871, destroyed his collections and manuscripts, embodying the results of 20 years of scientific labor, including his works on the shells of the E. coast, and on the crustacea of North America, with 500 drawings and 200 illustrations already engraved. He passed the winter of 1871-2 off the Florida coast, till a hemorrhage of the lungs ended his activity. His works include "A Revision of the Synonymy of the Testaceous Mollusks of New England" (Boston, 1851); "Synopsis of the Marine Invertebrata of Grand Menan," &c. (in vol. vi. of "Smithsonian Contributions to Knowledge," Washington, 1864); "Crustacea and Echinoidea of the Pacific Shores of North America" (Boston, 1857); "Prodromus Descriptionis Animalium Ecebratorum gua in Expeditione ad Oceanum Pacificum Septemtrionalen," &c. (8 parts, Philadelphia, 1857-76); "Notes on North American Crustacea" (New York, 1859); and "Researches upon the Hydrobiinae and Allied Forms" (1865).

STIRLING, a town of Scotland, capital of Stirlingshire, on the river Forth, 31 m. W. N. W. of Edinburgh; pop. in 1871, 14,279. It is on a height at the head of the navigation of the river, which is crossed by two bridges and a railway. Many of the public buildings are very ancient. The castle, which stands upon a rocky height 220 ft. above the plain, holds a prominent place in the history of Scotland, and is connected with most of the important events that occurred in that kingdom before it was annexed to England. The ancient royal palace is still standing, and there is also a palace begun by James V. and finished by his daughter Mary. There are several ancient churches and some modern ones within the town, besides numerous schools. The town house is very ancient, and the old residence of the earl of Mar is very curious. Stirling has long been a market of wools, hemp, cloth, &c. The river is shallow, but a considerable trade is carried on. The Scottish Central railway passes it, and three other railways have their termini at the town.

STIRLING, Earl of. See Alexander, William.

STIRLING, Sir William (Maxwell), a Scottish author, born at Kemnure, near Glasgow, in 1818. He graduated at Cambridge in 1839, and resided several years in Spain. He has published "Annals of the Artists of Spain" (2 vols. 8vo, 1849), "The Cloister Life of the Emperor Charles the Fifth" (1852), and "Velasquez and his Works" (12mo, 1855), and edited the marquis de Villars's "Memoires de la cour d'Espagne sous le regne de Charles II." (4to, 1862). From 1852 to 1865 he was a member of parliament for Perthshire. In 1866 he succeeded to the baronetcy and estates of his uncle, Sir John Maxwell, and assumed the surname of Maxwell. He was elected rector of the university of St. Andrews in 1863, and of that of Edinburgh in 1872.

STIRLINGSHIRE, a central county of Scotland, bordering on the counties of Perth, Clack-mannan, Linlithgow, Lanark, and Dumbarton; area, 466 sq. m.; pop. in 1871, 98,218. The chief rivers are the Forth, Avon, Kelvin, En-drick, and Carron. Loch Coulter, Loch Eligie, and half of Loch Lomond are in the county. Ben Lomond, in the N. W. part, rises 3,192 ft. above the sea. Coal and iron are mined; wool and cotton are manufactured; and there are immense iron works at Carron. The principal towns are Stirling, Falkirk, Alva, Bannockburn, and Denny.

STOKES, Joanna, a Greek compiler, probably born at Stoibi in Macedonia, lived probably in the 5th century A. D. He made extracts from more than 500 Greek authors, many of whom are not otherwise known to us. The work was early divided into two portions, the one called "Anthology" (Florilegium) or Sermones, the other "Physical, Dialectical, and Ethical Extracts" (Ecclopo Physis, Dialectica et Ethicer). The best edition of both portions is that of Meineke (6 vols., Leipsic, 1855-62).

STOCK. See Gilliflower.

STOCKBRIDGE, a town of Berkshire co., Massachusetts, on the Housatonic river and railroad, 115 m. in direct line W. of Boston, and 12 m. N. by W. of Pittsfield; pop. in 1870, 2,003; in 1875, 2,098. The surface of the town is varied; in the south is Monument mountain, separating it from Great Barrington, in the west West Stockbridge mountain, in the southeast the Beartown mountains, and in the northwest Rattlesnake mountain. Between these are valleys of great beauty. The Housatonic and its affluents drain the town. The Stockbridge or Housatonic Indians, among whom John Sergeant and Jonathan Edwards labored as missionaries, formerly had their home here, but removed westward in 1788. The village of Glendale and Curtisville have some manufactures. The village of Stockbridge has a hotel, a bank, an insurance office, an incorporated academy, several private schools, a library, and three churches (Congregational, Episcopal, and Roman Catholic).

STOCK EXCHANGE, a place where stocks are bought and sold. In England the term stocks is confined to government stocks, annuities, &c., and the term shares is used for the capital or stock of railroad, banking, and other companies; but in the United States bonds representing national, state, county, and city debts, and the shares of railroads, banks, mining, manufacturing, telegraph, and insurance companies, are all called stocks. In France the word rentes has the same limitation as stocks in England. Dealing in stocks, bonds, and annuities is the business of the stock exchange, and the dealers in them are known as stock brokers and stock jobbers. In New York the traffic in stocks is of two kinds, the regular sales at the first and second boards,
and the operations of the street. The first are legitimate, and the sales are presumed to be bona fide; the second are generally speculative, and are often mere gambling or betting by men without capital. The board of brokers in New York is composed of more than 1,000 regular members, who at their two daily sessions, either on their own account or as brokers for others, purchase or sell the various stocks which are called in order. The president, secretary, treasurer, and governing committee of 40 members, the executive of the exchange, and can admit, suspend, expel, and readmit members. Next in importance is the sub-committee of arbitration, which decides all disputes arising from transactions between members. When a member fails to deliver or pay for stocks as agreed, his name is struck from the list; but he may be reinstated upon effecting a settlement with his creditors. The New York stock exchange is the wealthiest organization of the kind in the world. The par value of annual sales made at the boards and "over the counter" is estimated at more than $22,000,000,000; but this enormous sum covers all sorts of speculative transactions, including those where no actual transfer of stocks occurs, and "differences" only are paid or adjusted, these operations forming in fact the bulk of the business in Wall street. The rules of the exchange are very strict, and cover a rigid scrutiny of all securities, a systematization of the brokerage business of member with member, a surveillance over members in respect of their fidelity to contracts, and a stringent examination of the character and responsibility of candidates for membership. An applicant for membership must be 21 years old, a banker, broker, or stock dealer in New York for one year, or a clerk to a member for two years, or a member in good standing of the Philadelphia, Baltimore, or Boston board. The initiation fee of a member admitted by election has recently been fixed at $10,000, and of one admitted by transfer at $500. During business hours the board is in constant communication with the financial centres of Europe, and the brokers pay $1,000,000 a year for telegrams from London alone. The stock exchange has its own peculiar terms, not generally understood by outsiders. Among those in most frequent use are "long" and "short," expressing individual excess or deficiency in the holding of a specified stock for speculative purposes; and "bull" and "bear," designating those respectively who find their interest in operating for a rise or fall in the price of stocks, or who, foreseeing either a rise or fall, take measures to protect themselves or make a profit on the "turn of the market." The bull endeavors to appreciate or "toss up," and the bear to depreciate or "pull down" the price. The phrase "buyer's option," added to the memorandum of a sale of stocks, implies that the purchaser who buys at 30 or 60 days can call for the delivery of the stocks at any time within the period by giving one day's notice and paying interest at 6 per cent. up to the time he calls. Such purchases are usually made at a little above the cash price. "Seller's option" is a little below the cash price, and the seller has the right to deliver on any day within the limited time, by giving one day's notice, receiving interest up to the time of delivery. A "corner" is an operation by one or several brokers, who form a clique to compel others to pay a heavy difference on the price of stock. Sometimes the clique purchase gradually a large amount of stock on time, buyer's option; they next sell nearly the same amount on time, seller's option, so as to secure an eventual market for their stock; then buy for cash, thus raising the price, and make a sudden call for the stock they have purchased on buyer's option, which, if they have calculated correctly, compels the parties from whom they have purchased to buy of them at a high price in order to deliver at a low one. "A point," the first element of successful speculation, is trustworthy private information concerning a certain stock, such as whether a bull movement is organizing, or an extra dividend is to be declared, or new stock is to be issued, or any other cause is likely to affect the price. A "lame duck" is a broker who is unable to respond with the shares or money when contracts mature. A "spread eagle" is the operation of a broker who sells a large quantity of stock on time, say 60 days, buyer's option, and buys the same quantity at a lower price, on the same time, seller's option. If both contracts run their full time, he makes his difference; but if the buyer or seller calls for a settlement before the time, he may be seriously embarrassed. The "staggers" or the "cub stoppers" are not governed by strict rules, and their operations are mostly speculative. "Put," "call," "ballooning," "saddling," "unloading," and more than 40 other terms make up the dialect of the exchange.—In the Paris bourse there are 60 agents de change, appointed by the government. Each must deposit 125,000 fr. in the national treasury as a guaranty of upright conduct, and also 100,000 fr. with the syndicate of the bourse as a cautionary fund applicable to losses sustained by the customer through the broker's fault. A broker's seat is worth from 1,500 to 2,000,000 fr., and cannot be sold without the consent of the governing committee. There are 60 courtiers de commerce and 8 courtiers d'assurance, who transact much of their business at the bourse. The haussiers and baiissiers correspond to the American bulls and bears, and the coulisse to street or curbstone operators. Cash sales are infrequent, and the greater part of the business is "privilege," technically marché à prime, the buyer deciding on the 15th and 30th of the month whether he will take the stock or not, but in either case having to pay the premium. The time transactions are usually the end of the current month,"
or the end of the next month. The 4th of each month is settling day. The parquet is in session from 1 to 3 P. M. every day; the coulisse is in session through the day, and it includes a large number of female jobbers and speculators. The London stock exchange numbers nearly 2,000 regular members, who must be reflected annually. Each member pays £10 yearly, and three members give security to the amount of £300 each for a new member.—The excitement at the hour of "high change," in London, Paris, or New York, is often such as baggards description; several hundred men are shouting, calling out what they have to sell or what they wish to buy, at the top of their voices, all together, and leaping and gesticulating, almost as if insane; in speculative periods, immense sums are made or lost in a few minutes. The stock exchanges of Amsterdam, Berlin, Frankfort, Madrid, and Vienna are among those most noted in Europe.

STOCK FISHER See Cod.

STOCKHARDT, Julius Adolf, a German chemist, born at Röhrs-dorf, Saxony, Jan. 4, 1809. After serving in a pharmacy, he taught natural sciences at Dresden in 1838–9, afterward at Chemnitz till 1847, and in 1848 was called to the new chair of agricultural chemistry in the academy of Tharand. In 1844 he began a course of lectures before the Chemnitz agricultural society, which led to the establishment of the system of agricultural experimental stations. From 1846 to 1849 he edited Das polytechnische Centralblatt, and from 1850 to 1855 (with Schober), Die Zeitschrift für deutsche Landwirte; and in 1855 he established at Berlin Der chemische Ackermann, in which are published his familiar lectures before farmers' clubs and societies, which he calls "field sermons." It is said that the yield of grain in Saxony has been doubled chiefly through his efforts. His principal works are: Untersuchung der zweckmässer Steinkohlen (1840); Teber Erkennung und Anwendung der Giftröre (1844); Schule der Chemie (1846); 17th ed., 1873; English translation by G. H. Pence, M. D., "The Principles of Chemistry illustrated by Simple Experiments," Cambridge, Mass., 1850; also by A. Henfrey, London, 1855; Guanoöliclein (1851); and Chemische Feld-predigten (1851; English translation by J. E. Teschemacher, "Chemical Field Lectures for Agriculturists," Cambridge, Mass., 1853).

**STOCKHOLM**

STOCKHOLM, a city and the capital of Sweden, in lat. 59° 20' N., lon. 18° 3' E., 330 m. N. E. of Copenhagen; pop. in 1874, 147,249. It is partly built on islands and intersected by many canals, surrounded on the land side by rocks, forests, and hills, and on the water side by Lake Malar and the Salt Sjö (Salt lake), an arm of the Baltic. This combination of land and water, together with the magnificent harbor and palace, and other remarkable sights, forms one of the most picturesque panoramas in the world. The city is well built, has several fine squares, and abounds in stately buildings. The royal palace, completed in 1754, consists of a huge quadrangle of solid granite; it is as remarkable for the fitting up of the royal apartments as for its grand and admirable proportions, and the chaste yet massive style of its Italian architecture. It is on the highest and most central of the three islands of the original town, distinctively called the city (Stad), and one of the three main metropolitan divisions. These islands have been enlarged by embankments built on piles, whence the name of Stockholm, meaning an island on piles. The other two chief divisions are the northern suburb (Norrmalm), the fashionable quarter, and the southern suburb (Södermalm), of the working classes; the former is connected with the city by a fine granite bridge, and the latter by several drawbridges, and there is a new line of railway, with remarkable viaducts and tunnels. The principal government offices and mercantile houses are adjacent to the palace and the quay, and the most elegant stores are in Norrmalm. The building next in beauty to the royal palace is the new national museum, at the S. end of the formerly separate island of Blasiholm, which is now united to Norrmalm. Its front faces the terrace garden of the royal palace, overlooking the harbor; it is 200 ft. long by 170 ft. broad, and 90 ft. high.
and has three stories filled with interesting collections, soon to include the picture gallery of the palace. A new building has also been provided for the royal or national library of about 70,000 volumes and 4,000 unique manuscripts, which occupied a space extending over nearly the whole S. E. wing of the palace. There are more than 25 places of worship, chiefly for Lutherans, but including several for other Protestants, one for Catholics, one for Swedenborgians, and a new and handsome synagogue. The interior of the church of St. Clara is exceptionally fine. The Swedish kings are crowned in the old St. Nicholas church. The most ancient church is that of Solna, with the tomb of Bernzelius, and the most picturesque is the Riddarholm, originally a Franciscan convent and now used as a pantheon. In the latter are the armor of Charles IX., attributed to Benvenuto Cellini, the shrine of Gustavus Adolphus, and that of Charles XII. in the opposite Carolin chapel. Bernadotte is buried in the chapel of the present dynasty, adjoining the Gustavian. Other notable buildings are the governor’s palace; the houses of parliament, including the Riddarhus, or house of the nobles and the diet; the royal mint; the exchange; the academy of sciences, with a library of 40,000 volumes, a cabinet of natural history, and a museum with rich zoological, mineralogical, and geological collections; the geological and technological institutes; the mining academy, recently removed hither from Fahlun; the new art union and exhibition buildings, with concert rooms; the royal theatre, where Gustavus III. was assassinated in 1792; and the houses in which Swedenborg and other eminent men were born. The most celebrated educational institution is the medical faculty, the principal one in Sweden, attended by a much larger number of students than that at the university of Upsal. Another great free university is projected, and there are three gymnasia, various special schools, a military college, and a high school of artillery, the last near the city at Marieberg. No city has a greater variety of rural and waterside pleasure grounds. The most celebrated is the Djurgard or deer park, which occupies almost an entire island opposite the “city,” since 1868 united to the metropolitan district. It is about 3 m. in circumference, and contains the Rosendal palace. The Haga park, a little beyond the observatory, opposite the new cemetery, is studded with islands, has water communication between its different parts and the city, and contains a royal palace. The adjacent park of Carlberg is another delightful summer resort. The park known as the Humlegard (hop garden), W. and N. of Norrsmal, has been greatly improved; it contains the new library building and large barracks. In Berzelius’s park is a monument to Berzelius. Among the other numerous monuments in the city are those to Birger Jarl and to Swedish sovereigns, That of Charles XII. was erected in 1868, opposite the palace in the Kungsträdgården (king’s garden) square. Few cities present greater natural beauties than Stockholm, and in the vicinity are many royal and private summer palaces and villas. The city is also the centre of Swedish industry and trade. It has about 300 manufacturing establishments, chiefly of sugar, tobacco, machinery, cast iron, leather, silk, soap, cloth, and porcelain. It is the principal Swedish port of entry. The imports in 1874 amounted to about $50,000,000, and the exports to $36,000,000; and the customs receipts reached nearly $6,000,000. The entries of British ships alone comprised 33 steamers and 161 sailing vessels. The total inward shipping in the foreign trade includes over 1,500 vessels, besides nearly 10,000 in the coasting trade, and about 60 local steamers. The exports to the United States in 1873–4, chiefly iron, were valued at $1,063,997 in gold. The harbor accommodates the largest vessels, and is defended by a fortress.—The reputed founder of Stockholm was Birger Jarl, the father and guardian of Waldemar, elected king in 1250. A settlement had been in existence at the spot since the destruction of Sigtuna by Finnish pirates in 1187. It was a powerful stronghold against the devastations of the pirates in all the towns along Lake Malar, and was frequently besieged. Stockholm became the residence of the Swedish monarchs soon after Birger’s death, though Upsal continued long afterward to be the seat of government. With Lübeck and Hamburg reciprocity of free trade was established, and soon after with Riga. In 1501 the citadel was held against insurgents by Christina, queen of Denmark, whose husband, King John, ruled over the three united kingdoms of Scandinavia. King John had left his queen in command of a garrison of 1,000 men, whose number, after a siege of eight months, was reduced to about 80. She was compelled to capitulate, May 27, 1502. A still more heroic defence against the Danes Christian II. was made by Christina Gyllenstierna, the widow of the fallen regent Sten Sturé. After a terrible siege of four months, the place was surrendered, Sept. 7, 1520, with the solemn guarantee of the king to respect the rights of the inhabitants. A fearful massacre ensued, known as the “blood bath of Stockholm.” Many treaties have been signed here in modern times; in 1855 that with the western powers guaranteeing the integrity of Swedish territories.

**STOCKING**, a close-fitting garment for the foot and leg, usually knit or woven. From paintings found at Pompeii, as also from notices in some of the Latin classics, it appears that stockings were known to the Romans in the latter days of the republic and under the empire; but they formed no part of the ordinary costume. *Pascia*, bandages wound round the leg from the ankle to the knee, were sometimes worn by persons in delicate health, or as a pro-
tection to the legs when walking through briars, as in hunting, on the march, &c. The art of knitting stockings is usually said to have originated in Scotland in the early part of the 16th century. In the times of Elizabeth it was an important industry in England, and the queen's government refused letters patent to William Lee, the inventor of the stocking frame (1589), on the ground that the machine-made goods would drive the home-made out of the markets and ruin the workpeople. Lee took his machine to France, and established a factory at Rouen, where he employed a number of his own countrymen. Political troubles soon drove him out of Rouen, and he died on the way to England. His brother introduced the manufacture into Nottinghamshire, which has ever since been famous for its production of stockings. Stocking frames were introduced into the United States in the 18th century at Philadelphia and Germantown, Pa., New York city, and several places in the middle and eastern states. The adaptation of the Lee machine to power was first accomplished by Timothy Bailey of Albany in 1831; and the first machine thus run was at Cohoes, N. Y., in 1832. The old Lee invention was a square frame, producing a straight strip, which was cut off in proper lengths, and seamed together to form the stocking. But a great improvement upon this, the origin of which is unknown, was the circular loom in which a continuous circular web is knit of any length, which is cut up and formed into the shape of a stocking. Several others have since been devised in the United States for manufacturing purposes, as also for family use.—The various knitting machines, which are too numerous to be mentioned in detail in this article, produce what is called the stocking stitch or chain work, consisting of loops formed in succession upon a single thread, each one locked by that which follows it. These machines may be distinguished by the different kinds of needles they employ, and also by the manner in which these are arranged: whether on a straight horizontal line, all pointing the same way, as in the common stocking loom, or around an open horizontal circle, all pointing toward the centre. The latter are known as the rotary round machines. Every needle is hooked at the end, so as to hold the thread laid across it that is to form the next loop, while the loop previously formed on the same needle slips back on the shank as the needle is pushed forward, and with its return runs over the hook and off the end. The contrivance by which this is effected distinguishes the several needles. In the straight frames the work is done first across the needles in turn in one direction and then back in the other, and so on; but in the rotary round machines the revolution carries the needles constantly round in the same direction, each one taking up the thread in turn, and so rapidly that the movements cannot be clearly perceived. The one class of machines produces a flat web, and the other a tubular one, each of which hangs from the needles and is drawn down as it lengthens by means of a weight. The number of stitches or loops which each machine can form in a minute varies with the gauge of the needles or the distance apart at which they are set. The machines constructed for family use, and worked by a treadle or crank like a sewing machine, make about half as many stitches as the factory machines. In the factory three or four machines are easily tended by one boy. Ribbed work is performed in the same machines by bringing in play a set of vertical needles, so arranged as to work in connection with the horizontal and produce the additional stitches required. As the needles are set to a particular gauge, they necessarily produce the same number of stitches to the inch; and the only variations practicable in the work are in using yarns or threads of different degrees of fineness, and in altering the tension or as to make the work closer or more open.—The shaping of the web to fit the foot is a matter of no little ingenuity. The flat web is either knit in long strips of sufficient width to make when turned over several stockings which are cut out from these; or the web is at once knit upon the machine in the shape required for making a stocking when the parts are properly folded over. In the latter the wider part, when turned over and fastened, forms the leg of the stocking. Two narrow strips at the base of this part, turned under and joined together, form the heel; while a central strip twice the length of the foot, being turned over at the toe, forms the top and bottom of the foot, and is neatly united to the heel and around its edges by knitting or seaming. In forming the foot to the cylindrical webs, a slit is made above the heel half across the web, which admits of the part designed for the foot being curved out at the instep. The loops along the edges of the cut are then taken up on hand needles, and the space for the heel is filled out by hand knitting. In the same manner the toe is completed; and thus the stocking is finished without a seam.—Notwithstanding the large number of machines employed in knitting, stockings are still largely produced by the old method of hand knitting, which admits of the use of a harder and firmer yarn than that adapted to the machines; and even where the machine work is produced in large mills employing steam power, the hand looms are also in extensive use, many of them in the houses of the operatives. In the factories the knitting machines are also made to produce many other articles of apparel, as undershirts, drawers, comforters, scarfs, opera hoods, calves, muffins, gloves, mitts, &c. The total production of this class of goods (hosiery) in the United States in 1870 amounted to $19,871,254; number of hands employed, 14,105. Nearly the whole amount was produced in the following states: New York, $5,528,742; Pennsylvania, $5,306,738; Massachusetts, $3,218,461; New Hampshire, $1,737,445; Connecticut,
STOCKMAR

$1,251,742; New Jersey, $568,900; Vermont, $551,129; and Rhode Island, $137,000.

STOCKMAR, Christian Friedrich von, a German physician, born in Coburg, Aug. 22, 1787, died there, July 9, 1863. He practised medicine at Coburg, and in 1814–15 in the army. In 1816 he became physician to Prince Leopold, and soon afterward his private secretary, and was comptroller of his household till after his accession in 1831 to the Belgian throne. Subsequently Leopold sent him to London to assist the princess and future queen Victoria with his advice. In 1836 he arranged the marriage of Prince Ferdinand of Coburg with Queen Maria II. of Portugal, and in 1837 accompanied Prince Albert to Italy. He was the trusted friend of the Coburg princes and other high personages, especially of Queen Victoria and Prince Albert, to whom he made a long visit every year till 1857. In 1858 he aided in the negotiations for the marriage of the present crown prince of Prussia with the English princess royal. The latter designed the monument erected to him at Coburg. He received the title of baron from several sovereigns.

STOCKPORT, a town of Cheshire, England, at the junction of the Mersey and the Thames, 5 m. S. E. of Manchester; pop. in 1871, 53,014. It stands upon a hill, and the houses rise above each other in irregular tiers. The Mersey is crossed by five bridges, and there are several suburbs, the most extensive of which are Heaton-Norris, Edgeley, and Portwood. The principal public buildings are the barracks, court house, union workhouse, and the building for the Sunday school, which is attended by nearly 4,000 children. A magnificent railway viaduct, 326 arches spans a portion of the town as well as the river below. The former extensive manufacture of silk has been supplanted by that of cotton, for the spinning and weaving of which there are in the town and suburbs about 100 factories. There are also establishments for bleaching, dyeing, and printing cotton, brass and iron foundries, &c. Rich coal mines are worked in the vicinity.

STOCKTON, a city and the capital of San Joaquin co., California, on a level prairie at the head of Stockton slough, a wide and deep arm of the San Joaquin river extending E. from that stream for about 3 m., and on the Central Pacific railroad, 63 m. (direct) E. by N. of San Francisco; pop. in 1860, 3,679; in 1870, 10,066, of whom 4,102 were foreigners, including 1,076 Chinese; in 1875, estimated at 14,000. The Stockton and Copperopolis railroad extends to Milton, Calaveras co., 30 m., and from it branches the Stockton and Visalia railroad, extending to Oakdale, Stanislaus co., 34 m. from Stockton. The Visalia division of the Central Pacific railroad, branching from

the main line 9 m. W. of the city, runs S. through the San Joaquin valley for nearly 200 m. to the low-gauge railroad to Ione City, Amador co., about 40 m., will render available the immense coal deposits of that county. Stockton has a good harbor, and the river is navigable to this point from San Francisco at all seasons by vessels of from 150 to 250 tons. In the winter and spring steamers ascend nearly 200 m. above the city. The business blocks are principally of brick. The court house and city hall, near the centre of the city, is surrounded with choice shade trees and shrubbery, as are also many of the residences. Several of the churches are costly structures. The city is lighted with gas, and is supplied with water through pipes from three artesian wells. It has a volunteer fire department, and a horse railroad. The business of Stockton consists chiefly in furnishing supplies to the farmers of the San Joaquin valley and in the shipment of wheat, wool, and other produce. The shipments of wheat for the three years 1873–5 averaged nearly 3,500,000 bushels, valued at about $3,000,000. The city contains four banking institutions, with an aggregate capital of $1,650,000, including a national gold bank and a savings and loan society. There are two manufactories of carriages, three of agricultural implements, two of sash, blinds, &c., one of paper, several of boots and shoes, saddlery and harness, furniture, tinware, &c., two flouring mills, two iron foundries, three tanneries, and three breweries. Considerable wine is also made here. Stockton is the seat of the state lunatic asylum. It has a high school and 33 other public schools of different grades, three newspapers, each having daily and weekly editions, and 12 churches, viz.: 2 Baptist, 1 Congregational, 1 Episcopal, 1 German Reformed, 1 Jewish, 3 Methodist, 2 Presbyterian, and 1 Roman Catholic. The city was laid out in 1849 and incorporated in 1850.

STOCKTON, Henry, grandson of the Declaration of Independence, born near Princeton, N. J., Oct. 1, 1730, died there, Feb. 28, 1781. He graduated at the college of New Jersey, at Newark, in 1748, was admitted to the bar in 1754, became a member of the executive council of New Jersey in 1768, and in 1774 a judge of the supreme court. In 1776 he was elected to congress, and served on the committee appointed to inspect the northern army. After his return to New Jersey he was captured by the British, confined in the common prison at New York, and treated with such severity as ultimately to cause his death.

II. Robert Field, an American naval officer, grandson of the preceding, born in Princeton, N. J., in 1796, died there, Oct. 7, 1866. He entered the navy in 1810, became a lieutenant in 1814, and in 1821 went to Africa in command of the Erie, and aided the colonization society in procuring the territory forming the present republic of Liberia. On his return he was sent to the West Indies against the pirates. For several
years he took an active part in politics as a partisan of Gen. Jackson. In 1858 he served as flag officer in the Mediterranean, and in 1859 was made a captain and recalled. He was one of the earliest advocates of a steam navy, and drew the plans for the steam sloop of war Princeton, built at Philadelphia in 1842-4, the explosion of one of the guns of which at Wash-
ington in 1844 caused the death of five per-
sons, including the secretaries of war and the navy. In October, 1845, he was sent to the Pacific coast, where he took command, and in the following year conquered California and established the authority of the United States, returning overland in 1847. In 1849 he re-
signed his commission, and in 1851 was elected United States senator. He promoted the abo-
lation of flogging in the navy, and resigned in 1858. His "Life, Speeches, and Letters" was published in 1856 (New York).

STOCKTON, Thomas Hewlings, an American clergyman, born at Mount Holly, N. J., June 4, 1808, died in Philadelphia, Oct. 9, 1868. He studied medicine in Philadelphia, but became a Methodist Protestant preacher, and was station-
ed at Baltimore in 1830. He was chaplain of the house of representatives from 1833 to 1835, and again from 1839 to 1861, and of the senate in 1862. In 1850-55 he was associate pastor of St. John's Methodist church in Balti-
more, and from 1856 of the New Testament in Philadelphia. He compiled and published a Protestant Methodist hymn book, and issued the New Testament in paragraph form, and editions of the Bible, each book by itself. His other works include "Floating Flowers from a Hidden Brook" (Philadelphia, 1844); "The Bible Alliance" (Cincinnati, 1850); "Ecclesiastical Opposition to the Bible" (Baltimore, 1833); "Sermons for the People" (Pittsburgh, 1854); "To the Blessing" (Phi-
adelphia, 1857); "Stand up for Jesus," a ballad with wood engravings and music, and a series of additional poems (Philadelphia, 1858); "Poems, with Autobiographical and other Notes" (1862); "The Peerless Magnificence of the Word of God" (1862); "Influence of the United States on Christendom" (1865); and from his manuscript, after his death, "The Book Above All" (1870).—See "Memory's Tribute to the Life, Character, and Work of Rev. Thomas H. Stockton," by the Rev. A. Clark (New York, 1869), and "Life, Charac-

STOCKTON-UPON-TEES, a town of Durham, England, on the left bank of the Tees, 10 m. from its mouth in the North sea, and 220 m. N. W. of London; pop. in 1871, 27,598. The river is crossed by a fine bridge. The principal public buildings are the custom house, town hall, borough hall, mechanics' institute, and theatre. It is an important railway centre, and several branch lines bring in the produce of the numerous coal and lead mines in the vicinity. It has considerable commerce, and vessels of 300 tons can come up to the quays. The manufactures comprise sail cloth, rope, linen and worsted yarns, and iron and brass work, and there are ship yards, breweries, brick kilns, and corn mills.—Stockton was ear-
y place of importance, and was the resi-
dence of the bishops of Durham. In 1295 it was ravaged by the Scots. In 1644 it was taken by the Scottish army, and in 1653 the castle was demolished.

STODDARD, a S. E. county of Missouri, bounded W. by the St. Francis and drained by the Castor river; area, about 800 sq. m.; pop. in 1870, 6,585, of whom 70 were colored. The greater portion of the county is level, and there are swamps and shallow lakes, the principal of the latter being Lake Necornny, 25 m. long and 4 m. wide. It is a part of the "sun
country" produced by the earthquake of 1811. Large forests of cypress abound. It is intersected by the Cairo, Arkansas, and Texas divi-
sion of the St. Louis and Iron Mountain rail-
road. The chief productions in 1870 were 84-
501 bushels of wheat, 384,051 of Indian corn, 17,259 of oats, 29,708 of potatoes, 118,534 lbs. of tobacco, 9,138 of wool, 37,688 of butter, and 11,981 gallons of sorghum molasses. There were 2,205 horses, 2,560 milch cows, 1,296 working oxen, 4,206 other cattle, 6,705 sheep, and 26,508 swine. Its chief wealth is the "Town and Country, and the Voices in the Shells," for children (New York, 1857); "Life, Travels, and Books of A. von Humboldt," with an intro-
duction, by Bayard Taylor (Boston, 1860; London, 1862); "The King's Bell," a poem (Boston, 1862; London, 1864; New York, 1865); "The Story of Little Red Riding Hood," in verse (New York, 1864); "The Children in the Wood," in verse (1865); "Abraham Lin-
coln, a Horatian Ode" (1866); "Putnam the Brave" (1869); and "The Book of the East," containing his later poems (1871). He has edited "Gen. Lyon's Political Essays, with his Life" (New York, 1861); "The Loves and Heroines of the Poets" (1861); J. G. Vas-
sars's "Twenty-one Years around the World" (1862); "Madrigals, mostly from the Old Eng-
lish Poets" (1865); "The Late English Poets" (1865); a new edition with additions of Gris-
wold's "Poets and Poetry of America" (1872), and of his "Female Poets of America" (1874); and the "Bric-a-Brac Series" (1874 et seq.).

H. Elizabeth (Bastow), wife of the preceding,

**STOKES,** a N. county of North Carolina, bordering on Virginia, and drained by a branch of the Dan river; area, 550 sq. m.; pop. in 1870, 11,208, of whom 2,608 were colored. The surface is hilly and the soil fertile. Iron ore is abundant. The chief productions in 1870 were 33,450 bushels of wheat, 11,948 of rye, 171,214 of Indian corn, 36,353 of oats, 11,346 of Irish and 9,058 of sweet potatoes, 844,145 lbs. of tobacco, 6,381 of wool, 48,325 of butter, 37,050 of honey, and 7,421 gallons of sorghum molasses. There were 916 horses, 504 mules and asses, 4,928 cattle, 5,482 sheep, and 12,192 swine. Capital, Danbury.

**STOKES,** George Gabriel, a British mathematician, born in Skreen, Ireland, Aug. 13, 1819. He graduated at Cambridge in 1841, and was elected a fellow of Pembroke college. In 1849 he was appointed Lucasian professor of mathematics in the university. In 1851 he was chosen fellow of the royal society, and in 1855 contributed to its "Transactions" his celebrated paper "On the Change of the Refrangibility of Light," which gained the Rumford medal. He was elected president of the British association in 1869. He has published many papers on questions in pure mathematics and physics, particularly on the theory of light.

**STOKES—EPON-TRENT,** a parliamentary borough, town, and parish of Staffordshire, England, on the river Trent, 134 m. N. W. of London; pop. of the parish (including Hanley and other towns) in 1871, 89,202; of the parliamentary borough, 190,988. The town is the centre of "the Potteries," is well built, with numerous wharves and warehouses, and is intersected by the great trunk Trent canal and the North Staffordshire railway. Pottery is the principal manufacture, employing a large proportion of the population, and the place is famous for its china, porcelain, statuettes, and ornamental and encaustic tiles.

**STOLBERG.** I. Friedrich Leopold, count, a German poet, born at Bramstedt, Holstein, Nov. 7, 1750, died near Osnabrück, Dec. 5, 1819. After the death of his father, the Danish chamberlain Count Christian Günther, who was the first of his rank to liberate his serfs, his mother imparted a strong religious bias to his education. From 1770 to 1773 he studied at Halle, and subsequently at Göttingen, where he and his brother became prominent members of the *Dichterbund*. In his travels in 1775 he was with Goethe at Frankfurt and other places, and next at Weimar, where he accepted an office at the court; but Klostock
prevaled upon him to enter the service of the prince-bishop of Lübeck, who in 1777 sent him as envoy to Copenhagen. He married Anna von Wittzeben in 1782, and resided at Eutin, where through his influence Voss became rector. In 1786 he was transferred to an office at Neuenburg in Oldenburg. After his wife's death in 1788 he sought solace in the society of the count and countess Reventlow at Emkendorf, and their influence made him more orthodox. Soon afterward he was appointed Danish ambassador at Berlin, and in 1790 he married the countess Sophia von Redern. He was appointed by the prince-bishop district governor at Eutin, but obtained leave of absence, and visited Münster, where he became acquainted with the ultramontane princess Amalia Gallitzin, and afterward Rome, where his growing partiality for Catholicism was greatly increased. Seven years later he and his whole family, excepting his elder daughter, formally joined the Catholic church (June 1, 1800). This alienated him from many of his former friends, especially from Voss, and his conversion influenced that of the younger Schlegel and the tone of other writers of the romantic school. He resigned his office at Eutin in the same year, and resided at Münster till 1812, when the surveillance to which his censure of the government subjected him drove him to a secluded locality near Bielefeld, and in 1816 he removed to his Hanoverian domain of Sondermühlen. His poetical works form the largest portion of the Werke der Brüder Stolberg (22 vols., Hamburg, 1821-86). Among his other works are Die Insel, a prose romance developing the Utopian scheme of a model republic, dramas with choruses, translations of the Iliad and of parts of Plato, Eschylus, and Ossian, and Geschichte der Religion Jesu Christi (5 vols., Hamburg, 1811-18; continued by Fr. Kerz to vol. xiv., Mentz, 1825-46, and by Brischar to vol. lii., 1849-50).—See Der Graf Friedrich Leopold von Stolberg und seine Zeitgenossen, by Menge (2 vols., Gotha, 1882). II. CHRISTIAN, count, brother of the preceding, born in Hamburg, Oct. 15, 1748, died near Eckernförde, Schleswig, Jan. 18, 1821. He was associated with his brother at Göttlingen, and shared in many of his poetical and other labors. He held an office at Tremsbüttel, Holstein, from 1777 to 1800. His wife, originally countess of Reventslou, figures in his poems as his beloved Louisa.

STOLPE, or STOLP, a walled town of Prussia, in the province of Pomerania, on the navigable river Stolpe, 10 m. from its mouth at the port of Stolpemünde on the Baltic, and 125 m. N. E. of Stettin; pop. in 1871, 16,280. It has a castle, three churches, a gymnasium, two hospitals, a house for invalids, and manufactures of amber, wool, linen, copper, hats, starch, tobacco, and leather.

STOMACH, the hollow organ in which the first part of the function of digestion is performed in every perfectly developed animal.

As a general rule, throughout the vertebrate animals we find a complex stomach associated with a vegetable diet; but this has striking exceptions, as in the dolphin, which has a multiple stomach with an animal diet, and the horse, which has a simple stomach with the same vegetable food as the ox. In man the stomach is the widest and most dilatable part of the alimentary canal; it is in the upper part of the abdomen, in the epigastric and part of the left hypochondriac region, below the diaphragm, above the arch of the colon and transverse mesocolon, and to a certain extent between the liver and spleen; it comes in contact in front with the anterior wall of the abdomen, and behind with the organs and vessels lying upon the spine. Its shape varies greatly, but when moderately distended, in or out of the body, resembles a bent cone, curved from before backward and from above downward, following its length; it lies almost transverse, a little obliquely downward, forward, and to the right; the anterior border is the greater curvature, and is lodged between the folds of the great omentum; the esophagus enters at about one quarter of the length from the left extremity; the great cul-de-sac on the left is united to the spleen by short vessels. The "pylorus" is the constriction between the smaller extremity of the stomach, directed toward the right, and the commencement of the duodenum. The average capacity of the stomach is regarded as about five pints; but this varies very much according to the age and habits of the individual, and even according to the alternating conditions of fulness or vacuity. When filled with food, the stomach becomes more horizontal, so that its great curvature looks forward and its lesser curvature backward. The stomach is composed of four distinct coats or tunics: 1. The external or peri-
The peritoneal coat is a thin serous layer covering the outside of the organ, continuous with the general peritoneal layer of the abdomen. Its moist and smooth external surface enables the stomach and other neighboring organs to glide readily over each other without friction or injury. 2. The muscular coat, immediately beneath the peritoneal covering, is composed of a double series of circular and longitudinal muscular fibres, of the smooth or unstriped variety, whose involuntary alternating contractions and relaxations cause the peristaltic movements of the walls of the stomach, and provide for the requisite mixture, transportation, and final expulsion of its contents. 3. The submucous cellular coat is a layer of loose areolar tissue, between the muscular coat and the mucous membrane. The office of this layer is to form such a connection between the muscular and mucous tunics as to keep them in a certain degree of apposition, and yet allow of the folding up of the mucous membrane when the organ is empty, and its expansion when filled with food. 4. The mucous membrane of the stomach, its most important tunic in a physiological point of view, is the membrane which secretes the gastric juice. Its internal surface is soft and velvety, owing to its being covered with minute conical folds or ridges which are partly distinct and partly connected with each other. Its thickness is composed of a great number of tubular glands or follicles, the "gastric tubules," which begin at the inferior portion of the mucous membrane by blind extremities, run perpendicularly through its substance, and open by minute orifices upon its free surface into the general cavity of the stomach. These tubules vary somewhat in different parts of the stomach. In the pyloric or right-hand portion they are nearly straight and simple in structure, and of the same diameter throughout. In the cardiac or left-hand portion they are more compound, several of them uniting, at a little distance below the surface, into comparatively wide circular tubes, lined with cylindrical instead of glandular epithelium. In the middle region of the stomach the gastric glands are also compound; and their inferior or tubular portions, which are here very long, are filled, in addition to the ordinary glandular epithelium, with very large, rounded, granular, nucleated cells, which often seem to fill nearly their entire cavity, and to project from their sides in such a way as to give them an irregularly tumefied or varicose appearance. The mucous membrane of the stomach is exceedingly vascular, the capillary blood vessels penetrating everywhere between the adjacent tubules, and forming an abundant superficialplexus about their orifices. At the time of digestion the quantity of blood circulating in the mucous membrane is greatly increased by an expansion of the smaller arteries supplying the capillary network. The mucous membrane becomes turgid and reddened, the gastric tubules enter into a state of functional activity and begin to pour out the gastric juice, which is to act upon the food. Soon afterward the muscular coat of the organ is in its turn excited to peristaltic action, by which the food is moved alternately to and fro, from the cardiac toward the pyloric extremity of the organ, and subjected also to a kind of gentle and continuous churning process by which the gastric juice exuded from the mucous membrane is made to penetrate every part of the alimentary mass, and come in contact simultaneously with the whole. As digestion proceeds, successive portions of the liquefied food are carried through the pylorus into the small intestine; and as the stomach is thus gradually emptied it resumes its previous condition of repose. The peristaltic motion comes to an end, the vascular congestion subsides, and the further secretion of gastric juice is suspended until the next period of digestion arrives.

**STOMACH, Diseases of the.** Diseases of the stomach may be classed as inflammatory, structural, and functional. Gastritis or inflammation of the stomach may be acute, subacute, or chronic. It is always attended by certain symptoms, but they are also mostly the symptoms of other diseases. Vomiting is frequent and persistent, but is of itself not sufficient evidence, nor when associated with pain in the epigastric region. The following combination of symptoms may be considered as diagnostic: intense pain of a burning character over the epigastrium, together with shooting pains in the chest, unaccompanied by the physical signs of pulmonary disease, nausea, and
vomiting of muco-serous matter tinged with bile and often with blood, the act causing intense suffering. The thirst, though not always present, is often so great as to be almost insupportable. The pulse is frequent, small, and wiry. The temperature of the skin is generally considerably raised. The bowels are constipated except in cases of poisoning.—Acute gastritis is caused by traumatic injuries and by irritant poisons; also by excessive indulgence in alcoholic drinks. Over-eating and the eating of indigestible food are also causes. The treatment does not involve much medication; rest, cooling drinks, light bland food, and the administration of nourishing enemas with sometimes small quantities of opiates, are the chief reliances. Lime water and milk may sometimes be taken better than almost anything else. Wine may be given by the mouth or spirits by the rectum.—Subacute gastritis is generally more or less transient. When attended with considerable fever, the affection is sometimes called "gastric fever;" but this term is indefinite, and is also applied to cases of what are called "abortive typhoid fever," in which the symptoms for the first few days are like those of typhoid fever and then cease. It is often the consequence of errors in diet, either of over-eating or of eating improper food, and frequently follows a debauch. There is tenderness in the epigastrio region and a furred tongue. Pain in the head is often a prominent symptom, frequently accompanied by nausea. The pulse is usually feeble and the extremities cold. If the inflammation approaches the acute character, the symptoms are heightened in proportion. Rest, abstinence from food for a time, bland and nutritious diet, regulation of the intestinal evacuations by enemas, the application of sinapisms or other counter-irritants or of warm water dressings over the epigastrum, and the administration of demulcents, as flax-seed tea, and also small pieces of ice, are ordinarily indicated. Subacute gastritis is frequently connected with acute dyspepsia, in which case it is often designated by the indefinite term "bilious attack," although the term is generally an improper one, as the liver is not usually particularly implicated. There is congestion of the mucous membrane of the stomach, in which that of the intestines finally participates, with active diarrhoea and sometimes severe colic. The treatment includes the unloading of the stomach and bowels, with sometimes the administration of anodynes, particularly chloroform.—Chronic gastritis may come on gradually, or it may follow the acute or subacute form. Its symptoms are liable to be mistaken for those of functional disorder which constitute dyspepsia. The causes are errors in diet, poisonous or irritating substances, excessive drinking of alcoholic liquors, poverty of the blood, irregularity in the circulation, and diseases of other organs. The treatment is rest of the organ, gentle exercise of the body, nutritious but easily digestible food, tonics, counter-irritants, bathing with after friction to the skin, and sometimes the administration of pills of nitrate of silver or of powders of substrate of bismuth.—The structural diseases of the stomach are induration, softening, ulceration, cancer, degeneration of the gastric follicles, and dilatation. Induration or sclerosis of the stomach is due to a morbid fibrous growth in the submucous areolar tissue, involving thickening of the coats of the organ. It is probably caused by chronic inflammation of the submucous areolar tissue. The affection may involve a part or the whole of the organ. When limited in extent the pylorus is the part usually affected, a condition liable to produce stricture and render the case dangerous from retention of food. It is a rare affection, scarcely ever attacking those who are under 40 years of age. Its symptoms are liable to be mistaken for those of cancer, but its long continuance without the rapid progress of cancerous disease, and also its appearance in other organs, are diagnostic. It is generally regarded as chiefly occurring in hard drinkers. The treatment is abstinence from spirits and other stimulants, and a nutritious and well regulated diet.

—Softening of the stomach may be the result of inflammation, but there are cases of non-inflammatory origin. The softening may be confined to the mucous coat, or it may involve all the others. Non-inflammatory softening is probably sometimes caused by defective nutrition of the membrane.—Ulceration of the stomach is one of the sequelae of acute gastritis, but it may follow inflammation limited to the space of the ulcer. The ulcer varies in size, sometimes being so small as not to be easily found, or it may be an inch or more in diameter. The disease may prove fatal from perforation, from haemorrhage, or from inanition. Its duration is variable, and it is often curable. The treatment should include as much rest as possible for the stomach consistent with nutrition.—Cancer attacks the stomach about as frequently as it does other parts, but it is in this situation nearly always primary; that is, the affection does not make its appearance previously in any other part. The pylorus is the situation mostly attacked, and the disease does not then usually pass into the duodenum. When however it may be in the rectum or the organ is the seat, the cancer generally also more or less affects the oesophagus. The cancer is generally of the hard variety known as scirrhus. The affection is attended with the peculiar lancinating pains of cancer, and vomiting is frequent, although less so than in simple ulcer. Blood is often found with the vomited matter, generally having the appearance of coffee grounds, and sometimes contains purulent matter. These symptoms are accompanied by prostrative anaemia and loss of weight.—Degeneration of the gastric follicles has been found a more frequent affection than was formerly suspected, and is the accompaniment of many
cases of dyspepsia. The treatment should be mainly constitutional, including good air and nutritious diet.—Dilatation of the stomach is usually caused by obstruction of the pylorus, but it sometimes, though rarely, occurs without it. The organ often becomes enormously distended, and filled with undigested and fermentated matter, and the mucous coat exceedingly thin. Regulation of the diet is the proper treatment.—The most important functional diseases of the stomach are dyspepsia and gastralgia. (See Dyspepsia.) Gastralgia is a painful nervous affection, sometimes of the most excruciating nature. It often accompanies dyspepsia, and sometimes the structural diseases. When existing alone and in an acute form, it may be caused by the presence of obnoxious ingesta. It sometimes results from malaria, frequently accompanies intermittent fever, and is sometimes associated with gout. It rarely attacks old persons or those under the age of puberty. Prof. Alfred Sillés states that it is often produced by chewing tobacco. The remedies directing the remission are analogous. Morphine may be given by the mouth or by hypodermic injection. Bismuth has been used, it is said, with good results, but it is not generally relied on. A few drops of chloroform with water often give speedy relief. The general treatment will depend upon regulating the bodily functions and the diet. When of a malignant origin the preparations of quinia are indicated, in full doses.

**STONE.** See Rocks.

**STONE,** the common name of calculi in the urinary bladder, for the composition of which see Calculi and Gravel. The prominent symptoms are irritability of the bladder with frequent irresistible desire to pass urine, and occasional stoppage of the stream, with pain in various parts of the urinary system, and sometimes the presence of blood, mucus, and pus in the urine. None of these, however, can be depended on, the only sure diagnosis resting on making the stone perceptible to the ear and fingers by means of a metallic sound introduced through the urethra, and brought into direct contact with the foreign body; even with this instrument, several introductions in various positions of the body are sometimes necessary for its detection. The symptoms vary in intensity according to the size and roughness of the stone, the state of the urine, and the condition of the bladder. Stone is formed by a precipitation of the urinary salts either in the kidney, passing thence to the bladder, or primarily in the bladder. In the latter case a foreign body may be the nucleus. Stone may be removed from the bladder by—1, solution; 2, extraction as a whole through the urethra; 3, extraction through an opening artificially made into the bladder (lithotomy); 4, crushing into fragments of such a size that they can pass through the urethra (lithotripsy).

1. Solutions may be attempted by remedies taken by the mouth or injected into the bladder. Urile acid calculi have been treated by the administration of alkalis, and the phosphatic by the injection of a solution of nitric acid. These methods have from their inefficacy fallen into disuse. 2. Extraction by the urethe is now done only in females; in them the canal is so short and dilatable that a stone of considerable size can be removed by this method. 3. Lithotomy is indicated in all males under puberty, and in others when the stone is large or there are several; when the urethra is stiitured; when the bladder is in such a condition as to be unable to bear the repeated introduction of instruments, and the irritation caused by the fragments resulting from lithotripsy; and when the kidneys are not much diseased. The operation may be done by incision above the pubes (the supra-pubic), through the perineum (the perineal), or through the rectum, or rectum and perineum (the recto-vesical). The supra-pubic and that through the rectum and perineum are usually employed only in cases in which, from the size of the stone or other causes, removal through the perineum is impossible. The perineal operations are three in number, the lateral, bilateral, and median. The lateral operation is in general the best, and it may be performed as follows: A grooved steel staff or sound of full size is introduced, the bladder being moderately distended, the patient on his back, with shoulders elevated, thighs separated widely in order to expose the perineum, and the hand grasping and bound to the foot; the patient being etherized, an incision is made on the left side of the perineum from about an inch before the anus downward and outward to a point midway between the anal opening and the tuberosity of the ischium, the muscular fibres being divided down to the staff; the left index finger passed into the wound keeps back the rectum, and at the same time feels at the membranous part of the urethra the groove, which is entered by the knife and conducts it to the bladder, the urethra and about half an inch of the prostate being divided; the finger is then introduced, dilating the opening; the finger being withdrawn, the forceps are introduced, opened, and the stone seized, if possible, with the first grasp of fluid from the wound, and then extracted by slow, steady, and undulating movements, dilating and not tearing the soft parts. If properly performed, and the after treatment not interfered with by haemorrhage, inflammation, sloughing, or other complications, the urine begins to flow by the urethra in about a week, and the wound heals completely in four or five weeks. In the bilateral operation, a curved incision, with the convexity upward, is made from one side of the perineum to the other, between the anus and the urethral bulb, dividing both sides of the prostate by a double bistoury. The median operation differs from the preceding in that the incision is vertical and in the median line, and the prostate is not cut, but is dilated, and somewhat lacerated, by
the finger introduced through the opening made into the urethra in front. The recto-vesical operation consists in cutting into the bladder from the rectum on the median line behind the prostate, or in dividing also the prostate and perineum in the median line. In the high operation the bladder is opened above the pubes through the linea alba, where there is no covering of peritoneum. Lithotomy was practised 23 centuries ago; Hippocrates bound his pupils by oath not to practise it, but it came into use again in the time of Celsus, in whose writings are found the first indications of the bilateral operation; the lateral operation was first practised toward the end of the 17th century; the supra-pubic method was first employed by Franco in the 16th century, and the recto-vesical by Pancius in the 19th. 4. Lithotripsy (more commonly called lithotrity) is indicated in patients beyond puberty, when the stone is single and not large, and when the urethra is not strictured, and the bladder and kidneys are not much diseased. The early instruments used for this purpose were very rude and dangerous; the stone being grasped by branches made to protrude from a straight catheter, and then bored by a drill extending through the instrument and worked by a watchmaker's bow; after it was bored it was crushed by another complicated instrument. To Civiale (1817-'24) is unquestionably due the credit of having introduced the operation by improving the instruments and the manner of their use. The instrument now used is composed of two sliding blades, introduced in the shape and after the manner of a sound, between which the stone is seized, and then crushed by the gradual pressure of a screw; the fragments may then be washed out by injections or by the urine, large pieces being again broken by the same or a smaller instrument. In properly selected cases, and with skilful manipulation, this operation is much safer than lithotomy.

STONE. I. A N. county of Arkansas, bounded N. E. by White river, and watered by the Little Red river. It was formed in 1873 from portions of Independence, Izard, Searcy, and Van Buren counties. The surface is irregular. The soil produces cotton, grain, tobacco, and fruits. Timber is abundant. Iron, lead, and marble occur. Capital, Mountain View. II. A S. W. county of Missouri, bordering on Arkansas, intersected by White river, and drained by its tributary the James; area, about 500 sq. m.; pop. in 1870, 3,253, of whom 20 were colored. The surface is broken, and the soil fertile. The Atlantic and Pacific railroad touches the N. W. corner. The chief productions in 1870 were 13,092 bushels of wheat, 121,735 of Indian corn, 14,340 of oats, 3,325 lbs. of tobacco, 3,521 of wool, 27,917 of butter, and 3,808 gallons of sorghum molasses. There were 1,398 horses, 903 milch cows, 1,885 other cattle, 3,023 sheep, and 10,722 swine. Capital, Galena. III. An E. county of Dakota, recently formed and not included in the census of 1870; area, about 700 sq. m. It is mostly table land, being occupied by the Coteau des Prairies, and has a rolling surface.

STONE, Thomas, a signer of the Declaration of Independence, born at Pointon Manor, Charles co., Md., in 1743, died at Port Tobacco, Md., Oct. 5, 1787. He was a lawyer, and was sent as a delegate to congress in 1774 and 1775. He strongly favored the establishment of an independent government, although under instruction from the Maryland convention to oppose it; but that state receded from its opposition in time to allow its delegates to sign the Declaration. He served on the committee to prepare a plan of confederation, and was reelected to congress in 1777 and 1788.

STONE, I. William Leete, an American author, born at New Paltz, N. Y., April 20,1792, died at Saratoga Springs, Aug. 15, 1844. He was a printer, and edited successively the "Herkimer American," "Hudson Whig," "The Lounger" (Hudson), "Albany Daily Advertiser," "Hartford Mirror," "The Knights of the Round Table" at Hartford, and from 1821 the New York "Commercial Advertiser." In 1843-4 he was superintendent of common schools in New York. His principal works are: "History of the Great Albany Convention of 1821" (8vo); "Narrative of the Grand Erie Canal Celebration" (New York, 1825); "Letters on Masonry and Anti-Masonry" (1832); "Matthias and his Impostures" (12mo, 1832, and 18mo, 1835); "Tales and Sketches" (2 vols. 12mo, 1834); "Essays on Social and Literary Topics" (12mo, 1835); "Ups and Downs in the Life of a Distressed Gentleman" (12mo, 1839); "Life of Maria Monk and Refutation of the Awful Disclosures" (8vo, 1836); "Letters on Animal Magnetism" (8vo, 1837); "Life of Joseph Brant" (2 vols. 8vo, 1838; new ed. by W. L. Stone, jr., with index, Albany, 1865); "Border Wars of the American Revolution" (2 vols. 12mo, 1839); "Poetry and History of Wyoming" (12mo, 1841; with index, 1864); "Life of Red Jacket—Sa-go-ye-wat-ha" (8vo, 1835 and 1841; new ed. with a life of the author by W. L. Stone, jr., 1866); and "Life of Uncas and Miostonomah" (24mo, 1842). II. William Leete, Jr., son of the preceding, born in New York, April 4, 1835. He graduated at Brown university in 1863 and at the Albany law school in 1859, and is now (1876) one of the editors of the "New York School Journal." He has published "Life and Times of Sir William Johnson, Bart.," begun by his father (2 vols. 8vo, 1865); "Life and Writings of Col. William L. Stone" (1866); "Saratoga and its Mineral Springs" (1866); "History of New York City" (1872); "The True History of the Jane McCreary Tragedy" (1874); "Reminiscences of Saratoga" (1874); and "Centennial Sketches" (1876). He has translated from the German the "Memoirs and Letters of Mrs. General Riedesel" (1867), and the "Life and Military Journals of Major General Riedesel" (2 vols. 8vo, 1868).
STONE, William Oliver, an American painter, born in Derby, Conn., Sept. 26, 1830, died in Newport, R. I., Sept. 15, 1875. He studied under Nathaniel Jocelyn in New Haven, lost all his early pictures by the burning of his studio, and removed to New York in 1851. His first picture exhibited in the national academy was "The Mantilla" (1854), and he afterward painted many portraits of prominent persons, being especially successful in those of women and children. He became a member of the national academy in 1859.

STONE BORER, a name given to several bivalve shells, especially pholus (Linn.) and lithodomus (Cuv.), from their power of boring into the hardest rocks. The pholadidae (Gr. phole, to hide in a hole) are true bivalves, and have two accessory plates in the neighborhood of the hinge for the protection of the dorsal muscles; they belong to the group siphonophora (Gray), or those having long respiratory siphons, united for the greater part of their length; they are all burrowing animals, penetrating the hardest substances. The shells are usually elongated, gaping at one or both ends, and closed by two adductor muscles; the foot is large and powerful, and the mantle is closed; they are found in all climates. The typical genus pholus is often of considerable size, with a white, hard, rough, but very brittle shell, rendering it an interesting question how it can perforate a solid rock; the operation is supposed to be performed by a rotatory motion of the shell effected by the powerful foot. The date shell or piddock (P. dactylus, Linn.), about 2 in. long and 6 or 7 in. wide, is found along the European coast, mostly in calcareous rocks; it is eaten along the Mediterranean. It is very luminous, and hence some have supposed that its excavations may be partly due to electrical action on the sea water. The smaller P. candida (Linn.) is used for bait in England. The P. crispata (Linn.) is found along the coasts of our middle and southern states. Many fossil species are known. The family of veneracea, of the same group, are also stone borers, principally by means of the foot.—Among the asiphonate bivalves, the most remarkable stone borer is the lithodomus lithophagus (Cuv.); it is commonly found in holes which it has excavated in calcareous and coral formations; it is the sea date shell of the Mediterranean, and is a delicate article of food. Its perforations have served as important indications of the change of level of the sea coast in modern times; the columns of the temple of Serapis at Pozzani are perforated by these shells at a considerable height above the actual level of the sea. Another bivalve, coming near the clams, generally considered a stone borer, is saxicava (Lam.), which appears under such a variety of forms that two genera and at least 15 species have been made of the single representative, S. rugosa (Lam.); the young symmetrical form constitutes the genus hiatella (Bosc). It is found in almost all parts of the world, largest in the arctic seas, in crevices of rocks and corals, assuming very exactly the shape of the cavity which contains it; it occurs from low-water mark to the depth of 140 fathoms; it is found fossil in the miocene and glacial deposits. It has been questioned whether saxicava is the excavator of the holes in which it is found, and the subject of the mechanism by which the stone borers operate is by no means well understood.—Sea urchins also may in many instances be called stone borers, the excavation of their cavities being effected by the constant action of their spines, and perhaps also by the vibratile cilia of their ambulacral tubes and suckers. It is conceivable, if not probable, that the continual action of soft vibratile cilia may excavate holes even in the hardest rocks.

STONE CHAT (saxicola rubicola, Bechst.), a dentirostral bird of the warbler family, and

![Date Shell (Pholas dactylus)](image)

![Stone Borer (Pholas dactylus)](image)
STONE CROP

subfamily erythraceae, or old world robins. The bill is short, with broad gape, furnished with bristles; wings long and rounded, with fourth and fifth quills equal and longest; tail short and broad; tarsi and toes slender, and

are much weather-worn, but in many of them the sharp angles and the tenons and mortices by which they were joined are well preserved. The outer circle has 17 stones remaining out of 30; the inner has but 8 stones entire, and fragments of 12 others. The inner oval consisted of about 20 smaller stones, of which 11 are still standing; the other oval consisted of 10 stones, of which 8 are remaining. Scattered over the plain are about 300 tumuli, or barrows, some of which have been opened, and found to contain charred human bones, fragments of pottery, and British and Roman ornaments and weapons. In the centre is a flat slab 15 ft. long, which is supposed to have been the altar; it is a grained calcareous sandstone, which strikes fire with steel. On excavating at the foot of this altar, remains of oxen, deer, and other animals were found, intermixed with burnt wood and fragments of Roman and British pottery. According to Geoffrey of Monmouth, Stonehenge was erected by order of Aurélianus Ambrosius, the last British king, in honor of 460 Britons slain by Hengist the Saxon; but Polydore Vergil argues that it was a monument to the memory of that king. Some authorities believe it to have been a Druidic temple, others assert that it was an astronomical observatory, and others that it was a place both of worship and of council, which was also used for assemblies of the people. Similar stone circles have been found in various parts of the world, and Sir John Lubbock refers them all to the bronze age, while other antiquaries and geologists maintain that some of them were erected 10,000 to 60,000 years ago. Nothing has as yet been brought forward to establish any of these theories beyond a cavil, and some doubt.

STONE CROP. See Sedum.

STONEHENGE, a collection of huge stones on Salisbury plain, Wiltshire, England, about 8 m. N. of Salisbury. Its name is old Saxon, and signifies "hanging stones." Seen from a distance, they appear to be merely an irregular

mass of stones, but a closer inspection shows them to have been originally arranged to form two ovals within two circles, surrounded by a bank of earth 15 ft. high and 1,010 ft. in circumference. There are altogether about 140 stones, weighing from 10 to 70 tons. They

bind toe long. There are several species. The stone chat, resident in England but migratory on the continent, is about 4½ in. long; the head, throat, and back black, on the latter edged with whitish red; sides of neck, upper part of wings, and rump white; breast orange brown; lower parts reddish white. A similar but migratory species is the whin chat (S. rubetra, Bechst.), so named for its partiality for furze or whin bushes. These two species belong to the subgenus pratineola (Koch).

STONINGTON, a town, borough, and port of entry of New London co., Conn., on Long Island sound, at the S. E. extremity of the state; pop. of the town in 1870, 6,313, of the borough, 1,661. The town is divided into five voting districts, Stonington borough, the villages of Mystic, Mystic Bridge, and Paquetuck, and the "Road." The borough is built on a narrow rocky point extending about half a mile into the sound, and has a good harbor protected by a breakwater. A second breakwater is now building and a third one is projected. Stonington is a favorite place for summer resort, and has a considerable coasting trade and several vessels employed in sealing. It is connected with Providence by the Stonington and Providence railway, with New London by a branch of the same, and with New York by the New York and Stonington steamboat line. Mystic Bridge is a thriving village, chiefly engaged in ship building. There are in the several villages four banks, a savings bank, 14 churches, 16 public schools, three woolen mills, one cotton mill, a large foundry and machine shop, and several other factories, and a weekly newspaper. On June 30, 1874, its

Stone Chat (Saxicola rubicola).

Stonehenge.
shipping amounted in the aggregate to 119 ves-
sels of 10,978 aggregate tonnage. — The town
was settled in 1649, and the borough was in-
corporated in 1801. On Aug. 9 and 10, 1814,
the borough was attacked by the British fleet
under Sir Thomas Hardy, but it was compelled
by the volunteers and militia to retire.

STONY POINT, a small rocky promontory on
the right bank of the Hudson river, in Rock-
land co., N. Y., 42 m. N. of New York, at the
entrance of the Highlands, and opposite Ver-
planck's Point. On both these points forts
were built by the Americans during the revo-
lution, which were captured by Sir Henry
Clinton about the first of June, 1779, strength-
ened, and garrisoned; but that on Stony Point
was retaken by a bold night attack under Gen.
Anthony Wayne, with 1,200 men, July 16, and
the garrison of 543 officers and men made
prisoners. The Americans had 15 killed and
83 wounded, and the British 63 killed. The
simultaneous attack on Verplanck's Point hav-
ing failed, the works on Stony Point were
destroyed and abandoned on the 18th.

STOPPAGE IN TRANSIT, in law, the arrest-
ing by the seller of goods on their passage to a
distant purchaser who has become insolvent.
When and how the doctrine of stoppage in
transit became a part of our law cannot be
definitely asserted. Its introduction was com-
paratively recent. The right exists only be-
tween a buyer and a seller. A surety for the
price of the goods, bound to pay for them if the
buyer does not, has not this right; but one who
is substantially a seller has. Thus, one ordered
by a foreign correspondent to buy goods for
him, and then buying them in his own name
and on his own credit, and sending them as
ordered, may stop them in transit. So may
a principal who sends goods to his factor, or
one who remits money for any particular pur-
pose. The reception and negotiation of a bill
for the goods does not defeat the right, nor
does part payment. But goods cannot be
stopped when they are sent to pay a precedent
and existing debt. — The right arises only upon
actual insolvency, which need not be legal or
formal bankruptcy or insolvency. It is enough
if the buyer cannot pay his debts, and also that
he refuses to comply with the specially agreed
terms of the sale, for this is insolvency so far
as the seller is concerned. When the goods are
stopped, the buyer may, by payment of the
price or by tender of security if they were sold
on credit, defeat the stoppage and reclaim the
goods. If the seller stop the goods malis-
ciously, and without actual belief of the insol-
veney on good grounds, he would doubtless be
answerable for any damages which the buyer
might sustain. The seller's right to stop the
goods cannot be defeated by any sale or mort-
gage thereof by the buyer, or by any claim
or lien or attachment of any other person, ex-
cept such lien as may arise in favor of any car-
rrier by whom they have been conveyed. — Nice
questions have arisen in respect to the tran-

STOPPAGE IN TRANSIT

situs. Generally speaking, the goods are in
transit when they are not in the actual posses-
sion either of the buyer or of the seller. But
the law goes sometimes further than this, and
inquires into the constructive possession; for
the goods may be in the actual possession of
the seller, and yet so far constructively in the
possession of the buyer that the seller cannot
retain them; or they may be in the actual pos-
session of the buyer, but under such circum-
stances that the seller's right is not taken away.
It becomes, therefore, very important in many
instances to ascertain whether the transit is
complete. A carrier of goods, by land as well
as by sea, acquires a lien on the goods which
he carries for the freight money. The goods
are still in transit, and may be stopped, so long
as the carrier withholds them from the buyer
by his lien for the freight, and a seller who seeks
to stop them then must discharge this lien.
In general, whenever a carrier enters into a
new arrangement with the consignee, by which
he agrees to hold the goods as the property of
the consignee and at his disposal, there is a
termination of the transit. Yet all acts in
reference to such question must be open to in-
vestigation by existing circumstances, the gen-
eral inquiry in such case being whether the
carrier, warehouseman, wharfinger, or other
person having actual possession of the goods
at the time of the intended stoppage in trans-
mit, was then acting as the agent of the seller
or of the buyer; for if of the latter, the tran-
sit was terminated. If the buyer order the
goods to be sent to some other person by any
suitable conveyance without designating any
one especially, or by a designated carrier who
is not specifically his agent or servant, the goods
remain in transit until they reach that second
person. Questions of constructive possession
arise very frequently in respect to goods in the
charge of warehousemen. In general, every
warehouseman is the agent of any party who
puts the goods in his warehouse and can take
them out at his pleasure; and therefore his
possession is the possession of such party. On
this point it is a material question whether any-
thing remains to be done by the seller; if noth-
ing, this goes far to make the warehousing a
delivery to the buyer. If a seller of goods that
are warehoused delivers an order for them to a
buyer, this alone may not transfer the posses-
sion; but if the buyer delivers the order to the
warehouseman, this in general transfers the pos-
session, and still more so if the warehouseman
enters the same in his books or otherwise ac-
cepts the order, so as to be responsible for the
goods to the buyer. If the buyer sells to a
third party, to whom the warehouseman certi-
fies that the goods are transferred to his ac-
count, and who thereupon pays the price, the
warehouseman becomes responsible to this
third party; and if the original seller, though
there remained something material to be done
by him to the goods, consented to the ware-
houseman's so certifying, he would be held to
have lost his right of stoppage in transitu.—The effect of the bill of lading upon the right of a seller to stop the goods in transitu is very important. The law regards the bill of lading not as a mere receipt which the carrier gives for the goods, but rather as a muniment of title, carrying property with it, and being itself quasi negotiable. An indorsement and delivery of the bill for value operate as a symbolic delivery of the goods mentioned in it. It results from this doctrine that a consignee, who sells for value goods to arrive and indorses over the bill of lading, confers upon the purchaser a title and property which destroy the right of the seller of the goods to stop them in transitu. But if the party buying from the consignee knows that the sale is in fraud of the original seller, it is voidable by that seller of course; and if he knows that the consignee is, or is about to become, insolvent, this knowledge would probably have the same effect, as would also knowledge or notice of any circumstances which rendered the bill of lading not properly assignable. If the bill of lading be transferred and indorsed by way of pledge to secure the consignee’s debt, the consignor does not lose entirely his right to stop the goods, but holds it subject to the rights of the pledgee; that is, he may enforce his claim to hold the surplus of the goods after the pledgee’s claim is satisfied, and he holds this surplus to secure the debt of the consignee to him.—The insolvency of the buyer, however complete or however manifested, will not operate of itself as a stoppage in transitu. The goods must be actually stopped, in some way which the law recognizes as adequate, by the seller or his authorized agent. An actual taking possession by the seller is not necessary, at least not in all cases, although actual possession should be taken if possible, and as soon as possible. A constructive possession may be acquired by giving notice to the carrier or warehouseman, forbidding him to deliver the goods to the buyer, and requiring him to give them up to the seller or his agent, or to hold them subject to his order. Delivery in disregard of this notice does not defeat the seller’s right; he has still a constructive possession, and the carrier is responsible to him for all the injury he may sustain. Or, if the buyer becomes insolvent, and the goods pass into the possession of his assignees, the seller may maintain an action of trover against them. What the consignor may do personally, he may do by his agent; and if the demand be made by one who acts as agent, but without authority, a subsequent adoption and ratification will have the effect of a previous authority, provided this be made before the goods are demanded by the buyer.

STORAX. See BALSAMS.

STOKEY, a W. county of Nevada, bounded N. by Truckee river and S. by the Carson; area, 420 sq. m.; pop. in 1875, 19,928, of whom 1,241 were Chinese. The valleys of the rivers contain small tracts of arable land, but the county derives its importance from the Comstock lode, on Mt. Davidson (7,000 ft. high), the richest silver-bearing lode in the world. According to the census of 1870, there were 19 quartz mines in operation, producing gold and silver to the value of $7,751,381; but the production has since very greatly increased. There were 3 manufactories of boots and shoes, 3 of carriages and wagons, 5 of furniture, 3 of iron castings, 3 of jewelry, 3 of saddlery and harness, 4 of tin ware, 8 breweries, and 26 quartz mills. Capital, Virginia.

STORK, a wading bird of the heron family, subfamily Ciconinae, and genus Ciconia (Linn.); other allied genera are the jabiru and marabou, described under their own names. In the storks the bill is long, straight, strong, gradually tapering to a sharp tip; sides compressed; wings long and ample, the third and fourth quills the longest and equal; tail short and broad; tarsi long and scaled; toes short and stout, webbed to the first joint; hind toe elevated, partly resting on the ground. They are large, most abundant in warm countries, and performing periodical migrations to and from the marshy regions of Europe, Asia, and Africa; like vultures and other carrion feeders, they eat almost any kind of garbage that comes in their way, and are hence valuable scavengers in hot climates; they seek their food on the borders of streams; the body is light and well balanced; during flight the head is thrown back and the legs are extended; the space round the orbits is destitute of feathers, and in some the whole face and throat are naked. There are about a dozen species, of which the best known is the white stork (C. alba, Briss.);

it is 3½ ft. long, the bill 7½ in.; the general color is white, with the quills and wing coverts black, and bill and feet red; around the eyes a bald blackish circle; it is the ciconia of the French. They arrive in N. Europe, especially in Holland and Germany, in the spring, return-
ing in the autumn to Africa by night and in large flocks; the only noise they make is by clapping the mandibles together like a pair of castanets; they rest sleeping on one leg, with the neck folded and head turned backward on the shoulder. The food consists of reptiles, fish, young birds, and insects. The nest is large, coarsely made of sticks and twigs, placed on house tops (often in the midst of crowded cities), and is repaired by the males year after year; the eggs are three or four, white tinged with buff, 2 f by 2 in.; both sexes incubate, and the young are hatched in about a month; the nestlings are tenderly cared for, and are fed by food regurgitated from the parents' stomach. The flight is very high, and the gait slow, with long and measured steps; the disposition is gentle, the manner familiar, and the docility considerable; they do not propagate in captivity. The stork was considered by the ancients as the personification of piety, conjugal and filial love, gratitude, and temperance; it was supposed to bear a charmed life, and it was a crime to offer it violence; in some places it was even an object of worship, and in hieroglyphic language it is the symbol of piety and beneficence; "pious" or "beneficent" is also the meaning of its name in Hebrew (Bechst.). The bladed stork (C. nigra, Bechst.) is about 2½ ft. long, with a bill of 5½ in.; the color above is black with green and purplish gloss, and white below. It avoids the vicinity of man, nests in trees, and feeds like the herons chiefly on fish; it is found in many countries of Europe, especially in the Alps. The American stork (C. Americana, Briss,) is about as large as the white species; it is found in South America, particularly in Brazil.

STORMONT, an E. county of Ontario, Canada, bounded S. E. by the St. Lawrence river; area, 409 sq. m.; pop. in 1871, 18,987, of whom 6,229 were of Scotch, 4,191 of Irish, 3,125 of German, 2,101 of French, 1,985 of English, and 1,922 of Dutch origin or descent. It is watered by several small streams, and is traversed by the Grand Trunk railway. Capital, Cornwall.

STORMS, violent atmospheric disturbances. (See Wind.) Storm areas are in general characterized by low barometric pressure at their centres; winds increasing in force toward the central region, and by their directions showing the lower portion of the atmosphere to be moving spirally in, toward and around the centre; heavy masses of low clouds attended by a higher stratum that moves around and out from the centre; rain or snow falling especially on the advancing side or front of the storm; temperatures above the average in front, and below the average in the rear of the storm. The storm area with its attending features moves bodily along the earth's surface for several days. A map showing the average number of centres of storms that pass over the eastern portions of the United States is published in the "Statistical Atlas" of the census bureau (1875), and is here reproduced.

The number of storm centres passing over any region increases as we go from the lower or latitudes toward Hudson bay, being greatest in the region of the St. Lawrence valley and the great lakes. This arises from the fact that while on the one hand many storms move eastward along the northern limits of our field of observation, on the other hand the storms that originate in the lower latitudes tend to move northward. Nine tenths of the storm tracks on which this map is based have moved toward and over New England and Lower Canada. The chart also shows in Nebraska a region of specially numerous storm tracks, from the fact that the storms coming both from Texas and from Dakota frequently move respectively N. E. and S. E. toward this region; and frequently we find here also the first trace of a class of storms that appear to originate on the spot. The peculiarities in the distribution of storms are apparently fully explained by the topography of the continent. When we consider that at any station in the northern hemisphere the winds veer from S. E. to S. W. and N. W. as a storm centre passes N. of it, we perceive from this map that throughout the United States E. of the Rocky mountains the veering of the wind will be more frequent than its backing, in the proportions indicated by the relative number of storm centres that pass to the north and south of the station. For the ocean, it has in general not yet been possible to compile any general map of the average paths of the storms; but from the logs of vessels a great mass of information relative to the frequency of gales and stormy winds has been compiled, and this information is very nearly related to that given by the accompanying chart. The first map of this kind was compiled at the United States naval observatory by M. F. Maury; and the work of collecting such data has been actively pursued by the meteorological officers of all nations. Especially England, within the limits of the equator storms are exceedingly rare, but their number increases rapidly as we approach the latitude of 50° N. or S. During our northern summer the percentage of storminess diminishes in the North Atlantic and increases in the South Atlantic ocean. In either hemisphere, winter is its stormy season. Within the limits of our observations, viz., up to the parallel of 40° on either side of the equator and in mid-ocean, the southern winter is sensibly as stormy as the northern; but beyond these parallels, and especially near the coast of North and South America, the northern hemisphere is far more stormy than the southern; the probable cause is the greater mass of dry land, and consequently of dry cold air, contiguous to the North Atlantic, as compared with the little land bordering the South Atlantic. Among the regions most frequently passed over by vessels of all nations, the neighborhoods of Cape Horn and the cape of Good Hope are next in importance to the great
highway between Europe and America. The chart of the ocean in the neighborhood of Cape Horn, published by the London meteorological office (1871), do not give the per-
centages of storms; but for the cape of Good Hope, the charts of Cornelissen (1874), of the meteorological institute of the Nether-
lands, show that during the southern summer the storms in this region are comparatively few and feeble. In winter severe westerly gales are exceedingly abundant to the south of the cape. In the immediate neighborhood of the continent, and on either side, the influ-
ence of the land is shown in the frequency of storm winds blowing off shore during winter, and on shore during summer.—Storm War-
nings. Suggestions for storm warnings were broached even in the 18th century, before the introduction of the electric telegraph had ren-
dered the undertaking practicable. The Euro-
peans were the first to engage systematically in storm warning; but in the early demonstration of the feasibility of the idea, the merchants and the individual meteorologists of the United States took the lead. If we pass by that which Franklin, Espey, Bache, Redfield, Loomis, Maur-
ry, and others did to advance our knowledge of atmospheric phenomena, and consider merely the steps taken to establish national systems of storm warnings, we shall note that in 1835 the joint meteorological committee of the Franklin institute and the American philos-
ophical society at Philadelphia appointed, at the suggestion of Bache and Espey, a sub-com-
mittee to memorialize congress upon the sub-
ject of a national weather bureau for the study and prediction of storms. When the success of the Morse telegraph was beyond all question, Redfield in 1846, and Loomis in 1847, urged its systematic application to the problem in hand. This idea was greatly furthered by Prof. Joseph Henry, who as secretary of the Smith-
sonian institution had just removed to Wash-
ington. In 1847, in behalf of that institution, he organized a system of volunteer meteoroo-
logical observations and reports. Through the liberality of the National telegraph line, Prof. Henry was in 1857 able to begin the publica-
tion of a telegraphic weather bulletin, and to make successful weather predictions. Mean-
while, the appointment of Espey as meteorolo-
gist successively to the war and navy depart-
ments, and the publication (1850 and 1857) of his famous reports on meteorology, had awak-
ened a universal conviction that storm pre-
dictions were practicable. Already many mer-
chants were habitually obtaining at their own expense weather reports from distant sections. The Smithsonian weather bulletin was of ne-
cessity discontinued in 1861, and an effort to revive it in 1864 was frustrated only by a con-
flagration which destroyed a portion of the Smithsonian building early in the following year. It does not appear that anything more was done in America in the prosecution of the subject of weather predictions until in

1868, in his inaugural report as director of the Cincinnati observatory, the writer proposed this as a work proper for one branch of the insti-
tution which he proposed to build in Cincinnati. A few months after this date the Cin-
cinnati chamber of commerce authorized him to obtain at its expense, for three months, the necessary telegrams, and to publish daily weath-
er predictions. This system went into opera-
tion on Sept. 1, 1869. In a modified form, and pending further negotiations, the work was continued at the joint expense of the writ-
er and the Western Union telegraph company from December, 1869, to May, 1870, and after-
ward entirely at the expense of that company, whose manifold weather maps were in much demand until the commencement in Novem-
ber, 1870, of the great work of the army signal office. (See Signal Service.)—Simultaneous-
ly with the spread of the telegraph in Europe began the publication of weather bulletins, and their collation and study. Kântz says that even in 1858 he had begun to study the weather reports in the Berlin papers, but it required the excitement of the Crimean war, in 1854, to force the importance of the subject upon the attention of European governments. In that year Leverrier as director of the Paris observatory took up the subject; his tele-
graphic reports began in 1855, and his interna-
tional bulletin in 1858. Weather probabil-
ities were not begun till 1863; these were dis-
continued in 1865, and only lately have been revived, but storm warning signals have been uninterruptedly displayed since 1860. In 1861 Admiral Fitzroy, of the meteorological depart-
ment of the board of trade, began the display of storm signals in England, and in the latter part of the year the publication of weather fore-
casts; his system of warnings consisted rather of a series of signals announcing the presence of storms, than of any real prediction of their advent. The Fitzroy system ceased in 1866, shortly after his death, but was renewed in 1867. Since that time the British ports have regularly received storm warnings, but the dis-
play of the storm signal and storm drum was only revived in March, 1875. The French and English systems of storm warnings were in some respects preceded by the system organ-
zized in Holland by Buys-Ballot, who in 1854 had announced his famous rule for that coun-
try in regard to the direction of the wind, as depending on barometric disturbance. In 1860 he began the communication to the ship-
ping ports of storm warning despatches, and was in fact by his signals the first to utilize the despatches contained in the telegraphic weather bulletins of Leverrier. The organ-
ization of the French, English, and Dutch systems suffices to furnish for other European nations such storm predictions as are needed for their respective ports. The United States, Spain, Italy, Sweden, Hanover, Russia, Austria, Turkey, and key receive regularly from Paris and London announcements of the condition of the wheat-
or, especially of impending storms. Every nation of the civilized world, including China and Japan, now has national offices for collecting and utilizing meteorological observations. As a general rule, the warning signal, whether it be the drum or cone as in England, or the flags and lights adopted in other countries, is intended to announce merely that the chances are that there will soon be a dangerous high wind in the neighborhood of the station.

STORRS, Richard Salter, an American clergyman, born in Braintree, Mass., Aug. 21, 1801. He graduated at Amherst college in 1839, and at Andover theological seminary in 1845, and was ordained pastor of the Harvard Congregational church, Brookline, Mass. In 1846 he became pastor of the church of the Pilgrims, Brooklyn, N. Y., which post he still retains (1876). He was associate editor of the "Independent" newspaper from its commence-
mente in 1848 to 1861. He has published a report on the revision of the English version of the Bible undertaken by the American Bible society; "Graham Lectures, on the Wisdom, Power, and Goodness of God, as manifested in the Constitution of the Human Soul" (New York, 1856); and lectures on "The Conditions of Success in Preaching without Notes" (1875).

STORY, a central county of Iowa, intersected by Skunk river; area, 550 sq. m.; pop. in 1870, 11,651. The surface is undulating and the soil fertile. The chief productions in 1870 were 131,032 bushels of wheat, 390,395 of In-
dian corn, 97,938 of oats, 25,066 of potatoes, 13,730 tons of hay, 8,918 lbs. of wool, 132,249 of butter, and 5,751 gallons of sorghum mol-
lasses. There were 1,580 horses, 2,358 milch cows, 4,021 other cattle, 3,185 sheep, and 5,388 swine. The Chicago and Northwestern railroad passes through the capital, Nevada.

STORY, I. Joseph, an American jurist, born in Marblehead, Mass., Sept. 18, 1779, died in Cambridge, Sept. 10, 1845. He graduated at Harvard college in 1798, and studied law in Marblehead. In 1801 he removed to Salem and was admitted to the bar. He soon ac-
quired a lucrative practice and the warm friend-
sip of some of the leading federalists, though he was a republican. In 1804 he published a volume of poems containing "The Power of Solitude," and some smaller pieces, but it was not successful. From 1805 to 1808 he was a member of the lower house of the legislature of Massachusetts, and took a very active part in the principal leader on the republican side; but in two of the measures which he espoused, he acted upon purely independent grounds. The first was a bill to increase, and to estab-
lish on a permanent basis, the salaries of the justices of the supreme judicial court, which was passed by his exertions in 1807. The other was a bill (1808) to establish a court of chancery for the state; but this did not suc-
cceed. In the same year he defended the em-
bargo as the only measure which the adminis-
tration of Jefferson could have adopted, short of a declaration of war, without submitting to the ignominious restrictions on American com-
merce by the belligerent powers. He had writ-
ten in 1806 the celebrated "Memorial of the Inhabitants of Salem relative to the Infringe-
ments on the Neutral Trade of the United States," addressed to the president and to con-
gress. In the autumn of 1808 he was elected to congress from the Essex district. In op-
position to the administration he exerted him-
self to procure a repeal of the embargo, upon the ground that he had originally supported it as a temporary measure, and that it had ac-
complished its real purpose. He left congress before the repeal was consummated, but not before he had largely contributed to bring it about, and Jefferson attributed the repeal almost wholly to his exertions. Declining a re-election to congress, he was again chosen to a seat in the state legislature in 1810, and in January, 1811, he was elected speaker of the house. On Nov. 18, 1811, he received the ap-
pointment of associate justice of the supreme court of the United States; and on Jan. 17, 1812, he resigned the office of speaker. In 1820 he was a member of the convention for the revision of the state constitution. His principal services in that body related to the tenure and the compensation of the judiciary, the apportionment of the house of representa-
tives, and the property basis of the senate. The original constitution contained a clause authorizing the legislature to increase the sala-
ries of the judges of the supreme judicial court. A motion was made and suddenly carried to insert the words "or diminish." The recon-
sideration and rejection of this amendment were produced by a powerful and brilliant argument by Judge Story, which commanded the ascent of more than two thirds of the con-
vention. In 1829 Judge Story was appointed professor of law in Harvard university, on a foundation established by Nathan Dane, for the delivery of lectures on the law of nature, the law of nations, commercial and maritime law, federal law, and federal equity; and for the rest of his life he resided in Cambridge. The law school of which he now became the head immediately attracted students from all parts of the United States. In his constitu-
tional views he was of the school of Wash-
ington and Marshall, upholding what he con-
sidered as the just powers of the Union, with-
out encroaching upon the rights of the states. His works comprehend "Commentaries on the Constitution of the United States" (3 vols. 8vo, 1833); "Commentaries on the Conflict of Laws" (1844); "Commentaries on Equity Jurisprudence" (2 vols. 8vo, 1856), and "Equity Pleadings" (1888); and treatises on the law of bailments, agency, partnership, bills of exchange, and promissory notes. All of these works have passed through many edi-
tions. Judge Story was gifted with great colloquial powers, and his social qualities in private life largely added to the influence of
his learning, talents, and public positions. A
life of him by his son, William W. Story, was
published at Boston in 1851 (2 vols. 8vo). There
is also a collection of his "Miscella-
nearous Writings" (8vo, 1852). His decisions
as a circuit court judge are contained in 13
vols. 8vo, being the reports of Gallison, Mas-
on, Sumner, and Story. His judgments in
the supreme court of the United States may
be found in the reports of Cranch, Wheaton,
Peters, and Howard, from 1811 to 1845. II.
William Welmore, an American sculptor and
author, son of the preceding, born in Salem, Feb.
12, 1810. He graduated at Harvard college in
1838, and was admitted to the bar in Boston.
In 1844 he published a "Treatise on the Law of
Contracts," and in 1847 a "Treatise on the
Law of Sales of Personal Property." He also
published three volumes of "Reports of Cases
argued and determined in the Circuit Court of
the United States for the First Circuit" (1847).
In 1847 he published a small volume of poems;
in 1851 a life of his father (2 vols. 8vo); and
in 1856 a second volume of poems. Among
his subsequent publications are: "Roba di Ro-
ma, or Walks and Talks about Rome," (2 vols.,
London, 1862; New York, 1864; new ed.
1875); "Proportions of the Human Figure"
(1866); "Graffiti d'Italia" (Edinburgh, 1869);"A
Roman Lawyer in Jerusalem" (1870); and
"Nero, an Historical Play" (1875). Since
1848 Mr. Story has resided in Rome, devoting
himself to sculpture, for which he early showed
a strong inclination. Among his works are a
sitting statue of his father, in marble, in the
chapel at Mt. Auburn; statues of George Pea-
body, Josiah Quincy, and Edward Everett;
busts of James Russell Lowell and Theobald
Parker; and many ideal works of great merit,
among which are "The Temple Bells," "Little
Red Riding-Hood," "Sappho," "Cléopâtra,
"Jerusalem" (an allegorical female figure re-
presenting the desolation of the city after the
destruction of the temple), a "Sibyl," and
"Semiramis." The last is owned in New York.
STOTHARD, Thomas, an English painter, born
in London, Aug. 17, 1755, died there, April 27,
1834. At the age of 14 he was apprenticed to
a designer of patterns, then became a designer
for illustrated books, and studied painting at
the royal academy, of which he was elected a
member in 1794 and librarian in 1812. He is
known by his contributions to "Boydell's Shakes-
ppear," his "Canterbury Pilgrims," the
"Flitch of Bacon," the Wellington shield, and
his illustrations of Rogers's "Poems" and
"Italy." The number of his designs is esti-
mated at 5,000, of which 3,000 have been en-
graved. — His son Charles Alfred (1786-
1821), draughtsman to the society of antiques,
published a work on the "Monumental Elegies of Great Britain" (16 parts, fol., 1811-
29), in which he was assisted by his wife, after-
ward Mrs. Bray, and his brother-in-law
A. G. Kempe. The former wrote his life and
that of his father. (See Bray, Anna Eliza.)

STOWE. See WARMING AND VENTILATION.
STOW, Baron, an American clergyman, born in
Croydon, N. H., June 16, 1801, died in Bos-
ton, Dec. 27, 1869. He graduated at Columbian
college, D. C., in 1825, and in 1825-27 edited
the "Columbian Star." On Oct. 24, 1827, he
was ordained pastor of a Baptist church in
Portsmouth, N. H., and in 1832 became pastor
of the Baldwin place Baptist church in Bos-
ton, and in 1848 of the Rowe street church.
He was recording secretary of the board of
the general missionary convention from 1838
to 1846. He published "Memoir of Harriet
Dow" (1832); "History of the English Bap-
tist Mission to India" (1835); "History of the
Danish Mission on the Coast of Coromandel"
(1837); "Daily Manna for Christian Pilgrims"
(1842); "The Whole Family in Heaven and
Earth" (1845); "Question Book of Christian
Doctrine" (1848); "The Psalmist," with the
Rev. S. F. Smith (1849); "Christian Brother-
hood" (1859); and "First Things, or De-
velopment of Church Life." (1869). His life
has been written by R. H. Neale (Boston, 1870).
STOW, John, an English antiquary, born in
London in 1626, died April 5, 1665. He was
bred a tailor, but from 1560 devoted himself to
the study of the antiquities of English history.
He made an extensive collection of papers,
many of them Catholic records, which occa-
sioned suspicion, and he was cited before an
ecclesiastical commission on charges preferred
by his own brother, but was acquitted. His
works are: a "Summarie of Englysh Chronic-
el" (12mo, 1661); "Anales, or a General
Chronicle of England" (4to, 1590); "A Sur-
vey of London" (4to, 1598; continued by John
Sryce, 2 vols., 1720; new eds., 1842 and 1846);
and "The Successions of the House of Eng-
lund, from the Beginning of Edward VI. to
the End of the Reign of Queen Elizabeth" (1688).
STOWE, L. Calvin Ellis, an American clergy-
man, born at Natick, Mass., April 6, 1802.
He graduated at Bowdoin college in 1824, and at
Andover theological seminary in 1828, and in
1828-30 was assistant professor at Andover.
In 1830 he became professor of languages in
Dartmouth college, and in 1833 of Biblical
literature in Lane theological seminary, Cin-
cinnati. In May, 1838, he visited Europe to
examine, in behalf of the state of Ohio, the
public school system of the German states,
and published "Elementary Education in Eu-
rope," which was distributed in every district
of Ohio by the legislature. He also published
reports on the "Education of Immigrants," on
"The Course of Instruction in the Primary
Schools of Prussia," and on "Elementary In-
struction in Prussia." In 1850 he became di-
vinity professor at Bowdoin college, and in
1852 professor of sacred literature in Andover
theological seminary. He resigned this office
in 1854, and has since resided in Hartford.
His remaining works are: a "History of the
Hebrew Commonwealth," translated from the
German of Jahn (Andover, 1828; 2
vols., London, 1829); "Lectures on the Sacred Poetry of the Hebrews," from the "Procrustes of Lowth, with notes (Andover, 1829); "Introduction to the Criticism and Interpretation of the Bible" (vol. i. only published, Cincinnati, 1838); and "Origin and History of the Books of the Bible" (part i., the New Testament, Hartford, 1867). II. Harriet Elizabeth Beecher, wife of the preceding. See Beecher.
m.; pop. in 1870, 30,243. It has an uneven surface, watered by numerous streams. The soil of the valley is fertile. Several railroads traverse it. The chief productions in 1870 were 5,123 bushels of wheat, 59,761 of Indian corn, 13,938 of oats, 13,531 of barley, 248,681 of potatoes, 15,752 lbs. of wool, 302,149 of butter, 42,667 of cheese, and 28,908 tons of hay. There were 1,983 horses, 4,227 milch cows, 2,602 working oxen, 3,666 other cattle, 4,627 sheep, and 1,775 swine; 21 manufactories of boots and shoes, 4 of cotton goods, 2 of iron ware, 5 of cotton and woollen machinery, 1 of floor oil cloths, 1 of paper, 1 of sand and emery paper and cloth, 7 of woollen goods, 2 cloth-printing establishments, 2 planing mills, 15 saw mills, 1 flour mill, 3 tanneries, and 1 currying establishment. Capital, Dover.

STRAFFORD, Thomas Wentworth, earl of, an English statesman, born in London, April 13, 1593, executed on Tower hill, May 12, 1641. He was educated at Cambridge, travelled abroad, at the age of 21 inherited large family estates, and in 1614 was elected to parliament for the county of York. He was at first a leading member of the opposition, but in 1628 he was created by Charles I. Baron and Viscount Wentworth, joined the court party, and soon became the king's most trusted counsellor. He was appointed lord president of the council of the north, and in 1632 made governor of Ireland. His administration here was severe and unjust. He maintained that Ireland was a conquered country, and treated it as such. His object was to make his master an absolute monarch by means of an executive system which he called "thorough," and he boasted that in Ireland the king was "as absolute as any prince in the whole world." It is generally admitted, however, that the material condition of the people improved under his government, in spite of his despotic measures. In January, 1640, he was created earl of Strafford and appointed lord lieutenant of Ireland. Later in the same year Charles put him in command of the army against the insurgent Scots, before whom the royal troops fled panic-struck, after the rout at Newburn (Aug. 28); and contrary to the strenuous advice of Strafford, the king accepted the terms imposed by the Scots. Dreading the meeting of the parliament which the king at this time, under compulsion, determined to summon, Strafford implored permission to return to Ireland. But Charles, pledging his royal word that "not a hair of his head should be touched by parliament," prevailed upon him to brave the issue. The assembly met on Nov. 3. On the 11th Pym appeared on the part of the commons at the bar of the house of lords, with a message of impeachment. The articles of impeachment accused Strafford of an attempt to subvert the liberties of the country. His guilt is placed beyond a doubt by evidence which has come to light since his death; but it was never proved by his accusers, and his defence, which he conducted himself with great eloquence and ability, was so strong that the house abandoned the original impeachment. A bill of attainder, brought into the lower house, was passed by a great majority. The lords, in a panic, complied; and the bill was sent to Charles for his approval. The king made some endeavors to save him, but apprehended popular violence if he refused a warrant for the execution; and Strafford advised him by letter, for the sake of the public peace, to sacrifice a life which would be resigned cheerfully to a master who had bestowed such "exceeding favors." He moved from his prison to Tower hill with dignity. "I lay down my head," said he, after declaring his innocence, "as cheerfully as ever I did when going to repose." His attainder was reversed under Charles II. His "Letters and Despatches" were edited by Dr. Knowler (2 vols., fol., London, 1739). His life has been written by Elizabeth Cooper (London, 1874).

STRAITS SETTLEMENTS, a British colony in Asia, consisting of islands in the strait of Malacca and detached portions of territory adjoining it. It is divided for administrative purposes into three provinces, Singapore, Malacca, and Wellesley, the last including the island of Penang, which will be found described under its own names. The area, and the population according to the census of 1871, are as follows:

<table>
<thead>
<tr>
<th>Provinces</th>

</table>

Of the total population in 1871, 200,433 were males and 107,664 females; 103,936 were Chinese, 1,730 Europeans, and the remainder Malays and other East Indians. The Straits Settlements is a crown colony, and is ruled by a governor, resident in Singapore, who is under the direct control of the home government. Subordinate to him are two sub-governors, resident at Malacca and Penang, who have charge respectively of the provinces of Malacca and Wellesley. The colony, which is free commercially, had no public debt in 1871. The gross public revenue in that year was £298,712; expenditure, £286,499. The total value of imports in 1871 was £10,161,563, of which £2,374,106 were from the United Kingdom; of exports, £9,416,642, of which £2,119,752 were to the United Kingdom. In 1851 the provinces now included in the Straits Settlements, which previously had been subordinate to the presidency of Bengal, were made a dependency of the crown under the governor general of India; and in April, 1867 (by act of Aug. 10, 1866), they were separated from India and created an independent crown colony.
STRALSUND, a strongly fortified seaport town of Prussia, in Pomerania, capital of a district of its own name, on the strait which separates the island of Rügen from the mainland, 125 m. N. by W. of Berlin; pop. in 1871, 26,731. The town is situated on an insular site, surrounded by the strait and several ponds, and can only be approached by bridges which connect it with its three suburbs on the mainland. It has a gloomy appearance, but is clean and well paved. The churches of St. Nicholas and St. Mary are fine specimens of the pointed style of architecture. The gymnasium has both a museum and a library. The manufactures include linen and woollen goods, starch, sugar, tobacco, soap, and leather. The town owns nearly 300 vessels, of about 70,000 tons. The chief exports are wheat, malt, timber, wool, and linen. The harbor is large, but shoals prevent vessels drawing more than 15 ft. from entering it.—Stralsund was built by Jaromar I., prince of Rügen, about 1200, and in the 14th century was one of the most important Hanse towns. It successfully resisted a memorable siege by Wallenstein in 1625. The Swedes gained possession of it by the peace of Westphalia, and Frederick William, elector of Brandenburg, captured it from them in 1678, but restored it in 1679. Stralsund surrendered to the Prussian, Danish, and Saxon forces in 1715, but was restored to Sweden in 1720. In 1807 it surrendered to the French, who destroyed part of the fortifications. By the treaty of Kiel in 1814 it was ceded to Denmark, and in 1815 Denmark surrendered it to Prussia.

STRASBRG. See DATURA.

STRANGE, Sir Robert, an English engraver, born in Pomona, one of the Orkney isles, July 14, 1721, died in London, July 5, 1792. While an apprentice in Edinburgh he joined the forces of the young pretender, and after the battle of Culloden took refuge in the highlands. He studied abroad for some years, and in 1751 settled in London as a historical engraver. During a visit to the continent in 1760 he executed many plates after the old masters. He was also a picture dealer, amassed a fortune, and was knighted in 1787. He wrote a "History of the Progress of Engraving," never published. There is a memoir of him by James Denniston of Denniston (2 vols. 8vo, 1855).

STRASBURG, or Strasbourg (Fr. Strasbourg), a city of Germany, capital of Alsace-Lorraine, formerly of the French department of Bas-Rhin, on the Ill, a tributary of the Rhine, about a mile from the latter river, 90 m. S. S. W. of Frankfort, and 250 m. E. by S. of Paris; pop. in 1876, 94,000, two fifthies Protestants. It stands on level ground, is nearly 6 m. in circuit, and is defended by a wall with bastions, ditches, and outworks, and a strong citadel constructed by Vauban. It is entered by seven gates, and the Rhine is crossed by a bridge of boats opposite Kehl. The Ill flows through the town in a N. E. direction, has many branches, and is crossed by several wooden bridges. The streets are generally crooked and narrow, but the principal ones are broad, and there are several fine squares. The houses are well built and rather lofty, with steep roofs. The cathedral, one of the finest Gothic buildings in Europe (see Cathedrals), was much damaged during the siege of 1870, but soon restored. It has a famous astronomical clock, constructed by Isaac Habrecht about 1870, one of the greatest works of its kind. Of the other churches the most interesting are those of St. Stephen, St. Thomas, the Temple Neuf, and St. Pierre le Jeune; and there is a fine synagogue. The city library, dating from 1531, was burned in 1870, during the war, with its 200,000 volumes; but it has since been restored, and in 1874 contained 300,000, and in 1875 350,000 volumes. The university, founded in 1521, was reopened May 1, 1872, by the Germans, and in 1875 had more than 700 students. The military establishments are on an extensive scale. The manufactures include woollen, linen, and cotton goods, sail cloth, jewelry, clocks and watches, cutlery, hardware and cast-iron articles, porcelain, earthenware, soap, leather, straw goods, hosier, paper, and cards. There are numerous bleach fields, dye works, sugar refineries, breweries, and printing offices; and the town is celebrated for its pâtés de Foie gras. The trade of Strasbourg is extensive, and is greatly facilitated by the navigation of the Rhine.—Strasbourg occupies the site of the ancient Ar.
gentoratum, which after the Roman conquest was made a frontier fortress against the Germans. It was a free city of the empire during the middle ages, and was a Protestant city till seized by Louis XIV. in 1681. A Catholic bishopric of Strasburg, however, at the same time ruled a considerable territory on both sides of the Rhine. After about one month's siege and bombardment, the commander, Gen. Uhrich, capitulated to the Germans in the night of Sept. 27-28, 1670; and the city was finally incorporated with the German empire by the treaty of May 10, 1871. The fortifications as well as the town have since been much enlarged.—See Friese, Vaterländische Geschichte der Stadt Strasburg (4 vols., Strasburg, 1791-’5); Hermann, Notices historiques, statistiques et littéraires sur la ville de Strasbourg (2 vols., 1819); Documents relatifs au siège de Strasbourg, by Gen. Uhrich (Paris, 1872); Geschichte der Belagerung von Strassburg im Jahre 1870, from German official sources, by Reinhard Wagner (2 vols., Berlin, 1874); and the account of the siege in vol. ix. of the history of the war published by the German general staff (1876).

STRATFORD, a town, port of entry, and the capital of Perth co., Ontario, Canada, on the Avon river, at the junction of the Grand Trunk railway with the Buffalo branch, 88 m. W. by S. of Toronto; pop. in 1871, 4,313. It has good water power, and contains manufactories of iron castings, mill machinery, agricultural implements, woolens, steam engines, leather, boots and shoes, &c., and several flouring mills, distilleries, and breweries. The railroad shops are very extensive. There are three branch banks, three weekly (one German) newspapers, a monthly periodical, and Baptist, Congregational, Episcopal, Methodist, Presbyterian, and Roman Catholic churches. The value of imports for the year ending June 30, 1874, was $1,026,038: of exports, $247,244.

STRATFORD DE REDCLIFFE, Stratford Canning, viscount, better known as Sir Stratford Canning, an English diplomatist, born in London, Jan. 6, 1788. In 1809 he was appointed secretary of embassy at Constantinople, in 1814 minister plenipotentiary to Switzerland, in 1820 a special commissioner at Washington, and in 1824 at St. Petersburg. He was ambassador to Constantinople from 1825 to 1827, and again from 1841 to 1858; and his diplomatic activity was very conspicuous both during the negotiations which resulted in the intervention of the western powers in favor of Greece, and during the opening period of the Crimean war. He was a warm friend of Reshid Pasha, and many important reforms in Turkey, particularly those affecting the condition of the Christian population, were attributed to his efforts. He was ennobled in 1859. He has published "Why am I a Christian?" (1873), and a play entitled "Alfred the Great in Athelney" (1876).

STRATFORD-UPON-AVON, a town of Warwickshire, England, on the right side of the river Avon, 8 m. S. W. of Warwick, and 82 m. N. W. of London; pop. in 1871, 3,863. The town exhibits the architecture of the 16th and 17th centuries. Annual fairs are held for the sale of horses, cattle, corn, and cheese. Stratford was a place of some consequence as early as the middle of the 8th century, but derives its chief interest now from the fact that it was the birthplace of Shakespeare, his abode in youth and age, and the place of his death and
burial. A part of the ancient house in which he is said to have been born, and which he retained to the time of his death, is still standing in Henley street; it has been purchased for the nation by subscription at a cost of about £4,000, and is as far as possible kept in the same condition as in his lifetime. A church near the river, a handsome cruciform structure with a fine tower and spire, contains his remains and those of his wife, in the vicinity of a monument, the distinguishing feature of which is the celebrated portrait bust of Shakespear in marble. This edifice was thoroughly restored in 1840. The grammar school, in which, according to tradition, the great dramatist was educated, is established in the upper part of the ancient guildhall. In 1769 a Shakespeare "jubilee" was celebrated in Stratford under the direction of Garrick, on which occasion the present town hall, which contains a statue of the poet, was erected. The tercentenary of Shakespeare's birth was celebrated here, April 23, 1864.

STRAUBING, a town of Bavaria, in the district of Straubing, on the right bank of the Danube, 25 m. S. E. of Ratisbon; pop. in 1871, 11,150. It is one of the oldest towns of the kingdom. It has an ancient town hall, a Gothic church with fine pictures, and one with a celebrated monument of Duke Albert II., and a palace where Duke Albert III. resided with his wife, Agnes Bernauer. (See Bernauer.) Straubing has many breweries and tanneries.

STRAUSS, the name of four German musicians, father and three sons. JOHANN, the father, was born in Vienna, March 14, 1804, and died there, Sept. 24, 1849. In early life he was a member of the orchestras, afterward organized a band of his own, gave concerts in the chief cities of Germany, and soon rivalled Lanner as a composer and conductor. The eldest son, JOHANN, born in Vienna in 1825, has been for many years, by appointment of the emperor, music director of the court balls. Before the death of his father he had organized a band, whose playing has created the greatest enthusiasm in the chief capitals of Europe. In 1873 Strauss (without his band) visited the United States, and conducted the orchestra of 1,000 performers in his own compositions at the so-called world's peace jubilee in Boston. Before returning he gave three concerts in New York. Besides nearly 400 compositions of dance music, he has published four operettas which have met with considerable success: Indigo (1871), Der Corneal in Rom (1873), Die Fledermaus (1874), and Ca-ghiostra (1875). Josse, who was born in Vienna in 1827 and died there in 1870, left nearly 300 compositions of dance music. The youngest brother, EUGARD, is the leader of an orchestra in Vienna, and has published nearly 200 compositions. The published compositions of the four Strausses are about 1,100 in number, all of which, excepting a few marches and the operettas above mentioned, are music for dancing. Between 300 and 400 are Waltzes, many of which are classed as the best productions of this kind of music.

STRAUSS, David Friedrich, a German theologian, born in Ludwigsburg, Württemberg, Jan. 27, 1768, died in Berlin, Feb. 9, 1874. He was educated at Blaubeuren and Tübingen, was curate in 1830 and professor at Maulbronn in 1831, and in 1832 became Repetent in the theological seminary of the university. His name was unknown when he published Das Leben Jesu (2 vols., Tübingen, 1835; translated by Marian Evans, now Mrs. Lewes, 3 vols., London, 1846; new ed., 2 vols., New York, 1860), which was republished by him in 1864, after the appearance of Renn's work on Jesus, under the title Das Leben Jesu für das deutsche Volk bearbeitet (latest ed., 1874). Its design is to critically establish for Christianity a mythical instead of a historical basis, to resolve the Gospels into popular legends, and the miracles into significant poetry. It supposes the existence of Jesus, an exemplary and reformatory rabbi of Galilee; that he lived and died an enthusiastic and admired teacher and innovator; that after his death many marvellous incidents concerning him gradually gained currency; that some of these were exaggerations of actual events, and others symbolic forms in which his disciples clothed his doctrines and precepts; that these wonderful narratives were not produced by single persons, but were the spontaneous outgrowth of poetical and philosophical tendencies in the early church, of which, after being circulated orally for about a century, various compilations were written. The second part of the work assigns a new meaning to the New Testament. The career of Christ symbolizes the moral history of mankind. Humanity is God manifest in the flesh, sinless, working miracles, dying, rising, and ascending to heaven. Thus the narrative applies not to an individual, but to the race; the dogmas are true, though the history is false. Strauss was deprived of his position as Repetent, and became a teacher at Ludwigsburg, and afterward in Stuttgart. In 1837 he replied to his critics by three volumes of Streitschriften, and in 1838 by Zwei friedlische Blätter, but subsequently availed himself of the new editions of his work to controvert his opponents. In 1839 he went to Zürich as professor of dogmatics and church history, but was soon dismissed with a pension, and his nomination resulted in the speedy downfall of the local radical government. In 1840 he married the vocalist Agnes Schebest, but was separated from her. In 1848 he was an unsuccessful candidate for the Frankfurt parliament, but was elected to the diet at Stuttgart, from which he withdrew in December on account of the unpopularity of his political conservatism. In 1873 he returned to his native town after a long residence at Darmstadt. His other prin-
STRAW

413
cipal works are: *Die christliche Glaubenslehre in ihrer geschichtlichen Entwicklung und in ihrem Kampfe mit der modernen Wissenschaft* (2 vols., Tübingen, 1840–41); *Der Romanitiker auf dem Throne der Cäsaren, oder Julian der Abtrünnige* (Mannheim, 1847); Ulrich von Hütten (3 vols., 1858–60; 2d ed., 1871; English translation by Mrs. Sturge, London, 1874); Voltaire (1870; 3d ed., 1873); *Krieg und Friede*, his correspondence with Renan on the Franco-German war (1870); and *Der alte und der neue Glaube, ein Bekenntniss* (1872), showing the contrast between liberty of thought and ecclesiastical domination, and adhering to the latest results of scientific investigations and to materialistic views of the universe. This last of his works created a no less profound sensation than his first. Charles Ritter has published a selected French translation of his minor essays, under the title of *Essais d'histoire religieuse et mêlangez littéraires*, with an introduction by Renan (Paris, 1872).

—See David Friedrich Strauss in seinem Leben und seinen Schriften geschildert, by Eduard Zeller (Leipsic, 1874; English translation, London, 1874).

**STRAW**, the stem of cereal grasses. On the farm it is used as fodder, for littering animals, as manure, and for thatching outhouses and stacks of hay and grain. It is much used for mattresses called pailles (Fr. *paillasse*, from *paille*, straw). It is employed to some extent for ornamental purposes, as for picture frames and baskets for cut flowers. The Japanese use many-colored straws in ornamenting the exterior of cabinets, work-boxes, &c. In the arts the chief uses of straw are for paper making (see *Pâpier*) and for the manufacture of hats and bonnets. The art of plaiting straw and similar materials is very ancient, and is found in various stages of perfection in every quarter of the globe. In Europe it remained in a comparatively rude state down to the end of the 16th century, when it began to attain commercial importance in France and northern Italy. James I. introduced it into England. The Leghorn plait of Tuscany began to acquire a European celebrity late in the 18th century; it is still unsurpassed. In that portion of Italy a peculiar variety of wheat (*triticum turgidum*) is grown solely for the straw, which is distinguished for its slenderness and strength. The seed grain is grown in the Apennines, and the straw crop on the lowlands, for which it is sown very thickly. The plant is cut before maturity, and left on the ground to dry in the sun, and then tied in bundles and stacked. It is afterward spread out on the ground again to be bleached in the sun and dew, and is finally steamed and fumigated with sulphur. In Tuscany the straws are sorted by women, who can instantly by the touch detect the slightest shades of difference in their thickness. In other countries the sorting is done by means of a series of graduated sieves. The Tuscan straw, owing to its fineness, is plaited as it comes from the hands of the sorter; other kinds must be split into splints for fine work. At first the splitting was done with a knife, but it is now done by passing into each straw a wire with several cutting edges, or more expeditiously by drawing the whole straw over a sharp steel comb. As the split straw when plaited presents alternately its inner and outer surface, the work lacks that uniformity of appearance produced by the whole straw. To secure this, the plan was devised, in the plait called the "patent Dunstable," of laying two splints with their inner surfaces together, which also increases its durability. The plait is of various widths, depending on the number and thickness of the straws. The usual length in Italy is about 50 metres (54 yards), in England 20 yards. In Tuscany the straws are coiled spirally into a flat, the edges being knit together and held fast by a thread concealed within the fabric; elsewhere they are usually wound around a block of the shape required, the edges overlapping and the successive coils stitched together. The first straw bonnet braided in the United States is said to have been made in 1798 by Miss Betsey Metcalf, of Providence, R. I. Large numbers of women and children were employed at one time in this country in plaiting straw, but now almost all the braid used is imported. Straw hats and bonnets are sewn in the United States almost entirely by the Bosworth straw-sewing machine, on which when run by steam 100 ordinary hats can be made in a day. For there are four companies in Massachusetts and one in Connecticut each of which employs about 100 of these machines, and they are also used by several smaller companies. The hats are pressed by another machine, also of American invention, which smooths them ready for trimming at the rate of four a minute. The value of the straw goods manufactured in the United States in 1870, as reported in the census, was $7,282,086, distributed among nine states: California, $60,700; Connecticut, $1,026,000; Massachusetts, $4,869,514; New Jersey, $54,530; New York, $1,006,000; Pennsylvania, $189,242; Rhode Island, $40,000; Vermont, $1,600; Wisconsin, $34,500. The number of men employed was 1,958; women, 12,594; youths under 16, 343. During the year 1874–75 the value of the product of Massachusetts increased about 25 per cent., while that of most of the other states has remained nearly the same.—In Ecuador, Colombia, and other parts of South and Central America, a straw is obtained from the *Carthodorea palmata*, called by the natives *jipijape* or *portorico*, which is largely used in the manufacture of the hats known as Panama hats, from the principal port of their shipment, cigar cases, &c. The leaves of the plant, which resembles a palm, are gathered before they unfold, and after the ribs and coarser veins have been removed are cut into shreds. These are exposed to the sun for a
day and then tied into a knot and immersed in boiling water until they become white, when they are hung up in the shade and afterward bleached for several days. The straw is then distributed through the districts, especially in Peru, where the manufacture is carried on. Whole colonies of Indians are engaged in this manufacture. The men, women, and children plait the straw upon a block of wood which they hold between their knees, finishing an ordinary hat in two or three days; but the finest hats occupy several months to complete them, and require especial care in the selection of the straw and the plaiting. The best are made in Ecuador.

**STRAWBERRY**, a well known wild and cultivated fruit, the Anglo-Saxon name of which, *strawberige* or *stroamberie*, was probably derived from the straw-like stems of the plant or from the berries lying strewn on the ground. The several species belong to the genus *Fragaria* (from the ancient Latin name *fraiga*), of the rose family; they are stemless perennial herbs, with compound leaves of three obovate, wedge-shaped, coarsely serrate leaflets, and multiply by runners, which are long weak branches, forming a bud at the end which soon develops roots and leaves, and by the decay of the branch connecting it with the parent becomes an independent plant. The flowers are in a cyme at the end of an erect scape, with a five-lobed, spreading, persistent calyx, and as many bractlets alternating, and thus appearing ten-cleft; petals (mostly white) five; stamens numerous; pistils simple, seated upon a convex receptacle, which when the ovaries are ripe is greatly enlarged, becoming pulpy and edible, and is popularly regarded as the fruit; it is really the much altered end of the stem (see Plant), while the true fruits are the small seed-like akenes, the ripened ovaries, which are scattered over its surface or sunk in little depressions. By abortion of the stamens some of the species become more or less dioecious.

The strawberry is found in all temperate parts of the northern hemisphere and in the mountains of South America. While Bentham and Hooker state that there are not more than three or four well defined species, a dozen or more have been described, the plants being, even in the wild state, very variable, while the varieties in cultivation resulting from hybridizing, crossing, and sporting are innumerable. Two species are widely distributed throughout the United States, and one is peculiar to the Pacific coast. The Virginian or common wild strawberry (*Fragaria virginiana*) is found from arctic America to Florida, and west to the Rocky mountains. Its leaves are rather thick, smooth on the upper surface, often shining; the hairs silky and appressed; the calyx erect after flowering; fruit mostly globular, with a narrow neck, and the akenes (seeds) sunken in deep pits in the surface of the receptacle. This has been described under many different names, as it varies greatly, and the western forms appear very different from the eastern. The Alpine strawberry (*F. vesca*), the common species of Europe, is indigenous to this country, especially far northward, extending to Oregon and the N. W. coast; it is found throughout Europe and northern and central Asia. It has thin pale green leaves, the upper surface strongly marked by veins; flower stalks longer than the leaves; calyx remaining open after flowering; receptacle conical or elongated, with the akenes attached to the surface, and not as in the preceding sunk in pits. A taller form is known as the wood strawberry. This was the earliest species cultivated, and is mentioned in the street cries of London of over 400 years ago; the garden of the bishop of Ely at Holborn was in 1483 celebrated for its strawberries, a fact alluded to by Shakespeare in "Richard III." A number of varieties of this are cultivated, but they are more popular in Europe than in this country. The Chilian strawberry (*F. chilensis*, the *F. grandiflora* of some) is found on the Pacific coast from Oregon southward; it is very robust, with leathery, thick leaflets of a dark green, and sometimes silky on both surfaces, or only below; the flowers are larger than in any other species, and the large yellowish white or rose-colored fruit, sometimes as large as a small hen's egg, erect. This was introduced into the south of France in 1712, and many valuable varieties resulted.

---

![Section of Flower and Fruit.](image)

Alpine Strawberry (*Fragaria vesca*).
STRAWBERRY

from hybridizing it with other species. The
Indian strawberry (F. Indica) is from upper
India, and is naturalized in the southern states;
it differs so much from the other species that
it was formerly placed in a distinct genus (Du-
chenaea); it has yellow flowers, and is a showy
house plant, especially for window baskets,
but the fruit is dry and tasteless.—Of the cul-
tivated American varieties, some are pistillate
only, and must be planted near perfect flowered
varieties, in order that they may be fertilized
and bear fruit. The present tendency of cul-
tivators is to discard all unisexual kinds.
The great step in their improvement was in the
production of "Hovey's seedling," raised by
C. M. Hovey of Cambridge, Mass., over 40
years ago; it is a nearly pure Virginian, and
has not been excelled if equalled in quality; it
is a pistillate, and needs careful cultivation.
The next great step was in the production of
"Wilson's Albany," or "Wilson" as it is gen-
erally called, a most hardy and productive va-
riety, with perfect flowers. Besides the above,
the leading American varieties are "Agricul-
turist," "Seth Boyden," "Charles Downing,
"Donner's Prolific," "Kentucky," "Nicanor,
"and "Monarch of the West." Among the Eu-
ropean kinds which plants set here on stony
soils are "Triomphe de Gand," "Jucunda,
"and "La Constante."—The cultivation of the
strawberry is now an important branch of
horticulture, the fruit being sent to the city
markets from great distances, especially by
water. In New York city the first supplies
come from Georgia and the Carolinas; then
Virginia, Maryland, and Delaware send large
quantities before the New Jersey season be-
gins; this lasts three or four weeks, and then
the later fruit comes from Connecticut and
Massachusetts. The culture requires a well
fertilized soil; the plants are formed by run-
ners as already described; they may be set
in autumn or spring, but the plants must
grow one year in place before they give a
crop. The method of planting and cultivation
varies. In the annual method, the plants
are set in rows two feet apart and a foot
apart in the rows; one crop is taken and
the plants are ploughed under, another field
being ready to come into bearing to take its
place. Another method is to plant in the same
manner, let the plants run, and the next spring,
when the spaces of paths between the rows
are filled with new plants, to plough out other
paths, turning under the old plants and allow-
ing the new ones to bear fruit; if the alternate
spaces are well manured, this method may be
continued indefinitely. Still another plan is
to cut off all runners as they start, and induce
the plants to form large clumps or stools;
some varieties do better in this manner than
others; it is the best plan for gardens, as the
plants continue in bearing three or four years.
In northern localities the ground is covered
with straw or leaves to prevent injury by fre-
quent freezing and thawing, and this is left on
until the fruit is picked, to keep it from being
soiled. New varieties are produced from seed,
from flowers carefully cross-fertilized or not,
sown as soon as ripe; the seedlings come up
in four or six weeks, and if protected during
the winter and transplanted the next spring,
they will bear fruit the following year.

STRAYS. See Estrays.

STREET, Alfred Billings, an American poet,
born in Poughkeepsie, N. Y., Dec. 18, 1811.
A lawyer by profession, in 1839 he settled in
Albany, where for a number of years he was
state librarian. He has published "The Burn-
ing of Schemectady, and other Poems" (1842);
"Drawings and Tintings," poems (1844); col-
clected poems (1846); "Frontenac," his longest
poem (1849); "The Council of Revision," con-
taining the votes of the council, a history of
the courts of New York, and biographical
sketches of governors and judges from 1777 to
1821 (8vo, 1860); "Woods and Waters, or the
Saranac and Racket," a description of a tour
in the great northern wilderness of New York
(1860); "Forest Pictures in the Adirondacks"
(1864); and "The Indian Fuss" (1869).

STREILITZ. See Mecklenburg.

STRENGTH OF MATERIALS. The resistance of
data adopted for the material of a structure to
change of form or to fracture. 1. The resistance
of materials to external forces tending to over-
come their cohesion is classified, according to
their forms, as follows:

| Longitudinal | Compressing, resisting pulling asunder |
| Transverse | Squeezing, resisting cutting across |
| Torsional | Resisting twisting or wrenching |

Two or more of these forms of resistance are
sometimes called into action simultaneously,
as in the case of the crank of a steam engine,
which tends to break the shaft both by a
transverse strain and by torsion. 2. The "ul-
timate strength" is the maximum resistance
offered to rupture. The "proof strength" is
less degree of resistance, which the body
may safely offer when tested. The "working
load" is some fractional part of the ultimate
strength which may be selected as giving per-
fected protection against anticipated strains for
an indefinite period. 3. The "factor of safety"
is the ratio of the ultimate strength to the
working load. The following are minimum
values of this quantity adopted in what is
generally considered good practice, under "dead"
and "live" loads, and where the latter are lia-
ble to be accompanied by heavy shocks:

<table>

</tbody>
</table>

4. The proof strength is usually, and should be
always, below the elastic limit, i.e., the point at
which set becomes proportional, or nearly so, to the distortion produced by the applied force. It is generally about one half or one third the ultimate strength. 5. Tensile resistance, or tenacity, is determined by experiment for each material. The ultimate strength or breaking load of any piece is measured by the product of the area of fractured section into the tenacity of the material of which it is composed;

\[ i.e., \quad P = T K, \quad \text{and} \quad K = \frac{P}{T} \]

where \( P \) represents the breaking force, \( T \) the tenacity of the material, and \( K \) the area of section. Values of \( T \) are given in the accompanying table of coefficients of resistance. The very best grades should have values 20 per cent. higher. \( P \) and \( T \) are taken in pounds upon the square inch. 6. When thin cylinders are exposed to internal pressure, as in steam boilers, steam cylinders, &c., the bursting pressure may be determined by multiplying the thickness of the shell by the tenacity of the material, as given above, and dividing by the semi-diameter. To ascertain the thickness of pressure, and the diameter of the cylinder being given, multiply the pressure by the semi-diameter, and divide by the tenacity of the material as given in the table; or \( P = \frac{TV}{R} \), and \( t = \frac{Pr}{T} \), where \( P \) = pressure, \( t \) = thickness, \( T \) = tenacity, and \( R \) = radius of the cylinder. If \( d \) = diameter, \( P = \frac{2TV}{d^2} \) and \( t = \frac{pd}{2T} \). Where the joints are double-riveted, the strength at the joints is usually about 0.7 that of the solid plate; single-riveted joints have 0.56 the strength of a solid plate. The mean strength of single-riveted boilers, where the joints are properly shifted, or "broken," is nearly or quite five eighths that of solid plate. A sphere will bear twice as much internal pressure as a cylinder of the same diameter. A thick cylinder is not as strong relatively as a thin cylinder of the same material, and no cylinder, however thick, can withstand an internal pressure exceeding its limit of tenacity, \( T \), as given above. The rule for calculating the strength of a thick cylinder is expressed algebraically thus:

\[ P = T \frac{d^2 - r^2}{R^2 + r^2}, \quad \text{and} \quad \frac{R}{r} = \sqrt{\frac{T + P}{T - P}} \]

where \( r \) = internal radius, \( R \) = the external radius, and other values as before. For thick spheres,

\[ P = T \frac{2R^2 - 2r^2}{10^2 + 2r^2}, \quad \text{and} \quad \frac{R}{r} = \sqrt{\frac{2T + 2P}{2T - 2P}} \].

The stayed surfaces are usually the strongest parts of a steam boiler. The following formula gives the proper distance between stays, where \( t \) = thickness of plate, \( P \) = the pressure in pounds per square inch, and \( P \) = the factor of safety: \( d = \frac{2000}{P} \), \( P = F \left( \frac{500}{d} \right) \). 8. Bolts, rivets, and lugs are usually exposed to shearing strain. The resistances to shearing of the most commonly used materials are to be taken as equal to the tensile strength.

Where shearing is to be resisted, the parts should be fitted with great care, to avoid the possibility of cutting, and to insure that all parts of the cross section attacked shall resist the shearing force as nearly as possible together. Where a pin is fitted but not forced into its socket, the resistance to shearing is taken as three fourths of that due the section exposed to rupture. 9. Crushing is resisted by any given material with a force that varies directly with the form given it.

Very short columns or compact masses resist very high crushing strains, in consequence of the resistance offered by their particles to dispersion, as well as by their cohesion. Tall columns first bend and then break under a comparatively slight force. The figures in column \( C \) of the table give the resistance to crushing when bending does not occur. Seasoned timber has nearly twice as great resistance to crushing as green. Steel should not be used under pressure exceeding its compressive elasticity, which, in tool steel, is about 50,000 lbs. to the square inch. Wrought iron should not be exposed to pressure exceeding 25,000 lbs. to the square inch. 10. For tall columns, the following formulas were proposed by Prof. Eaton Hodgkinson:

\[ f^8 = \frac{1 + \frac{r}{d}}{1 + \frac{t}{R}} \]

for tall columns. \( P \) = crushing load in pounds; \( S \) = sectional area in square inches; \( l \) = length and \( D \) = external diameter, both being in the same units of measure, whether feet or inches. The following are the values of \( f \) and \( a \):

</table>
This formula is frequently designated as Gordon's, having been deduced by Gordon from Hodgkinson's experiments. Multiply the value of \( a \), as given in the table, by 4 for columns rounded or jointed at both ends, and by 2 where fixed at one end, rounded at the other. Connecting rods of steam engines are calculated as pillars rounded at both ends. Piston and pump rods are considered as fixed at one end, free at the other. 11. The collapsing of boiler flues was made the subject of a series of experiments by Mr. Fairbairn, and the following formula was deduced:  
\[
P = 806,000 \frac{2a^2}{d^2},
\]
where \( P \) = collapsing pressure in pounds per square inch, \( t \) = thickness of iron in flues, \( L \) = length of flue in feet, and \( d \) = its diameter in inches. When the flue is strengthened by angle-iron rings, as is sometimes done with long flues, \( L \) is taken as the distance between the rings. This formula has not been verified for short flues of great diameter, or for exceptional proportions. A slight deviation from a truly cylindrical form considerably reduces the strength of the flues; \( t^2 \) is generally taken instead of \( t^3 \). Elliptical flues, having a major diameter \( a \) and a minor diameter \( b \), are of equal strength with a cylindrical flue of the diameter \( 2a^2 \).  

12. The transverse strength of beams may be calculated by the following formulas:  
\[
W = \frac{Kd^2}{L} \text{ and } W = \frac{K\alpha d}{L} \text{ for beams fixed at one end and loaded at the other.}
\]
\[
W = \frac{Kd^2}{L} \text{ and } W = \frac{K\alpha d}{L} \text{ where fixed at one end and uniformly loaded.}
\]
\[
W = \frac{4Kd^2}{L} \text{ and } W = \frac{4K\alpha d}{L} \text{ where supported at both ends and loaded at centre.}
\]
\[
W = \frac{8Kd^2}{L} \text{ and } W = \frac{8K\alpha d}{L} \text{ where supported at both ends and uniformly loaded.}
\]
\[
W = \frac{2Kd^2}{L} \text{ and } W = \frac{2K\alpha d}{L} \text{ where supported at both ends and uniformly loaded.}
\]
\[
W = \frac{12Kd^2}{L} \text{ and } W = \frac{12K\alpha d}{L} \text{ where fixed at both ends and uniformly loaded.}
\]

Here \( W \) = breaking weight in pounds, \( K \) = a coefficient which varies with every change in form of cross section of the beams, \( d \) = depth of beam in inches, \( b \) = breadth in inches, \( A \) = area of cross section of the beam at point of rupture in square inches, and \( L \) = length between supports in feet. The values of \( K \) given in the table, where the beams are of rectangular section, fixed at one end and loaded at the other, are obtained from various sources. 13. For other than rectangular sections the following may be taken as the values of \( K \) for cast iron: Shape, \( \Box \); value, \( K = 500 \). Shape, \( \blacksquare \), equal flanges; value, \( K = 520 \). Fairbairn, \( \blacksquare \); value, \( K = 580 \). Hodgkinson, \( \blacksquare \); value, \( K = 850 \). The following values are given for wrought iron: rolled rails, \( \blacksquare \), 600; Fairbairn's riveted beam, \( \blacksquare \), 900; box beam, \( \blacksquare \), 1,000. 14. For the wrought-iron beam, when supported at both ends and uniformly loaded, the formula \( W = \frac{36\pi}{L} \left( \frac{d^4}{a^3} \right) \) is used by some American manufacturers. \( D \) = depth in feet; \( a \) = area of flange in inches; \( a \) = that of "stem" or web; \( S \) = stress per square inch of area, \( a + \frac{d}{2} \), in tons. The deflection, \( S = \frac{6W}{(a + \frac{d}{2})^2} \), where \( W \) be applied at the middle, and \( S = \frac{6Wt^3}{(a + \frac{d}{2})^2} \) when the load is applied at the middle.  

The deflection of a beam is measured by the centres of gravity of the flanges. In such beams it is customary to allow as maxima 10,000 lbs. per square inch in tension and 6,000 to 8,000 in compression. Deflection should not exceed \( \frac{1}{2} \) of an inch per foot of length, in any structure. 15. Torsional strength is computed by the formula \( W = \frac{S^2}{D^2} \); \( D = \frac{\pi}{R} \); where \( W \) = breaking weight in pounds, \( D \) = diameter of shaft in inches, and \( R \) = length of lever arm in feet. The coefficient \( S \) is very nearly proportional to the tenacity of the material, while the torsion is equal in degree. 16. Resilience is a term introduced by Dr. Young. It is measured by the amount of work performed in producing the maximum strain which a given body is capable of sustaining, and is the quality of primary importance where shocks to be sustained. Mallet's coefficient of resilience is the half product of the maximum resistance into the maximum extension. But for tough metals it is equal approximately to two thirds the product of the ultimate strength of the material by the distance through which the body yields before the straining force. For very brittle materials it is measured by half that product. No material can resist the shock of a body in motion, unless it is capable of offering resilience equal to the amount of work performed in setting that body in motion at the given velocity; \( i. e. \), equal to the amount of energy stored in the moving mass at the instant of striking. In predicting the effect of shock, therefore, it becomes necessary to know the amount of energy stored in the moving body and the resilience of the resisting material. To meet a violent shock successfully, resilience, rather than mere strength, must be secured.
secured by the use of a large factor of safety in proportioning parts exposed to them, by care during construction in the selection of tough resilient materials, and in management by carefully adjusting all parts, and applying the load so as to avoid jarring action as far as possible. 17. If a weight, acting as a steady load, produces a given deflection or change of dimensions, it will require but half that weight suddenly applied to produce a similar effect, whether it be fracture or a 2nd alteration of form. The extension of ordinary wrought iron within its limit of elasticity is about -0001 per ton per square inch of section. The amount of extension before fracture by tension is given, with the finest quality of wrought iron, at 20 per cent., with medium quality 16 per cent., and it runs in some irons as low as 4 per cent. Cast iron of fair quality is elongated but a fraction of 1 per cent. 18. The extension of steel varies with the amount of carbon, and nearly as nearly as its tenacity. The following table is taken in part from Trautwine's "Engineer's Pocket Book:"

**ULTIMATE TENSILE STRENGTH IN POUNDS PER SQ. IN., AND ELONGATION IN INCHES, BEFORE BREAKING.**

**Note.**—The specimens tested were steel bars of different grades made from pure Swedish iron, and each bar was turned to a diameter of one inch for a length of 14 inches.

</table>

In the larger table, the ultimate resilience of metals is given as tested in the Stevens institute of technology, Hoboken, N. J. Phosphor bronze considerably exceeds ordinary bronze in ductility and resilience. 19. Heating wrought iron within certain limits, and then cooling under stress, increases its strength by relieving internal strain. Cold rolling and wire-drawing increase it, in some cases, 100 per cent. Mr. Dean of Boston and Uchafius of Vienna have similarly increased the strength and elasticity of bronze. Overheating, annealing, and cold hammering decrease its strength. Cast iron of open structure and low density is increased in strength by successive remeltings, sometimes to the amount of 100 per cent., over pig metal. Casting under a head, or under considerable pressure, similarly benefits both cast iron and cast steel. Sir Joseph Whitworth produced a steel of extraordinary strength and toughness by casting under heavy pressure. The internal stress consequent upon sudden cooling, or upon cooling awkwardly shaped castings, seriously reduces their strength and sometimes produces actual fracture. The character of cast iron is largely determined by its density, 7.2 to 7.8 representing the best limits for ordinary practice. Cold wrought iron is more than twice as strong as red-hot. Strength, ductility, and resilience increase with diminishing temperatures, when the materials are of good quality. Cold-blast cast iron is usually stronger than hot-blast iron made from the same ores. Copper loses 25 per cent. of its tenacity at 550°F, 50 per cent. at 810°, and 67 per cent. at 1,000°, the diminution of tenacity varying nearly as the square root of the third power of the temperature. Metals in large masses have usually less density and strength than when worked into sheets, bars, or wire. Wrought iron is particularly liable to loss of strength in large forgings. Bars two inches in diameter being made of the same metal as other bars one inch in diameter, the latter are sometimes found to have 20 per cent. more strength. Steel exhibits even greater differences. 20. Indentation is resisted by wrought iron nearly in proportion to its thickness. Fairbairn found the force necessary to push a blunt point or a ball 3 in. in diameter through boiler plate, one quarter of an inch thick, to be 17,000 lbs., and nearly equal to that required to drive the same instrument through a three-inch oak plank. Resistance of armor plate to penetration by shot varies, if the plate be well backed, as the square of thickness, within the limit of moderate thickness. The material should be strong and ductile. 21. Generally, in designing machines or parts of machines, they should be so proportioned that all parts will have factors of safety of nearly equal value. Economy of material is thus secured, and also the very important advantage, where exposed to severe shock or sudden strains, of utilizing the resilience of the whole machine in resisting them. Forms of uniform strength should therefore be used wherever possible. Suspension rods of uniform strength must have a greater section at the point of support than at the point of attachment of the load, as the upper portions carry not only the load but the weight of the lower part of the rod. Pump rods and wire ropes for deep mines are for this reason made tapering, with the largest section at the top. Care should always be taken that the pieces connected and their fastenings are, when possible, equally strong. Tall columns are slightly swollen at the middle portion in order that they may be equally liable to break at all points, and the Hodgkinson form of cast-iron beams, and the Fairbairn (1) form of section of wrought-iron beams, are given their peculiar shapes in order that no surplus material may exist in either top or bottom flange. Beams of uniform strength, when fixed at one end and loaded at the other, if of uniform depth, are triangular in plan. If uniformly loaded, they represent in plan a pair of parabolas whose vertices touch at the outer end. When of uniform breadth, their vertical sections are parabolic in the first
These far to application beyond the material application of elasticity, measure stress, where elasticity affects the physical character of the materials. It has no fixed relation to the ultimate strength. It will be seen that this quantity may be defined as the measure of that force which, supposing no limit to elasticity, would shorten or lengthen a bar, originally a unit in length, to the extent of one unit. Thus, a bar of ordinary forged iron, one foot long, would be altered in length \( \frac{2.5 \times 10^{-5}}{22,000} \approx 2500 \) lbs. per square inch of section.

24. Testing Machines. The strength of materials is determined by means of testing machines. 25.Fig. 1 represents a machine for determining longitudinal resistance, as built by the Messrs. Riehle of Philadelphia. It consists of a weigh-beam, accurately made and nicely poised upon knife edges. At its outer end it sustains a scale pan upon which weights measuring 2,000 or 4,000 lbs. are placed. Intermediate weights are measured by a poise, not shown in the figure, which traverses the beam, the latter being divided into parts of 10 lbs. each, similarly to the steelyard balance. The specimen is secured at the upper end by wedges or clamps, in a strong collar which is hung from two knife edges, one on each side the knife edge carrying the scale beam.

These knife edges are placed at slightly different distances from the knife edge supporting the beam, thus making the latter a "differential lever," and permitting the measurement of a very great force without compelling the use either of large weights or of a series of levers. A similar collar below takes the lower end of the specimen to be tested. This second collar is secured to the head of a hydraulic press which is placed within the lower part of the frame of the machine. A small pump, worked
by a hand lever, is used to force oil into the press. The breaking force is thus applied from below, and is measured upon the lever above.

26. With the autographic recording testing machine of Prof. K. H. Thurston, fig. 2, nearly all of the essential qualities as well as the strength of materials are determined by the automatic production of a strain diagram. This diagram is an exact graphical representation of all circumstances attending the distortion and fracture of the specimen. No system of personal observation yields results as trustworthy or with such precision as an autographic registry. No other method gives simultaneously, and at every instant during the test, the intensity of the distorting force and the magnitude of the coincident distortion. In this machine two strong wrenches are carried by the A frames, and depend from axes which are both in the same line, but which are not connected with each other. The arm of one of these wrenches carries a weight at its lower end. The other arm is designed to be moved by hand in the smaller machines and by a worm gear in larger ones. The heads of the wrenches are fitted to take the head on the end of the test pieces, which are usually given the form shown in fig. 3. A guide curve of such form that its ordinates are precisely proportional to the torsional moments exerted by the weighted arm while moving up an arc to which the corresponding abscissas of the curve are proportional, is secured to the frame next the weighted arm. The pencil holder is carried on this arm, and as the latter is forced out of the vertical position, the pencil is pushed forward by the guide curve, its movement being thus made proportional to the force which, transmitted through the test piece, produces deflection of the weighted arm. The guide curve is a curve of sines. The other arm carries the cylinder upon which the paper receiving the record is clamped, and the pencil makes its mark on the table thus provided. This table having a motion, relatively to the pencil, which is precisely the angular relative motion of the two extremities of the test piece, the curve described upon the paper is always of such form that the abscissa of any point measures the amount of the distortion which the force produces. 27. The vertical scale of the diagrams produced is a scale of torsional moments, and the horizontal scale is one of total angles of torsion. Since the resistance to shearing, in a homogeneous material, varies with the resistance to longitudinal stress, the vertical scale is also for such materials a scale of direct resistance; and with approximately homogeneous substances this scale is approximately accurate, where, as here, all specimens compared are of the same dimensions. 28. By fig. 4 it will be seen that the first portion of the line rises at a slight inclination from the vertical, and very nearly straight. The amount of distortion here is seen to be approximately proportional to the distorting force, illustrating Hooke's law, *Ut tensio sic vis.* After a degree of distortion which is determined by the specific character of each piece, the line becomes curved, the change of form having a rate of increase which varies more rapidly than the applied force. When this change begins, the molecules, which up to that point retain generally their original distribution, while varying their relative distances, begin to change their positions with respect to each other, moving upon each other in a manner similar to that action described by H. Tresca, and called the "flow of solids." This point, at which the line begins to become concave toward the base, is considered as marking the torsional limit of elasticity. It is well defined in experiments upon woods; is less marked, but still well defined, in the fibrous irons and the less homogeneous specimens of other metals; and becomes quite indeterminable with the most homogeneous materials, as with the best qualities of well worked cast steel. This point does not indicate the first set, since a set occurs with every degree of distortion, however small. It is at this elastic limit that the sets begin to become proportional to the degree of distortion. The inclination of the straight portion of the line from the vertical measures the stiffness of the specimen. This rigidity is very closely, if not precisely, proportional to the hardness, in homogeneous substances; and this quantity is taken, for practical purposes, as a measure of the hardness of the metals and of their elastic resistance to compression. After passing the elastic limit, the line becomes more and more nearly parallel to the base line, and then, with the woods invariably, and in some cases with the metals, begins to fall before fracture becomes evident in the specimen. With the more ductile substances, nearly all the particles are brought up to a maximum in resistance before fracture occurs, and this circumstance has an important influence in deter-
mining the resistance to rupture. The hardest and most brittle materials break with a snap before any flow is perceptible, before the line of the diagram begins to deviate from the direction taken at the commencement, and before the approach to the elastic limit is indicated. The elasticity of the material is determined by releasing the distorting force, and allowing the specimen to relieve itself from distortion so far as its elasticity will permit. In such cases, the pencil traces a line $\xi$, resembling, in its general form and position in respect to the coordinates, the forming the initial portion of the diagram, but almost absolutely straight, and more nearly vertical. The degree of inclination of this line indicates the elasticity, precisely as the initial straight line gives a measure of the original stiffness of the test piece. The homogeneity of the material tested is hardly less important than its strength. The degree of depression of the line immediately after passing the elastic limit exhibits the greater or less homogeneity of the material. The resilience of the specimen is measured by the area included within the curve, this being the product of the mean force exerted into the distance through which it acts in producing rupture; i.e., it is proportional to the work done by the test piece in resisting fracture, and, taken up to the ordinate of the limit of elasticity, measures the capacity for resisting shock without serious distortion or injurious set. The ductility of the specimen is deduced from the value of the total angle of torsion, and its measure is the elongation of a line of surface particles, originally parallel to the axis, which line assumes a helical form as the test piece yields, and finally parts at or near the point where the maximum resistance is observed. 29. The strain diagrams exhibit the characteristic differences of various materials. The woods have a structure which differs in a distinguishing degree, both in the distribution of the substance and in the action of those molecular forces capable of resisting rupture, from that of the metals, the latter being far more homogeneous than the former. Wood consists of an aggregation of strong fibres, lying parallel, or approximately so, and held together often by a comparatively feeble force of interal cohesion. The metals, on the other hand, are naturally homogeneous, both in structure and in the distribution and intensity of the molecular forces. Well worked and thoroughly annealed cast steel, as an example, is equally strong in all directions, is perfectly uniform in its structural character, and is almost absolutely homogeneous as to strain. Wrought iron, as usually made, has a somewhat fibrous structure, which is produced by particles of cinder originally left in the mass by the imperfect work of the puddler while forming the ball of sponge in his furnace, which, not having been removed by the squeezer or by hammering the puddle ball, are, by the process of rolling, drawn out into long lines of non-cohering matter, and produce an effect upon the mass of metal which makes its behavior under stress somewhat similar to that of the stronger and more thready kinds of wood. In the low steels also, in which, in consequence of the deficiency of manganese accompanying almost of necessity their low proportion of carbon, this fibrous structure is produced by cells and bubble holes in the ingot, refusing to weld up in working, and drawing out into long microscopic, or less than microscopic, capillary openings. In consequence of this structure, a depression indicating this heterogeneity of structure interrupts the regularity of their curves, immediately after passing the limit of elasticity. 30. The presence of internal strain constitutes an essential peculiarity of the metals which distinguishes them from organic materials. The latter are built up by the action of molecular forces, and their particles assume naturally and invariably positions of equilibrium as to strain. The same is true of all naturally formed organic substances. The metals, however, are given form by external and artificially produced forces. Their molecules are compelled to assume certain relative positions, and these positions may be those of equilibrium, or they may be such as to strain the cohesive forces to their very limit. This peculiar condition is of serious importance where the metal is brittle, as is illustrated by the behavior of cast iron, and particularly in ordnance. Even in ductile metals, it produces a reduction in the power of the material to resist external forces. This condition of internal strain may be relieved by annealing hammered and rolled metals, and by cooling castings very slowly, so that the particles may naturally assume positions of equilibrium. In tough and ductile metals, internal strain may be removed by heating to a high temperature and then cooling under the action of a force approximately equal to the elastic resistance of the substance. This process, called "thermo-tension," was first used by Prof. W. R. Johnson in 1836. The cause of this, which he terms an anomalous condition of the metal, was not soon discovered. Ductile metals may be strengthened in a considerable degree by this relief of internal strain, and also by simply straining them while cold to the elastic limit, and thus dragging all their particles into extreme positions of tension, from which when released from strain they may all spring back into their natural and unstrained positions of equilibrium. This fact was noted by Prof. Thurston, and soon after independently by Commander Beardslee, U. S. N. It has an important bearing upon the resisting power of materials, and upon the character of all formulas in which it may be attempted to embody accurately the law of resistance of such materials to distorting or breaking strain. The initial portion of the diagram, when the material is free from internal strain, is a straight line up to the limit of elasticity. This line, with strained materials, becomes con-
vex toward the base line. The initial portion of
the diagram, therefore, determines whether
the material tested has been subjected to in-
ternal strain, or whether it is homogeneous as
to strain. This is exhibited by the direction of
this part of the line, as well as by its form.
The existence of internal strain causes a loss
of stiffness, which is shown by the deviation
of this part of the line from the vertical to a
degree which becomes observable by compar-
ing its inclination with that of the line of
elastic resistance. 31. In fig. 4, the strain
diagram A is that of zinc. The concave form
at the commencement indicates its inelastic
nature, its slight altitude shows its weakness,
and, breaking at 65°, it is shown to lack duc-
tility. Tin, T, is vastly more ductile, but is still
less tenacious. B and O are the diagrams given
by cast and forged copper, the latter twisting
500°, and its fibres stretching to three times
their original length. Cast copper is compar-
tively weak and brittle. wrought iron gives
the strain diagram D. It indicates the elasti-
city of the metal, its ductility, and its strength.
The elastic limit is plainly indicated. The con-

![Strain Diagrams](image)

Fig. 4.—Strain Diagrams.

cavity of the initial portion of the line indi-
cates some internal strain, and the horizontal
portion immediately above the elastic limit
shows that the metal was “seamy” and not
perfectly homogeneous. The lines e and O are
“elasticity lines.” They differ slightly in direc-
tion from the initial portion of the diagram,
confirming the previously indicated presence of
internal strain. E is the terminal portion of
the diagram of a soft ductile iron. F is that
given by a very strong and ductile and excep-
tionally homogeneous iron, a very smooth and
symmetrical curve. G is a soft Bessemer steel.
H is somewhat harder, the one containing 0.4
and the other 0.5 per cent. of carbon. I and J
are tool steels containing 1 per cent. of carbon.
K is medium, L spring, and M double shear
steel. N and P are obtained from white and
gray cast iron. One is stiff, hard, and brittle,
the other weaker, soft, and comparatively
tough. O is a malleable iron cast from
N; it has lost no strength, and has
gained considerable ductility. Strain diagrams
may be produced by plotting data obtained
by observation in the usual manner and simi-
larly interpreted. 32. An examination of the

![Fracture Diagrams](image)

Fig. 5.

fracture in each case assists in determining the
character of the material, and in interpret-
ing the strain diagram. The following fig-
ures exhibit the characteristics of various
qualities of iron and steel. Fig. 5 resembles
which gave the diagram marked
D. The metal is good and tough,
but seamy, and
not thoroughly
worked, as is
shown by the
breaks extending
around the neck
and by the irregularly
distributed flaws on its end.
Fig. 6 exhibits the
appearance of the
sample F. The
surface of the
neck was originally smoothly turned, polished,
and fitted to gauge. Under test it be-
came curiously altered and assumed a
rough, striated appearance. The end
has the peculiar appearance character-
istic of tough and ductile metals, and
the uniformly bright appearance of
the fractured section shows that all
held together up to the instant of rup-
ture, and that fracture finally took
place by shearing. Fig. 7 represents
the appearance of low steels. The
peculiarities of the finest tool steels
are exhibited in fig. 8. In this the
fracture is ragged and splintery, and
the separated surfaces have a beauti-
fully fine, even grain, which proves the excel-
ence of the material. The surface, which
was turned and polished in bringing the metal
to size, remains as perfect as before the speci-
men was broken. By an inspection of the
broken test pieces in this manner, the grade of
the steel, and by the practised eye the slightest

</table>
possible variations, are readily distinguished. Fig. 9 is white cast iron. Its surface, where fractured, has the general appearance of broken tool steel, but the color and texture of the metal are distinctive; it has none of the "steely grain." Fig. 10 represents dark foundry iron. Its color, its granular structure, and coarse grain are markedly characteristic. Good iron plates should, in addition to the above tests, be subjected to the following: When red-hot, they should be capable of being bent sharply to a right angle without cracking, up to an inch in thickness. Ordinary boiler plate of good quality should bend double. When cold, they should bend along the grain without cracking, as follows: 1 in. thick, 15°; ¼ in. thick, 25°; ½ in. thick, 35°; ¾ in. thick, 90°. Across the grain they should at least bend half as far. They should be bent on a slab rounded on the corners with a radius of ¼ in. Steel plates should be 50 per cent. more ductile. 34. Testing within the Limit of Elasticity. In determining the value of materials of construction, it is usually more necessary to determine the position of the limit of elasticity, and the behavior of the metal within that limit, than to ascertain ultimate strength or resilience. It should be possible to test every piece of material which goes into an important structure, and then to use it with confidence that it has been proved capable of carrying its load with a sufficient and known margin of safety. It is common to test bridge rods to a limit of strain determined by specification, and to compel their rejection when they are found to take a considerable permanent set under that strain. Specification now frequently (and it should invariably) makes the limit of elasticity the basis of calculation and test.—See Fairbairn, "Cast and Wrought Iron" (London, 1865); Haswell, "Engineers' and Mechanics' Pocket Book" (New York, 1868); Trautwine, "Civil Engineers' Pocket Book" (Philadelphia, 1873); Rankine, "Useful Rules and Tables" (London, 1872); Thurston, "Strength, Elasticity, Ductility, and Resilience of Materials of Construction" (Philadelphia, 1874); and Wood, "Resistance of Materials" (New York, 1875).

STRICKLAND, Agnes, an English authoress, born at Reydon hall, Suffolk, July 19, 1796, died in London, July 13, 1874. She was carefully educated under the personal supervision of her father. Her works are: "Worcester Field, or the Cavalier," a poem (1812); "Demetrius," a poetical romance (1833); "The Pilgrims of Walsingham," a series of tales (1855); "Ala, the British Captive" (1841); with her sister Elizabeth, "Lives of the Queens of England" (12 vols., 1840–49; abridged and edited by Caroline G. Parker, 1 vol. 12mo, New York, 1867), and "Lives of the Queens of Scotland" (8 vols., 1850–50); "Queen Victoria, from her Birth to her Bridal" (2 vols., 1840); "Historic Scenes and Poetic Fancies" (1850); "Old Friends and New Acquaintances" (1850); "Lives of the Bachelor Kings of England" (1861); "How will it End?" a novel (1865); "Lives of the Seven Bishops committed to the Tower in 1688" (1866); and "Lives of the Tudor Princesses" (1868). She edited an edition of the letters of Mary, queen of Scots, and thus brought to public notice many documents of much historic value. In 1871 she received an annual pension of £100. —The sisters of Miss Strickland, Jane Margaret, Catharine Parn (Mrs. Trail), and Susannah (Mrs. Moodie), besides assisting her in her historical works, published several books under their own names. Mrs. Trail and Mrs. Moodie are residents of Canada, and their chief works have been upon life in that country.

STRICKLAND, William Peter, an American clergyman, born in Pittsburgh, Pa., Aug. 17, 1809. He was educated at the Ohio university, Athens, O., entered the ministry of the Methodist Episcopal church in 1832, labored several years in Cincinnati, and then became agent of the American Bible society. In 1850 the Ohio university conferred on him the degree of D. D. In 1856 he removed to New York, where he engaged in literary labor, mostly in connection with the Methodist book concern. In 1862 he was chaplain of the 48th New York regiment, stationed at Port Royal, S. C. Since 1866 he has been pastor of the Presbyterian church in Bridgehampton, L. I. His principal publications are: "History of the American Bible Society" (New York, 1849; new ed., with history continued, 1850); "History of Methodist Missions" (1850); "Genius and Mission of Methodism" (1851);
“Christianity Demonstrated” (1852); “Memoir of the Rev. James B. Finley” (1863); “A Manual of Biblical Literature” (1853); “The Light of the Temple” (Cincinnati, 1854); “The Astrologer of Chaldea” (1856); “Pioneers of the West” (New York, 1856); “Life of the Rev. Francis Asbury” (1858); “Life of Jacob Gruber” (1859); and “Old Mackinaw” (Philadelphia, 1860).

STRINGHAM, Silas Horton, an American naval officer, born at Middletown, N. Y., Nov. 7, 1798, died in Brooklyn, Feb. 7, 1876. He entered the navy as midshipman in 1809, became lieutenant in 1814, and served in Decatur's squadron in the Algerine war. Subsequently he assisted in the capture of slaves off the coast of Africa. In command of the Ohio in 1846 he took part in the bombardment of Vera Cruz. He was in constant service on sea or shore duty till 1861, when he became flag officer of the Atlantic blockading squadron, and in August cooperated in the capture of Forts Hatteras and Clark on the coast of North Carolina. He was promoted to rear admiral on the retired list in 1862, was commandant of the Charleston navy yard in 1864-6, and was made port admiral of New York in 1867.

STRIGINES, a suborder of Incensatorial or perch- ing birds, without song, comprising such as have the hind toe capable of being turned more or less laterally forward, having apparently all four of the toes in front. It includes the families of the humming birds, swifts, and goatsuckers. (See ONTHOLOGY.)

STRONG, Caleb, an American statesman, born in Northampton, Mass., Jan. 9, 1745, died there, Nov. 7, 1819. He graduated at Harvard college in 1764, and was admitted to the bar in 1772. During the revolution he was a member of the general court and of the Northampton committee of safety. He held several states, was a member of the convention for framing a national constitution, was elected one of the first United States senators from Massachusetts in 1789, was reelected in 1793, and resigned in 1796. From 1800 to 1807 he was governor of Massachusetts, and again from 1812 to 1816. As a federalist he was opposed to the war with England, and believed himself justified on constitutional grounds in disregarding the president's requisition for troops, while amply providing for the defence of the state. (See MILITIA, vol. xi., p. 641.)

STRONG, James, an American author, born in New York, Aug. 14, 1822. He graduated at Wesleyan university, Middletown, Conn., in 1844, and in 1844-6 was a teacher in the Troy conference academy, Poultney, Vt. In 1847 he settled at Flashing, Long Island, where he held several local offices, projected and as president constructed the Flashing railroad, laid out a cemetery and two suburban villages, and taught Greek and Hebrew to private pupils. In 1856, although a layman, he received the degree of S. T. D. from Wesleyan university. In 1858-61 he was professor of Biblical literature and acting president of the Troy university; and in 1868 he became professor of exegetical theology in Drew theological seminary, Madison, N. J. In 1874 he made an extended tour in the East. He is a member of the Anglo-American commission for the revision of the authorized English Bible, and of the Palestine exploration society, and president of the oriental topographical corps. His chief literary work is the "Cyclopedia of Biblical, Theological, and Ecclesiastical Literature," projected by him and Dr. John McClintock in 1858, in which he had charge of the department of Biblical literature, and Dr. McClintock, to the time of his death in 1870, of theological and ecclesiastical literature. Since that date Dr. Strong has been supervising editor of the whole work, assisted by Prof. J. H. Worman. The first volume appeared in 1867, and the sixth in 1875; and it is to be completed in ten volumes. Dr. Strong has also published "Harmony and Exposition of the Gospels" (New York, 1852); "Greek Harmony of the Gospels" (1854); brief manuals of Greek and Hebrew grammar; and articles on Biblical topics and on ministerial education, the latter eliciting much controversy; and he prepared the part on Daniel for the English translation of Lange's "Commentary" (New York, 1875).

STRONTIUM, one of the three metals of the alkaline earths, barium and calcium being the other two. It was first obtained from the native carbonate of strontium by Sir Humphry Davy in 1808, in a manner similar to that for barium. The pure metal may be more readily obtained from the fused chloride by electrolysis according to the method of Matthiessen. A small porcelain crucible, having a porous cell in the middle, is filled with anhydrous chloride of strontium mixed with a little sal ammoniac. The negative electrode, consisting of a thin iron wire wound round a thicker one, and all but about 2/5 of an inch covered with a piece of tobacco-pipe stem, is placed in the porous cell. The positive electrode, in the form of an iron cylinder, is placed in the crucible round the porous cell. The heat is so regulated that a crust shall form in the cell, under which the metal collects during the passage of the galvanic current. The pure metal has a pale yellow color and a specific gravity of 2-54. Its symbol is Sr; its atomic weight, 87-6. When heated in the air it burns with a crimson flame, emitting sparks, and decomposes water with evolution of hydrogen gas. It is about as hard as gold, very ductile, and may be hammered into very thin plates. With oxygen it forms two anhydrous oxides: strontium monoxide, SrO, and strontium dioxide, SrO2, each of which unites with water to form a hydrate. The oxide, called strontia, has the same relation to the metal that lime has to calcium; and, like lime, one of its most important compounds is the carbonate, or strontianite, which was discovered in 1787 at Strontian in Argyllshire, Scotland, whence the
name. The mineral was then regarded as a carbonate of barium, but Crawford's supposition that it consisted of a peculiar earth was confirmed by Hope in 1792, and by Klaproth in 1793.—Principal Satte. The chloride (SrCl₂), the iodide (SrI₂), and the bromide (SrBr₃) are all easily soluble in water and decomposable by heat. The nitrate (Sr₂NO₃) is extensively used in producing the crimson lights of fireworks. A mixture of 40 parts of strontium nitrate with from 5 to 10 parts of potassic chloride, 12 of sulphur, and 4 of antimonials sulphide, deliquesces with a magnificent crimson color. Its preparation is dangerous, in consequence of its liability to ignite spontaneously.

Nitrate of strontia may be prepared by treating the native carbonate with dilute nitric acid, but it is more usual to employ the native sulphate, which is reduced to a sulphide by heating it with charcoal, and then subjected to the action of dilute nitric acid. It crystallizes from hot, concentrated solutions in anhydrous octahedrons, which are insoluble in alcohol, but soluble in half their weight of boiling water and in five parts of cold water. From the cold solution it may be obtained in monocline crystals, having four molecules of water. Sulphate of strontium (SrSO₄) is found native as the mineral celestine, so named from its occasional delicate blue color, although it occurs white, gray, yellow, and red. It may also be prepared by the action of sulphuric acid on strontianite, or of a soluble strontia salt, as the nitrate, on another metallic sulphate. Its crystals are modifications of the right rhomboic prism, being isomorphous with the sulphates of barium and calcium. The mineral is usually associated with limestone, or sandstone of the Silurian, Devonian, and other formations. It is also found in beds of gypsum, rock salt, and clay, and sometimes in trap rocks, and with volcanic sulphur. Splendid crystals are found at Giros and Sicily, associated with sulphur and gypsum. It is found at Rex in Switzerland, at Dornburg in Saxe-Weimar, in Tyrol, in rock salt at Issel in Austria, and in trap rocks near Tantallan in East Lothian, Scotland. Beautiful bluish crystals occur in Trenton limestone about Lake Huron, particularly on Strontian island, and at Kingston, Canada. Fine specimens have been found at Schoharie and at Lockport, N. Y. A blue, fibrous celestine is found near Franktown, Huntingdon co., Pa.; on Drummond island, Lake Erie, it occurs mixed with barite.

STROSSMAYER, Joseph George, a Croato-Slavonian prelate, born in Eszék, Feb. 4, 1815. He was educated at Pesth, Vienna, and Padua, and became bishop of the united sees of Bosnia and Sirmia, May 20, 1850. At the Vatican council he strenuously maintained the inopportuneness of defining the doctrine of pontifical infallibility. He was represented as having delivered a violent opposition speech in one of the sessions, the text of which was re-produced by several journals; but in 1872 he addressed a letter to the François denying the authenticity of this speech, and affirming that he "never said one word during the entire council which could in any way diminish the authority of the holy see, or tend to promote discord in the church." He is known as a zealous champion of Slavice autonomy, and a munificent promoter of Slavice culture. In 1875 he published a pastoral letter on the occasion of his 25th anniversary as bishop, declining a public manifestation in his honor, "while the fellow countrymen of the Croats across the frontier are shedding their blood for liberty, and Christian charity makes it a duty to aid the widows and orphans of the fallen."

STROther, David Hunter, an American artist, born in Martinsburg, Va., Sept. 26, 1816. He studied drawing and painting, in 1845 went to New York, learned to draw on wood and illustrated some books, and in 1849 returned to Virginia. From 1853 till 1861 he published, under the pseudonyme of Porte Crayan, a series of illustrated papers, mostly relating to Virginia and the south, some of which were collected in his "Virginia Illustrated," (New York and London, 1857). On the outbreak of the civil war he volunteered in the United States service, was a colonel of cavalry, and at the close retired as a brevet brigadier general. Since 1866 he has resided at Berkeley Springs, W. Va., and continues his illustrated papers on southern subjects.

STROUSBERG, Bethel Henry, known as doctor, a German adventurer, born of Jewish parents at Nelderburg, East Prussia, Nov. 20, 1823. His original name was Baruch Hirsch Stransberg. In 1885 he entered the commission house of his uncles in London, became a Christian, and married an English woman. He finally engaged in the insurance business, incurred losses in 1847, taught languages at New Orleans in 1849, returned in 1849 to London with money made by trading in damaged goods, and was interested in publishing "The Chess Player," "Lawson's Merchant's Magazine," and "Sharpe's London Magazine." In 1855 he settled in Berlin as agent for an insurance company, and in 1861 obtained for English capitalists the concession of an East Prussian railway. After building other railways for different companies, he built many on his own account, chiefly in northern Germany, Hungary, and Roumania, and became the owner of vast establishments for producing all the materials required for them, as well as of beet-sugar, porcelain, and other factories, mines, the Berlin cattle yard, the Antwerp south citadel grounds, and the great Zbirow domain in Bohemia. At one time he employed more than 100,000 persons, and was engaged in speculations involving several hundred millions of dollars. He eloped princes in his luxurious living and ostentatious charities, and was popularly known in Berlin as
Der Wunderdoctcr. He lost heavily during the war of 1870-71, became inextricably involved in 1872 after a ruinous settlement with the Roumanian government on account of unfulfilled railway contracts, failed in 1875, and in November was imprisoned at Moscow for alleged fraudulent transactions with a bank.

STRUENSEE, Johann Friedreich, count, a Danish statesman, born in Halle, Aug. 5, 1739, executed at Copenhagen, April 28, 1772. He became in 1768 the physician and favorite of King Christian VII., and subsequently of his queen, Carolina Matilda. The king gave himself up to vicious indulgence, while the queen dowager led by Count Bernstorff, and the party of the queen led by Struensee, strove for power. The latter triumphed, and Struensee was appointed prime minister. After instituting important reforms, he became obnoxious on account of his arbitrary measures and his alleged illicit relations with the queen, and his enemies finally succeeded in procuring his arrest. (See Christian VII., and Carolina Matilda.)

STRUJT, Joseph, an English antiquary, born in Springfield, Essex, Oct. 27, 1742, died in London, Oct. 16, 1802. He studied painting and engraving, afterward engaged in antiquarian research in the British museum, and published "The Regal and Ecclesiastical Antiquities of England, containing the most authentic representations of the English Monarchs from Edward the Confessor to Henry VIII." (4to, 1778; new ed. by J. R. Planché, 1842); "Horda-Angel-Cyman, or a Complete View of the Manners, Customs, Arms, Habits, &c., of the Inhabitants of England from the arrival of the Saxons till the Reign of Henry VIII." (3 vols. 4to, 1774-6); "The Chronicle of England" (2 vols. 4to, 1777-8), intended to comprise 6 vols., but terminated with the Norman conquest; "Biographical Dictionary of Engravers" (3 vols. 4to, 1785-6); "Complete View of the Dress and Habits of the People of England, from the Establishment of the Saxons in Britain to the present Time" (2 vols., 1796-9; new ed., 1875); and "The Sports and Pastimes of the People of England" (4to, 1801), well known by Hone's edition (8vo, 1830; latest ed., illustrated, 1875). He left a fragment of a romance entitled "Queen Hoo Hall," edited by Sir Walter Scott (1808), and other writings published posthumously. Strutt engraved a series of plates illustrating the "Pilgrim's Progress."

STRUVE. I. Friedrich Georg Wilhelm von, a Russian astronomer, born in Altona, April 15, 1795, died in St. Petersburg, Nov. 23, 1864. He was educated at Dorpat, and in November, 1815, was appointed extraordinary professor of mathematics and astronomy there, two years later becoming ordinary professor. His duty in that office was not only to attend to the observatory, but also to lecture on astronomy and mathematics; but in 1822 the two offices were separated, and Struve was henceforth free to work exclusively as an astronomer. In 1839 he was made director of the observatory of Pulkova, which had been built under his direction, and not long after he was made councillor of state. He confined his labors as an astronomer principally to the observation of fixed and double stars, and made large additions to the knowledge of these bodies. He also conducted the triangulation of Livonia, and measured the degrees of latitude in the Baltic provinces, and an arc of the meridian between Norway and southern Russia. In 1857 Struve visited England to organize and arrange the measurement of an arc of parallel through the entire breadth of Europe, from Orsk at the foot of the Ural mountains to Valentia at the western extremity of Ireland. This work he fairly initiated, but in 1858 he was attacked by a malady which prevented him from cooperating further in it save by advice and calculation; and in December, 1861, he was compelled to resign his active duties as director of the observatory. His most important works are: Observationes Dorpatenses (8 vols., Dorpat, 1817-39); Catalogus Novus Stellarum Duplicium (1827); Stellarum Duplicium Menoea Micrometrica (St. Petersburg, 1827); Description de l'Observatoire Astronomique central de Russie (1845, with 36 plates); Études d'astronomie stellaire sur la voie lactée et la distance des étoiles fixes (1847); and Stellarum Fizarum imprimis Duplicium et Multiplicium Positiones Mediae pro Epocha 1830, &c. (fol., 1852).—See a memoir by Prof. Cleveland Abbe, in the appendix to the report for 1859 of the secretary of the Smithsonian Institution.

II. Otto Wilhelm, son of the preceding, born at Dorpat, May 7, 1819. He became his father's assistant at Pulkova in 1839, and succeeded him as director in 1862. From 1847 to 1862, as consulting astronomer, he had the oversight of all investigations conducted by the Russian army and navy. His labors relate chiefly to nebulae, double stars, faint satellites, and comets, and include a new determination of the constant of precession, the discovery of about 500 new double stars, most of them barely separable, the determination of the mass of Neptune, investigations in regard to Saturn and his rings and to the parallax of various fixed stars, and observations of the nebula of Orion. He first showed that the red prominences visible in a total solar eclipse belong to the sun's surface. Besides numerous papers in the Mémoires of the academy of St. Petersburg, he has published Uebersicht der Thätigkeit der Nikolai-Hauptsternwarte während der ersten 25 Jahre ihres Beethens (St. Petersburg, 1865).

STRUVE. I. Georg Adam, a German jurist, born in Magdeburg, Sept. 20, 1619, died in Jena, Dec. 15, 1692. He studied law at Jena and Helmstedt, and in 1646 was appointed professor of law at Jena, and in 1648 assessor to the high court of the circle of Saxony. In 1667 he was appointed privy councillor to the duke of Weimar, and was selected as his advocate in the case of the succession to the
The most important of his numerous works is his *Corpus Juris Gentium* (Jena, 1748).

**strychnia**, or **strychnine**, a poisonous vegetable alkaloid, discovered in 1818 by Pelletier and Caventou in the seed of the *strychnos multiflora* or *St. Ignatius* bean, and the *strychnos nux-vomica*. (See *Nux Vomica*.) It is associated with brucia, an alkaloid having similar poisonous properties, but of much less strength. (See *Brucia*.) Strychnia is also said to be contained in larger proportions in the seeds of the *strychnos tinctus*, a native of Java, from which the poison called upas tincte is extracted. In preparing strychnia, the seeds of the plant may be first softened by steam and sliced, dried, and ground, or they may be reduced to a pulp by beating. The following is Merck's process for extracting the alkaloid: The seeds are boiled for 24 or 36 hours in a closed boiler with water enough to cover them, acidulated with one eighth of its weight of sulphuric acid. They are then beaten into a paste, and the liquor is expressed. Excess of caustic lime is added, which throws down the alkaloids. The precipitate is then boiled in alcohol of specific gravity 0.850, and filtered hot. Strychnia and brucia are deposited together in a colored and impure state, and may be separated by cold alcohol, which dissolves the brucia. The remaining strychnia is then boiled in alcohol with a little animal charcoal, and the solution filtered boiling hot. On cooling, the strychnia crystallizes in small brilliant, colorless, octahedral crystals, soluble in about 7,000 parts of cold and 2,500 parts of boiling water.—Strychnia is inodorous, but has an exceedingly bitter taste, which is perceptible when the drug is dissolved in 1,000,000 parts of water. It is one of the most active and powerful poisons. The symptoms it produces are difficulty of breathing and a sense of suffocation, disordered twitching of the limbs and tetanic convulsions, the body becoming arched in the back, often resting on the head and heels, a condition known as *opisthotonus*. The features are convulsed, attended by spasm of the jaws and choking. The attack occurs in paroxysms, between which the intellect is often clear at first, but becomes clouded after a succession of paroxysms. The medical properties of strychnia are like those of *nux vomica*, which was employed by the Arabian physicians. In small doses it acts as a tonic, and it is often given as an adjunct to laxative pills, particularly to dinner pills, in debilitated conditions of the muscular coat of the intestines. When given in larger doses its action is directed to the motor nerves, probably through the medium of the spinal marrow. It produces trembling in the limbs, and a tendency to involuntary muscular contraction, as in tetanus, and frequent starts and spasms occur as from electric shocks, which are increased in intensity by a perseverance in the medicine. It sometimes produces pain in the head, vertigo, contracted pupils, and diminiss of vision. The pulse is not particularly affected, though sometimes slightly accelerated. It has been employed on the continent of Europe as an antitode to the plague, in intermittent fevers, and as a remedy in mania, hysteria, rheumatism, and hydrophobia. It is said to have cured spasmodic asthma. Its peculiar influence upon the nerves of motion, to which attention was first called by Magendie, caused M. Fouquier, a French physician, to use it in paralytic affections, and it is now considered a standard remedy in palsy. It is a singular fact that its action is directed first to the muscles of the paralytic part. Its action varies in degree with different animals, being particularly marked upon the canine race. Pelletier and Caventou killed a dog in half a minute with one sixth of a grain. One grain might prove fatal in the human subject; indeed, half a grain proved fatal in the case of Dr. Warner. One twelfth of a grain every four hours, repeated several times, will cause decidedly unpleasant symptoms; but a great difference in its effects is observed in different individuals, some being affected by the administration of one thirtieth of a grain two or three times repeated, while others have been said to take more than a grain at a time, and as much as three grains in the course of 24 hours.—Many antidotes have been proposed. According to M. Duclous, its poisonous effects subside under the application of negative electricity, while they are aggravated by positive. Kermes mineral has been recommended by M. Thorel, being thought by him to form an insoluble sulphur, and he recommends the administration at the same time of an emetic. Tannic acid, chloride, and tinctures of iodine and bromine are regarded as the best antidotes by Prof. Bellini. The indications are to evacuate the stomach as quickly as possible, and for this the stomach pump is the most efficient means. In its absence sulphate of zinc or powdered mustard may be used. To relieve the spasms various narcotics have been used, as conium, opium, and *cannabis Indica*, and the reports of their effect are in some
cases decidedly favorable. Chloroform is said to have been used with good effects.

STRYMON. See MACEDONIA.

STRYPE, John, an English clergyman, born in London, Nov. 12, 1643, died Dec. 13, 1737. He was educated at St. Paul's school and at Cambridge, and from 1669 till about 1728 he was minister of Low Leyton in Essex. His works include "Memorials of the most renowned Father in God, Thomas Cranmer, sometime Lord Archbishop of Canterbury" (fol., 1694); "The Life of the Learned Sir Thomas Smith" (8vo, 1698); "Historical Collections relating to the Life and Acts of Bishop Aylmer" (8vo, 1701); "Annals of the Reformation" (4 vols. fol., 1709-31); and "Ecclesiastical Memoirs" (5 vols. fol., 1721). He published an edition of Stow's "Survey of London" (2 vols. fol., 1720), with important additions of his own. His works have been reprinted at Oxford (29 vols. 8vo, 1822-8).

STUART, Henry Benedict Maria Clement, earl of Lennox, brother of Darnley and uncle of James I., born about 1575, died in the tower of London, Sept. 27, 1615. She was related to Queen Elizabeth in the same degree as her cousin James, the successor to the throne; and this relationship made her the subject of constant intrigues. An early plan to marry her to her relative Lord Esme Stuart was defeated by Elizabeth's opposition; several similar schemes failed from various causes; and she was still unmarried when in 1608 Sir Walter Raleigh was accused of a plot to raise her to the throne. This design probably never existed, but the accusation brought her into public notice, and made her situation still more dangerous; and further hostility was aroused against her by the discovery in 1610 that she had been secretly married to William Seymour, grandson of the earl of Hertford. Seymour was at once committed to the tower, and the lady Arabella placed in the custody first of Sir Thomas Parry at Lambeth and afterward of the bishop of Durham. While on the journey to Durham, she escaped by feigning illness (June, 1611), and made her way to a French vessel waiting for her and her husband, the latter having also escaped from the tower. He did not get to the ship, which sailed without him; but it was captured before reaching the French coast, while the small vessel in which

ASSASSINATION OF ROBERT II. Robert Stuart was assassinated in 1437; James II., who was accidentally killed in 1460; James III., murdered in 1488; James IV., slain in the battle of Flodden in 1513; James V., son of the preceding and of Margaret Tudor, sister of Henry VIII., of England, who died in 1542; Mary, executed in England in 1587; her son James VI., who succeeded Queen Elizabeth as James I. of England, died in 1625; Charles I., executed in 1649; Charles II., who died in 1685; James II., who died in 1701, and was the last reigning male member of the family, though his daughter Mary, wife of William of Orange, came to the throne after his expulsion in 1688 as queen regnant with her husband, and his second daughter Anne succeeded her in 1702, reigning till her death in 1714. The only son of James II., James Francis Edward Stuart, was a pretender to the throne of England, and died in Rome in 1766. His son Charles Edward Stuart (born in 1729, died in 1788) was a second pretender. Henry Stuart, Cardinal York, brother of Charles Edward, was the last of the male line of the family, and with his death in 1807 it became extinct. Its chief branches in the female line are the houses of Savoy and Orleans, both descended from Henrietta Anna, daughter of Charles I. The late duke of Modena, who was that king's lineal representative, and thus, but for the act of settlement, heir to the crown of England, died childless in November, 1875. (See CHARLES EDWARD, JAMES FRANCIS EDWARD, and STUART, HENRY BENEDICT MARIA CLEMENT.)

STUART, Arabella or Arbelia, often called the lady Arabella, the only child of Charles Stuart, earl of Lennox, brother of Darnley and uncle of James I., born about 1575, died in the tower of London, Sept. 27, 1615. She was related to Queen Elizabeth in the same degree as her cousin James, the successor to the throne; and this relationship made her the subject of constant intrigues. An early plan to marry her to her relative Lord Esme Stuart was defeated by Elizabeth's opposition; several similar schemes failed from various causes; and she was still unmarried when in 1608 Sir Walter Raleigh was accused of a plot to raise her to the throne. This design probably never existed, but the accusation brought her into public notice, and made her situation still more dangerous; and further hostility was aroused against her by the discovery in 1610 that she had been secretly married to William Seymour, grandson of the earl of Hertford. Seymour was at once committed to the tower, and the lady Arabella placed in the custody first of Sir Thomas Parry at Lambeth and afterward of the bishop of Durham. While on the journey to Durham, she escaped by feigning illness (June, 1611), and made her way to a French vessel waiting for her and her husband, the latter having also escaped from the tower. He did not get to the ship, which sailed without him; but it was captured before reaching the French coast, while the small vessel in which
he took passage later made the passage safely. Lady Arabella was thrown into the tower, where she became ill from neglect and ill treatment, and finally insane a short time before her death.

STUART, Gilbert, a Scottish author, born in Edinburgh in 1742 or 1746, died in Musselburgh, Aug. 13, 1786. He was educated at the university of Edinburgh, and in 1767 published a Historical Disquisition concerning the Antiquity of the British Constitution, which procured him the degree of LL. D., and in 1768 "View of Society in Europe in its Progress from Rudeness to Refinement." He failed to procure a professorship in Edinburgh on account of his dissipation, spent several years in London, and in 1773 started the "Edinburgh Magazine and Review," in which for four years he published savage attacks upon prominent Scottish authors. He afterward again lived for some time in London. His remaining works are: "Observations concerning the Public Law and Constitutional History of Scotland" (8vo, Edinburgh, 1770), an attack on Dr. Robertson, whom he especially hated; "History of the Establishment of the Reformation of Religion in Scotland" (4to, London, 1780); and "History of Scotland from the Reformation to the Death of Queen Mary" (2 vols. 8vo, London, 1782).

STUART, Gilbert Charles, an American painter, born in Narragansett, R. I., in 1756, died in Boston in July, 1828. He received his first instructions from a Scottish painter named Alexander, by whom, when about 15 years of age, he was taken to Edinburgh. His master died soon after their arrival in that city, and Stuart worked his passage home before the mast, and began practice as a portrait painter at Newport, R. I. He removed successively to Boston and New York, and set sail in 1778 for London, where for two years he made little progress, and suffered greatly from poverty; but becoming acquainted with Benjamin West, he received valuable assistance from him, and for several years resided in his family. About 1781 he began practice in London on his own account, and soon rose to great eminence as a portrait painter, rivaling Reynolds and the best English artists of the day. Subsequently he resided successively in Dublin and Paris, and in 1793 returned to America. He went to Philadelphia to paint a portrait of Washington, and destroyed his first picture; but at the second sitting he produced the well known head from which he painted all his other portraits of Washington, and which has long been regarded as the standard likeness. The original study, together with a head of Mrs. Washington, is now in the possession of the Boston Athenaeum. After residing several years in Washington, he settled in 1806 in Boston. As a painter of heads he holds the first place among American painters, if we except Copley, and his flesh coloring rivals the finest modern efforts. Upon accessories he bestowed little labor, and they are sometimes finished in the most slovenly manner.

STUART, Henry Benedict Maria Clement, Cardinal York, the last of the Stuart family in the male line, born in Rome in 1728, died at Frascati in 1807. He was the son of the pretend- er James Francis Edward, who created him duke of York, and the younger brother of the "young pretender" Charles Edward, whom he was proposing to aid with a body of French troops assembled at Dunkirk when the over- throw of the Jacobites at Culloden ruined the Stuart cause in Britain. He subsequently took orders in the Roman Catholic church, and in 1747 was appointed by Benedict XIV, a cardinal, the ducal title given him by his father, though valueless in England, being recognized by the pope in the style of his nomination as Cardinal York. On the death of his brother in 1788 he assumed the title of king of England as Henry IX., gratia Dei, non voluntate hominum, as the medal struck on the occasion declared. On the abjuration of the Papal States by the French he retired to Venice, and in his last years was dependent upon the British court for the means of subsistence.

STUART, James, sometimes called Athenian Stuart, an English antiquary, born in London in 1713, died Feb. 2, 1788. In early life, till about 1742, he painted fans. He then went to Rome, where he studied art, the ancient languages, and archaeology. In 1750 he accompanied Nicholas Revett on an antiquarian tour to Greece, remaining in Athens from March, 1751, to the close of 1753. Returning to London in 1755, he engaged in the practice of architecture, and began, at first in conjunction with Revett, a work on the "Antiquities of Athens." The work was completed in 4 vols. imp. fol., with 384 plates; the first volume appeared in 1762, and the other three were edited respectively by Newton (1787), W. Reveley (1794), and Joseph Woods (1816). A second edition of the first three volumes with smaller plates, and a supplementary volume with 50 plates, were published by Kinnard (1825-30). Among other editions is one in French (4 vols. fol. and a supplementary volume, Paris, 1808-32).

STUART, John, earl of Bute. See BUTE.

STUART, Moses, an American author, born at Wilton, Conn., March 26, 1780, died in Andover, Mass., Jan. 4, 1852. He graduated at Yale college in 1799, was admitted to the bar in 1803, and for the two succeeding years was a tutor in Yale college. He afterward studied theology, and was ordained pastor of the first Congregational church of New Haven, March 5, 1806. From 1809 to 1848 he was professor of sacred literature in the theological seminary at Andover. He published a "Grammar of the Hebrew Language without Points" (Andover, 1813); "Letters to the Rev. William E. Channing, containing Remarks on his Sermon recently preached and published in Baltimore" (1819); a "Grammar of the Hebrew Language
with Points" (1891); "Letters to Dr. Miller on the Eternal Generation of the Son of God." (1829); "Commentary on the Epistle to the Hebrews" (2 vols. 8vo, 1827-28); "Hebrew Chrestomathy" (2 vols., 1829-30); "Exegetical Essays upon Several Words relating to Future Punishment" (1830); "Commentary on the Epistle to the Romans" (1832); "Is the Mode of Christian Baptism prescribed in the New Testament?" (1838); "A Grammar of the New Testament Dialect" (1834); "Philological View of Modern Doctrines of Geology" (1830); "Hints on the Prophecies" (2d ed., 1842); "Commentary on the Apocalypse" (2 vols., 1845); "Critical History and Defence of the Old Testament Canon" (1845); "Commentary on Daniel" (1850); "Conscience and the Constitution" (1851); "Commentary on Ecclesiastes" (New York, 1851); and "Commentary on Proverbs" (1852). He also published several translations, including "Elements of Interpretation," from the Latin of Ernesti (Andover, 1822); "Hebrew Grammar," from the German of Gesenius (1829); with Edward Robinson, "Greek Grammar of the New Testament," from the German of Wiener (1829); and "Discoparies between the Sabellian and Athanarian Methods of Representing the Doctrine of the Trinity," from the German of Schleiermacher (1833).

STUHL-WEISSENBURG. I. Properly Weissenburg (Hung. Fejér), a county of S. W. Hungary, bounded E. by the Danube; area, 1,605 sq. m.; pop. in 1870, 196,234, chiefly Magyars. The N. part of the county is mountainous, while the S. is level. Among the products are tobacco, wine, and marble, and there are several mineral springs. II. A city, capital of the county (Hung. Székes-Féjér város; Lat. Alba Regia), on the left bank of the Csorgó, near the border of an extensive morass, 36 m. S. W. of Buda; pop. in 1870, 22,653. The principal buildings are the cathedral and the episcopal palace. There are manufactures of woollen and linen goods, hardware, and several minor articles. The kings of Hungary were crowned here down to Ferdinand I, and the cathedral contains many of their tombs. Four tombs dating from the 13th century, and other relics, were excavated in 1874, including those of a remarkable chapel.

STURGEON, the name of cartilaginous fishes of the class of gnoids and family sturionidae. The body is elongated and fusiform, covered with a rough skin protected by five longitudinal rows of tubercular plates; the largest of these rows is along the back, and there is also one on each side, and one from each pectoral to the ventral fins; the plates are flattened, and marked with radiating striae. The head is depressed, and ends in a long triangular snout covered with bony plates; mouth funnel-shaped and protractile, on the under surface, without teeth, having in front a few depending barbels, evidently organs of touch; gill covers very large and gills free; pseudo-bran-chie and spiracles are present, but no branchiostegal rays; fins well developed, the dorsal and anal opposite and behind the ventrals; tail heterocercal or unsymmetrical, the vertebral cord being prolonged into the upper lobe as in the sharks, and strengthened by fulera along its upper margin; a soft caudal on the under surface of the tail. The vertebral column consists of an undivided soft chorda dorsalis; the air bladder is very large, communicating freely with the oesophagus; there is a spiral valve in the intestine, and a conglomerate pancreas. They are generally large, and inhabit the northern temperate seas of both coasts of America, eastern Europe, and western Asia, from which they ascend the rivers in spring to spawn, returning to the salt water in autumn; species are also found in the great American fresh-water lakes, which never descend to the sea. They are oviparous; the food consists of any soft substances which they stir up from the bottom with their snouts, and of small fish; they frequently jump out of water.—The genus acipenser (Linn.) has the characters of the family. The common sturgeon of Europe (A. sturio, Linn.) attains a length of 8 to 10 ft., and sometimes more; it is found in the Caspian and Black seas and the rivers opening into them, and sometimes on the coasts of Great Britain and the Baltic; the flesh is delicate, and is largely consumed in Russia, fresh, salted, and pickled. A larger species, also found in the seas and rivers of S. E. Europe, is the beluga (A. huso, Linn.), attaining a length of 12 to 15 ft. and a weight of 1,200 lbs., and occasionally much larger; it ascends the rivers opening into the Caspian and Black seas, with other and smaller species. The flesh is tough; the sound or air bladder furnishes an abundant supply of isinglass, for which great numbers are caught in Russia. Caviar is also made from the roe of the female, which sometimes constitutes one third of the weight of the fish; the skin is used for

Common European Sturgeon (Acipenser sturio).
harness leather, and the dorsal cord, cut in pieces and dried, is used as food. The sterlet (A. Ruthenus, Linn.), found in the Caspian, and growing to a length of 2 or 3 ft., furnishes a most delicate food and the best caviare. In the Volga it spawns early in May, on rocky bottoms, in water of 64° F.; the eggs, which are easily fecundated artificially, soon adhere to any object; they are hatched in about seven days, the embryos being then about a quarter of an inch long; in ten weeks these attain a length of two inches, feeding on larvae of insects on the bottom. Both eggs and young will safely bear a journey of five days, and have been carried to W. Russia and even to stock British rivers; the young live only in fresh water. The color in these species is brown of various shades, the plates whitish, and the abdomen silvery. The several species in the Baltic hybridize freely, and are probably only varieties of one.—In North America sturgeons are not found north of the watersheds between lat. 53° and 54° N.; where the mean annual temperature is about 39° F.; they seldom enter cold streams, but ascend muddy rivers in such numbers that many large Indian tribes subsist entirely on their flesh in summer; each watershed has its own species, varying in some minor characteristics. The sharp-nosed sturgeon (A. oxyrhynchus, Mitch.) attains a length of from 3 to 7 ft.; it is found on the coasts of New England, New Brunswick, and Nova Scotia; it is common in Long Island sound from the middle of June to October, and is taken by harpoon and in nets; the smaller ones are esteemed for the table; it is grayish brown above, silvery on the sides, and white below. The short-nosed sturgeon (A. brevirostris, Mitch.) is dusky above and white below; the snout is short and blunt; it attains a length of 2 to 5 ft., and is so common in the Hudson that its flesh in the market has been known as Albany beef; it much resembles the A. sturio of Europe. Other species are described from the northern waters, the rivers of the N. W. coast, and from Lake Superior, by Richardson and Agassiz.—The genus polyodon (Lacép.) or spatularia (Shaw) has the general form of acipenser; but is without the bony plates on the body and head; the snout is very much elongated, and compressed into a thin leaf-like organ, partly bony and partly cutaneous, sometimes nearly as long as the body; gill covers very large, extending far back in a membranous point; the mouth is wide, with numerous minute teeth in the young animal, which are lost with age. The spoon-bill sturgeon (P. folium, Lacép.) is steel-blue above and white below; it attains a length of 5 ft., and is found in the Mississippi, Ohio, and their tributaries; it is also called shovel fish and paddle fish; the flesh is tough; the singularly shaped snout is used to shovel up the mud in search of food. The genus platirostra (Les.) is probably only the adult of polyodon, the principal difference being the absence of teeth.

STURLESON. See SNORRI STURLASON.

STURT, Sir Charles, an English explorer, died in Cheltenham, June 16, 1869. He entered the army at an early age, and in 1825 (being then a captain) was stationed at Sydney, New South Wales. At this time the interior of Australia was almost entirely unknown; and in 1828 Gen. Darling organized an exploring expedition. Oxley ten years before had been stopped by the great swamps W. of the Blue mountains, and this expedition was to penetrate beyond them as far inland as possible. Sturt was attached to the party, and soon took the virtual lead of it. He discovered the Macquarie, Castlereagh, and Darling rivers, and explored a great portion of their valleys. Later he led another expedition, explored the course of the Murrumbidgee, discovered (June 14, 1830) the great Murray river, followed it to Lake Alexandrina, and returned at the beginning of 1831. The account of these journeys was published in London in 1833, under the title of "Two Expeditions into the Interior of South Australia during the years 1828-31." His health, and especially his eyesight, had suffered greatly; and he was compelled to rest for several years before undertaking his next expedition, which was overland from Sydney to Adelaide. At Adelaide he was made surveyor general of South Australia. In 1844 he undertook a fourth journey, and, after the greatest hardships in the Stony Desert, reached a point near the centre of the continent. This expedition he described in a report published in London in 1848. After his return he became registrar general and later colonial secretary of South Australia; but the injury to his eyes resulted in total blindness, and he returned to England. He was knighted a few days before his death.

STUTSMAN, an E. central county of Dakota, recently formed and not included in the census of 1870; area, about 2,100 sq. m. It is drained by the head waters of the Dakota or James river. The W. part is occupied by the Plateau du Coteau du Missouri. The Northern Pacific railroad traverses it from E. to W. The surface is rolling.

STUTTERING. See STAMMERING.

STUTTGART, a city of Germany, capital of the kingdom of Würtemberg, 2 m. S. W. of Canstatt on the Neckar, and 97 m. S. E. of Frankfort; pop. in 1876, over 107,000, including 9,000 in several villages. It stands in a very beautiful valley surrounded by vine-clad hills, with wooded mountains in the distance. The town is generally well built, and is divided by the long Königsstrasse, the principal street, extending nearly N. and S. throughout its en-
tire length, and bordered by the chief business buildings. In the principal square is a fine old Gothic church, with a high tower and many ancient sculptures and monuments of the princes of Wurttemberg. The royal (formerly ducal) palace, begun in 1746 and finished in 1806, is a large building of freestone finely decorated and furnished in the interior; the old palace, completed in 1750, resembles a medieval castle, and is now occupied by officials connected with the government. In the same square is a monument to Schiller by Thorwaldsen. The hospital church is a Gothic building, finely decorated in the interior, and contains the original model of Danneck-er's "Christ." The town hall was built in the 15th century. There is a museum of natural history; a royal library of 450,000 volumes and 3,500 manuscripts; a cabinet of medals containing more than 17,000 specimens; a museum of the fine arts, with many valuable statues and pictures; a bazaar, and a theatre. Stuttgart has also a gymnasium, military academy, polytechnic school, a royal school of art, attended in 1874-5 by about 100 students, and a conservatory of music, attended in January, 1875, by 376 male and female pupils, including 79 from the United States and 58 from England. The manufactures include woollen, silk, linen, and cotton goods, jewelry, musical and philosophical instruments, leather, and tin ware. The book trade is extensive, and connected with it are numerous paper mills, type founderies, and lithographic establishments. The town is the central point of the Wurttemberg railways, seven lines extending from it; and the railway station is perhaps the finest in Germany. There is a horse railway between Stuttgart and Cannstatt, a pleasant suburb and favorite summer resort. Besides the public garden, which is one of the finest in Germany, there are in the vicinity numerous parks and gardens, where the public are admitted; that of Rosenstein, the king's summer palace, and the gardens of the Wilhelma palace at Canstatt, are the most beautiful.—The date of the foundation of Stuttgart is not accurately known. It is mentioned as early as 1229, and was selected as a residence by Count Eberhard in 1290. In 1482 Count Urtic made it the capital of Wurttemberg. The city had little of its present beauty until the middle of the 18th century; after that time it was greatly improved during several successive reigns, owing its chief embellishments to Kings Frederick and William. The population and prosperity of Stuttgart have of late much increased.—See Wochner's Stuttgart seit 25 Jahren (Stuttgart, 1871).

STUYVESANT, Petrus, the last Dutch director general of New Netherland (New York), born in Holland in 1602, died in New York city in August, 1682. He served in the war in the West Indies, was director of the colony of Curacao, lost a leg in battle, and returned to Hol-land in 1644. In 1646 the Dutch West India company appointed him director general of New Netherland. He arrived in May, 1647, conciliated the savages, who had been provoked to hostilities by his predecessor William Kieft, and restored order in every department. In 1650 he arranged at Hartford with the New England commissioners a line of partition, before undefined and disputed, between the Dutch and English territories. In 1651 the Dutch built Fort Casimir on the Delaware, which was captured by Rising, the governor of New Swe-den, in 1654. Next year Stuyvesant sailed into the Delaware with seven vessels and 600 or 700 men, and took the whole settlement. For the next ten years there was nearly unbroken peace. In 1653 a convention of two deputies from each village in New Netherland demanded that "no new laws shall be enacted but with the consent of the people; that none shall be appointed to office but with the approbation of the people; that obscure and obsolete laws shall never be revived." Stuyvesant commanded the separation of this assembly on pain of punishment, telling them: "We derive our authority from God and the company, not from a few ignorant subjects." The spirit of resistance nevertheless increased. The en-coachment of the New England colonies induced Stuyvesant to recommend before a conven-tion of the united colonies at Boston, but he met with little favor; and a second embassy to Hartford had no better success. In 1664 Charles II. granted to his brother, the duke of York, the territory from the Connecticut river to the shores of the Delaware, and an English fleet under Richard Nicolls appeared in the bay of New York in August and demanded the surrender of the city. Stuyvesant was unwilling to capitulate, but the municipality, seeing the futility of resistance, insisted on yielding; and at last he consented, and the city was given up on Sept. 3, 1664. Stuyvesant went in 1665 to report to his superiors in Holland, but returning, spent the remainder of his life on his farm or brouwenij (whence the name of the street called the Bowery), then outside the limits of the city. He lies buried in the vaults of St. Mark's church in 10th street.

STY (Lat. hordeolum, from hordeum, barley), a small inflammatory tumor on the edge of the
STYLE

eyelid, about the size of a grain of barley. Sty has its seat in the cellular tissue at the margin of the lid, involving generally the roots of one or more of the eyelashes. The tumor is funicular, and almost invariably goes on to suppuration; its progress is sometimes tedious and the suppuration imperfect. Sty is most common in persons of a strumous habit, and often has for an exciting cause derangement of the digestive organs. When the little tumor has made its appearance, it is best to promote its maturation by warm and emollient fomentations. It is commonly advisable to leave it to burst of itself; but when maturation has occurred, if it occasion much uneasiness, it may be punctured.

STYLE, Old and New. See Calendar.

STYLITE (Gr. στυλίτης, belonging to a pillar), a class of anchorites who spent their lives on pillars. The originator of this mode of Christian penance was Simeon (known as St. Simeon Stylites), a Syrian, who was born in Sisan or Sasan about 390, and died near Antioch in 459. He spent several years in convents, but not being satisfied with the severity of their discipline, he built for himself on Mt. Tola a small hut in which he inflicted upon himself all manner of bodily pains, in the hope of thereby attaining to spiritual perfection. His fame drew around him large numbers of admirers, and in order to escape their constant intrusions and persistent efforts to approach him and touch his garments, he decided to live on top of a pillar. At first he maintained himself standing upon it by means of a beam, but he soon learned to do without this support, and to obtain rest by leaning against the lower parapet. His pillar was at first only about 10 ft. high, but he had it repeatedly increased in height to about 60 ft. high. On this pillar, the top of which is said to have measured only one few feet in circumference, he lived upward of 30 years; and when he died the people of Antioch received his body into their city and revered him as their patron saint. His example found numerous imitators in the East, but his peculiar kind of asceticism met with little favor in the West. He and his followers received the designation of stylites, but are known also as air martyrs, pillarists, and pillar saints. There were several other stylites called Simeon. One died in 595, and another, one of the last recorded in history, lived in the 12th century. It is related of one Alypius that he maintained himself 70 years on a pillar near Adrianople.

STYRIA (Ger. Steiermark), a duchy of Austria, bordering on Upper and Lower Austria, Hungary, Croatia, Carniola, Carinthia, and Salzburg; area, 8,671 sq. m.; pop. in 1870, 1,137,990. It is divided into the circles of Gratz, which contains the capital of the same name, Marburg, and Bruck. It is traversed by three chains belonging to the Noric branch of the Alpine system, the highest summits of which are on the N. W. and S. W. frontiers, rising to an elevation of 8,000 ft. and upward. The N. W. part is known as Upper Styria, and the country in the opposite direction as Lower Styria. The surface belongs to the basin of the Danube. The most important streams are the Mur, Enns, Raab, Save, and Drave, all of which except the Raab are navigable for boats. There are numerous small lakes, and hot and mineral springs. Limestone, sulphur, alum, rock salt, gold, silver, lead, copper, cobalt, zinc, and iron ore of superior quality are found. The soil in the valleys is generally fertile, but no surplus of grain is produced. The vine thrives well. The forests cover about half the surface. The inhabitants are mostly German, but the Winds or Slovaks are numerous, constituting about 36 per cent. of the population; nearly all are Roman Catholics. Iron is extensively manufactured, and linen, cotton, woollen, and silk to some extent; but the most important branch of industry is timber. Millions of jewshaps are annually exported.—Under the Romans the eastern part of Styria belonged to the province of Pannonia, and the western to Noricum. Christianity was introduced in the 4th century, but the northern barbarians afterward overran the province. Styria was annexed to Austria in 1192, was subsequently attached to Bohemia, and in 1276 together with other territories surrendered by King Ottocar II. to Rudolph I. of Hapsburg. It subsequently belonged to various branches of that house, until the Styrian line became the ruling one with the succession of Ferdinand II. to the emperor Matthis in 1619. Ferdinand exterminated Protestantism in the duchy. Under the constitution of Cisleithan Austria the Styrian diet elects 13 members to the Austrian Reichsrath.—See Das Volkstum in Steiermark in Charakter- und Sittenbildern dargestellt, by P. K. Rosegger (2 vols., Gratz, 1875).

STYX (connected with Gr. στυγήω, to abhor), in Greek mythology, the chief river of the lower world, around which it flows seven times. The name was said to be derived from the nymph Styx, the daughter of Oceanus, who, when Jupiter prepared to wrest the power from the hands of Saturn and the Titans, was the first of the immortals to answer to his call, coming with her children to his assistance. He made her children his constant attendants, and herself the oathsanctifier of the gods. In the Hesiodic theogony Styx is called the daughter of Oceanus and Tethys. She was the mother of Zetes (zeal), Nike (victory), Bia (strength), and Cratos (power).

SUABIA. See SWABIA.

SUAKIN, or Sookiun, a seaport town of Nubia, on the coast of the Red sea, 285 m. N. W. of Massowah; lat. 19° 17' N., lon. 37° 20' E.; pop. about 6,000. The town proper is on an island 14 m. in circumference, which is connected by a bridge with a suburb on the mainland. It is defended by a small fort,
and contains several mosques and public buildings, the principal of which are the governor's house, custom house, and bazaar. The harbor is sheltered from all winds, but is too shallow to admit large vessels. The adjacent country is a level plain. The climate is very hot. Suakin is fast increasing in commercial importance, and has a considerable trade in cattle, hides, butter, ivory, ostrich feathers, gum arabic, cotton, and coffee, the last from Abyssinia. More than 150 vessels enter its port yearly. It was formerly subject directly to the Turkish power, but in 1805 was surrendered to the viceroy of Egypt. In 1870 telegraphic communication was established with the Soofan, an attempt to effect which in 1865 had resulted in the loss of the engineers and 8,000 camels. There is a direct caravan route from Suakin to Berber, on the Nile, and to Khartoom, and great numbers of pilgrims pass over it yearly on their way to Mecca.

**SUAREZ, Francisco**, a Spanish theologian, born in Granada, Jan. 5, 1548, died in Lisbon, Sept. 25, 1617. He early entered the order of Jesuits, and was successively a professor at the universities of Alcalá, Salamanca, Rome, and Coimbra. His *Defensio Fidei, &c.* (Coimbra, 1613), was in 1614 ordered by the parliament of Paris to be burned, because it claimed for the pope a coercive power over kings. In the same year and subsequently it was reprinted at Cologne. His complete works appeared at Lyons and Mentz (28 vols. fol., 1630 et seq.; new eds., Venice, 1740, and Besançon, 1856-82). Francisco Noël prepared an abridged edition (2 vols. fol., Geneva, 1732; republished by J. P. Migne, Paris, 1858). The life of Suárez has been written in Latin by Deschamps (Perpignan, 1671), and in German by Werner (Ratisbon, 1861 et seq.).

**SUBLIMATION**, a process of distillation in which the vapors condense in a solid form. It takes place naturally in volcanic fissures and craters. Deposits thus formed are termed sublimates. A great variety of mineral substances are subject to vaporize by heat and become solid again on cooling; and the number of such increases with the increased degree of heat which we can apply. Some vegetable substances also possess the same property, as camphor and benzoin. Sublimation is much employed as a means of separating volatile from fixed bodies, usually for obtaining the former in a purer state. The vapor is sometimes chemically changed by contact with the oxygen of the air, and the sublimate is then of a different composition from the original body, as when oxide of zinc is produced by subjecting the metal or its ores to heat exposed to the air.

**SUBLIME PORTE** (Fr., lofty or magnificent gate; Turk., bâli hümâyûn; Ar. ed-damlet el-âliye), the title officially given to the Ottoman government. Orkhan (1326-56) erected in his capital Brusa a palace with an imposing entrance, on which he bestowed the name of "Sublime Porte," which from that time to the present has been applied to the monarch and government of the Ottomans. This use of the term is partly owing to the oriental custom of transacting public business at the gate or in the antechamber of the palace.

**SUBPOENA**, a judicial process directed to a witness commanding him to appear at the court, to testify what he knows in the case therein described, under a certain penalty (*sub poena*) mentioned in the process. If the court wishes to examine any books or papers which are in possession of the witness, a clause is inserted bidding him to bring them with him; and the subpoena is thence called a *subpensa duces tecum*. The subpoena ought to be served upon the witness personally, for otherwise he cannot be proceeded against as for a contempt if he neglects to appear. Service may be made by any person, and is proved generally by affidavit, or, if it be made by a sheriff or his officer, by a simple return or certificate of service. When a witness has been duly summoned, and his fees have been paid or tendered, or payment or tender has been waived, he is guilty of a contempt of court if he fails to appear at the appointed time, and may be proceeded against by attachment, for the double purpose of compelling him to appear and testify, and of vindicating the dignity of the court by the infliction of suitable punishment. The party actually injured by the non-appearance may also have an action for all damages caused by his default.—The office of the subpoena at common law is simply to bring into court a witness whose evidence is sought. Chancery, borrowing the name of the writ, but giving it a far larger scope, issued it in order to compel a defendant in cause to appear and answer upon oath the plaintiff's allegations. This process in chancery answers to a summons in the courts at law, and is the process by means of which the defendant is constructively brought before the court.

**SUBROGATION.** Where one person becomes entitled in law to the position of another as creditor or as the holder of securities, he is said to be subrogated to the rights of the other, and in contemplation of law there is a substitution or subrogation. When a surety pays the debt of his principal, he becomes subrogated to the rights of the creditor in any securities he may have hold, with the right to enforce them for his own indemnity. So if one having a lien on property pays off a prior lien for the protection of his own, he becomes entitled to hold it against the interest of those who should have paid; and so would one tenant in common who should discharge a mortgage upon the whole title. The doctrine rests on principles of equity, and is one of very general application.

**SUBSCRIPTION**, in law, a contract by which one agrees to contribute with others for a common purpose. The word is sometimes applied to the sum of money subscribed. The contract
of subscription depends for its validity upon the same principles and facts as other contracts. The subscribers may be sued for their subscriptions whenever the conditions upon which they have promised to pay are fulfilled, if the purpose of the contract is legal and founded upon a good consideration, and if there is a party capable of maintaining the action. Subscriptions papers are often hastily drawn up and carelessly expressed, and the difficulty in the way of enforcing contracts of subscription has arisen chiefly from the want of proper parties and of a valid consideration for the promise. In their disposition to uphold this class of contracts, if they can be upheld consistently with the rules of law, the courts have gone in some cases so far as to say that the subscribers to a common object may be treated as contracting with each other, the consideration of each subscription being the promises of the other contributors, each subscriber being thereby liable to a suit by all the others. There seems to be some difficulty in sustaining this view, and to avoid it subscriptions are usually made payable to some corporation or person who is to act as treasurer for the purpose of collection, and perhaps also in expending the moneys. Such undertakings, made on behalf of educational and charitable institutions or other public objects, or even for public celebrations, have frequently been sustained and enforced, and there seems to be no sufficient reason against such action. If by the subscription paper the promise expressly undertakes to apply the moneys to the object in view, the case is clear; and certainly, if in any other case the subscription be accepted and acted upon by the expenditure of moneys or otherwise before notice that subscriptions are withdrawn, it should be held that this constitutes a consideration sufficient to support the promises, and that they cannot be withdrawn subsequently, but may be enforced. And such seems to be the tendency of decisions.

**Succinic Acid**, an acid found ready formed in amber and in certain lignites, and occasionally in the animal organism. It may be obtained in colored crystals by heating amber in retorts. It is formed artificially in several ways, as by the action of hydriodic acid on malic acid or tartaric acid, or by the oxidation of certain fatty acids. It is most conveniently prepared by the fermentation of malic acid, the crude malate of calcium obtained by adding chalk or slaked lime to the juice of mountain ash berries being used for the purpose. The malate is mingled with water and yeast or decaying cheese, and kept for a few days at 86° or 100° F., when succinate of calcium forms. This salt is then decomposed by sulphuric acid, insoluble sulphate of lime being thrown down, while succinic acid is left in solution, and may be obtained by evaporation and cooling in colorless oblique rhombic prisms, soluble in five parts of cold and three parts of boiling water. The combinations of succinic acid with bases are called succinates, of which the most important are the calcium succinate above mentioned and succinate of ammonia. Succinic acid, though formerly official, is now seldom used in medicine. Succinate of ammonia is said to have been used with success in delirium tremens.

**Sucker.** See Cyprinidæ.

**Sucker, Louis Gabriel, duke of Albufera**, a French soldier, born in Lyons, March 2, 1770, died in Marseilles, Jan. 3, 1826. He entered the army in 1792, was at the siege of Toulon in 1793 as chief of battalion, and was then transferred to the army of Italy. He was selected as one of the commanders in the army of Egypt, but was detained by Brune as major general in the army of Italy, in which he re-established order and discipline; afterward served as chief of staff under Masséna on the Danube, and again in Italy as general of division; and in 1800 distinguished himself in the defence of Genoa. In 1805 he commanded the left wing under Lannes at Austerlitz, and in 1806 took an important part in the battle of Jena. In 1808 he was made commander of a division in the army of Spain, and after successive victories he became marshal in 1811. He afterward took Oropesa and Murviedro, and defeated Blake near the lagoon of Albufera, under the walls of Valencia, and forced him to surrender that city, Jan. 9, 1812, with 18,000 Spanish troops and immense stores. For this victory he was rewarded with the title of duke of Albufera and a large revenue. He gained the esteem of the Spaniards by his justice and moderation. Louis XVIII. made him a peer in 1814. He wrote *Mémoires sur la guerre d'Espagne*, 1808–1814 (2 vols. Svo, Paris, 1829).

**Sucker**, the popular name of the soft-rayed fishes of the carp family (cyprinidæ) included in the genus *catostomus* (Lesueur). They are characterized by a single dorsal, three rays in the gill membrane, smooth head and gill covers, jaws without teeth and retractile, mouth beneath the snout, and lips plaited or lobed suitable for sucking; there are comb-like teeth in the throat; the intestine is very long, and the air bladder divided into two or more parts. There are about 30 species in the fresh-water rivers and lakes of North America; they rarely take bait, and are very tenacious of life. The common sucker (*C. Bottioniensis*, Les.) is 8 to 15 in. long, of a brownish color, olive on the head, reddish with metallic lustre on the sides, and white below; it is common in New England and the middle states. The chub sucker
SUCKING FISH

(C. gilbowus, Les.) is 7 to 12 in. long, dark brown above, golden greenish yellow on the sides, anterior part of abdomen whitish, and fins dark; body convex in front of dorsal, and sides of head sometimes spiny or tuberculated; it is common in the ponds of the New England and middle states. Large species from the northern regions have been described by Richardson and Agassiz. Among the larger species of the western rivers are the Missouri sucker (C. elongatus, Les.), 2 to 3 ft. long, in the Ohio river, black on the back, and hence called black horse and black buffalo; and the buffalo sucker (C. bubalus, Raf.), of about the same size, in the Ohio, Mississippi, Missouri, and their tributaries, brownish above, bronzy on the sides, and whitish on abdomen.

SUCKING FISH, the popular name of the remora, a spiny-rayed fish of the genus echeneis (Linn.), so named from the Greek ἔκχεις, to hold, and καίος, a ship. The body is elongated, tapering behind, covered with very small scales; there are four perfect branchia; very small teeth on jaws, vomer, and palat e, crowded and hardly distinguishable posteriorly; mouth small and horizontal, the lower jaw the longer; eyes above the angles of the mouth; ventrals thoracic, narrow, united only at the base; head flattened. Above the head and anterior dorsal vertebrae is an oval disk, presenting from the middle to both sides oblique transverse cartilaginous plates, arranged like the slats of a Venetian blind; on the middle of the under surface are spine-like projections connected by short bands with the skull and vertebræ, and their upper margin is beset with fine teeth. According to De Blainville, this organ is an anterior dorsal fin, whose rays are split and expanded horizontally on each side instead of standing erect in the usual way. By means of this apparatus, partly suctoriel and partly prehensile by the hooks, these fishes attach themselves to rocks, ships, and the bodies of other fishes, especially to sharks. The dorsal is opposite the anal, but the fins are weak, and these fishes accordingly adhere to sharks and other moving bodies, which transport them to places where food is abundant, and often from the tropics to temperate regions. There are six or eight pyriform appendages, but no air bladder. The common sucking fish of the Mediterranean, so well known to the ancients (E. remora, Linn.), is from 12 to 18 in. long, shaped somewhat like a herring, dusky brown above and lighter below; it has 17 or 18 plates on the head; it occurs in the Atlantic ocean, on the British coasts, and has even wandered to the American shores. The Indian remora (E. naurates, Linn.) attains a length of 24 ft.; it is olive-brown above and whitish on the sides, and has 22 to 24 plates in the sucking disk; it is found in the Atlantic, on the American and African coasts, in the Red sea, Indian ocean, and even around Japan. Peculiar to the American coast is the white-tailed remora (E. albi-avula, Mitch.); it is from 1 to 2 ft. long, grayish slate above, with dark band on sides; the disk has 21 plates; it is not uncommon on the southern shore of Massachusetts and in Long Island sound, where it is generally called shark sucker. None of the species feed upon the fish to which they are attached, their food being small fishes and floating animals. (See LUMP FISH.)

SUCKLING, Sir John, an English poet, born at Whitton, Middlesex, in 1609, died in Paris probably in 1642. He was educated at Cambridge, inherited an immense fortune from his father, comptroller of the royal household, and in 1681-2 served as a volunteer under Gustavus Adolphus. He was afterward a member of the court of Charles L, and in 1639 he equipped a body of 100 horse for the royal service, but was disgraced by pusillanimous conduct in an encounter with the Scots near Dunse. In 1640 he was elected to the long parliament; but having joined in a plot to rescue Strafford from the tower, he was compelled to take refuge in France. His literary remains include four plays, a number of short poems, chiefly amatory, and a treatise on "Religion by Reason." His works were published by Tonson in 1705, and in 1826 appeared "Selections from his Works," with a memoir by the Rev. Alfred Sukling. A new edition of his "Poems, Plays, and Remains" was published in London in 1874.

SUCRE, or Chuquisaca, the capital of Bolivia and of the department of Chuquisaca, on a plateau above the Rio de la Plata, about 10,000 ft. above the sea; lat. 19° 20' S., lon. 65° 17' W.; pop. in 1865, 26,664, the greater part of whom were Indians. It has regular, spacious, and clean streets, with well built houses, generally of two stories. The principal buildings are the cathedral, in the Moresque style, the president's palace, the churches of San Miguel and San Francisco, two monasteries, three nunneries, and the theatre. It is the see of an archbishop.

SUCRE, Antonio José de, a South American soldier, born in Cumana, Venezuela, in 1798, assassinated near Pasto, Ecuador, in June, 1850. He joined the insurrectionary army in 1811,
and was made brigadier general in 1819, and soon afterward commander of a division. In May, 1822, he won the victory of Pichinch, which was followed by the capitulation of Quito. In 1823 he led a Colombian army of 3,000 men to Lima, which he found in the hands of the royalists, and retired to Callao, where he was besieged several weeks till the successes of Gen. Santa Cruz compelled the royalists to evacuate Lima. In 1824 he succeeded Bolivar in command of the liberating army, and on Dec. 9 won the crowning victory of Ayacucho. (See Ayacucho.) In 1825 Bolivia was created into an independent republic, and on Aug. 11 the constitutional assembly appointed Sucre president. In an insurrection in 1827 he was attacked and severely wounded. In 1828 Gen. Camarra forced him to quit Bolivia. He went to Colombia, was made commander of the Colombian army of the south, and conducted a successful series of operations, which terminated in the defeat and massacre of the Peruvians under Gen. La Mar at Tarqui, Feb. 26, 1829. In 1830 he was a member of the constituent congress, and was returning to Quito from a session of that body when he was assassinated.

**SUDERMANIA.** See Södermanland.

**SUDETIC MOUNTAINS.** See Germany, vol. vii., p. 744.

**SUDORIFICS.** See Diaphoretics.

**SUE, Marie Joseph Eugène,** a French novelist, born in Paris, Dec. 10, 1804, died in Anneyey, Aug. 3, 1837. He was an army and navy surgeon for several years till 1829, when he inherited a large fortune, and commenced writing maritime novels, of which _La Salamandre_ (1832) attracted most attention. Under the patronage of the government he wrote _Histoire de la marine française au 17e siècle_ (5 vols. 8vo., 1835–7), which was a failure. In 1835 appeared _Cécile_ and in 1841 _Mathilde,_ two of his best novels, and in 1842 _Le morne au diable et Thérèse Dunoyer._ _Les mystères de Paris,_ a work presenting terrible pictures of vice and corruption (10 vols., 1842–9), and _Le Juif errant,_ a merciless attack upon the Jesuits (10 vols., 1844–5), had a prodigious circulation, and passed through many editions and translations. His other works include _Martin, Venfant trouvé_ (12 vols., 1847); _Les sept péchés capitaux_ (16 vols., 1847–9); and _Les mystères du peuple,_ a narrative of the sufferings of a proletarian family through ages, which, after being continued serially from 1849 to 1856, was suppressed on account of its alleged immorality. He failed in 1848 as a candidate for the constituent assembly, but the socialist tendencies of his most popular works gave him in 1850 a majority in a metropolitan district, and he was a silent member of the extreme left till the coup d'état of Dec. 2, 1851, which drove him from France. He afterward lived in Switzerland, continuing his remarkable literary activity.

**SUTONIUS TRA QUILLUS, Caius,** a Roman historian, born about A. D. 72, died probably about 140. He was the son of a military tribune, and the younger Pliny helped him to become _magister epistolarum._ From this position he is said to have been removed by Hadrian about 121 in consequence of an indiscreet familiarity with the empress Sabina, though many historians entirely disbelieve the story, and give other causes for his dismissal. From the list of his works given by Suidas he must have been one of the most voluminous of Roman authors. His chief extant work is the _Vita XII Caesarum,_ in eight books, which abounds in details and anecdotes of a questionable character; besides which the treatises _De Illustribus Grammaticis_ and _De Claris Rhetoribus,_ and some brief biographies of Terence, Horace, Lucan, Juvenal, Persius, and Pliny the Elder, pass under his name. Fifteen editions of Suetonius's works had been published previous to 1590, of which the oldest with a date is that of Rome (fol., 1470). Among the best subsequent editions are those of Burmann (2 vols. 4to., Amsterdam, 1736) and Baumgarten-Crusius (Leipzig, 1816), revised by Hase (2 vols. 8vo., Paris, 1828), and newly edited by Roth (1858). All the fragments attributed to Suetonius have been published, with a critical commentary by Roth (1860). The first English translation was by Philemon Holland (fol., London, 1606), and the latest by Thomson and Forrester (Bohn's "Classical Library," 1855). On the sources from which Suetonius drew his facts, see Clason, _Tacitus und Sueton_ (Breslau, 1871).

**SEVI,** a powerful group of migratory German tribes, who about the beginning of the Christian era are said by ancient writers to have occupied the larger part of Germany. Caesar describes them as dwelling between the Rhine and the Weser. According to Strabo, they extended across the central parts of modern Germany, between the Rhine and the Oder, and as far S. as the head waters of the Danube. Tacitus seems to designate by the name Suevi the tribes of eastern Germany from the Danube to the shores of the Baltic. In the 2d century the collective appellation disappears, the single tribes of the group being designated by their distinctive names. Later, however, other Suevi, an adventurous German people of mixed origin, appear upon the banks of the Neckar, where they gave rise to the modern name Swabia, and also in northern Spain, where they conquered Galicia early in the 5th century. Their Galician realm was destroyed by the Visigoths in 585.

**SEZ.** An isthmus separating the Mediterranean and Red seas, and connecting the continents of Asia and Africa. From the most northerly part of the gulf of Suez in the Red sea to the gulf of Pelusium or Tinch in the Mediterranean the distance is a little more than 72 m.; on the line of the Suez canal it is about 100 m., and to the surface above the general elevation of only 5 to 8 ft. above the adjoining seas, but there are several ridges of from 20
to have crossed the Red sea on their exodus from Egypt a few miles below the head of the gulf. (See Exodus, and Red Sea.) III. A town of Egypt, at the head of the gulf of Suez, 77 m. E. of Cairo; lat. 29° 57' 30'' N., long. 32° 35' E.; pop. in 1872, 13,500, of whom 2,400 were foreigners. The old town is walled on the three landward sides, but open toward the sea. It stands on the border of a sandy plain where rain seldom falls, and previous to the opening of the fresh-water canal from the Nile in 1865 it depended for water on supplies brought from a distance. Suez was a mere fishing village until the building of the railway from Cairo, when it began to increase in size and importance; and the construction of the Suez canal, with its quays, docks, and other works, soon made it a large and busy place. The new quays and harbors, with the railway station and dry dock, are about 2 m. S. of the town, with which they are connected by railway. Among the principal buildings at Suez are the storehouses of the Peninsula and Oriental steamship company and of the messes-

Suez.

geries maritimes, the water works which supply the town from the fresh-water canal, the English hospital, and the chalet of the khedive on the heights overlooking the town and harbor. Suez is connected by railway with Cairo and Alexandria, but derives its principal importance from the Suez canal, of which it is the southern terminus. From the opening of the canal in November, 1869, to Dec. 31, 1874, 4,781 vessels, of 6,643,368 total tonnage, had passed through, of which 2,588 entered from the Mediterranean and 2,193 from the Red sea. Of the whole number, 3,286 were British, 394 French, 281 Austrian, 235 Italian, 121 Ottoman, 109 Dutch, 85 Egyptian, 83 German, 61 Spanish, and the remainder of other nationalities, only 8 being American. The number of passengers during the same period was 278,231, including 34,197 Moslem pilgrims and many troops of various nations. The total amount of tolls received during this time was 77,728,838 francs. In 1874, 1,264 vessels, of 2,421,803 gross tonnage, passed through the canal, of which 670 entered from the Mediterranean and 555 from the Red sea. The total receipts for tolls in 1874 were 24,748,900 francs. In November, 1875, all the shares of the Suez canal stock belonging to the khedive of Egypt, 177 out of 400, were purchased by the British government for £4,000,000. See Lettres et documents pour servir à l'histoire du canal de Suez, by Ferdinand de Lesseps (Paris, 1875).—Suez occupies probably the site of the ancient Clymax, the Kolzum of the Arabs. In the 8th century, after the destruction of the canal connecting with the Nile, it fell into decay. In the beginning of the 16th century it became a naval depot for the Turkish fleet in the Red sea, but soon lost its importance again with the decline of navigation in that sea in consequence of the discovery of the route to India by the cape of Good Hope.

SUCCUBUS. See Asphixia.

SUFFOLK. I. An E. county of Massachusetts, bordering on Massachusetts bay; area, about 44 sq. m. It comprises the cities of Boston and Chelsea and the towns of Revere and Winthrop. The population as returned
SUFFOLK

by the census of 1870 was 270,802; the subsequent annexation of the town of West Roxbury from Norfolk co. and the town of Brighton and city of Charlestown from Middlesex co. to Boston added 41,975 inhabitants, making the population within the present limits of Suffolk co. in 1870, 312,775; in 1875, according to the state census, 364,880. The number of manufacturing establishments, according to the census of 1870, was 2,546; number of hands employed, 43,550; amount of capital invested, $47,311,185; value of materials used during the year, $59,384,505; annual value of products, $111,380,840. Almost every variety of articles is produced. Capital, Boston, which is also the capital of the state.

II. A S. E. county of New York, comprising the E. part of Long Island, bounded N. by Long Island sound and E. and S. by the Atlantic, drained by the Peconic river and several smaller streams, and traversed by the Long Island and other railroads; area, 1,500 sq. m.; pop. in 1875, 52,058. The surface is hilly and uneven in the north, but nearly level in the south; the soil is generally sandy, but fertile along the sound. The coast is indented by numerous harbors and inlets, and the county includes several small islands. The chief productions in 1870 were 184,564 bushels of wheat, 35,436 of rye, 515,099 of Indian corn, 322,069 of oats, 20,800 of buckwheat, 557,925 of potatoes, 43,006 tons of hay, 47,168 lbs. of wool, and 564,766 of butter. There were 7,113 horses, 9,269 milk cows, 9,704 other cattle, 14,412 sheep, and 12,624 swine; 6 manufactories of brick, 21 of carriages and wagons, 3 of cotton, 16 of fish oil, 3 of paper, 10 of saddlery and harness, 3 of sails, 12 flour mills, 1 woollen mill, and 10 ship yards. Capital, Riverhead. Suffolk county was once one of the counties of England, belonging on the counties of Norfolk, Cambridge, and Essex, and the North sea; area, 1,481 sq. m.; pop. in 1871, 348,479. The coast line extends about 50 m., and a great part of it is low and marshy. The principal streams are the Stour, Orwell, Lark, and Waveney; and there are several small lakes. The surface is undulating, with some flat and marshy tracts, and the soil is generally a rich alluvial loam. The manufactures, with the exception of agricultural implements, are trifling. Fishing is actively carried on. There are many remains of antiquity, including the Roman castle of Burgh, the walls of which are still standing. Suffolk contains two county towns, Ipswich and Bury St. Edmunds; other chief towns are Eye, Aldborough, Orford, and Sudbury.

SUFFOLK

SUGAR

SUGAR, a name used in nearly all languages, in various forms, to designate a limited number of sweet products of plants, which is made by the chemist to include several organic compounds, many of which may be artificially produced from similarly constituted organic bodies. Sugars are therefore divided into natural and artificial. In general terms they are now included among a group of compounds called hexatomic alcohols. Two of the natural sugars, mannite and dulcete, having the composition C,H,O, are saturated hexatomic alcohols, derived from the saturated hydrocarbon CH, ,. Several others, called glucoses, have the formula C,H,O, and may be regarded as aldehydes of these alcohols. It may be remarked that ordinary glucose or grape sugar is converted into mannite by the action of nascent hydrogen, just as acetic aldehyde, C,H,O, is converted into common alcohol, C,H,O. There are also diglucoses, C,H,O,, the most important of which are cane sugar and milk sugar.—Mannite, C,H,O, is the chief component of manna, an exudation from a species of ash. It is also found in several sea weeds and in mushrooms. It may be prepared by dissolving mannite in boiling alcohol and filtering while hot. It crystallizes on cooling in tufts of slender, needle-like, four-sided prisms. It may be formed artificially by the action of sodium amalgam on glucose, the latter taking up two atoms of hydrogen. By oxidation with nitric acid mannite is converted into saccharic acid, C,H,O, and ultimately oxalic acid. The boiling point is 329° F. Dulcete, or dulcose, having the same formula, is obtained from a crystalline substance of unknown origin, imported from Madagascar, by boiling water. Crystals belonging to the monoclinic system form on cooling the solution. It thus differs from mannite, the crystals of which are triclinic, and also in its boiling point, which is 360°.—The glucoses are a group of sugars having the common formula C,H,O,, and consisting, as far as known, of eight members: 1. Ordinary glucose or dextro-glucoze, so named from its power of rotating a ray of polarized light to the right, is made by hydration of starch by the action of dilute acids or of diastase. It is found in honey and various fruits, especially grapes, and therefore also called grape sugar. (See Fermentation.) Its rotatory power is +56° at all temperatures. 2. Maltose is produced by the limited action of diastase on starch, and differs from ordinary glucose only in its power of rotating a ray of polarized light, having a dextro-rotatory power three times as great as that of ordinary glucose. It is converted into ordinary glucose by boiling with dilute acids. 3. Luvulose is isomeric with the others, but distinguished from them by turning the plane of polarization to the left. It also, unlike other sugars, has its rotatory power changed by varying the temperature, the power diminishing with increase of temperature, being —106°.
at 57° F., -79.5° at 125.5° F., and -53° at 194° F. It occurs, associated with dextro-glucose, in honey and many fruits. A mixture of levulose and dextro-glucose constitutes fruit sugar, fructose, or invert sugar, which is also levorotatory, because the specific rotatory power of levulose at ordinary temperature is greater than that of dextro-glucose. 4. Mannitose, produced by the oxidation of mannite, is uncrystallizable and fermentable, but has no action on polarized light. 5. Galactose, formed by the action of acids on milk sugar, crystallizes more readily than ordinary glucose, has a dextro-rotatory power of 88.8°, and is easily fermentable. 6. Inositol occurs in the muscular substance of the heart and other organs of the animal body, in green kidney beans, and in other plants. It forms prisms resembling gypsum, soluble in water, but insoluble in alcohol and ether. It does not ferment with yeast, but in contact with cheese, decaying flesh, or membrane, with chalk, it undergoes lactose fermentation, producing lactic, butyric, and carbonic acids. It has no optical rotatory power. 7. Sorbitine occurs in the juice of the mountain ash berry. The juice on standing deposits brown crystalline matter, which by recrystallization forms crystals belonging to the trinomical system. It dissolves easily in water, and has a very sweet taste. It is converted by hot nitric acid into oxalic acid, and does not ferment with yeast, but like inositol undergoes lactose fermentation. It has a rotatory power of about -47°.

8. Eucalyne is found with other kinds of sugar in the so-called Australian manna, which falls in opaque drops from various species of eucalyptus. Its optical rotatory power is about +50°.—Besides these glycoses, there are sugars which may be regarded as formed by the combination of two or more molecules of glucose with the elimination of a number of molecules of water. These sugars have been called polyglycosic alcohols, having the formula \( C_{n}H_{2n}O_{n}. \) 1. The most important member, as well as the most important of all the sugars, is cane sugar, or saccharose, which is found in the juice of many of the grasses and the sap of several forest trees, particularly the hard maple, in the roots of the beet, parsley, mall, and several other plants, and in most sweet fruits, associated with levulose and dextro-glucose (currant sugar, fructose). Walnuts, hazelnuts, and almonds contain only cane sugar. Honey and the nectaries of flowers contain cane sugar together with invert sugar. Pure cane sugar separates from a solution by slow evaporation in large transparent colorless crystals, having the figure of a modified monoclinic prism. From hot saturated solutions it is obtained in masses of smaller crystals (loaf sugar). Its optical rotatory power is +73.8°. In sp. gr. 1.6 unused, unchanged in the air. When heated a little above 320° it is converted, without loss of weight, into a mixture of dextro-glucose and levulose, the anhydride of levulose (\( C_{6}H_{12}O_{6} = C_{6}H_{11}O_{5} + C_{6}H_{11}O_{3} \) or levulose). It changes with loss of water into other substances as the temperature rises, until at 410° a brown substance called caramel is formed, which consists of a mixture of several compounds, all resulting from the elimination of the elements of water from sugar. As the temperature rises gases are evolved, consisting of carbonic oxide, marsh gas, and carbonic acid, and a distillate is obtained consisting of brown oils, acetic acid, acetone, and aldehyde, a quantity of charcoal remaining in the retort. By prolonged boiling with water, cane sugar is converted into invert sugar, the transformation being accelerated by the presence of acids, especially sulphuric. It is not directly fermentable, but by the action of yeast is resolved into dextrose and levulose, which then enter into fermentation. It is a reducing agent, capable of readily taking the oxygen from several oxides and metallic salts. It forms with chlorate of potassium a mixture which detonates on percussion, and burns vividly in contact with oil of vitriol. It is distinguished from glucose by not turning brown when triturated with alkalies; but it combines with the alkalies, forming compounds called sugars.

2. Parasaccharose, \( C_{6}H_{12}O_{6} \), is produced by the spontaneous fermentation of a solution of cane sugar containing ammonium phosphate. Its rotatory power is +108°. 3. Melitose, \( C_{6}H_{12}O_{6} \), is found in the Australian manna, associated with mannitose. The crystals which are deposited from the aqueous solution are hydrated, the formula being \( C_{6}H_{12}O_{6} + 3H_{2}O \). At 212° F. they give off two molecules of water, and at 286° become anhydrous. Its rotatory power is +109°. Melitose ferments by the action of yeast, but is first resolved into glucose and eucalyne. 4. Melezitose, \( C_{6}H_{12}O_{6} \), is a kind of sugar found in the so-called manna of Briançon, which exudes from the young shoots of the larch. It is not as easily acted on by reagents as the foregoing. Its rotatory power is about +94°. 5. Trehalose, \( C_{12}H_{22}O_{11} \), 2H₂O, is obtained from trehalia manna, the produce of a species of echinops growing in the East. It forms rhombic crystals, which when heated below 212° F. slowly give off their molecules of water. Its rotatory power is +199°. With strong nitric acid it forms a detonating nitro-compound. It is not readily acted on by reagents. 6. Mycose, isomeric with trehalose, and also containing two molecules of water, is obtained from the ergot of rye by precipitating the aqueous extract of the fungus with basic acetate of lead, removing the lead from the filtrate by hydrosulphuric acid, evaporating to a sirup, and leaving the liquid to crystallize. Its rotatory power is +192°. 7. Milk sugar, or lactose, contains one molecule of water, the formula being \( C_{12}H_{22}O_{11} + H_{2}O \). It is an important constituent of milk, and is obtained by evaporating the whey to a sirup, from which
on standing it separates in impure crystals, and may be purified by redissolving in water and filtering through animal charcoal. It forms white, translucent, four-sided, trigemetric prisms of great hardness. It dissolves slowly in cold water, requiring five or six times its weight. Its optical rotatory power is +59°3'. Very strong nitric acid converts milk sugar into nitro-lactine. It is brought very slowly into alcoholic fermentation by the action of yeast, but when cheese or rennet is used it is readily converted into lactic acid, alcohol being formed at the same time. A kind of sugar called glycyrrhizine or liquorice sugar, having the formula \( C_9H_{12}O_9 \), is found in liquorice root (glycyrrhiza). It has a peculiar sweet taste, but cannot be made to ferment. According to Gorup-Beasanez, when boiled with dilute acids, it splits up into a resinous body called glycyrretine, \( C_9H_{14}O_6 \), and glucose.—Saccharimetry. There are various methods of estimating the proportion of sugar in a given solution, which are embraced under the generic term saccharimetry. They are usually employed for the estimation of cane sugar. There are four principal methods: 1, by the specific gravity of the solution; 2, by the determination of carbonic anhydride or of alcohol it will yield in fermentation; 3, by the amount of suboxide of copper precipitable from a solution by the action of grape sugar, into which the cane sugar present is first converted; 4, by the degree of rotation given to a beam of polarized light in passing through the solution. In the first and fourth methods instruments called saccharimeters are employed, the term saccharimeter being often applied to the polarizing instrument. The specific gravity or hydroscopic saccharimeter is used by brewers for determining the amount of saccharine matter which has been produced in wort by the fermentation of malt. (See Beasana, and Hydroimeter.) The instrument is also employed by sugar makers and distillers. The brewer's saccharimeter is usually graduated so as to indicate the excess of weight of 1,000 parts of a liquid by volume over that of the same volume of distilled water. For this purpose the hydrodrometer is marked 1000 upon its stem at the point to which it sinks in water, and with increasing numbers below this point. If the tested solution is dense enough to float the instrument till the number 1065 is at the surface, it is said to have a specific gravity of 65; if only 1030, its gravity is said to be 30. Tables are used by which the quantity of sugar may be estimated from the specific gravity thus ascertained, and the tables may be adapted to differently graduated instruments, but the one above described (Baumé's) is usually employed. As beer wort holds other substances besides sugar in solution, the method is not exact, but in experienced hands it answers all the purposes of the brewer. When the solution is purely saccharine, or nearly so, as in clarified cane juice, the process is more nearly accurate; but when other substances are present the precise amount of sugar may be determined by the second method, that of producing fermentation and estimating the quantity of carbonic anhydride or of alcohol which is thereby formed. The third method, that by precipitation of suboxide of copper from an alkaline solution of tartrate of copper and potash, is briefly as follows: A standard solution, known as Fehling's, is prepared with 1 oz. of crystallized sulphate of copper, 3 oz. of bitartrate of potash, \( \frac{3}{4} \) oz. of pure carbonate of potash, and 14 or 16 oz. of a solution of caustic potash of sp. gr. 1:12, with sufficient water to make the solution weigh 15,160 grs.; 200 grs. of this solution contain an amount of copper which is completely precipitated by 1 gr. of grape sugar. In using Fehling's solution a temperature approaching the boiling point should be maintained, and the saccharine solution should be slowly added from a graduated burette. It is necessary before testing to convert the cane sugar into glucose, which is done by adding sulphuric acid and boiling. The method by polarized light is performed by employing an instrument first devised by Biot, but since modified and improved by Soleil. In the article Lactur, vol. x., pp. 449, 450, it is shown that several substances have the property of rotating the plane of a polarized ray, some to the right and some to the left, and also that substances having the same chemical composition may rotate the ray in both directions. A solution of dextrose (grape sugar or glucose) has the property of right-handed rotation, while levulose, having the same chemical composition (\( C_6H_{12}O_6 \)), turns the plane of polarization to the left. Quartz also, by reason of a difference in its molecular structure, is in some specimens right-handed and in others left-handed in its power of rotation. The original apparatus devised by Biot employed a tube containing the solution of sugar to be examined, the depth of the liquid producing a certain degree of rotation indicating the proportion of glucose it contained, and therefore the amount of cane sugar, this being first converted into glucose. The saccharimeter devised by M. Soleil does not measure the degree of rotation produced directly, as in Biot's instrument, but employs the principle of compensation, and furthermore employs a comparison of color, using therefore white instead of homogeneous light. The amount of compensation is measured by an attachment called a compensator, which is made of two wedge-shaped pieces of quartz whose combined thickness may be varied by sliding them over each other. A copper tube, \( n \), figs. A and B, tinned on the inside and containing the solution to be tested, is closed at both ends by two glass plates, and rests upon the support \( k \), which also bears at its ends the tubes \( a \) and \( \tau \). These tubes contain the analyzers and polarizers, which are represented in section at B. The light of a com-
The common lamp is passed through the aperture $S$ and the double-refracting prism $P$, the polarizer which transmits the ordinary ray, the extraordinary being thrown out of the field of vision. (See Light, vol. 8, pp. 445, 446.) The prism is so placed that the plane of polarization is in the axis of the instrument and also vertical. After passing through the double-refracting prism the polarized ray meets a refracting plate $g$, shown in section at $E$, composed of two pieces of quartz placed side by side, one having right-handed and the other left-handed polarizing powers. These plates are each 6-75 millimetres thick, producing a rotation of 90° and a rose-violet tint, called the transition tint. These two quartz plates, having equal powers of rotation, turn the ray in opposite directions, and therefore when viewed through a double-refracting prism they appear of the same tint when the plane of the ray is perpendicular; but if it has been turned by passing through a rotating solution, a difference of tint will be produced. After passing through the double quartz plate $g$, the ray traverses the solution in the tube $m$, and a single quartz plate $i$, fig. B, of any thickness and either right-handed or left-handed. The compensator $n$, composed of two wedge-shaped pieces of quartz, shown in section at $C$, both either right-handed or left-handed, of opposite rotation to the plate $i$, is next traversed by the ray. This compensator can be varied in thickness and therefore in rotating power so as to balance exactly the degree of rotation produced by the solution. Its thickness is regulated by means of a rackwork and pinion turned by the milled head screw $b$, figs. A and B. A scale and vernier shown at $D$ is affixed to the plate $n$, by which the thickness of the compensator may be read, the vernier pointing to zero when the thickness of the two plates is equal to that of $i$. A double-refracting prism $c$, fig. B, is placed next behind the compensator to act as an analyzer which has been acted upon by the solution and the various plates. When the liquid in the tube is inactive and the compensator is not at zero, the plate $i$ and the compensator will neutralize each other's effect, and the two parts of the double quartz $g$ will have the same tint; but when the tube $m$ contains a solution having a rotatory power, like sugar, this power added to that of one of the plates will rotate the plane of polarization of the transmitted ray either to the right or to the left. If the solution contains cane sugar or dextrose, or a certain excess of either, it will rotate it to the right; if it contains levulose or a certain excess, it will rotate it to the left, and therefore a difference in tint will be observed in the two halves of the double quartz plate $g$, one half perhaps being red and the other blue. The thickness of the compensator is then adjusted by turning the milled head $b$ until the tints become the same, and the increase or decrease in the thickness of the two plates will indicate the rotatory power of the solution, either right-handed or left-handed, and may be read upon the scale. The following standard of comparison is employed: If 16-471 grs. of pure cane sugar is dissolved in sufficient water to make 100 cubic centimetres, this solution placed in a tube 20 centimetres long will produce the same degree of rotation as a right-handed quartz plate one millimetre thick. Or if a tube exactly 37-65 in. long is filled with a solution containing 10 per cent. of pure cane sugar (crystallized sugar candy), and a polarized ray from the middle of the yellow band of the spectrum is passed through it, the rotation of the plane will be 73°-8°. This, compared to the rotation produced by a solution of pure cane sugar of a different strength, will show the relative proportion it contains; or if the depth of the solution is less, the rotation will be less in the same proportion. If the solution contains left-handed sugar, the result will be vitiated and corrections have to be made. This may be done by converting all the sugar into left-handed sugar by the action of hydrochloric acid, and making a second observation, when by a comparison of the results obtained at both observations the amount of cane sugar may be estimated. The optical rotatory power of the various sugars mentioned in this article has been determined according to the standard of comparison here given. The arrangement of prisms and lenses placed behind the double-refracting prism $c$ forms what M. Soleil calls the producer of sensible tints. The particular tint which allows the most delicate difference in the color of the two halves of the double quartz to be distinguished is not the same for all eyes. This effect is produced by placing in front of the prism a quartz plate $o$ cut perpendicular to the axis, then a small Galilean telescope, consisting of a double convex lens $g$ and a double concave lens $f$, with adjustable focal distance. The double-refracting prism $c$ acts as polarizer to the quartz $o$, while the prism $a$ is the analyzer, and on being
turned to the right or left may be made to produce that tint to which the eye of the observer is the most sensitive.—Sugar Cane.

Commercial cane sugar is made from species of *Saccharum*, especially *S. officinarum*, a genus of grasses of the tribe *Andropogoneae*, of which subdivision the cultivated sorghum and broom corn are familiar examples. Sugar cane is a perennial grass, with solid stems from 6 to 20 ft. high, the older plants throwing up numerous stems or suckers from the root; the leaves, 3 ft. or more long and 3 in. broad, have thin sheaths, usually glaucous with a bloom or waxy exudation, which is also found upon the stem, especially in the dark-colored varieties; the flowers are in a large, ample, and showy panicle, about 3 ft. long, the ultimate branches of which are notched or jointed, bearing at each joint two flowers, one of which is sessile and neutral, the other on a short pedicel and perfect; both kinds of flowers are surrounded by a tuft of long hairs, which gives the cluster a soft silvery appearance. The sap or juice of the plant contains from 15 to 20 per cent. of sugar. It has not been found in the wild state in any part of the world; and while there is much doubt as to its native country, the most careful investigations point to Bengal as the origin of *S. officinarum*, and it was there that the manufacture of sugar commenced. If, as botanists are disposed to admit, the sugar cane of China is a distinct species (*S. Sinense*), it would appear that the cultivation of related plants for the extraction of sugar was undertaken separately in two distinct and widely separated countries. While the product was anecdotally referred to as "honey of canes," and by other names, sugar as we know it is not mentioned before the commencement of the present era. Dioscorides, about A.D. 100, mentions *saccharon*. In the 9th century the cultivation had extended to Persia, and in the 10th and 11th centuries Avicenna and other eastern physicians used sugar in medicine. Its cultivation was carried on in Spain in the 10th century, at which time sugar was an article of trade, especially by the Venetians, through whom the English received their supply. The cane was introduced into Madeira in 1420, and some time after into the Canaries. With the discovery of America, its distribution was very rapid, Santo Domingo, Brazil, Mexico, Guadeloupe, and other countries undertaking its culture in quick succession. Meanwhile it spread to Africa and the Indian archipelago. In 1852 it was taken to New South Wales; it had long previously been cultivated in most of the islands of the Pacific. Several early writers mention the sugar cane as one of the indigenous products of the United States, and it was said to grow in Virginia and in Louisiana; of course some other large grass was mistaken for the sugar cane; both the common reed (*phragmites*) and the southern cane (*arundinaria*) have a sufficiently near resemblance to sugar cane to lead a careless observer into this error.

The plant appears to have been cultivated in this country for the first time about 1751, near the site of New Orleans, by some Jesuits from Santo Domingo. In 1758 the first sugar mill was built, a little further down the river, by M. Dubreuil. According to a statement of E. J. Forstall in De Bow's "Industrial Resources," vol. iii., p. 275, the manufacture of cane into sugar does not seem to have commenced before 1764; but sugar is said to have been one of the staple products of the colony in 1770. After the revolutionary war it was prosecuted so successfully by emigrants from the United States that in 1803 there were 81 sugar estates on the Mississippi delta alone. Thecession of Louisiana to Spain seems to have arrested the industry, as no accounts of sugar making are found until 1791, when the first sugar house under the Spanish government was erected by a Mr. Solis at Terre aux Bœufs, in the parish of St. Bernard. The next was established in 1796 on a plantation where now stands Carrollton. The success of this enterprise was the foundation of the sugar culture in Louisiana. In 1818 the production was 25,000 hogsheads, and the cane was ground altogether by cattle, steam power not being introduced till 1822. The sugar-growing district in Louisiana is on both sides of the Mississippi, from 57 m. below New Orleans to nearly 100 m. above; on the Red river and its tributaries; and on many of the bayous. But even Louisiana is rather too far north to allow of the perfect ripening of the plant, which is sometimes killed by the frost in the spring, and also injured in October and November. In Texas the crop is important, and cane is grown to a considerable extent in several of the other gulf states, especially in Florida, and to a limited extent in South Carolina, Tennessee, and Kentucky. In the more northern localities it is profitably cultivated mainly for

Sugar Cane (*Saccharum officinarum*).
the manufacture of sirup.—It is not definitely settled whether the sugar cane from China (S. Sinense) is really a distinct species, but all others formerly so regarded are now consid-
ered as only forms of S. saccharatum, of which each sugar-growing country has several varie-
ties. The country or creole cane, the kind first introduced into the West Indies and Lou-
siana, and regarded as the original form of the species, was at one time much esteemed, but
has greatly deteriorated. The ribbon cane, so
called from the yellow and purple stripes upon the stem, is inferior to the following varie-
ties. The Otaheite or Bourbon cane was introduced
into Georgia in 1805, and is also a favorite
variety in some parts of the West Indies, its
stem being thicker than that of the others. It
has been supposed that this was a native of
Otaheite or Tahiti. The violet or Batavian
cane has a purple stem, varying in depth of
color with the nature of the soil; its leaves
are luxuriant and of a dark green color, and
the flowers are purplish; it has been described
as a distinct species, S. violaceum, but there is
nothing to warrant its separation from the
ordinary cane. Besides these leading varie-
ties, there are the claret, imperial, Mont Blanc,
and others, with numerous local subvarieties.
The dark-colored canes are found to resist the
attacks of disease much better than the light-
colored ones, a peculiarity of which there are
numerous other illustrations among plants and
animals.—In none of the sugar-producing coun-
tries does the sugar cane ever perfect seeds,
and it is quoted as an illustration of the fact
that plants which have long been propagated
by other methods lose the power of producing
seeds. The cane is always propagated by cut-
tings, and as the lower portion of the stem is
the richest in sugar, the upper and compara-
tively worthless portions are used for cuttings,
a practice to which the deterioration of varie-
ties is ascribed. The details of cultivation
vary in different countries; in the cooler cane
regions there is a season when growth must
cease, while in others it is continuous; in some
prolonged rains modify the culture, and in
others irrigation must supply the needed mois-
ture. But wherever it is grown, it must have
a fertile soil; it is a plant which quickly exhaus-
tes the soil, and unless manure is used, the
land is fallowed, or the crop forms part of a
rotation, the soil is soon run down. In some
sugar-growing countries the ground is prepared
by ploughing cattle upon the fields; in others
some crop is grown which, with the weeds, is
turned under; and in the British West Indies
fertilizers of various kinds are used. The
distance between the rows varies from 2$\frac{1}{2}$ to 8 ft.,
the latter distance giving a better crop than
closer rows. In the best culture the land is
well ploughed, and then thrown up into ridges
with the plough, at the desired distance apart;
a trench, 3 in. or more deep, is opened upon
the top of the ridge, in which the cuttings,
about 2 ft. long, are laid in a single and some-
times a double row; the cane is then covered
by hoses, or by a cane coverer drawn by horses,
which will cover 10 acres in a day. After the
shoots appear they are kept clear of weeds
until they shade the ground, and prevent all
other growth. In dry countries it is customary
to "trash" the cane when it gains a sufficient
size; the lower leaves are broken off and laid
upon the earth to prevent evaporation. The
shoots produced the first year from the cut-
tings are called "plant canes;" it is known to
have attained its full growth by "arrowing;"
the lower joints are usually about 6 in. long,
but above they increase in length while they
diminishing in diameter and are much less rich
in sugar, until finally a long joint (in tropical
countries 6 or 8 ft. long) shoots up, which if
permitted would bear the flower cluster; this
shoot is termed the "arrow," and its appear-
ance indicates that the cane should be topped,
or cut up at once, else the accumulated sugar
in the juices of the plant would be expended
in the production of flowers. In climates where
the season is short the cane does not arrow,
and the time for cutting is governed by the
probable appearance of frost. In Louisiana
it begins to ripen at the bottom in August;
with each joint ripens the leaf belonging to it
withers, and when it is time to harvest the
upper part of the cane is cut back to a joint
upon which the leaf is dry, and the crop is cut
off close to the ground; if frost is apprehended,
the cane is "mattressed," the product of three
rows being so laid together that the leaves of
each armful will cover the buts of the prece-
ding; being thus thatched, the canes are pro-
tected from frost and will keep in this state
for several weeks without injury. The second
year after planting numerous shoots start up
from the old plants; these are called "ratoons" (Fr. rejetons), and the crop is there-
after a ratoon crop, the value of which, though
less than that of the plant cane, depends upon
the original fertility of the soil, or the manner
in which this has been maintained. In Louisi-
a but one or two ratoon crops are taken,
requiring a replanting every second or third
year; while in some of the West Indies the
plantation lasts from six to ten years, and in
the East even longer; but when thus long
continued, the yield is small and the impov-
ishment of the soil correspondingly great.
Manufacture of Cane Sugar. As soon as
the canes are cut they are ground in a mill.
There are many forms of mills, and those in
use in the East Indies from the earliest times
are exceedingly rude, slow, and inefficient,
and very rude mills are still used by small
planters in the West Indies; but powerful
mills driven by steam are employed upon the
larger estates, the crushing apparatus usual-
ly consisting of three heavy cast-iron rollers.
The canes are usually passed twice through the
mill. About two thirds of all the juice is ex-
tracted, and the crude liquor contains, besides
sugar, woody fibre, soluble salts, albumen,
In the hot climate of the sugar plantations the juice if left to itself begins to ferment in the course of an hour; it is therefore immediately treated with from \(\frac{1}{3}\) to \(\frac{1}{2}\) of its weight of lime, and heated to 140° in large flat-bottomed copper pans or clarifiers holding from 300 to 400 gallons each. This coagulates the albuminous portions, which rise to the surface as scum. Some planters treat the juice with sulphuric acid, by which fermentation is delayed. The scum, after cooling for an hour or two, is drawn off for concentration by boiling. The fuel used is usually the dried crushed canes, the ashes of which are returned to the soil. By the old method practised in Asia a series of 11 kettles or earthen boilers is set in a line in a rudely constructed range, at one end of which is the fire, with a large iron boiler over it, and at the other the chimney. The juice is first put into the boiler furthest from the fire, and is gradually transferred to the others, as the process goes on, until the final concentration is effected in the iron boiler. The product is afterward drained and the sugar is clarified by boiling again with water, an alkaline lye, and milk. A somewhat similar arrangement of kettles, to the number of four, five, or six, has been employed in this country and the West Indies, each kettle having its own fire, and the defecation or partial purifying being effected during the boiling by "tempering" the liquor with slaked lime. This, when used in small quantity, causes the glutinous matters present to coagulate and rise upon the surface in a scum, which may be continually removed by skimming. It also neutralizes any acid that may have formed. In Louisiana it has been the practice to concentrate the juice 42° Baumé in the last kettle, called the battery, and then transfer it to large wooden vats, called coolers, for granulation; but the operations have been variously modified there, and different methods too have been pursued in the West Indies. Instead of kettles, each one requiring a separate fire, large copper caldrons are heated by steam, either by being enclosed in a steam jacket or by containing a coil of steam pipe. The clarification is effected as before by means of lime added to the sirup diffused through a portion of juice, or in the form of milk of lime of known strength and carefully graduated, so that exact quantities may be used. Just enough should be used to neutralize exactly the sirup, which may be known when litmus paper indicates neither an acid nor alkaline reaction. An excess of lime should be particularly guarded against, as it involves a loss of sugar; and when it occurs the effect should be corrected by careful addition of alum, or better of sulphate of alumina, which contains no potash. The heat employed in clarifying should not reach the boiling point of the sirup. At a less degree a scum gathers upon the surface, and with this it breaks up into white froth, the clarification is completed. The heat is then stopped, and the liquor is left to repose for an hour, when it is drawn away from the scum, and is seen as it flows into the first of the evaporating pans to be of a clear bright wine-yellow color. These pans, to the number of three or more, are set in succession over a flue heated by a fire at one end. The liquor is gradually transferred to the smaller pans, and as it boils away the scum that rises is taken off. It is the skimmings in these operations that furnish the best materials for distillation, and the manufacture of rum is very generally carried on in connection with that of sugar. In the smallest and last pan, to which sometimes the term "teache" is exclusively applied, the sirup is finally collected; and when it is judged to be sufficiently concentrated for granulating, it is transferred into the coolers, and thence into the vessels, also called coolers, in which the granulating takes place. These are of wood with thick sides, about 7 ft. in length, 5 or 6 ft. in width, and not less than a foot deep. This depth and the thick sides are requisite to secure slow cooling, without which the grains could not be coarse. In about 24 hours the graining takes place, the crystals forming a soft mass in the midst of the liquid portion or molasses. The separation of the two products is effected by drainage in what is called the curing house. This is a large building covering an open reservoir. Frames are provided for hogsheads so that the drippings from these shall flow into the reservoir. In the bottom of each hogshead several holes are bored, and into each hole is put a crushed cane or the stalk of a plantain leaf, the lower end projecting several inches below the bottom. The hogsheads being filled with the soft sugar mixture, the slow cooling gradually drains away from it, dripping from the stalks. The operation goes on for three to six weeks, till the sugar is considered sufficiently dry for shipping. It still retains considerable molasses, and in the moist hold of the ship the separation continues, the molasses leaking away and involving a serious loss. The "Julius Robert diffusion process" for extracting sugar from cane is in use at the sugar establishment of Messrs. Koch, in Bayou Lafourche, Louisiana. A series of tall cylinders connected by pipes are filled with thinly sliced canes and water. The diffusion allows the hydraulic pressure to carry off the dissolved sugar. The water is heated by steam to about 190° by a boiler through which the diffusion juice passes. It is said that a much greater proportion of the sugar is extracted by this method, and that the clarifying process is much simplified and abridged.—Sugar Refining. The preparation of the purest varieties of sugar did not originate in the sugar-producing countries, but the art was applied first by the Venetians to the crude sugars brought from Egypt. It was practised in Antwerp in the 16th century, and was thence introduced into England. At present it is an important branch of manufacture
SUGAR

447

in most of the principal commercial cities of the United States and of Europe. As formerly practised, raw sugar was dissolved with lime water in a large open boiler, and, when warm, bullock’s blood was added, which as it coagulated on boiling collected most of the lighter impurities and carried them to the surface in the form of a thick scum. This being removed, the liquor was partially evaporated by boiling, filtered through woollen cloth, then concentrated and granied on the general plan already described. The best sugar refiners do not now use blood or any other coagulating substance to collect suspended matters, but separate them entirely by filtration. The process in the best establishments is substantially as follows: On the ground floor the raw sugar is dissolved in hot water in large cisterns. Water enough is added to produce a specific gravity of about 1:25, or 29° Baumé. By a large pump near each cistern at the same level the solution is drawn off through a connecting pipe provided with a coarse wire strainer, which prevents all except the smaller solid particles from entering the pump. The saccharine solution is pumped up into the highest story, which is usually the seventh or eighth, it being cheaper as well as more convenient to elevate the sugar in solution than in a solid state. It is pumped into vessels called "blow-up pans," because steam was formerly blown into them to heat them. They are now heated with close coils to about 208° or 210° F. Milk of lime is added to the solution in these pans for the purpose of neutralizing any acid which it may contain. From these pans the sirup passes down to the next floor and into filters by which it is completely deprived of all suspended solid particles. These filters consist of a great number of bags 4 or 5 in. in diameter and 8 or 10 ft. long, made of two thicknesses of cloth, an outer of coarse and an inner of fine material. They are enclosed in sets of about 200, in boxes, to prevent cooling. After a time they become foul, when they are turned inside out and washed. After leaving the bag filters, which it does at a temperature of from 170° to 180°, the sirup is run through filters of animal charcoal or bone black. These are immense cylinders, 6 or 8 ft. in diameter and usually from 20 to 25 ft. high, filled with pulverized bone black, which substance has the property of absorbing all the coloring matter in the sirup, which runs from the bag filters of a sherry wine color. After a time the charcoal becomes foul and loses its property of absorbing coloring matter, when it is taken to a neighboring room and returned in kils. The sirup which runs from the charcoal filters at a temperature of about 150°, and, in a perfectly colorless condition, is now pumped into vacuum pans and concentrated to the granulating or crystallizing point. These vacuum pans were invented by Howard and patented in 1812. They are large conical or ovoid vessels heated by steam and exhausted with air pumps, by which the air and vapor are rapidly removed. In the later stages of the process the pressure is reduced to only 3 in. or less of mercury. The pans are sometimes supplied with an apparatus for condensing the steam by a cold spray. In making hard sugars, at the commencement the evaporation is conducted at a temperature of 170° to 180° F., but as soon as granulation begins it is lowered to 180°, and just before the evaporation is completed it is reduced to 140°, this being the lowest temperature at which crystallizing sugar boils at a pressure of 3 in. of mercury. An ingeniously devised sliding tube, by which a "proof" may be taken without admitting air, is attached to the vacuum pan. In making soft sugar the temperature is kept rather lower. As soon as crystallization begins the sugar is run off, and if it is to be made into soft sugar, the sirup is discharged by means of centrifugal mills. If it is for hard sugar, it is run into a vat which has a gate in its bottom; from this it is run into conical moulds placed upon carriages, which are drawn under the gate. In the bottom of each mould there is an orifice which is kept closed by a stopper for several hours, until the sugar crystallizes, when it is removed and the sirup allowed to drain away. The loafs which remains has a slight yellow tint, which is removed by allowing a colorless solution of sugar to pass through it. The loaves are then taken out of the moulds and dried in ovens at a temperature of about 190°. The sirup which drains from the moulds still contains a small percentage of cane sugar, but too small to recover with profit. It is therefore sold as sirup. It may be here remarked that raw molasses contains enough cane sugar to make it profitable for some establishments to make a specialty of extracting it. The muscovado molasses from Cuba, Porto Rico, and Antigua is esteemed the best.—Beet Sugar. In 1747 Marggraf, a Berlin chemist, found that the white beet yielded 6·2 per cent. and the red beet 4·6 per cent. of sugar, but the manufacture was not developed till the close of the year 1800. (See Beet.) The beets preferred in Europe for the manufacture of sugar are varieties of the white Silesian, yielding a juice richer in sugar and more free from salts than that of other kinds of beets. The weight of the larger ones is about 5 lbs. each; and the yield per acre in France and Belgium is 14 or 15 tons, and about Magdeburg 10 to 12 tons of beets. The crop is successful over the greater part of Europe, but more particularly N. of lat. 45°, and upon light dry soils, in a dry atmosphere. The richness of the juice is injured by direct application of manures to the growing crop, and it is less in large beets than in small ones. When the leaves begin to die, the beets are dug, the heads cut off, and the roots are thrown together and covered to protect them from light and frost. They may be thus kept for some time, though there is always risk of portions of the sugar passing
into the uncrystallizable variety. The proportion of sugar contained in the fresh root varies from 5 to 12 per cent., and the product in a large way is usually about 6 per cent., sometimes 7%. The other contents of the root are: water, 83 to 94 per cent.; ligneous fibre and albumen, 2% to 4%; and small proportions of ash, pectine, and a trace of mineral substances. In the factory the beets are first washed clean in a cage revolving on a horizontal axis, and partly immersed in water; and when washed they are discharged by the action of the machine itself. As the juice cannot be forced out from the cells by compression alone, it is found necessary to tear open the cellular tissue, and this is done by a grating machine of the form of a rotating drum, the inner surface of which is studded with teeth. The pulp is then subjected to powerful hydraulic pressure. Masson has also been employed to separate the juice. For this purpose the beets are cut into thin slices and put into a cistern with about their own bulk of hot water. In half an hour the liquor is let down upon other slices in another cistern, and so on through three to five vessels, until it acquires a density of 53.4 to 70° B. By this process the juice is rendered very weak and apt to ferment, and requires much fuel to concentrate it. Perhaps the best method is to expel the juice by centrifugal force. Another method practised near Heidelberg is, as soon as the beets are gathered and washed, to cut them into small rectangular pieces and dry them upon floors. Their bulk is then reduced about 84 per cent., leaving 16 of dry matter, which may be kept for any time and transported to any distance. The sugar is then extracted by infusion or by maceration through a long series of vessels. The factory where this operation is carried on at Waghäusel is of immense extent, the buildings, formerly a Benedictine monastery, covering 12 acres of land. The infusing vessels, 20 in number, are 12 to 14 ft. deep and 7 ft. wide. The beets when dried produce about 46 per cent. of sugar. The juice, however obtained, is rendered alkaline by the addition of lime water, and is then boiled. Excess of lime is removed by the chemical process of converting it into carbonate by passing a current of carbonic acid gas into it, which may be generated by a coke furnace according to the method proposed by Barruel of Paris in 1811, or the gas may be generated by the action of sulphuric acid on chalk, as since proposed by Michaelis. This process is called de-liming, and it may also be effected by filtering the solution through animal charcoal. Several other methods have been employed or proposed. Durbunfaut and Masson patented a method with caustic baryta, which forms with cane sugar an impervious, insoluble saccharate, C₂₂H₃₁O₂₃BaO₄, sufficient baryta being used to throw down all the sugar. The supernatant fluid, which contains all the impurities, is then run off, when the sugar is recovered by treating with carbonate, by which the baryta is withdrawn in the form of insoluble carbonate, the sugar dissolving. The subsequent processes of filtration, concentration, and crystallization are similar to those already described. The manufacture of beet sugar has been attempted in the United States, but as yet with little success except in California, where it promises to become an important industry. (See California, vol. iii., p. 665.)—Maple Sugar. Several species of the maple afford, when the sap begins to flow in the spring, a juice containing crystallizable sugar. That yielding the richest juice is the *acer saccharinum*, the rock or sugar maple. The swamp or river maple, known also as the white or soft maple, produces a juice of inferior quality, but which is sometimes employed in sugar making. The manufacturer is said to have originated in New England about the year 1752. It thence extended throughout the wooded portions of the country where the sugar maple abounds, particularly New York, Michigan, Pennsylvania, and Ohio, and on the range of the Alleghanies farther south. It is carried on in Canada both by whites and Indians. (See Maple.—Production and Trade. Louisiana produces the great bulk of the cane sugar crop of the United States, and is the only state which exports sugar, the other cane-growing states producing scarcely sufficient for local consumption. The product of Louisiana from 1860 to 1875 is given under Louisiana. The crop of 1874 is estimated at 125,000 hhd.s., and of 1875 at 135,000 hhd.s. The total exports of sugar from Havana and Matanzas from Jan. 1 to Nov. 23, 1875, were 1,018,296 boxes, 249,331 hhd.s., or 332,105 tons, of which 344,187 boxes, 204,061 hhd.s., or 184,455 tons went to the United States. The imports of sugar from all sources, from Jan. 1 to Dec. 1, 1875, were: at New York, 408,981 tons; Boston, 111,192 tons; Philadelphia, 34,680 tons; Baltimore, 63,141 tons; total for the Atlantic coast, 617,944 tons, for 1874, and 598,995 tons in 1875, or an average of 609,554 tons for three years. The imports at San Francisco from Jan. 1 to Oct. 1, 1875, were: from Manilla, 10,503 tons; Hawaiian islands, 6,679 tons; China, 2,088 tons; Central America, 324 tons; total, 19,544 tons, against 27,438 tons in 1874, and 21,132 tons in 1873, or an average of 22,703 tons for three years. The consumption of cane sugar on the Atlantic coast in 1874 was 710,369 tons; on the Pacific coast, 20,046 tons; of sugar made from molasses, 43,600 tons; of maple sugar, 15,000 tons; total, 799,015 tons, against 738,925 tons in 1873, and 720,873 tons in 1872, an increase in 1874 of 8 per cent. over 1873, and 11 per cent. over 1872. In nine months ending Sept. 30, 1875, the Atlantic ports exported of refined sugar 13,688 tons, against 3,050 tons in 1874, and 3,412 tons in 1873. The imports at the principal European depots in 1873, 1874, and for nine months

The imports from all sources into Great Britain were: in 1872, 784,000 tons; 1873, 883,500 tons; 1874, 835,000 tons. The consumption in the same years was 715,000, 786,000, and 896,000 tons. The importations of foreign refined, mainly beet sugar from France, were: in 1872, 87,700 tons; 1873, 118,000 tons; 1874, 136,000 tons. The production of beet sugar holds the balance of power in the sugar markets of the world. In the ten crop years from 1864-5 to 1874-5 the production increased from 545,000 to 1,054,000 tons. The principal producing countries are France, about 450,000 tons, and Germany, about 280,000 tons; the remainder is produced in Austria, Russia, and Holland. Among the treatises on cane culture and the manufacture of sugar are: Chomponier, "Statement of the Sugar Crop made in Louisiana" (annual reports, New Orleans, 1845-57); Evans, "Sugar Planter's Manual" (London, 1847; Philadelphia, 1848); Wray, "Practical Sugar Planter" (London, 1848; latest ed., 1871); Leon, "Sugar Cultivation in Louisiana, Cuba, and the British Possessions" (London, 1848); Kerr, "Practical Treatise on the Cultivation of the Sugar Cane, and the Manufacture of Sugar" (London, 1851); Burgh, "Manufacture of Sugar and the Machinery Employed" (London, 1866); Reed, "History of Sugar and Yielding Plants" (London, 1866); and Soames, "Treatise on the Manufacture of Sugar" (London, 1872). The manufacture of beet sugar is described by Dumas in his *Traité de chimie appliquée aux arts*, vol. vi.; see also Dureau, *De la fabrication du sucre de betterave* (Paris, 1858); Grant, "Beet-Root Sugar and Cultivation of Beet" (Boston, 1867); and Crooks, "Manufacture of Beet-Root Sugar" (London, 1870).

SICIS, a Greek lexicographer, supposed to have lived shortly after the 10th century A.D. His "Lexicon" contains articles on geography, biography, and history, under proper names, which are given coordinately with the words of the Greek language, and contains many extracts from ancient Greek writers, the works of some of whom are lost. It appears to have received additions from various hands. The first edition was published by Demetrius Chalcondyles (fol., Milan, 1449); the best are those of T. Gaisford (3 vols. fol., Oxford, 1834) and Bernhardy (4 vols., Halle, 1834–53).

SULIOTES, a people of mixed Albanian and Greek descent, who formerly dwelt in the southern part of the pashalik of Janina, the ancient Epirus. They derive their origin from a number of families who in the 17th century fled from the tyranny of the Turks and took possession of the ridge of the Suli mountains and the valleys on both sides of it. In the second half of the 18th century the population numbered about 10,000, half Parasuliotess (subjugated people of different origin), and dwelt in 70 villages, Kako-Suli, 1,200 ft. above the river Acherson, being the chief. Near this village they erected the castle of Suli on a semilunar mountain, which terminates in so narrow a ridge as hardly to leave a path from one fortification to another. The Suliotes belonged to the Greek church, and their language was Albanian, although they also spoke Greek; their form of government was a mixture of oligarchy and democracy. They were divided into about 30 tribes or clans. In war they usually fought as skirmishers, each clan having its captain, subject to an officer called polemarch, who was elected by vote. In the war of 1787–92 between Russia and Turkey, the Suliotes strongly supported the former power, defeated in 1789 the troops of Ali Pasha of Janina, ravaged Acaarnania to the Acheulous in 1790, and afterward invaded Arta and Janina, and aided the corsair Lambro Canzani with men and money. Deserted by the Russians after the peace of 1792, they fought desperately and successfully against the troops of Ali Pasha, who sought to exterminate them, and secured a truce for a few years. But in May, 1801, Ali renewed the war and put large numbers to the sword; the women threw themselves into the river rather than be captured. Most of the survivors, about 4,000, in 1808 retired to Farga. Compelled by Ali to leave this place, they went to the Ionian islands. Many afterward enlisted in the Greek regiments raised by the English during the war, which were disbanded in 1814. When in 1820 Ali Pasha, in revolt against the Porte, was hard pressed by the Turks under Kureish Pasha, and deserted by the Albanians, he recalled the Suliotes. The tyrant of Janina fell in 1822, but the Suliotes remained hostile to the Porte, adhering to the cause of Grecian liberty. In spite of the heroic efforts of their leader, Marco Bozzaris, the Suliotes were hemmed in in their inaccessible valley; and at last, Suli being taken, Sept. 4, 1829, they accepted the offer of an asylum from the governor of the Ionian islands. About 2,000 were carried in English ships to Cephalonia, the remainder dispersing among the mountains.

SULLA, or Sylla, Lucius Cornelius (Felix), a Roman dictator, born in 138 B. C., died in 78.
The family was originally called Rufinus and belonged to the great Cornelia gens. He acquainted himself with Greek and Roman literature, and was said to have all the accomplishments and all the vices of the day. Inheriting the property of his stepmother and of a countess, he aspired to the honors of state. In 107 B.C. he was elected questor, and was sent with cavalry to Africa to aid Marius in the Jugurthine war. Marius regarded him as a zealous patriot, ignorant of the arts, but Sulla's conduct soon won his esteem and the affection of his soldiers. He took a leading part in the battle of Citara and in the transactions which ended in the betrayal of Jugurtha. In 104 he was legate under Marius during the threatening invasion of the Cimbri and Teutons; in 103 he was military tribune; in 102 he left Marius, who had become jealous of him, to serve under Q. Catulus, who made him chief manager of affairs; and in 101 he was engaged in the great battle which completely destroyed the Cimbri. In 93, by a liberal distribution of money among the people, he gained the praetorship. In 92 he was sent as propraetor to Cilicia to restore Ariobarzanes to his kingdom of Caspadoce, from which Mithridates had expelled him. His success attracted the attention of Arsaces, king of Parthia, who sent an embassy to Sulla to solicit an alliance with the Romans. On his return to Rome both he and Marius, representatives of the aristocratic and popular parties respectively, desired the command of the army in the impending war against Mithridates; but the breaking out of the social war checked their private feuds and united the two generals against the common foe. In this war Sulla's successes far outshone those of Marius, but his most brilliant exploits were in 89, when as legate of the consul L. Cato he destroyed Stabiae, subjugated the Ibirini, defeated the Samnites, and captured their chief town, Bovianum. In 88 he became consul, and was appointed to the command against Mithridates. Marius conspired with the tribune P. Sulpicius Rufus and with the lately enfranchised Italians to wrest this command from Sulla, and succeeded in driving him out of the city. He hastened to the army then besieging Nola, persuaded six legions to march under him against Rome, entered the city, and drove out Marius. Early in 87 he joined his troops at Capua, embarked for Greece, and began the war against Mithridates. In 86, after a long siege, he took and plundered Athens, and from this time till his return to Rome in the spring of 83 he enjoyed almost uninterrupted success. In the mean time Marius and L. Cinna returned to Rome and were elected consuls. Sulla declared a public enemy, and against both him and Mithridates was sent an army, which in 85, under Fimbria, gained several victories over the armies of Mithridates in Asia, while Sulla in the same year defeated his army in Greece. In 84 Sulla made peace with Mithridates, and turning his attention to Fimbria, then at Thyatira, he defeated him. Fimbria, deserted by his soldiers, committed suicide. Sulla exacted enormous sums from Asiatic cities, and then set sail with his army for Athens, from which he carried to Rome the celebrated library of Apollonius. Although both Marius and Cinna were dead, the Marian party were still strong against Sulla; but by victories, by intrigues, and by seducing their soldiers to desert to him, Sulla succeeded in shutting up the younger Marius in Praeneste, and leaving a force to besiege the place, he hastened with the bulk of his army to Rome, which was threatened by the Samnites and Lucanians. Both armies arrived almost simultaneously, and before the Colline gate was fought, Nov. 1, 82, the great battle in which 60,000 men on each side are said to have fallen. The victorious Sulla massacred all his Samnite prisoners. Praeneste soon surrendered; the Praenestines and Samnites were slaughtered, and the younger Marius killed himself. This ended the Marian war. The next step of Sulla, now master of Rome, was to exterminate the popular party. At the close of 82 the dictatorship, which had been in abeyance for about 130 years, was revived, and Sulla as dictator had absolute power over the lives and property of all citizens. A reign of terror followed. Sulla posted in the forum a list called a proscriptio of persons to be considered as outlaws, who might be killed by any one, and their confiscated property was to be sold at auction. Fresh lists constantly appeared, till Sulla was rid of his enemies, while their property helped to enrich his friends. But he did not intend to abolish the republic, and in 80 he was elected consul, still holding the dictatorship. In 80-79 he introduced his reforms in the constitution and established military colonies throughout Italy. All his reforms were by leges, including the laws relating to the constitution, to the religious corporations, to the administration of justice, and to the improvement of public morals. Having effected these reforms, he voluntarily resigned the dictatorship in 79, and retired to his estate at Puteoli, where he devoted himself to literary and sensuous enjoyments. His excesses shortened his life; the immediate cause of his death was the rupture of a blood vessel. He had just completed the 224th book of his memoirs, which have not come down to us, but were largely used by Plutarch. The senate gave him a public funeral, which was a gorgeous pageant. His monument in the Campus Martius bore an inscription, said to have been composed by himself, to the effect that none of his friends ever did him a kindness, and none of his enemies a wrong, without being fully repaid. His constitutional reforms endured but a few years, and only paved the way for the advent of the Caesars.

SULLIVAN, the name of six counties in the United States. I. A W. county of New Hamp-
shire, drained by small tributaries of the Connecticut river; area, about 820 sq. m.; pop. in 1870, 18,088. The valley of the Connecticut is level and contains much excellent land; the rest of the county is broken and sometimes hilly. It is traversed by several railroads. The chief productions in 1870 were 16,884 bushels of wheat, 138,071 of Indian corn, 124,819 of oats, 13,945 of barley, 286,721 of potatoes, 206,629 lbs. of wool, 576,725 of butter, 100,429 of cheese, 342,298 of maple sugar, and 54,588 tons of hay. There were 3,615 horses, 6,882 milch cows, 8,122 working oxen, 8,681 other cattle, 39,078 sheep, and 2,829 swine; 9 manufactories of woollen goods, 5 of wooden ware, 5 of paper, 5 of machinery, 2 of cotton goods, 2 of boots and shoes, 5 flour mills, 6 tanneries, 4 curing establishments, and 24 saw mills.

Capital, Newport. 4 A S. county of New York, separated from Pennsylvania by the Delaware river, and watered by several streams; area, about 880 sq. m.; pop. in 1875, 34,935. The surface is elevated and intersected N. E. and S. W. by several ridges. The valleys are generally wide and fertile. It is traversed by the Delaware and Hudson canal and several railroads. The chief productions in 1870 were 5,136 bushels of wheat, 49,025 of rye, 181,551 of Indian corn, 231,354 of oats, 130,421 of buckwheat, 295,881 of potatoes, 22,011 lbs. of wool, 1,185,642 of butter, and 65,992 tons of hay. There were 4,168 horses, 7,570 of milch cows, 4,169 working oxen, 12,565 other cattle, 12,556 sheep, and 5,471 swine; 18 manufactories of carriages and wagons, 15 flour mills, 34 tanneries, 8 curing establishments, and 45 saw mills.

Capital, Monticello. 5 A N. E. county of Pennsylvania, drained by tributaries of the Susquehanna river; area, about 450 sq. m.; pop. in 1870, 6,191. The surface is generally rolling and hilly. The chief productions in 1870 were 16,360 bushels of wheat, 5,676 of rye, 42,942 of Indian corn, 70,141 of oats, 54,435 of buckwheat, 52,307 of potatoes, 21,219 lbs. of wool, 1,201,700 of maple sugar, 292,972 of butter, and 13,446 tons of hay. There were 1,074 horses, 2,705 milch cows, 3,990 other cattle, 6,976 sheep, and 1,982 swine; 1 flour mill, 5 tanneries, 2 curing establishments, and 6 saw mills.

Capital, Laporte. 6 A N. E. county of Tennessee, bordering on Kentucky and intersected by the Holston river; area, 300 sq. m.; pop. in 1870, 18,136, of whom 857 were colored. The surface is very hilly and well timbered, and the soil fertile. Iron ore and coal are found. The East Tennessee, Virginia, and Georgia railroad passes through it.

The chief productions in 1870 were 132,647 bushels of wheat, 302,227 of Indian corn, 176,387 of oats, 16,307 lbs. of tobacco, 27,026 of wool, 171,579 of butter, 7,785 of flax, 12,360 of maple sugar, 18,120 of honey, and 20,077 gallons of sorghum molasses. There were 3,884 horses, 3,405 milch cows, 5,535 other cattle, 15,634 sheep, and 18,478 swine; 13 flour mills, and 8 saw mills.

Capital, Blountsville. 7 A S. W. county of Indiana, separated from Illinois by the Wabash river; area, 480 sq. m.; pop. in 1870, 18,455. The surface is generally level and the soil fertile. The chief productions in 1870 were 297,452 bushels of wheat, 703,801 of Indian corn, 93,736 of oats, 42,692 of potatoes, 3,305 tons of hay, 4,125 lbs. of tobacco, 67,640 of wool, 176,279 of butter, 42,250 of maple sugar, and 30,166 gallons of sorghum molasses. There were 5,912 horses, 4,892 milch cows, 7,027 other cattle, 27,246 sheep, and 32,080 swine; 4 cooperages, 8 flour mills, and 19 saw mills.

The Evansville and Crawfordsville railroad passes through the capital, Sullivan. 8 A N. county of Missouri, drained by tributaries of Grand river; area, 648 sq. m.; pop. in 1870, 11,907, of whom 42 were colored. The surface is rolling, about two thirds being prairie and one third timbered. The soil is productive; coal is found. The chief productions in 1870 were 61,407 bushels of wheat, 15,826 of rye, 412,624 of Indian corn, 164,614 of oats, 38,754 of potatoes, 26,619 lbs. of tobacco, 70,094 of wool, 234,055 of butter, and 14,569 tons of hay. There were 6,171 horses, 665 mules and asses, 5,024 milch cows, 9,926 other cattle, 25,569 sheep, and 17,770 swine; 11 flour mills, 5 saw mills, and 3 wool-carding and cloth-dressing establishments.

Capital, Milan.

SULLIVAN, Arthur S., an English composer, born in London in 1844. He was instructed by his father, a music teacher, and sang for three years when a boy at the chapel royal. At the age of 14 he gained the Mendelssohn scholarship, and continued his studies at the royal academy under John Gloss and Sir Sterndale Bennett. He then studied under Rietz, Hauptmann, and Moscheles, in Leipzig, and composed the incidental music to Shakespeare's "Tempest," performed for the first time at the crystal palace in 1862. He soon after composed an opera, never played, with the libretto by Chorley, entitled "The Sapphire Necklace." He has written the cantata "Evilworth," "On Sea and Land," and "The Bride of Neath Valley," a symphony performed at Liverpool in 1866; several overtures; three operettas, "Theespis," "Contrabandista," and "Box and Cox;" and two oratorios, "The Prodigal Son," produced at the Worcester festival in 1868, and "The Light of the World," produced at the Birmingham festival in 1873. He has also composed songs and piano music, including "The Songs of the Wrens," for which the words were written by Alfred Tennyson.

SULLIVAN, T. John, an American general, born in Berwick, Me., Feb. 17, 1740, died in Durham, N. II., Jan. 28, 1795. He practised law in Durham. In 1774 he was a member of the first general congress, and in December of that year, with John Langdon, led a force against Fort William and Mary, near Portsmouth, and seized 100 barrels of gunpowder (afterward used at the battle of Bunker Hill), 15 cannon, all the small arms, and other stores.
This was the first act of armed hostility committed in the colonies. In June, 1775, he was appointed by congress a brigadier general, and commanded on Winter hill at the siege of Boston. After its evacuation he enforced the army in Canada, where, after the death of Gen. Thomas, he took command, June 2, 1776, and conducted the retreat from the province. He was commissioned by congress as major general, Aug. 10, acted under Putnam on Long Island, and by a combat of two hours in the woods (Aug. 27) contributed to the preservation of the American army. He was taken prisoner, but was exchanged for Gen. Prescott. After Gen. Lee's capture Sullivan took command of his division, and led the right at Trenton on Christmas night, 1776. On Aug. 22, 1777, he made a bold descent on Staten Island, the entire success of which was prevented by misconstruction of his orders, but he was justified by a court of inquiry and by a vote of congress. He commanded the right wing at the battle of Brandywine. He defeated the British left at Germantown, but mistakes on the American left, occasioned by fog, changed a victory into a repulse. In August, 1778, he commanded in Rhode Island, and prepared to attack the British lines at Newport, but was deprived of cooperation of the French fleet under D'Estraing, and was obliged to raise the siege; but at Butts' hill, on the 29th, he repulsed the enemy, and withdrew from the island with slight loss. On Aug. 29, 1779, he defeated the Indians under Brant and Tories under Sir John Johnson, at Newtown, near the present site of Elmiria, N. Y. He then resigned his commission on account of ill health. In the autumn of 1780 he again took his seat as a member of congress. In 1782–5 he was attorney general of New Hampshire, and in 1786–90 president of the state. In the troubles of 1786 he saved the state from anarchy by his intrepidity and good management, and in 1788 secured the ratification of the federal constitution. In 1789 he was appointed federal judge of New Hampshire, which office he held till his death. His life has been written by O. W. B. Peabody, in Sparks's "American Biography," 2d series, vol. iii., and by Thomas C. Amory (1868).—His son George (1774–1838) was an eminent lawyer, and was several times a member of the legislature, of congress 1811–13, and attorney general of the state 1815–7 and 1816–5. II. James, governor of Massachu- setts, brother of the preceding, born in Berwick, Me, April 22, 1744, died in Boston, Dec. 10, 1808. He was king's attorney for York co., Me, but joined the revolutionary movement. He was a member of the provincial congress of Massachusetts (of which Maine then formed a part) in 1775, and with two others executed a difficult commission to Ticonderoga. In 1776 he was appointed a judge of the superior court, and in 1779–80 was a member of the convention which framed the constitution of the state. In 1783 he was chosen a member of congress; and he was repeated elected a representative of Boston (to which place he had removed) in the legislature. In 1787 he was a member of the executive council and judge of probate for Suffolk co., from 1790 to 1807 was attorney general of the state, and was elected governor in 1807 and 1808. He was one of the commissioners for settling the boundaries between the United States and the British provinces. He published a "History of the District of Maine" (1799), and "History of Land Titles in Massachusetts" (1801). III. William, son of the preceding, born in Saco, Me., Nov. 30, 1774, died in Boston, Sept. 3, 1889. He graduated at Harvard college in 1792, studied law, and was long president of the association of the Suffolk bar. He was constantly a member of one or the other branch of the state legislature. He published "Familiar Letters on Public Characters and Events from 1783 to 1815" (12mo, Boston, 1884); "Historical Causes and Effects, from the Fall of the Roman Empire to the Reformation in 1517" (8vo, 1838); and "The Public Men of the Revolution," published with a biographical sketch by his son, J. T. S. Sullivan (8vo, Philadelphia, 1847). IV. John Langdon, an American engineer, brother of the preceding, born in Saco, Me., April 9, 1777, died in Boston, Mass., Feb. 9, 1805. He travelled in Europe, studying the construction of canals in France and England, and in 1804 was appointed agent and engineer of the Middlesex canal, which was completed in seven years. He invented the steam towboat, for which he received a patent in 1814, in preference to Robert Fulton, who applied for it at the same time, his priority of discovery being fully sustained. In 1824 he was appointed associate civil engineer of the United States board of internal improvements, which post he resigned the next year, after making a report on the practicability of a canal across the Alleghanies. He then studied medicine, in 1837 commenced practice in New Haven, afterward adopted the homeopathic system, and in 1847 removed to New York. "SULLIVAN'S ISLAND. See Moultrie, Fort. SULLIVANT, William Starling, an American botanist, born at Franklinton, near the site of Columbus O., Jan. 15, 1803, died in Columbus, April 30, 1873. He graduated at Yale college in 1823, and settled in Columbus as a sur- veyor. In 1840 he published "Catalogue of Plants, Native or Naturalized in the Vicinity of Columbus, Ohio," and in 1842 an article on three new plants discovered in that district. He made a journey in 1843 from Maryland to Georgia, and published "Musci Alleghanii- conicus" (55 set of 2 vols, printed privately, 1855). He wrote papers on bryology and hepaticology for the "Memoirs of the American Academy of Arts and Sciences" (1846–9), and contributed the "Musci and Hepaticae of the United States East of the Mississippi River" to the second edition of
SULPHATES

Grays "Manual of Botany" (1856); this was afterward published separately. A second volume of this, his most important work, has appeared since his death. Musci Boreali-Ameri-

cani, consisting of 550 species and varieties of dried mosses, was the joint work of him-

self and his associate L. Lesquereux (1866). He also published "Mosses brought home by Wilkes's Exploring Expedition, 1838-42" (with 26 fol. plates, 1859); "Mosses and Hepaticae collected mostly in Japan" (with 18 4to plates, 1860); Musci Cubenses (1861); and Icones Muscorum (with 129 plates, 1864).

The genus Sullivantia was founded by Torrey and Gray upon a rare plant of the saxifrage family discovered by him.

SULLY, a S. central county of Dakota, recently formed and not included in the census of 1870; area, about 1,900 sq. m. It is bound-
ed W. by the Missouri and watered by its afflu-
ents. The surface is mostly undulating prai-

ries. The Missouri bottom is very productive.

SULLY, Maximilien de Béthune, baron de Rosny, duke of, a French statesman, born at Rosny, near Mantes, Dec. 13, 1560, died near Chartres, Dec. 22, 1641. He belonged to a noble Pro-

testant family, and followed King Henry of Navarre in all his wars, and became his chief adviser. When his master, on the death of Henry III., claimed the throne of France, Rosn

y advised him to turn Catholic in order to reconcile the majority of the nation to his cause. On a secret mission to Queen Eliza-

beth of England, he secured her assistance to Henry IV., and he was instrumental as an en-

gineer in taking Dreux in 1598, Loa in 1594, La Fère in 1596, and Amiens in 1597.

In 1597 he was appointed superintendent of finance, and became in fact the chief minister of Henry IV. He reformed the financial system, and cancelled the public debt, which amounted to 322,000,000 livres, remitting 20,000,000 taxes in arrears, alleviating the annual taxation, and gathering a reserve of 17,000,000, which was deposited in the Bastille. He fostered agricul-

ture, made the grain trade free, suppressed tolls and prohibitions, built or improved high-

ways and roads, constructed canals, and en-

couraged drainage and mining. He had re-

ceived the title of marquis of Rosny in 1601, and was created duke of Sully in 1606. At the death of Henry IV. in 1610 the reserve in the Bastille amounted to 42,000,000. Sully remained as chief minister some time longer, but his severity and rigid principles becoming obnoxious to Maria de' Medici and her advisers, he left the court in 1611, and resigned most of his offices and dignities. Cardinal Richelieu in 1634 made him marshal of France. During his retirement he composed his personal me-

moirs, Mémoires des sages et royales économies d'Etat de Henry le Grand (4 vols. fol., 1634-

'62, several times reprinted; English transla-
tion by Mrs. Lennox, 3 vols. 4to, London, 1756; new ed., 5 vols. 8vo, 1854-6).—See Éloge his-
torique de Sully, by Perrens (Paris, 1871).

SULLY, Thomas, an American painter, born at Horncastle, Lincolnshire, England, in June, 1783, died in Philadelphia, Nov. 5, 1872. He was brought to the United States by his pa-

rents, who were players, in 1792. In 1803 he settled as a portrait painter in Richmond, Va., re-

moved a few years later to New York, and in 1809 settled in Philadelphia. Among his large works are full-length portraits of George Frederick Cooke as Richard the Third, Dr. Benjamin Rush, Commodore Decatur, Thos-

mas Jefferson, Lafayette, and Queen Victoria, painted during a visit to England. His well

known picture of "Washington crossing the Delawaro" is now in the Boston museum.

SULPHATES, salts formed by the union of sulphuric acid with bases. The union, strictly speaking, is only partial, as a portion, and in normal salts all, of the hydrogen of the sulphuric acid is displaced by the base. (See Sulfites.) Thus, H₂SO₄ + 2K = 2H + K₂SO₄, normal sulphate of potassium; or H₂SO₄ + K = H + KHSO₄, acid sulphate of potassium. The sulphates are extensively employed in the arts, in medicine, in agriculture, and in the chemical laboratory. 1. Sulphates of Alumina. The normal sulphate, Al₂SO₄ + 18H₂O, is found native in many localities, as on the volcanic island of Milo in the Grecian archipelago, in the craters of volcanoes in the Andes, and at Adelaide in Australia. It is known in mineralogy as alumogen, hair salt, feather alum, and halotrichite. Its hardness is 1½ to 2; sp. gr. 1·6 to 1·8; lustre vitreous; color white, or tinged with yellow or red. It is manufactured in large quantities, is known in commerce as concentrated alum, and is used in dyeing instead of common alum. Clay as free as possible from iron is heated to redness, and then ground and mixed with half its weight of sulphuric acid of sp. gr. 1·45, in a reverberatory fur-

nace, till the acid begins to volatilize. Af-

ter exposure to the air for several days, water is added and the solution freed from what iron it may contain by precipitation with fer-

rocyanide of potassium. The solution is then evaporated to a sirup, which solidifies on cool-

ing. It is soluble in two parts of water, in-

soluble in alcohol. There is a series of double aluminic sulphates, forming true alums, which are treated under the head of Alum. Not all alums contain aluminum, but they are so named because they are formed on the type of the alum salts. 2. Sulphates of Barium. Some of the sulphates of barium are double salts. The most important is the neutral sul-

phate, BaSO₄, or heavy spar, which is found native in large quantities, and when ground into powder is used to adulterate white lead as a pigment. An amorphous sulphate is made on a large scale for the same purpose, and called permanent white. There is an acid salt, BaH₂SO₄, and a basic soda sulphate, Ba-

₃N₄SO₄. 3. Sulphates of Calcium and Chro-

mium. An anhydrous neutral sulphate of cal-

cium, CaSO₄, occurs native as the mineral an-
SULPHATES

SULPHIDES

Hydrate. It may be formed artificially in crystals by fusing sulphate of potash with an excess of chloride of calcium. Gypsum is native hydrated sulphate of calcium, CaSO₄·2H₂O. (See Gypsum.) The sulphates of chromium, both the pure chromium and also the double salts, are an important class of compounds, and include the chrome alums, as ammonio-chrome alum, potassio-chrome alum, and sodio-chrome alum.

4. Sulphates of Copper. The normal sulphate, CuSO₄·5H₂O, is the blue vitriol of commerce, extensively used in the arts. (See Copper, vol. v., pp. 318–19.) There are several basic sulphates of copper, and double sulphates of copper and ammonia of various shades of blue, some of which form solutions of exceedingly beauty. By mixing solutions of ammonio-cupric sulphates or of potassic-cupric sulphates with corresponding double sulphates of cobalt, iron, magnesium, manganese, nickel, or zinc, an interesting series of complex salts is obtained, all of which crystallize in monoclinc prisms and tables, isomorphous with the magnesium double salts; and furthermore, by mixing the solutions of three or four of these double salts, others still more complex may be formed, isomorphous with the preceding. Copper also forms with magnesium, sodium, and zinc beautiful double sulphates. In the preparation of cupric sulphate from materials which contain iron compounds, several so-called ferrous-cupric sulphates are formed, having different proportions of base, but which are not true double salts. The Salzburg vitriol, prepared at Buxweiler in Alsace, contains 3 molecules of iron to 1 of copper; Admont vitriol, 5 to 1; Bairenth vitriol, 7 to 1.

5. Sulphates of Iron. Sulphuric acid forms with iron an extensive series of salts, some of which have a constitution analogous to the peroxide, and are called ferric salts; others, analogous to the protoxide, are called ferrous salts. Among the former are several interesting double salts, including ammonio-ferric sulphate, or ammonia-iron alum, and potassio-ferric sulphate, or potash-iron alum. Ferrous sulphate, green vitriol, or copperas, FeSO₄·7H₂O (or Fe₂(SO₄)₃·7H₂O, old formula), is the most important commercial salt of iron. It occurs native, sometimes in crystals, but more often in amorphous masses, in iron mines in various parts of the world, being formed by the oxidation of iron pyrites; but most of the copperas consumed in the arts is prepared simultaneously with alum from schists containing iron pyrites. Ferrous sulphate crystallizes in monoclinc prisms or tables, which when moist readily absorb oxygen and pass into ferric sulphate; but if crushed and deprived of moisture by strong heat, or between folds of cotton cloth or filter paper, it may be kept in bottles for a long time without change. (See Copperas.)

6. Other Metallic Sulphates. The normal sulphate of magnesium, MgSO₄·7H₂O, is described under the title Epsom Salt. There is an acid sulphate and several double salts. The sulphaes of potassium are described with that metal. Glauber's salt is the normal and principal sulphate of sodium. (See Glauber's Salt.) The other metallic sulphates of sufficient importance are treated under the heads of the respective metals. 7. Alcoholic Sulphates. Sulphuric acid combines with various alcohol radicals to form a series of sulphuric ethers, the most important among which are acid sulphate of ethyle, or sulphovinic acid, (CH₃CH₂)₂SO₄, and neutral sulphate of ethyle, or true sulphuric ether, (CH₃CH₂)₂SO₄. (This latter ether must be distinguished from what is ordinarily called sulphuric ether, which is the oxide and not the sulphate of the radical ethyle, CH₂=CH₂.) Sulphovinic acid is formed by the action of strong sulphuric acid upon alcohol, ether, or ethylene, and was first noticed by Daubill in 1800 in the residues of the preparation of common ether. The molecule of hydrogen which it contains may be replaced by a metal forming a salt which is called a sulphovaninate, or ethyle sulphate. Neutral sulphate of ethyle, or true sulphuric ether, is formed by passing sulphuric anhydride into a flask containing common sulphuric ether surrounded by a freezing mixture. It is a yellowish oily liquid of sp. gr. 1.12, having a sharp taste and the odor of oil of peppermint. As it is decomposed when heated in the air, it must be distilled in an atmosphere of carbonic anhydride. Sulphuric acid forms with methyle an acid sulphate of methyle, or sulpho-methyle acid, CH₃H₂SO₄, and a neutral sulphate of methyle or methylsulphuric ether, (CH₃)₂SO₄. The molecule of hydrogen in sulpho-methyle acid may be replaced by a metal, forming a salt called a methyl-sulphate.

SULPHIDES, or Sulphures, compounds in which sulphur forms the electro-negative element. Sulphur unites with all the metals, with most of the non-metallic elements, and with many organic radicals. The sulphides have generally a constitution corresponding to the oxides, and like them may be divided into acid and basic sulphides, which are capable of uniting and forming sulphur salts. Thus, we have stannate of potassium, K₂SnO₂, and also sulphostannate of potassium, K₂SnS₂. The sulphides are decomposed more or less perfectly by hydrochloric acid, and behave like the corresponding oxides, yielding one molecule of sulphuric acid for every molecule of sulphur in the sulphide. Thus, FeS₄·2HCl=H₂S+FeCl₄; and Sn₂S₅·6HCl=3SnCl₅+2SbCl₅. Of the sulphides of the non-metallic elements, those of carbon and chlorine are the most important. Bisulphide of carbon, carbon disulphide, or sulpho-carbonic acid, CS₂, is the only sulphide of carbon which is positively known. It is prepared on a large scale as a solvent for various manufacturing purposes. A large earthen retort has a tube which passes through the mouth down to near the bottom. The retort is filled with charcoal and heated to redness in a furnace, and bits of sulphur are dropped from
SULPHITES

time to time down the tube, which after each introduction is stopped with a cork. The neck of the retort is connected with a condensing tube, which is kept cold by a stream of water, and dips into a vessel of cold water. The sulphide which collects at the bottom of this vessel contains an excess of sulphur, from which it is freed by redistillation. By another process sulphur vapor is driven over red-hot coke. Sulphide of carbon is a colorless, mobile, highly refracting liquid, its index of refraction being 1.678. (See Lieur, vol. x., p. 430.) It has a peculiar, fetid, disagreeable, allaceous odor, and when breathed produces great depression, followed by coma. The density of the liquid is 1.274, water = 1; of the vapor, 2-67, air = 1; boiling point, 118° F. It freely dissolves sulphur, depositing it on evaporation in beautiful octahedral crystals. It also dissolves phos- phorus, iodine, camphor, and caoutchouc, and mixes easily with oils. It is extensively used in the vulcanizing of caoutchouc and the manufacture of gutta percha, for extracting bitumen from mineral substances, and of oil from seeds. Sulphide of chlorine, $S_2Cl_6$, is formed by passing dry chlorine over melted sulphur contained in a glass retort. A deep orange-yellow, mobile fluid distils over, having a peculiar disagreeable odor, boiling at 282° F.; sp. gr. 1.687. It dissolves sulphur in large quantities. Dissolved in crude benzole with excess of sulphur, it is also used in Europe for vulcanizing caoutchouc. The principal sul- phides of organic radicals are of the alcoholic series, and form a class of ethers, as hydro- sulphuric ether, or monosulphide of ethyle, $(C_2H_5)_2S$, and the disulphide, $(C_2H_5)_2S_2$. Sulphuride of ethyle, or mercaptan, $C_2H_5SH$, is interesting as being the sulphur analogue of common alcohol, or hydrated oxide of ethyle, $C_2H_5OH$. (See Alcohols, and Ethylene.) Mercaptan (mercurium captans, etc.) constitutes a strong tendency to seize upon or combine with mercury) was discovered by Leise in 1833, and has since been examined by Liebig and others. It is a colorless mobile liquid, of a exceedingly offensive and permanent garlic odor; sp. gr. 0.842; boiling point about 144° F. When it is mixed with mercureic oxide, violent reaction ensues, with formation of water, and a white substance, soluble in alcohol, which by the action of sulphuric acid yields sulphide of mercury with reproduction of mercaptan. A drop on the end of a glass rod waved through the air will evaporate so rapidly as to freeze a portion remaining. It forms an interesting class of compounds with other elements, for which the reader is referred to larger works on chemistry. The sul- phides of methyl, $(CH_3)_2S$ and $(CH_3)_2S_2$, and also methyl sulphhydral, or methyl mercap- tan, $CH_3SH$, and other organic sulphides and sulphhydrides, possess much chemical interest.

SULPHITES, salts formed by the union of sul- phurous acid with bases, or more strictly speak- ing by the action of sulphurous acid on bases;

the two atoms of hydrogen in the molecule of the acid being partially or wholly replaced by a metallic basyle or a radical, forming normal and acid salts. (See SALT.) Thus, normal sulphite of potassium, $K_2SO_3$, may be formed by wholly replacing the hydrogen in the acid, $H_2SO_3$; or the acid sulphite, $KHSO_3$, may be formed by employing half the quantity of acid. The sulphites of the metals are usually formed by passing sulphurous anhydride, $SO_2$, through aqueous solutions or mixtures of hydrates or carbonates, the anhydride being first converted into the acid by combining with the elements of water, whereupon double decomposition immediately takes place, with an exchange between the metallic basyle and the hydrogen constituent of the acid. Sulphurous acid com- bines with nearly all the metals, the most im- portant sulphites being those of calcium and sodium. Sulphite of calcium may be precipi- tated in an anhydrous state by passing sul- phurous anhydride through water having hy- drate of lime in suspension, or through a solu- tion of chloride of calcium. It is manufac- tured on a large scale and used in bleaching, and for protecting organic substances from decay. The sulphites of sodium comprise a normal salt, $Na_2SO_3$, and an acid salt, $NaHSO_3$. The normal salt is prepared by saturating a solution of carbonate of soda with sulphurous acid and adding to it as much carbonate of soda as it originally contained while warm. On cooling, the salt separates in monoclinic crystals, having seven molecules of water of crystallization ($Na_2SO_3+7H_2O$). Another hy- drate was formed by Muspratt, containing ten molecules of water. The acid sulphite is pre- pared by supersaturating the solution of sodic carbonate with sulphurous acid. Both of these salts have been used to remove the traces of chlorine in paper pulp, under the name of anti- chlor, but they have been partially superseded by hyposulphite of sodium, or this salt is used in connection with them. (See Paper.)—The two atoms of hydrogen in the molecule of sul- phurous acid may be partly or wholly replaced by monatomic alcohol radicals, forming acid and neutral sulphurous ethers, the acid ethers being sometimes called sulpho-acids. Ethyl- sulphurous acid, $(C_2H_5)_2H_2SO_3$, is formed by the action of nitric acid on sulphuride of ethyle or mercaptan, $(C_2H_5)_H_2S$. Neutral sulphurous ether, $(C_2H_5)_2SO_4$, may be formed, among other methods, by the action of absolute alcohol on disulphide of chlorine. The alcoholic sulphites and other sulpho-ethers and compounds have been carefully studied by Muspratt, Gerhardt, Rammelsberg, Kolbe, and others. They form an extensive and interesting series.

SULPHUR, an elementary substance belonging to the class of metalloids. It has been known from the earliest times as the sublimed product of volcanoes, and as a natural mineral deposit in clay and marl strata in tertiary formations, and is also associated with gypsum, being one of the sources of this mineral. (See Gypsum.)
It occurs in some schistose rocks, and in coal and lignite deposits, and is deposited from the sulphuretted waters of certain mineral springs. It is found in Sicily in beds of blue clay lying in a matrix of rock salt, gypsum, and celestine. (See Stryonym.) It also exists in primitive rocks, as granite and syenite, and abounds in the lava fissures of volcanic craters, as in the solfatara near Naples and at Popocatepetl, Mexico. It is a constituent of many minerals, such as iron and copper pyrites, galena or sulphur of lead, cinnabar or sulphuret of mercury, gray antimony, and realgar or sulphuret of arsenic; also of ternary salts of metals, such as the sulphates of copper and iron, and of strontia, barium, and calcium (celestine, heavy spar, and gypsum); and of more soluble compounds which are constituents of mineral waters, as the sulphates of magnesium and sodium (Epson and Glauber's salts). It is a constituent of the protoxide compounds of animals and vegetables, in the tannine of bile and the cystine of urine, and certain volatile oils, as oil of onions and oil of mustard. Sulphur is obtained from the natural deposits of free sulphur by melting or by distillation. Rich deposits are simply melted in large cast-iron or earthen caldrons, the gangue and small stones being removed with perforated ladles. Sometimes rude furnaces somewhat like lime kilns are employed for the coarser deposits, in which a portion of the sulphur is burned, while the great mass is drawn off at the bottom. A better method than the latter is that of distillation, in which the product is much purer. This is done in large earthen pots or retorts placed in a long furnace. Rude receivers of earthenware or wood are placed outside of the furnace in which the sublimate is condensed. The product obtained by melting is known as rough sulphur, and contains about 3 per cent. of foreign matter, from which it is separated by distillation, in stills having large chambers for condensers, in which it is deposited in the form known as flowers of sulphur; or it may be condensed in the liquid form in smaller and hotter receivers, and cast into cylinders called roll sulphur. Sulphur may also be obtained from iron pyrites by heating it in close vessels, in which case the dioxide parts with one molecule of sulphur and becomes protoxide. It is one of the products of the heating of copper pyrites preliminary to copper smelting. Sulphur is also a by-product of gas manufacture when salts of iron are used to decompose sulphuretted hydrogen. (See Gas, vol. vii, p. 637.) The iron salt, which before using is mixed with lime and exposed to the air to convert it into peroxide, in the gas-purifying process becomes a hydrated sulphur. This is again recovered to peroxide by exposure to the air, with evolution of sulphur.—Pyrites. Native sulphur occurs either in amorphous masses, or in transparent yellow crystals derived from the octahedron with a rhombic base. Sublimed sulphur of commerce, known as flowers of sulphur, is a yellow gritty powder having a slight peculiar odor, but from its insolubility is nearly tasteless. It is a non-conductor of electricity, and becomes negatively excited on being rubbed by most substances. It has a strong affinity for oxygen, taking fire when heated in the air to 450°, burning with a blue flame and emitting suffocating fumes of sulphurous anhydride. It is therefore classed among highly inflammable substances. It melts at 239°, forming an amber-yellow liquid which is lighter than solid sulphur. It boils at about 836°, forming a deep yellow vapor of sp. gr. 0.617, one volume of which contains three atoms of sulphur. When heated to about 1832° the vapor is only one third as dense as at 900°, and then has the same atomic volume as oxygen. Sulphur has also a very strong affinity for chlorine, bromine, and iodine, forming respectively chlorides, bromides, and iodides of sulphur. It combines readily with most of the metals, forming sulphides or sulphurates, which generally have a constitution corresponding to the oxides of the same metals. Sulphur, like phosphorus, is remarkable for the number of modifications or allotropic conditions which it may assume under different circumstances. (See Allotropicism, and Phosphorus.) These different modifications are divided into two distinct varieties, those in the first variety being soluble and those in the second insoluble in bisulphide of carbon. Berthelot has named the first or soluble variety electro-positive sulphur, because it is separated at the positive electrode of a galvanic battery during the electrolysis of a solution of hydrosulphuric acid, and also because it is in this form that it is separated from sulphides of electro-positive metals. The second variety he named electro-negative sulphur, because it appears at the negative pole of the battery during the decomposition of sulphurous acid, and separates from sulphur compounds with electro-negative elements, as chlorine, bromine, iodine, and oxygen. Soluble sulphur, or that which is soluble in bisulphide of carbon, presents three forms, two crystalline and one amorphous. In the first the crystals are octahedrons with a rhombic base, and all the modifications of both varieties have a tendency finally to assume this form. It is formed when sulphur separates from its solutions at common temperatures. The second crystalline form is that of brownish yellow needles belonging to the oblique prismatic system. It is obtained by melting a mass of sulphur, allowing it to solidify on the surface, piercing the crust, and allowing the fluid portion to run out. On breaking away a part of the crust the long, needle-like crystals will be exposed to view. These two forms are not only very unlike as to their crystallography, but differ widely in their specific gravities and their melting points, the octahedral crystals having a density of 2.05 and melting at 239° F., while the needles have a density of only 1.98, that of ordinary roll sul-
SULPHUR

phr, and melt at 248°. After a time the prismatic crystals will be found to consist of aggregations of minute octahedral crystals. When a saturated solution of sulphur in hot turpentine cools, the first crystals formed will be prismatic, while those which are deposited when the solution is comparatively cool will be octahedrons. Roll sulphur or brimstone is at first prismatic, but after keeping becomes octahedral, and the change of form is attended with the evolution of heat. The amorphous variety of soluble sulphur is precipitated as a greenish white emulsion on adding acids to dilute solutions of alkaline polysulphides. This amorphous sulphur changes after a time into a mass of octahedral crystals. Ordinary sublimed sulphur (flowers of sulphur) belongs to this variety, but always contains small quantities of one of the insoluble modifications. The principal modifications of the insoluble variety of sulphur are: 1, an amorphous modification, obtained as a soft pasty mass, or magma, by decomposing bisulphide of chlorine with water, or by adding dilute hydrochloric acid to a solution of a hyposulphite; 2, a plastic form, obtained by pouring viscid sulphur raised to nearly 500° into cold water. The effect of heat upon sulphur is remarkable. It begins to melt at about 239°, and between 248° and 254° it is yellow, transparent, and limpid. As the temperature rises to 356° it becomes brown, and at last nearly black and opaque and quite viscid. At this point the temperature becomes stationary for a time, although the supply of heat is kept up, in consequence of a molecular change which is going on. Soon the temperature again rises, and when it has reached about 500° the mass becomes more liquid, but retains considerable viscosity. If it is now suddenly cooled by pouring it in a small stream into cold water, a brown tenacious mass is produced, which may be drawn out into elastic threads having a specific gravity of only 1.957. In a few hours it becomes yellow and opaque, and passes into the octahedral form. If the dextrine sulphur is heated to 213° the change is sudden, with a further rise of heat, from condensation, to 230°.—Compounds. Sulphur forms with oxygen an interesting series of compounds: two anhydrous oxides, or anhydrides, sulphurous anhydride, SO₂, and sulphuric anhydride, SO₃; two acids, sulphurous and sulphuric, formed by the union of these anhydrides respectively with water, and a further series of acids which have no corresponding anhydrides. The constitution of all these bodies is remarkably illustrative of the law of multiple proportions. The formulas of the acids are as follows:

Thiosulphuric acid (Gr. θείον, sulphur) is so called because it has the constitution of sulphuric acid with a molecule of oxygen replaced by one of sulphur. The last four acids in the table are called polythionic acids, because they contain varying proportions of sulphur united with constant proportions of the other elements. Sulphurous anhydride, SO₂, formerly called sulphuric acid, is the only product when sulphur is burned in dry air or oxygen gas. When the combustion takes place in pure oxygen, it is found that on returning to its former temperature the gaseous product is doubled in weight, but that its volume is unchanged. It is in fact formed by the condensation of one volume of oxygen and half a volume of sulphur vapor into one volume. When required pure, sulphurous acid is usually obtained by the partial reduction of sulphuric acid. This is conveniently effected by boiling strong oil of vitriol with copper turnings or mercury. The reaction is shown in the following equation: Cu₂(SO₄)₂ + 2H₂SO₄ = CuSO₄ + 2H₂O + SO₃. It may also be obtained by passing the vapor of sulphuric acid over red-hot platinum foil or sponge, the product being sulphurous anhydride and oxygen. (See Oxygen, vol. xii., p. 769.) Sulphuric anhydride is a colorless gas, having a density of 2.21. When subjected to a pressure of three atmospheres at common temperatures, or if cooled to 0° F. at the ordinary pressure, it is condensed to a colorless, transparent liquid, which solidifies to a crystalline mass at -105°. The liquid anhydride may be obtained in large quantities by passing the gas from the generator first through a small quantity of water to wash it, then through a tube surrounded by ice to remove moisture, then through a tube containing pieces of calcium chloride to dry it completely, and finally through a worm, or into a receiver immersed in a mixture of salt and ice. It may be preserved in sealed glass tubes, or corked and wired soda bottles. Sulphuric anhydride dissolves in water, forming a solution of sulphuric acid, H₂SO₄, which again decomposes by the application of gentle heat into the anhydride and water. Water at 60° absorbs about 45 times its volume of the gas, the resulting liquid having a density of 1.04. By exposure to the air the solution slowly passes into sulphuric acid. By cooling a saturated aqueous solution to 32°, Döpping obtained the pure acid, H₂SO₄, in cubical crystals. A crystalline hydrate, SO₃H₂O, according to Pierre, may also be obtained at a low temperature, which melts at 39°, suffering decomposition. Sulphurous acid is a powerful reducing agent, instantly discoloring acid solutions of manganates and chromates, reducing the latter to green oxides of chromium. It reduces the salts of gold, precipitating the metal in the metallic state, and is capable of taking the second molecule of oxygen from almost any metallic binoxide. Brewers often employ a solution of sulphuric acid to wash out their beer.
SULPHURIC ACID

Sulphuric acid, the hydrate of sulphuric anhydride, or teroxide of sulphur, $\text{SO}_3 + \text{H}_2\text{O} = \text{H}_2\text{SO}_4$. It may also be regarded as a salt of hydrogen, this element holding the place of a base to the radical sulphion, $\text{SO}_4$. (See SALTS, vol. xiv., pp. 582, 583.) The discovery of sulphuric acid is ascribed to Basil Valentine, a monk of Erfurt in Saxony, about 1440. He obtained it by distilling green vitriol or the sulphate of iron, and as the liquid product had an oily appearance when poured out, it was called oil of vitriol. He also obtained it by burning sulphur under a bell glass containing moisture, calling the product oleum sulphuris, or oil of sulphur by the bell. This was the germ of the present process of manufacture, which consists in producing sulphurous acid and carrying it to a higher state of oxidation by nitrous and hypoponitrous acids. The old process of distillation from green vitriol is still employed in some parts of Germany, particularly in the neighborhood of Nordhausen in Prussian Saxony, and near Prague in Bohemia. Sulphate of iron, chiefly produced by the oxidation of iron pyrites, first has its water of crystallization expelled, when it is subjected to a high
SULPHURIC ACID

459

claimed for a calico printer at Rouen, with improvements by Chaptal, such claimants giving credit to Dr. Roebuck only for the invention of the leaden chambers in which the process was carried on. A large and long chamber, divided into sections by partitions which alternately leave open spaces at the top and bottom, has at one end a small furnace in which the flame of sulphur heats a crucible containing a mixture of nitre and oil of vitriol. The chamber is lined with sheet lead, and its floor is covered with a thin stratum of water. Jets of steam are also introduced. The sulphur in burning produces sulphurous anhydride, SO₂, which in the presence of moisture becomes sulphurous acid (SO₂ + H₂O = H₂SO₃) and this again, by the action of NO₂, becomes sulphuric acid, H₂SO₄, the nitric acid being at the same time reduced to a lower oxide. According to the researches of Weber and Winkler, the following is the rationale of the process: The oxidation of the sulphurous acid to sulphuric acid takes place in the leaden chambers under the influence of the vapor of water, at the expense of the oxygen of the nitric or nitrous acid, which is converted into deutoxide of nitrogen. It is necessary however that the nitrous acid be first absorbed in plenty of water, which takes up the free nitrous acid and decomposes the deutoxide of nitrogen, a process greatly promoted by the presence in the chamber of sulphuric acid purposely introduced. The water, usually in the form of steam (practical experience proving that a certain elevation of temperature is required), acts in this process as in others wherein sulphurous acid effects reduction. By the presence of atmospheric air in the chamber the deutoxide of nitrogen is oxidized into hyponitric or nitrous acid, and this acid again is decomposed by sulphuric acid. A peculiar crystalline substance sometimes forms, having the formula H₂SO₄ + N₂O₃S0₃, and formerly thought to play an important part in the transformation; but according to R. Weber this substance only appears when the process is not well managed, and is chiefly due to want of water. The process of forming sulphuric acid may be illustrated on a small scale by means of the apparatus shown in fig. 2. A flask, b, furnishes sulphurous anhydride, and the bottle c deutoxide of nitrogen, to the large glass balloon r, and the flask e supplies steam when it is required. Air is occasionally blown into the balloon through the bent tube f, the effete products passing out at o. If but little vapor of water is present, the white crystalline solid above mentioned makes its appearance upon the sides of the globe; but when sufficient water is present the substance is not deposited, neither is it supposed to be formed as a necessary stage of the process. Gay-Lussac invented what is called a condenser as an attachment to the large leaden chambers, for the purpose of economizing the consumption of nitre, which formerly amounted to from one eighth to one twelfth of the weight of sulphur. The condenser consists of a leaden tower filled with fragments of coke, through which sulphuric acid of 66° Baumé is constantly trickling. Through this condenser the spent gases are passed, and the oxides of nitrogen which they may contain are absorbed. The sulphuric acid which collects at the bottom of the chambers is too dilute for most purposes; it is not found advantageous to allow it to attain a specific gravity of quite 1-6, because at that strength it absorbs too much of the nitrous fumes. It may be used at this strength for the manufacture of salt cake (see Soda), but for other uses it must be further concentrated. This is generally effected by two different stages, the first in leaden pans, the second in platinum or glass retorts. Some makers concentrate to 60° Baumé (sp. gr. 1-71) in leaden pans; others use them only till the acid is raised to 55° Baumé (sp. gr. 1-59). The leaden pans are rectangular, long and wide, supported by iron plates to protect the lead from immediate contact with the flame which is used for evaporation. The pans are generally arranged in steps, the acid being conveyed from the upper to the lower ones by syphons, the density of the acid increasing from one pan to the next lower. When it has attained a density of from 1-65 to 1-72 in the leaden pans, it is known as brown oil of vitriol, and may be used by bleachers, calico printers, dyers, &c.; but to raise it to the strength of commercial oil of vitriol, it is further concentrated in the glass or platinum retorts above mentioned. Glass retorts holding 20 gallons or more are often used, set in an iron pot, the bottom of which is covered with dry sand. The concentration requires from 12 to 16 hours; the vapors which distil over toward the last, carrying some acid with them, are passed into condensers and returned to the lead pans. Platinum retorts are more costly, but are thought by many to be more economical in the end on account of their not being liable to break. Fig. 3 shows a section of a platinum retort. The syphon z is worked without a stopcock by the vessel c, in the following ingenious manner. When the vessel is lowered

densation required of chars partial obtained; this orless, The acid through the water, vapor the flue cent, to concentrated 18-36 parts, which gives 18-36 per cent. of the elements of water, while Marignac obtained 19-62 per cent. from the concentrated acid. According to Playfair, if the concentration is conducted at a temperature not exceeding 500°F., the true compound, of sp. gr. 1.844, is obtained; but if heated to ebullition, there is partial decomposition.—Properties. The oil of vitriol of commerce is an oily-looking, colorless, and odorless liquid, of sp. gr. 1.842. It clairs nearly all organic substances, in consequence of abstracting from them the elements of water, leaving a carbonaceous residue. It mixes with water in all proportions, with condensation of volume of the mixture, and consequent evolution of heat. Its attraction for moisture is so great, that if exposed to the air for a few days in a shallow vessel it frequently doubles its weight; and advantage is taken of this in the laboratory for drying various substances. The boiling point of sulphuric acid is 620-6° F., and it freezes at about -29°, although when frozen it does not melt below 32°. Marignac finds that the true sulphuric acid when heated parts with a small quantity of vapor of the anhydride, and the remaining liquid boils at 640-4°. Sulphuric acid forms two definite hydrates, the monohydrate, H₅SO₄·H₂O, and the dihydrate, H₂SO₄·2H₂O. The first, of sp. gr. 1.78, crystallizes at 47° in splendid rhombic prisms, of sp. gr. 1.951. From this property it is often called glacial sulphuric acid. It boils at about 409°. The dihydrate may be formed by concentrating a dilute acid in vacuo at 210 till it ceases to lose weight. Its sp. gr. is 1.02; boiling point, 370°.—Uses. Sulphuric acid is the starting point of nearly all the great chemical manufactures. It is used to procure nitric acid from the nitrates of potassium and sodium, and hydrochloric acid from common salt, at the same time furnishing salt cake, from which the carbonates of soda are obtained. It is therefore used in the preparation of various bleaching compounds. Phosphate of lime in artificial manures is reduced to biphosphate by the action of sulphuric acid. In medicine, diluted with water or spirits of wine and known as acidum sulphuricum dilutum and acidum sulphuricum aromaticum, it is used as a tonic, refrigerant, and astringent. It is given in typhoid fevers, in convalescence from various fevers, and as an aid to digestion.

SULPICIANS, or Priests of the Society of St. Sulpice, a congregation of priests in the Roman Catholic church founded in the parish of St. Sulpice, Paris, in 1645, by Jean Jacques Olier de Verneuil, and specially devoted to the training of candidates for the priesthood. In 1645 Olier and two other clergymen formed a community at Vaugirard, and bound themselves to found ecclesiastical seminaries. His companions soon abandoned him, and becoming in the same year rector of the parish of St. Sulpice, he set about realizing his plan there. The act founding the society of St. Sulpice is dated Sept. 6, 1645, and was immediately sanctioned by the proper authorities. The corner stone of the present seminary of St. Sulpice was laid in September, 1649; the edifice was completed and occupied in August, 1651. The society formed two bands, the one devoted to parish work, the other to that of teaching. The Sulpicians were warmly befriended from the beginning by St. Vincent de Paul, and the establishment of Sulpician seminaries in nearly all the dioceses of France soon followed. Thereby the society came to have the chief part in the education of the French clergy down to the revolution of 1789. They were at first favored by Napoleon, but were suppressed by him in 1812 for their attachment to Pius VII.; they were restored by Louis XVIII., and ever afterward directed the most important diocesan seminaries in France.—Olier in 1636 formed a company for colonizing the island of Montreal. They purchased it in 1640, sent out Sieur de Maisonneuve with priests and nuns in 1641, and transferred their proprietorship to the Sulpicians in 1656. In 1657 the Sulpicians De Queylus, Souard, and Gallinier took possession of

![Fig. 3.—Platinum Retort.](image-url)
the island and founded there a missionary establishment; but their claims to exclusive parochial jurisdiction being resisted, De Queylus in 1659 obtained in Rome a bull erecting Montreal into an independent parish, and used the powers thus conferred in spite of Bishop de Laval, till a

April, 1821, on the erection of the see of Montreal, and has been kept up till the present time, the most eminent Canadian jurists taking sides in the controversy. Both parties appealed to Rome, and a final decision had not been reached in the beginning of 1876. The Sulpicians François de Fénélon, brother of the author of Télémaque, and Clau-de Trouvé, founded in 1668 the first Iroquois mission at the western extremity of Lake Ontario. In July, 1669, a party of Sulpicians under Dollier de Casson first explored Lake Erie and sailed round it and Lake St. Clair. But their missionary labors were soon necessarily limited to the Indian tribes in the immediate neighborhood of Montreal, where they collected the remnants of the Christian Algonquin and Iroquois tribes into two contiguous settlements at the lake of Two Mountains on the Ottawa. In Montreal city, besides the seminary proper attached to the church of Notre Dame as a parochial residence, founded in 1637, they possess the theological seminary, to which students are sent from every part of the United States, the preparatory seminary or "college of Montreal," founded in 1778, and several other successful churches with their residences.—In April, 1791, at the call of Bishop (afterward Archbishop) Carroll, a band of four Sulpicians and three seminarrians, headed by François Charles Nagot (died 1816), sailed for Baltimore, where they formed for a time the clergy of the cathedral. They sent some of their number to teach in Georgetown college, and founded in Baltimore the theological seminary of St. Mary's, with a collegiate or preparatory school. The seminary was raised by Pope Gregory XVI, to the rank of a Catholic university; the collegiate school was removed to near Ellicott City, Howard co., in 1849, and suppressed in 1852.

SUMACH or Sume (Arab. summak), the common name for plants of the genus rhús (the ancient Greek and Latin name), of the cashew family or anacardiaeeæ, which includes, besides the cashew, the mango and other tropical fruits. The sumachs are represented in the United States by about 12 species, which are shrubs or small trees, with alternate, sometimes simple, but generally trifoliolate or odd-pinnate leaves, and small polygamous flowers in terminal or axillary panicles; the sepals and petals are five, and the stamens, also five, are inserted under the margin of a disk which lines the calyx; fruit a small, dry, nut-like drupe. Our species are separable into several well marked sections or subgenera. 1. The sumachs proper, with pinnate leaves, flowers in a terminal crowded panicle, and the globular fruit clothed with acid hairs; the plants not poisonous, and containing an abundance of tannin. The smooth sumach (rhús glabra) is the most common, often covering extensive tracts of barren soil; it grows from 2 to 12 ft. high, with leaves a foot or more long, consisting of 11 to 31 lance-oblong, pointed, serrate leaflets, which are whitish beneath; the yellowish green flowers appear in June, and are pleasantly fragrant; the fruit, in dense clusters, is of the richest crimson, with a velvety appearance from the number of small hairs; it has a pleasant acid taste, due to the presence of a great abundance of bimulate of lime; an infusion of the berries is sometimes used to make a cooling drink in fevers, and as a gargle in affections of the throat and mouth. The leaves of this species are among the first which put on autumn colors, and show fine tints of yellow and scarlet; a variety in which the leaflets are much subdivided, discovered some years ago in Pennsylvania, is in cultivation for the fern-like beauty of its foliage under the name of cut-leaved sumach. The stag's-horn sumach (R. typhina) is the...
largest of the northern species, sometimes reaching 30 ft., but is usually about 10 ft.; it is readily distinguished from the preceding by the copious soft velvety down which clothes the ends of the branches; the wood and abundant pith are yellowish or orange-colored; the clusters of fruit, at first crimson, turn purple in autumn; they have the same acid properties as the foregoing. The dwarf or mountain sumach (R. copallina) is a remarkably neat shrub, seldom more than 6 or 8 ft. high; the branches are downy, but less conspicuously so than in the stag's-horn sumach, and it is readily distinguished from either of the others by its dark shining leaves, the common petiole to which bears a winged margin; the leaves in autumn turn to a rich purple; fruit similar to the preceding. A very dwarf species of this section, R. pumila, with branches only about a foot high, is found from North Carolina southward in pine barrens; this has been erroneously described as poisonous. 2. The section lobadium includes species in which the flowers are in short ament-like spikes preceding the leaves, fruit flatish, and leaves of three leaflets, not poisonous. The principal species is the fragrant sumach (R. aromatica), a straggling bush 4 or 5 ft. high; its range is from Vermont to Florida, and westward to the Rocky mountains, where it has smaller leaves and has been described as a distinct species (R. trilobata). The leaves of the eastern form are pleasantly fragrant when bruised, and those of the western have a strong and heavy odor; they with other leaves form the kinnikinick or killikinick, smoked by the Indians as a substitute for tobacco. 3. The section cotinus has simple leaves, not poisonous, and flowers in loose panicles. This is represented by the well known Venetian sumach, or smoke tree of the gardens (R. cotinus), sometimes called by nurserymen the purple fringe tree; it is a native of southern Europe, and is rarely over 10 or 12 ft. high; in summer it is nearly enveloped in large, feathery, cloud-like masses, which are at first greenish and later tinged with red; this very showy effect is produced by the little pedicels or stalks of the flower cluster, very few of which bear flowers and fruit, while the abortive ones lengthen greatly, branch, and become plumose with long hairs. This plant was known to the ancients, and has long been used in Greece and other countries for tanning and dyeing. A tree closely resembling this, found in the interior of Alabama, and described by Nuttall as a distinct species (R. cotinoides), is so little known that it is not yet admitted as really different. 4. The toxicodendron group includes two species with white or dun-colored berries in loose panicles and highly poisonous foliage. The poison ivy or poison oak (Rhus toxicodendron) is also in some localities called mercury vine; it has leaves of three leaflets, which are rhombic oblong, and variously notched, lobed, or even entire; its flowers are in loose slender axillary panicles; the smooth fruit is pale brown. This is found nearly all over the country, especially in moist and shady places, and presents two forms, one erect and the other climbing, which were formerly described as distinct species, but run into one another in such a manner that they can hardly be regarded as varieties; it clammers over rocks and fences, and by means of aerial rootlets ascends the trunks of the tallest trees, and adheres with great pertinacity; when wounded it exudes a milky juice, which becomes black upon exposure to the air, and upon fabrics makes a stain indelible by all ordinary solvents; the leaves taken internally promote the secretions of the skin and kidneys. This plant is highly poisonous to many persons. The poison sumach (R. tenenata), also often called poison dogwood and poison elder, is an exceedingly neat and graceful shrub, 6 to 18 ft. high, found in swamps from Canada to Louisiana; the young shoots are purple, or green clouded
with purple, and marked by orange-colored dots which turn grayish; the leaves have 7 to 18 leaflets, which are dark green, pointed, and entire on the margins; the greenish yellow flowers are in loose axillary panicles, and the greenish white fruit hangs in loose clusters on stems 6 or 8 in. long, and remains after the leaves have fallen; the juice is milky, and dries to a black varnish. This has poisonous characters similar to the preceding, but is much more virulent. The susceptibility to the poison varies greatly in different persons; many can handle the plants without any unpleasant results, while others are seriously affected by touching them, or even passing near them. The poisonous properties of these plants are due to a volatile acid named by its discoverer, Prof. J. M. Maisch, toxicoendric. Its effect is an acute eczematous inflammation of the skin, often accompanied by much swelling. The usual remedies are cooling saline purgatives and an external application of lead water. The coral sumach (R. metlopium), a native of the West Indies, is found in the southernmost parts of Florida; it is a tree 15 to 20 ft. high, with leaves of three to seven thick leaflets, and loose clusters of scarlet berries the size of peas; this also is poisonous.—The sumach of commerce formerly consisted entirely of the imported leaves of Rhus cotinaria of southern Europe and northern Africa; it greatly resembles in appearance our stag's-horn sumach (R. typikoa), and like that forms a small tree; it is largely cultivated in Sicily, where the suckers are planted in rows about 4 ft. apart, and the shoots are yearly cut back to within a few inches of the ground, the crop for the next year being furnished by the new stems which push from the stumps; the shoots are dried and threshed, the leaves are finally ground between mill stones and bolted, and the powder is put into sacks of 163 lbs. each for shipment; the product is sometimes adulterated with other leaves, but when pure contains from 30 to 35 per cent. of tannin. Sumach is used for tanning light-colored leathers and in dyeing and calico printing; it yields with different mordants a great variety of tints. Since the civil war the collection and preparation of the leaves of our native sumachs have assumed considerable importance, especially in Virginia, the headquarters of the industry being at Richmond. The plants grow so abundantly in the wild state that cultivation has not been attempted; the smooth, the stag's-horn, and the mountain sumachs are collected indiscriminately, but as the first named is the most abundant, the product consists mainly of that; the gathering begins early in July and continues till frost. The leafy tops of the plants are broken off and carefully dried; the best being that dried in the shade; when dry it is beaten with sticks, and the leaves are taken to the mill to receive the same treatment as that described for Sicilian sumach. American sumach contains from 15 to 20 per cent. or more of tannin.—The Japan wax, or vegetable wax of Japan, is yielded by Rhus succedanea, being found as a thick white coating of the seed within the capsule. To extract it, the bruised seed vessels are boiled in water and the wax skimmed off as it rises to the top; it has much the appearance of white wax (bleached beeswax), but is rather more opaque; it melts at about 127°, saponifies readily, and formed into candles gives a fine clear light; mixed in proper proportions with paraffine, it makes a candle in appearance closely resembling one of wax.—The lacquer of the Japanese is produced by R. verniesfera, a shrub so nearly like our poison sumach in appearance and in poisonous qualities that the two were at one time supposed to be identical. The juice, obtained by wounding the tree, is at first milky, but becomes black on exposure, and is largely used for furniture and various kinds of woodwork. Americans in Japan have become seriously poisoned by coming in contact with newly varnished wares. Dr. Jacob Bigelow many years ago demonstrated that our poison sumach affords a similar product. Other and poisonous species afford lacquer to the natives of China and India.—The singularly shaped Chinese galls are the result of the puncture and deposition of the egg of an insect in the leaf stalks and young shoots of a sumach,
**SUMATRA**

S. minus, of northern India, China, and Japan; the galls are very irregular in shape, 1 to 2½ in. long, mostly egg-shaped, with various knotty protuberances, and often lobed, velvety with a green face; they are more or less brittle shells about ½ in. thick, breaking with a shining fracture, and containing about 70 per cent. of tannin. In 1873, 8,021 cwt. of these galls were imported into Great Britain alone.

**SUMAROKOFF, Alexei Petrovich, a Russian dramatist, born in Moscow in November, 1727, died there in October, 1777. He was educated at St. Petersburg, and the empress Elizabeth placed him in the school of cadets. In 1756 he founded the first national theatre at St. Petersburg, and became its director with the rank of brigadier general. Catharine II. made him councillor of state. He modelled his plays after Corneille, Racine, and Voltaire. Among his tragedies are Khoreff and Sinaff i Truxor. He also wrote prose works, satires, and other poetry. His complete writings (10 vols., 1787) have passed through several editions.

**SUMATRA** (Sans. Samudra, the ocean), an island of the Indian archipelago, in the Indo-Malay group, lying directly under the equator, S. W. of the Malay peninsula and parallel to it, between lat. 5° 40' N. and 5° 55' S., and lon. 95° 20' and 106° 5' E.; bounded N. by the bay of Bengal, N. E. by the strait of Malacca, E. by the Chinese sea, the strait of Banca, and the Java sea, S. by the strait of Mandana, and S. W. by the Indian ocean; extreme length 1,050 m., greatest breadth 250 m.; area, 160,000 sq. m.; pop. estimated at from 8,000,000 to 4,000,000. About three fourths of the island is subject to the Netherlands, a portion directly, and the rest through dependent native rulers. To the first class belong four colonial establishments, which include the adjoining islands: 1. The government officially known as Sumatra's West Coast, comprising the western seaboard from lat. 3° 30' N. to 1° 55' S., and including the residencies of Tapanuli and Padang, an aggregate area, about 47,000 sq. m.; pop. in 1873, 1,620,979. 2. Bencoolen, on the S. W. coast, described under its own title. 3. Lampong, at the S. extremity of the island; area, 10,000 sq. m.; pop. 112,371. 4. Palembang, on the S. E. coast opposite Banca. (See PALEMBANG.) The principal native state in Sumatra is Acheen, which embraces the northern end of the island from coast to coast, and is wholly independent of the Dutch. (See ACHENE.) The territory of the cannibal Batakas extends southward from Acheen, along the interior, to the border of the colonial districts of the W. coast. The largest native countries in the east are Siak, lodet velvet, and the S. extremity of Malacca, and Jambi, between Siak and the Dutch residency of Palembang.—The physical conformation of Sumatra resembles that of Java in the long volcanic range which extends throughout the island, although the active volcanoes are not nearly so numerous, and probably do not exceed five. The range is near the W. coast, from which it is separated by a strip of lowlands from less than 20 to 30 m. wide, above which the mountains rise abruptly to a height of 1,000 m. along many lofty peaks. They form four or five parallel ridges with elevated plateaus between them. There are four summits over 10,000 ft., high, and six others over 5,000 ft. Mt. Berapi, just S. of the equator (12,000 ft.), is the centre of a volcanic district containing numerous hot springs, and continually emits vapor. The altitude of Mt. Ophir (or Passaman peak), at the equator, and Mt. Indrapura, in lat. 1° 38' S., is estimated at upward of 12,000 ft., and a height of 11,000 ft. is assigned to the Abong-Abong mountain, which rises from the very centre of the undeveloped interior of Acheen. The portion of Sumatra which lies eastward of the great linear volcanic range is a vast low and comparatively level forest region, watered by numerous and extensive rivers, and subject to frequent inundation near the coast. The formation of this great plain is alluvial, and comparatively recent in geological time, while the W. coast is believed to be gradually wearing away. According to Wallace, Sumatra was formerly connected with the Malay peninsula, and also with Borneo. In western Sumatra the underlying formation consists of granite and syenite, overspread with mud and coral, sandstone, and lava and other volcanic products. Limestone and marble occur in Padang, and there are extensive coal beds in the island, but of very recent origin. Sumatra has long been noted for its yield of gold, which is still considerable, being derived from the beds of the rivers, particularly the Indragiri, the Jambi, and their tributaries. Iron, copper, tin, sulphur, and petroleum are also found.—The coast is about 2,500 m. in circuit. The island terminates on the northwest in Acheen head and on the northeast in Diamond point. Between these points stretches the N. coast of Acheen, formerly known as the Pelir coast, on which is the town of Passier, believed to be the first place to which the name Sumatra (see SUMATRA) was applied. The shore is high and bold, and the anchorage is mostly in open roadsteads. The N. E. coast is low, and from the narrowest part of the strait of Malacca southward to the strait of Sunda it is bordered by extensive banks of mud and sand, making navigation intricate and dangerous. The entire W. coast is exposed to a very heavy surf, and more especially that portion which lies S. of the equator. It is indentured by several excellent harbors, that of Tapanuli being considered one of the finest in the world. Parallel to it and about 400 m. distant is a chain of islands, between lat. 3° N. and 5° 30' S., comprising several of considerable size, including Pulo Babi or Hog island (50 m. long), Pulo Nias (70 m.), Siberu, Sipora, the Pugi islands, and Engano. Most of them are high, well wooded, and thickly inhabited. The chief islands off the E. coast
are Banca and Rupat, the latter in lat. 2° N., extending about 25 m. each way, and separated from Sumatra by a narrow strait, only navigable by small vessels. The large rivers of Sumatra flow down the eastern watershed, and although there are many rivers on the W. coast, they all have short courses and are very rapid. The principal eastern watercourses are the Rakan, flowing northward from the equator; the Siak, 200 m. long, in the native state of Siak; the Kamper, still further S.; the Indragiri, having a general eastward course not far from the 1st parallel of S. latitude, and said to be 300 m. long; the Jambi, in the country of that name; and the Musi or Palembang, falling into the strait of Banca, the largest river in Sumatra and navigable 200 m. inland. In the lower part of their courses these rivers are very sluggish, and they all have extensive deltas. Among the mountains in the west are several lakes, of which the best known is Sinkara, nearly 1° S. of the equator, at a height of 1,700 ft. above the sea. It is 10 m. long, 3 m. broad, and 1,182 ft. deep. The Maindyu lake, in the same region, occupies the elliptic crater of an extinct volcano, and is 6 m. long by 4 m. in width, with a depth of 2,060 ft. The climate of Sumatra is warm and moist, the thermometer ranging throughout the year between 76° and 86°. There are about 200 days of rain in the year on the Padang plateau, 2,400 ft. above the ocean. During the N. W. monsoon, which blows from November to January, the weather is excessively rainy; but from June to September, when the S. E. monsoon prevails, the rainfall is limited to showers. Except in the marshy districts, the coasts are moderately healthful. Sumatra is overspread with vast forests, rich in the most valuable products of the tropics. Much of the E. coast is covered with mangrove bushes. Further inland are found palms, and trees of gigantic growth. There are more than 100 ft. high. On the W. shore, besides the myrtle and several varieties of fig, all the fruit trees common to the archipelago abound, and most of the mountains are covered to their summits with jungle. In the forests are many valuable timber trees, immense tree ferns, bamboos, rattans, the camphor tree, caoutchouc, and benzoin. The parasitic Rufifera bears a flower with a calyx a yard in diameter. The soil of Sumatra is remarkable for its fertility, and yields large and valuable crops of rice, coffee, pepper, and tobacco, and some cotton. The coconut tree, the betelnut, and the sago palm also afford important products. There is a considerable export of coffee to the United States from Padang, where it is grown on the plateau. In Acheen pepper is the chief crop. The Sumatran fauna corresponds closely with that of Java and Borneo, the other great islands of the Indo-Malay group. Of the quadrupedal, it comprises 11 species, among them the siamang ape, and the orang-utang, whose sole other habitat is Borneo; it is believed to be confined to the N. W. portion of Sumatra. The tiger, the two-horned rhinoceros, and the elephant (E. Sumatrana) are all found on the island. Many elephants were tamed in former times, but no attempt is now made to domesticate them. Other mammals are the musk deer and great Malay sun bear, the tapir, the flying lemur, the Malayan sun bear, squirrels, and bats. There are many beautiful pheasants, parrots, partridges, woodpeckers, herons, and the large hornbill. Crocodiles and pythons are the most formidable reptiles. The forms of insect life are numerous and varied, including 21 popilionidae, among which is the leaf butterfly. In many parts of the island travelling is rendered uncomfortable by swarms of leeches and mosquitoes. Buffaloes, horses, goats, and Chinese pigs are the common domestic animals. The inhabitants of Sumatra are of the Malay race, of which the island is supposed to have been the cradle. They are divided into several tribes, who speak languages that are considered as dialects of one common tongue. There are tribes in the interior whose origin is involved in obscurity. The people of the N. part of Sumatra, about Acheen, are taller, stouter, and of darker complexion than the other tribes, and are supposed to have a considerable infusion of Hindoo blood. The Bataks or Battas, who occupy the country immediately S. of these people, are smaller and of lighter complexion, and in some respects a very singular race. (See Batak.) Mohammedanism is the prevailing religion, but it is in a relaxed state, and the people of the interior cannot be said to belong to any particular faith. Polygamy is not common except among the chiefs. The Malays round the coast appear to be collected from different parts of the archipelago, and it is estimated that more than 6,000 Chinese have settled in the Dutch possessions. Among the natives the customary dress is a loose, trowsers reaching to the knee; the upper part of the body is commonly uncovered in both sexes, but a scarf is sometimes worn about the shoulders. The houses are raised on posts or pillars from 4 to 8 ft. from the ground, and in some parts of the country they are erected in trees. Those of the poorer classes are made of bamboo and thatched with grass, but the houses of the more wealthy are generally framed of wood and the sides enclosed by large sheets of bark. Agriculture is in a very rude state. The only important manufactures are of textiles and cloth for domestic purposes. Iron for native use is now wholly imported. The trade of Sumatra is principally carried on with Java, Madura, Singapore, Malacca, Penang, and British India. The chief exports are pepper, gold dust, camphor, nutmegs, cloves, mace, benzoin, gutta percha, copper, tin, sulphur, and coral. —For administrative purposes the Dutch colonial possessions are divided into districts, each under a controller, who visits the various villages from time to time. The native inhabi-
tants are forbidden to bear firearms. The entire number of Europeans in the country probably does not exceed 2,000. The chief towns are Aceh in the north, Palembang in the southeast, Bencoolen in the southwest, and Padang on the W. coast.—The first historical notice of Sumatra occurs in Arab manuscripts written in the 9th century. The island was visited in 1292 by Marco Polo, who described it very accurately under the name of Java the Less. It began to be known to foreigners as Sumatra in the last half of the 14th century. Before the middle of the 15th century it was reached by the Venetian traveller Nicolò di Conti. The Portuguese first arrived there in 1509, visiting the Acehnese coast, where they found a powerful king, who effectually opposed their efforts to obtain a footing. The hostilities thus begun between Portugal and Aceh were continued with but little intermission till 1641, when the Portuguese lost Malacca. Sumatra was first visited by the Dutch in 1599 and by the English in 1602. The Dutch formed a settlement at Padang in 1649, got possession of some districts in the S. part of the island, and established several factories. In 1795 all their Sumatran territories fell into the hands of the English, who had established a station at Bencoolen in 1685. They were restored in 1815, but Bencoolen was retained till 1824, when all the British possessions in Sumatra were ceded to the Netherlands in exchange for Malacca and small settlements upon the coasts of India. The Dutch have since found means to annex a great extent of territory. At the time of the treaty of 1824, the Dutch government pledged itself not to assail Aceh, but for many years the prevalence of piracy and the ill treatment of foreign vessels on the N. coast have led to much complaint. All objections on the part of Great Britain to the extension of Dutch rule in Sumatra were removed by a treaty made in 1871, and in consequence of repeated violations of faith on the part of the sultan of Aceh, a naval and military expedition was despatched from the Netherlands to the N. coast of Sumatra in 1875. It was repulsed by the Acehnese with heavy loss, and the war has since been carried on with varying success.

SUMBAWA, an island of the Indian archipelago, in the Sunda chain, lying between Flores on the east and Lombok on the west, the S. W. point in lat. 9° 2', S., lon. 116° 42' E.; length E. and W. about 170 m., extreme breadth 50 m.; estimated area, 6,000 sq. m.; pop. about 80,000. Wallace classifies it zoologically in the Timor group. A deep bay penetrates the N. coast, and it is separated from Flores by Sapi and Mangeralistraits, between which lies the island of Cabo. Sumbawa is divided into six native states, each governed by a rajah who acknowledges the supremacy of the Dutch. They are Tombor and Sumbawa on the N. coast, Bima on the E. coast, where the Dutch have a resident, and Dampo, Sangar, and Papakat. The island is mountainous, and lies within the volcanic belt of the Indian archipelago, containing Mt. Tomboro, a volcano near the N. coast, 8,940 ft. high, the eruption of which in 1815 caused a subsidence of the surface, and was characterized by tremendous explosions which were heard over an area having a radius of more than 800 m. Nearly 12,000 persons were killed; the ashes fell in Java and Flores to the depth of several inches, and even in Sumatra, 840 m. from the volcano. In Lombok immense damage was done and many lives were lost. In 1836 a less destructive eruption occurred. Gold, sulphur, and saltpetre are found. Sumbawa is not well wooded, but sandal and sapan wood and teak occur to a limited extent. It has one of the best breeds of horses in the Indian archipelago, and they are extensively exported. The pearl oyster is found. The manners and language of the natives strongly resemble those of the inhabitants of Celebes. The island has been subject to the Dutch since 1676.

SUMMER, the warm season of the year, including astronomically the time between the vernal and autumnal equinoxes, or from about the 21st of June until about the 22nd of September. The calendar summer comprises in the United States the months of June, July, and August; in England, May, June, and July. In the southern hemisphere the summer months are December, January, and February according to the American method of regarding the seasons, or November, December, and January according to the English method. Between the tropics there is no summer properly so called, the hottest times being those when the sun passes to the zenith at noon, which at the equator will correspond to the vernal and autumnal equinoxes, the two dates being on our summer side of the equinoctes for places N. of the equator, and on our winter side in places S. of the equator. The Indian summer is a period of warm, pleasant weather, which usually occurs every year over the northern portion of the United States after the autumnal storms, and continues often without interruption two or three weeks. It appears to be a more decided season in the interior than near the coast, and in the region of the great lakes is especially noticeable, the waters during its continuance remaining placid, and the atmosphere filled with a peculiar haziness. The Indians regarded it as the gift of their most honored deity, the god of the southwest, who sends the S. W. winds, and to whom they believed their souls to go after their decease.

SUMMERFIELD, John, an American clergyman, born in Preston, England, Jan. 31, 1798, died in New York, June 13, 1825. He was educated at a Moravian school, returned to Dublin in 1813, joined the Wesleyan society at the age of 19, and became a preacher. In 1821 he removed to New York, where his eloquence drew crowds to hear him. In 1822 he visited Philadelphia, Baltimore, and Wash-
SUMMER RED BIRD

ington, and in December went to Paris, and then to England. In 1824 he returned to New York, and continued for a time to travel and preach. He was a founder of the American tract society. His biography has been written by John Holland (8vo, New York, 1829), and by William M. Willett (Philadelphia, 1857). His "Sermons and Sketches of Sermons" were published at New York in 1842.

SUMMER RED BIRD. See Taxagen.

SUMMERS, a central county of West Virginia, bounded S. W. by the Meadow river, and intersected by Gauley river. It has been formed since the census of 1870 from Nicholas co. The surface is greatly diversified, and the valleys are productive. The staples are wheat, corn, oats, hay, and dairy products. Capital, Hinton.

SUMMERS, Thomas Osmond, an American clergyman, born near Corfe Castle, Dorsetshire, England, Oct. 11, 1812. He emigrated to the United States in 1830, and became a preacher of the Methodist Episcopal church, at first in Virginia. In 1840 he went to Texas as one of nine ministers to constitute the first conference there. In 1844 he joined the Alabama conference, and as secretary of the convention at Louisville, Ky., assisted in organizing the Methodist Episcopal church, South. By appointment, he assisted in editing the "Southern Christian Advocate" and in compiling a new hymn book. In 1850 the general conference elected him editor of their books and tracts, and of the "Sunday School Visitor," and in 1858 also of the "Quarterly Review." In 1866 he was elected editor of the "Nashville Christian Advocate," and in 1874 professor of systematic theology in the new Vanderbilt university, Nashville, Tenn. His writings include "Commentaries on the Gospels and on the Acts of the Apostles;" "Commentary on the Ritual of the M. E. Church, South;" "A Treatise on Baptism;" "A Treatise on Holiness;" "Sunday School Teacher, or the Catechetical Office;" "Seasons, Months, and Days;" "Talks Pleasant and Profitable;" "The Golden Censer;" "Scripture Catechism" (2 vols., Old and New Testament); "Refutation of Thomas Paine's Theological Writings;" and an enlargement and revision of Watson's "Biblical and Theological Dictionary."

SUMMIT. I. A N. E. county of Ohio, drained by the Cuyahoga river and the head streams of the Tuscarawas, and traversed by the Ohio canal and several railroads; area, 400 sq. m.; pop. in 1870, 34,674. It is the most elevated land on the line of the Ohio canal. The surface is uneven and the soil highly fertile. Coal is mined in large quantities. Water power abounds. The chief productions in 1873 were 307,123 bushels of wheat, 685,619 of Indian corn, 386,714 of oats, 98,889 of potatoes, 352,587 tons of hay, 105,639 lbs. of wool, 749,370 of butter, and 1,586,842 of cheese. In 1874 there were 8,223 horses, 28,911 cattle, 28,065 sheep, and 9,594 hogs. In 1870 there were 5 manufactories of agricultural imple-

ments, 10 of brick, 28 of carriages and wagons, 11 of cheese, 16 of cooperage, 1 of cutlery and edge tools, 1 of anchors and chains, 8 of iron castings, 9 of tanned and 6 of curried leather, 7 of machinery, 3 of paper, 26 of stone and earthen ware, 3 of woollen goods, 10 flour mills, and 15 saw mills. Capital, Akron. II. A N. W. county of Colorado, bounding on Utah, and watered by the Grand, White, and Bear rivers; area, about 8,500 sq. m.; pop. in 1870, 288. This county formerly occupied the whole N. W. corner of the territory W. of the Rocky mountains, but in 1874 Grand co., with an area of about 11,000 sq. m., was formed from the N. portion. The E. includes a portion of the Middle park, and is crossed by the Rocky mountains. The W. portion is densely timbered with pine and spruce, and there are immense beds of coal. Gold, copper, lead, iron, and zinc are found. On the Grand and Blue rivers and their tributaries are good grazing lands; little is known of the agricultural capabilities of the county. The population is chiefly in the S. E. corner, on the head waters of the Blue river, and is almost exclusively engaged in gold placer mining. Capital, Breckenridge. III. A N. E. county of Utah, bordering on Wyoming, and containing the head waters of Bear and Weber rivers; area, 1,250 sq. m.; pop. in 1870, 2,512. It is crossed by the Union Pacific railroad. The surface is mountainous. Coal, gold, silver, and lead are found. The chief productions in 1870 were 18,855 bushels of wheat, 2,028 of oats, 1,362 of barley, 15,149 of potatoes, 13,540 lbs. of butter, and 2,560 tons of hay. The value of live stock was $65,353. Capital, Coalville.

SUMNER. I. A N. central county of Mississippi, formed in 1874 from Choctaw, Montgomery, and Oktibbeha counties; area, 408 sq. m.; pop. about 8,000. It is drained by the Big Black river. The surface is somewhat undulating and the soil productive. The chief crops are Indian corn, sweet potatoes, and cotton. Capital, Mt. Tabor. II. A N. county of Tennessee, bordering on Kentucky, bounded S. by the Cumberland river and drained by affluents of Big Barren river; area, about 500 sq. m.; pop. in 1870, 23,711, of whom 7,777 were colored. The surface is undulating and the soil fertile. The Louisville, Nashville, and Great Southern railroad passes through it. The chief productions in 1870 were 169,114 bushels of wheat, 1,155,914 of Indian corn, 238,837 of oats, 35,253 of Irish and 25,074 of sweet potatoes, 4,921 tons of hay, 909,668 lbs. of tobacco, 88,860 of wool, 224,295 of butter, 15,665 of honey, and 88,560 gallons of sorghum molasses. There were 7,762 horses, 3,073 mules and asses, 5,378 milk cows, 9,500 other cattle, 20,421 sheep, and 37,504 swine. Capital, Gallatin. III. A S. county of Kansas, bordering on Indian territory, and intersected in the northeast by the Arkansas river; area, 1,152 sq. m.; pop. in 1870, 22; in 1875, 4,925. It consists of fertile prairies. Capital, Sumner.
CHARLES SUMNER, an American statesman, born in Boston, Mass., Jan. 6, 1811, died in Washington, D. C., March 11, 1874. His father, who died in 1839, was a graduate of Harvard college, a lawyer, and for 14 years high sheriff of the county of Suffolk. The son received his early education at the Boston Latin school, and graduated at Harvard college in 1850. He was appointed reporter of the circuit court of the United States, in which capacity he prepared three volumes known as "Sumner's Reports," containing decisions of Judge Story. He also at the same time edited the "American Jurist," a quarterly law journal of high reputation. During the first three winters after his admission to the bar, while Judge Story was absent in Washington, Mr. Sumner was appointed librarian to the law students, and part of the time he had sole charge of the school. His favorite topics were those relating to constitutional law and the law of nations. He visited Europe in 1837, travelled in Italy, Germany, and France, and resided for nearly a year in England. He carried to England a letter of introduction from Judge Story, in which he was described as "a young lawyer giving promise of the most eminent distinction in his profession, with truly extraordinary attainments, literary and judicial; and a gentleman of the highest purity and propriety of character." He was received with unusual distinction in the highest circles, was introduced by eminent statesmen on the floor of the houses of parliament, and invited by the chief judges to sit with them in Westminster hall. He returned to Boston in 1840, and in 1844-6 published an elaborate edition with annotations of "Vesey's Reports" in 20 volumes, and in 1846 was elected to the house of representatives at the age of 35. He was not a member of either house for more than three years. In 1848 he made an address to the New Hampshire convention of Massachusetts on "The Antislavery Duties of the Whig Party," and shortly afterward published a letter of rebuke to Mr. Robert C. Winthrop, who then represented Boston in congress, for his vote in favor of the war with Mexico. These steps led eventually to Mr. Sumner's separation from the whig party and association with the free-soilers, to whose candidates, Van Buren and Adams, he lent efficient support in the presidential contest of 1848. After the withdrawal of Mr. Webster from the senate of the United States by his entrance into the cabinet of Mr. Fillmore in 1850, Mr. Sumner was nominated for the vacancy by a coalition of free-soilers and democrats in the Massachusetts legislature, and was elected on April 24, 1851, after a most earnest and protracted contest. He took his seat on Dec. 1, 1851, and retained it by successive refactions till his death. His first important speech was upon the fugitive slave act, against which he argued that congress had no power under the constitution to legislate for the rendition of fugitive slaves; and that if it had, the act in many essential particulars conflicted with the constitution, and was also cruel and tyrannical. In this speech Mr. Sumner laid down as a guide for political action the formula to which he ever afterward adhered, that "freedom is national and slavery sectional." In the debate on the repeal of the Missouri compromise, in the contest in Kansas, Mr. Sumner took a very prominent part. His last speech upon this topic, which was printed under the title of "The Crime against Kansas," occupied two days in its delivery, May 19 and 20, 1856. Some passages in it greatly incensed the members of congress from South Carolina, one of whom, Preston S. Brooks, on May 22 assaulted Mr. Sumner while he was writing at his desk in the senate chamber, and with a gutta percha cane struck him on the head till he fell to the floor insensible. (See Brooks, Paesinos S.) The injury thus received proved very serious, and was followed by a severe and long disability, from which his recovery was not complete till three or four years later. His term of office as senator expired March 4, 1857, and in the preceding January the legislature of Massachusetts reelected him by a unanimous vote in the senate, while in the house of representatives, consisting of several hundred members, he received all but seven votes. Under the advice of physicians he went to Europe for the benefit of his health in March, 1857, and returned in the autumn to resume his seat in the senate. His health being still impaired, he went abroad again in May, 1858, remaining till the autumn of 1859, and submitted to a course of extraordinarily severe medical treatment in Paris. His next serious effort was an elaborate speech in the senate, denouncing the influence of slavery on character, society, and civilization, which was printed under the title of "The Barbarism of Slavery." In the presidential contest of 1860 he made several speeches in behalf of Abraham Lincoln and Hannibal Hamlin. In the senate and in popular addresses during the civil war he earnestly opposed all concession to or compromise with slavery, and early proposed emancipation as the speedi-
est mode of bringing the war to a close. He based his arguments not only on moral and historical, but on constitutional grounds, and always claimed that his positions were in strict accordance with the constitution of the United States. In March, 1861, when the republican party obtained the control of the senate, Mr. Sumner was made chairman of the committee on foreign relations. On Jan. 9, 1862, he delivered an elaborate speech arguing that the seizure of Messrs. Mason and Slidell on board the steamers Trent was unjustifiable on the principles of international law which had always been maintained by the United States. This speech had great influence in reconciling the public to the surrender of the confederate envoys. Later in the war he made powerful speeches on "Our Foreign Relations" (1863), and on "The Case of the Florida" (1864), and in 1865 he pronounced a eulogy on President Lincoln. A speech upon our claims on England, April 13, 1869, caused great excitement and indignation in Great Britain, where it was erroneously supposed to threaten war and regarded as an attempt to excite the popular feeling against that country by exaggerating the "consequential damages" she had incurred in recognizing the belligerency of the seceding states and in allowing the confederate cruisers to sail from her ports. In the same year his opposition to the Santo Domingo treaty, against which he delivered a speech in the senate, brought him into collision with the administration of President Grant, and led to his removal in March, 1870, from the chairmanship of the committee on foreign relations, and ultimately to his separation from the republican party and his support of Horace Greeley, the liberal republican and democratic candidate for president in 1872. In the spring of that year he had delivered in the senate an animated speech against the renomination of President Grant, which did not have the weight he expected with the republican convention that met shortly afterward. On Sept. 11 a convention of democrats and liberal republicans, held at Worcester, Mass., nominated him for governor of the state; but he had already gone to Europe for medical advice, and when the news of his nomination reached him in England he declined it. He returned from Europe late in 1872, and on taking his seat in the senate reintroduced two measures which he had unsuccessfully proposed before. One was the civil rights bill, the other a resolution providing that the names of the battles won over fellow citizens in the civil war should be removed from the regimental colors of the army and from the army register. This last resolution was strongly denounced, and led to a vote of censure on him by the legislature of Massachusetts in 1873, which was rescinded in 1874, shortly before his death. He died of angina pectoris, after an illness of a few hours. Mr. Sumner's addresses were first collected under the title of "Orations and Speeches" (2 vols. 12mo, Boston, 1850), to which was added "Recent Speeches and Addresses" (12 vols., Boston, 1856). During the last years of his life he prepared a final and complete collection entitled "The Works of Charles Sumner" (12 vols., Boston, 1871-5). Two or more three volumes are to appear, under the charge of his executors, of whom the chief is Prof. Longfellow.—See "A Memorial of Charles Sumner," published by order of the legislature of Massachusetts (Boston, 1874), and "Life and Public Services of Charles Sumner," by C. Edwards Lester (New York, 1874).

SUMNER, John Bird, an English clergyman, born at Kenilworth, Warwickshire, in 1780, died in London, Sept. 6, 1862. He graduated at Cambridge, and in 1820 became canon of Durham, in 1828 bishop of Chester, and in 1848 archbishop of Canterbury. He was a leader of the evangelical school in the church of England, and while he was primate of England occurred the controversy about the work entitled "Essays and Reviews," and also the revival of the synodical power of the convocations. He published an essay on "Apostolical Preaching" (London, 1815); "The Records of Creation" (2 vols., 1816), which won the second Burnet prize of £400; "Evidences of Christianity" (1824); and a volume of selections entitled "Practical Reflections" (1859).

SUMTER, the name of four counties in the United States. I. An E. county of South Carolina, bounded W. by the Wateree river, and drained by Black river and its affluents; area, about 600 sq. m.; pop. in 1870, 31,480, of whom 28,086 were colored. The surface is generally undulating and the soil fertile, and there are extensive forests of pine. It is intersected by the Wilmington, Columbia, and Augusta railroad and its branch. The chief productions in 1870 were 189,089 bushels of Indian corn, 36,113 of sweet potatoes, 7,212 bales of cotton, 245,325 lbs. of rice, and 2,282 tons of hay. There were 905 horses, 1,126 mules and asses, 1,699 milk cows, 2,630 other cattle, 1,076 sheep, and 658 swine; 6 manufactories of carriages and wagons, 4 of tar and turpentine, and 5 saw mills. Capital, Sumter Court House. II. A S. W. county of Georgia, bounded E. by Flint river; area, about 600 sq. m.; pop. in 1870, 16,559, of whom 10,639 were colored. The color is level and the soil fertile. It is traversed by the Southwestern railroad. The chief productions in 1870 were 280,379 bushels of Indian corn, 22,085 of oats, 11,516 of peas and beans, 40,994 of sweet potatoes, 12,823 bales of cotton, 61,021 lbs. of butter, and 15,310 gallons of molasses. There were 654 horses, 1,796 mules and asses, 1,768 milk cows, 878 other cattle, 852 sheep, and 7,674 swine. Capital, Americus. III. A central county of Florida, bounded W. by the Withlacoochee river; area, 1,370 sq. m.; pop. in 1870, 2,952, of whom 280 were colored. The surface is generally level and swampy, and there are several small lakes.
The chief productions in 1870 were 67,278 bushels of Indian corn, 112,620 of sweet potatoes, 8,800 lbs. of rice, 501 bales of cotton, and 18,650 gallons of molasses. There were 14,995 cattle and 5,480 swine. Capital, Leesburg.

IV. A W. county of Alabama, bordering on Mississippi, bounded E. by the Tombigbee and intersected by the Noxubee river; area, about 800 sq. m.; pop. in 1870, 24,109, of whom 18,907 were colored. The surface is uneven and the soil fertile. It has water communication by the Tombigbee river, and is intersected by the Alabama and Chattanoog railroad and a branch of the Mobile and Ohio. The chief productions in 1870 were 334,110 bushels of wheat, 14,941 of sweet potatoes, 2,513 lbs. of wool, and 11,646 bales of cotton. There were 1,243 horses, 1,957 mules and asses, 2,097 milch cows, 988 working oxen, 3,644 other cattle, 2,249 sheep, and 8,024 swine. Capital, Livingston.

SUMTER, Fort, a work built upon an artificial island near the entrance of the harbor of Charleston, S. C., which it was designed to protect from surface ships. It was about 23 m. from Castle Pinckney, the fort near the point of the peninsula upon which Charleston is built, and about half that distance from Fort Moultrie on Sullivan's island. It was intended to mount 140 heavy guns, in three tiers; but at the close of 1860 the fort was still incomplete, few of the guns being mounted. The United States garrison, numbering 199 men, of whom only 63 were combatants, under Major Robert Anderson, occupied Fort Moultrie. On the night of Dec. 28 Major Anderson, learning that the secessionists had made preparations to capture Fort Moultrie and seize the other fortifications near Charleston, transferred his force to Fort Sumter. Here he was able to mount only 52 of the lighter guns. About the same time commissioners were sent by the state authorities to demand from the government of the United States the surrender of all the forts in South Carolina. President Buchanan refused, and Fort Sumter was virtually in a state of siege. Early in January, 1861, an unsuccessful attempt was made to throw in supplies, by means of an expedition from New York in the steamer Star of the West. On April 11 Gen. Beauregard, who had been placed in command of the forces raised by the confederate government, and had constructed powerful batteries on every point commanding Fort Sumter, demanded the immediate surrender of the fort. Major Anderson refused, but said that if he was not reinforced by the 15th he would evacuate the fort; to which Beauregard responded that he would open fire at about half past 4 on the morning of April 12. Fire was accordingly opened, and in a few hours the works were seriously damaged. The bombardment was fiercely continued, but no one was hurt. The provisions and ammunition being nearly exhausted, the evacuation of the fort was agreed upon on the afternoon of the 13th, and on the 14th Major Anderson marched out with flying colors. The confederates strengthened the fort and put in a strong garrison, and until near the close of the war it formed the main defence of Charleston. In April, 1863, it was unsuccessfully bombarded by a monitor fleet under Admiral Du Pont. Still later it was subjected to a heavy fire from batteries erected on Morris island, and reduced almost to a mass of shapeless ruins; but every direct attempt to take it failed, and it fell into Union hands only when Charleston was finally abandoned by the confederates in February, 1865.

(See Charleston.) On April 14, 1865, just four years after the surrender, the Union flag, the same which had been lowered in 1861, was again formally raised over the dilapidated walls of Fort Sumter.

SUMTER, Thomas, an American revolutionary general, born in Virginia in 1784, died near Camden, S. C., June 1, 1832. He was a volunteer in the French and Indian war, was present at Braddock's defeat, and in March, 1776, became lieutenant colonel of the second regiment of South Carolina riflemen. After the capture of Charleston by the British in 1780, he took refuge in the swamps of the Santee, and, with the rank of brigadier general, became one of the most active and able partisan leaders of the south. On July 12 he defeated a British detachment on the Catawba, but on Aug. 18 was surprised and routed at Fishing creek by Tarleton. He collected another corps, and on Nov. 12 deceased Col. Wemys, who had attacked his camp in Chester district near Broad river. A few days later Tarleton attempted to surprise him while encamped at Blackstocks on the Tiger river, but was compelled to retreat with severe loss. Sumter was severely wounded in this encounter; but in March, 1781, he raised three new regiments, and, in concert with Marion, Pickens, and others, harassed the enemy's scattered posts in the low country. In January, 1781, congress passed a resolution of thanks to him and his men. He was a member of congress from South Carolina in 1789-'93, and United States senator in 1801-'03; and in 1809 he was appointed minister to Brazil, where he remained two years. He was the last surviving general of the revolution.

SUN, the central ruling body of the planetary system, and the greatest source of light and heat. The visible orb of the sun, as distinguished from the complex structure of which that orb is but a part, is a globe about 859,000 m. in diameter. So far as observation extends, this globe is spherical in shape, no difference having been detected in the polar and equatorial diameters. In fact, no single set of measurements, however carefully made, could lead to the conclusion that there is any compression in the solar orb, since the equality of the diameters results not from a single set of measures, but from comparisons between many thousands of observations made at Greenwich, Paris, Washington, and other leading observa-
tories. The volume of the sun exceeds the earth's nearly 1,258,000 times. His mean density is almost exactly equal to one fourth of the earth's, so that his mass exceeds hers about 316,000 times. Gravity at the visible boundary of the solar globe exceeds gravity at the earth's surface about 27:1 times; and a body dropped from rest near the sun's surface would fall through 430 ft. in the first second, and have acquired a velocity of 872 ft. a second, or about 10 m. a minute. The sun's mass exceeds the combined mass of all the planets about 750 times. His mean distance from the earth has been estimated at about 91,430,000 m.; though we may expect that the results obtained during the late transit of Venus (December, 1874) and to be obtained during the coming transit (December, 1882) will lead to some correction of this estimate. It already appears probable that the sun's estimated mean distance must be increased to about 92,000,000 m. The greatest and least distances of the sun from the earth (assuming his mean distance to be 91,430,000 m.) are respectively 92,963,000 and 89,897,000 m.; and his apparent diameter varies from 31° 31' 8" to 32° 36' 4" as he passes from his greatest to his least distance.—The sun has an apparent motion among the stars from west to east along the great circle called the ecliptic (see ECLIPTIC), making a complete circuit of the heavens in 365 days, 6 hours, 9 minutes, and 9-6 seconds, though the passage from vernal equinox to vernal equinox (first point of Aries) occupies only 356d. 6h. 48m. 45-9s., because of the precession of the equinoxes. (See PRECESSION.) These two periods are called respectively the sidereal year and the tropical year. There is one other astronomical year (besides the civil, Julian, and lunar years) known as the anomalistic year, being the interval separating successive passages of the perigee of the solar path, viewed geometrically; its length amounts to 355d. 6h. 18m. 49-3s. The apparent motion of the sun is not uniform in the ecliptic, owing to the eccentricity of the earth's orbit; it is greatest about Dec. 31 to Jan. 1, when he moves through 1° 1' 9" in 24h., and least about June 30—July 1, when he only moves through 9° 57' 11-5" in 24h. The sun has also three real motions: 1, an axial rotation, the nature of which will presently be described; 2, a motion about the centre of gravity of the whole solar system, but in consequence of the great superiority of his mass over that of all the other bodies this centre of inertia is always within the sun's volume; 3, a progressive motion in space toward the direction of the constellation Hercules, the rate of which has been estimated at 150,000,-000 m. per annum, but on evidence exceedingly questionable. The fact of solar motion toward Hercules is as nearly certain as possible, but the rate of this motion is not known. Recent researches suggest that it is far greater than the rate just mentioned, great though that rate may appear.—Examined with a tele-

scope, the sun's surface, which appears very nearly uniform to the naked eye, is seen to be brightest near the centre, and to grow progressively darker toward the circumference. It is also marked by various irregularities, spots, faculae, mottling, besides other appearances requiring greater telescopic power for their detection. The spots on the sun were independently discovered by Galileo, Fabricius, Scheiner, and Harriot. It was soon perceived that they move in such a way as to indicate that they are real surface markings, not bodies passing between the earth and the sun, and that therefore the sun's rotation can be measured by observing them. It was found that the sun rotates in a period of about 25¾ days; and as the spots do not at all times pass on straight lines across the sun's face, but sometimes on a course slightly bowed upward and at others on a course slightly bowed downward, it was seen that the sun's axis of rotation is not quite upright as referred to the plane of the ecliptic, but slightly inclined. The following elements of the sun's rotation belong to the astronomy of recent times, having been deduced from results obtained by Carrington and Spörer, reduced to the year 1899:

It will be perceived that a mean rotation is indicated. Carrington's observations have shown that spots in different solar latitudes travel at different rates, varying in fact from a daily rotation through about 12° in lat. 50° (nearly the highest in which spots have been observed) to a daily rotation through nearly 14° at the solar equator (where, however, spots are very rarely seen). Carrington gives the following formula for the rotation in different solar latitudes: daily rotation = 14° 26° — (2° 45°) sin² lat.; but this formula is purely empirical. The curious point about this variation in the rate of turning is that, taking two parts of the visible solar surface in the same longitude, but one in lat. 45° (say), the other on the equator, the latter will advance further and further in longitude from the former, gaining daily about two degrees, so that in the course of about 180 days it will have gained a complete revolution. That is to say, the sun's equator makes about two revolutions more per annum than the regions in 45° north and south solar latitude. The spots on the sun have usually a dark central region called the umbra, within which is a still darker part called the nucleus, while around this there is a fringe of fainter shade than the umbra, called the penumbra. Although the umbra and nucleus appear dark, however, it is not to be supposed that they are really dark; in fact, Prof. Langley of Pittsburgh has succeeded in examining the light from the nucleus alone.
and he finds that though the nucleus looks perfectly black by contrast with the general surface, it shines in reality with a light unbearably brilliant when viewed alone, while his thermal measurements show that the heat from the nucleus is even greater proportionately than the light, and not very greatly below the heat of the surrounding surface. The boundary between the umbra and the penumbra is in general well defined; and commonly the inner part of the penumbra nearest to the umbra is brighter than the exterior portion. Many spots are of enormous size, so as to be visible with the naked eye. Sir W. Herschel saw one in 1779 which had a diameter exceeding 50,000 m, and many far larger than this have since been seen. The spots are not scattered over the whole surface of the sun, but are for the most part confined to two belts between lat. 5° and 30° on either side of the solar equator. An equatorial zone 6° wide is almost entirely free from spots. Owing to this peculiarity of arrangement, Sir J. Herschel suggested the existence of motions in the solar atmosphere corresponding to our trade winds; but the circumstances of the solar orb and atmosphere differ so entirely from those of our earth and air, that such comparisons are unsafe. Dr. Wilson of Glasgow was the first to show that the umbra of a spot is below the level of the penumbra. He observed that a spot, visible in 1769, changed in shape as it traversed the solar disk, precisely as it would if the spot had been a depression below the general surface of the sun. The penumbra was markedly wider on the side nearest the edge of the solar disk than on the other side, whereas the reverse should have been the case if the spot had been a surface marking. Sir W. Herschel in 1777 began a series of solar observations which before long confirmed Wilson's views. He was led to explain the spots by the theory that the sun's globe is surrounded by two layers of clouds, suspended in an atmosphere at different elevations. He supposed the upper cloud stratum to be self-luminous, and to be the source of the solar light, or the true photosphere (to use a convenient term invented by Schröter). The lower layer he regarded as opaque, and as owing whatever light it appears to possess to the reflection of light received from the upper layer. He supposed that when an opening is formed in the outer layer we see merely a penumbral spot; but that when the inner layer also is displaced we see the true surface of the sun, which he supposed to be solid, and not necessarily so heated as to be unfit for habitation. Modern researches show this part at least of Herschel's theory to be wholly untenable, everything tending to prove that the whole mass of the sun to its innermost core is intensely heated. The recognition of a nucleus within the umbra would seem to indicate that a third cloud layer exists within the second or internal layer of Herschel's theory. But the observations of Prof. Langley show that most probably all the features of the solar photosphere yet observed are phenomena of cloud envelopes, since he has been able to recognize cloud forms at one level floating over cloud forms at a lower level, while even in the (relatively) darkest depths of the nucleus clouds are still to be perceived, though so deep down that their outlines can be barely discerned. The study of the solar spectrum (see Spectrum Analysis), while revealing much respecting the constitution and physical condition of the solar orb, has thrown some light also on the nature of sun spots. Mr. Huggins, for instance, has found that several of the absorption bands belonging to the solar spectrum are wider in the spectrum of a spot, a circumstance indicative of increased absorption so far as the vapors corresponding to such lines are concerned. Spots are more numerous in some years than in others, and occasionally no spots are visible for many successive days. Schwabe of Desau began to study this peculiarity in 1826, and after many years recognized a remarkable periodicity in the frequency of sun spots. They are found gradually to increase in number during a certain period, and then to decrease until at length there are no spots; then they increase again, and so on. According to Schwabe's earlier investigations, the cycle lasts 10 1/2 years; but Wolf of Zürich has found by examining earlier observations that the true average period is about 11-11.5 years. (See Magnetic, Terrestrial.) Various minor cycles have been suspected, besides a long cycle of about 66 years. Wolf in 1859 presented a formula by which the frequency of spots is connected with the motions of the four bodies, Venus, the earth, Jupiter, and Saturn. Prof. Loomis of Yale college has since advocated a theory (suggested by the present writer in 1865, in "Saturn and its System," p. 168, note) that the long cycle of 56 years is related to the successive conjunctions of Saturn and Jupiter. But the association is as yet very far from being demonstrated, to say the least.—Besides the spots, the telescope reveals minute dark dots or pores mottling the surface, which have been lately found to be the intervals separating numberless cloud-like forms, apparently minute, but in reality from 200 to 1,000 m. in diameter, the brilliancy of which so greatly exceeds that of the intervening spaces that they must be recognized as the principal radiators of the solar light and heat. These are found to be in constant fluctuation, and Sir J. Herschel compares their appearance to the slow subsidence of some flocculent chemical precipitates in a transparent fluid when viewed perpendicularly from above. Near the great spots or groups of spots there are often seen streaks more luminous than the neighboring surface, called faculae. They are oftenest seen toward the borders of the disk. Mr. Dawes saw, on Oct. 22, 1859, in a large mass of faculae, one bright streak forming the
very edge of the sun, and projecting irregularly beyond the circular contour, reminding him of a ridge of low hills often seen at the enlightened limb of the moon. M. Chacornac, a most diligent French investigator, observed on one occasion a sudden transformation of the luminous part of the photosphere into dark parts; luminous bridges were seen crossing the spots, and then gradually becoming dark. As these luminous bridges darkened, they at the same time plunged into the deeper parts, and became covered with other luminous bridges which formed above them. The phenomena witnessed during total solar eclipses are next to be considered. The red prominences were first seen during the solar eclipse of July 8, 1842. In the eclipse of July 28, 1851, it was shown that they belong to the sun, since the advancing moon visibly concealed those on one side and disclosed those on the other side. During the eclipse of June 18, 1860, Secchi and De la Rue photographed the prominences at two stations in Spain, and thenceforth the solar nature of these appendages was admitted by all. As some of them were seen to extend fully 3' from the edge of the sun on that occasion, it became manifest that they are objects of enormous dimensions, since 3' at the sun's distance corresponds to an extension of about 80,000 m. In the Indian eclipse of August, 1868, the prominences were examined with the spectroscope by Col. Tennant, Capt. Herschel, and Messrs. Janssen and Rayet. The spectrum was found to consist of bright lines, showing that the colored prominences are masses of glowing gas, the bright lines of hydrogen were recognized, and an orange-yellow line was ascribed (mistakenly, however) to sodium. But on the following day Janssen applied a new method of research, the principle of which had been indicated earlier by Huggins ("Report of Council of Astronomical Society," "Monthly Notices," February, 1868). Since prismatic dispersion reduces the brightness of the solar spectrum, but only throws the lines of a gaseous spectrum further apart, it follows that by directing a tele-spectroscope toward the place of a prominence, the light from the air which usually obliterates the prominence light can be so reduced by sufficient dispersion that the prominence lines may be rendered visible. Janssen found this to be the case, and by noting the indications thus afforded he was able to determine the presence and even the shape of prominences at various parts of the sun's edge. Two months later, but before the news of Janssen's success had reached England, Mr. Lockyer obtained a similar result. Before long Huggins, who had been the first to enunciate the principle of the method, showed how by opening the slit of the spectroscope the whole of a prominence could be seen at once. Since then the prominences have been successfully studied by Zöllner, Respighi, Secchi, and others. Prof. Young of Dartmouth college has been particularly successful in applying this method of research.—Even before the prominences were discovered, it was known that a border of red light surrounds the solar disk; it had been seen on the eastern side at the beginning of total eclipse, and on the western side at the end. In 1860 this envelope was very clearly seen, and even photographed. It has been designated as the sierra, because of its serrated appearance; but recently the name chromosphere (for chromatopsphere) has been given to it. The observations of prominences and sierra as summarized by Secchi indicate the following results: "The sierra presents four aspects: 1, smooth, with defined outline; 2, smooth, but no defined outline; 3, fringed with filaments; and 4, irregularly fringed with small flames. The prominences may be divided into three orders, heaps, jets, and plumes. The heaped prominences need no special description. The jets are those to which alone the following description by Respighi (erroneously given as generally applicable to all prominences) can be applied: They originate generally in rectilinear jets either vertical or oblique, very bright and very well defined. They rise to a great height, often to a height of at least 80,000 m., and occasionally to more than twice that: then bending back, fall again upon the sun like the jets of our fountains. Then they spread into figures resembling gigantic trees more or less rich in branches. Their luminosity," proceeds Secchi, "is intense, insomuch that they can be seen through the light clouds into which the sierra breaks up. Their spectrum indicates the presence of many elements besides hydrogen. When they have reached a certain height they cease to grow, and become transformed into exceedingly bright masses, which eventually separate into fleecy clouds. The jet prominences last but a short time, rarely an hour, frequently but a few minutes, and they are only to be seen in the neighborhood of the spots. Wherever there are jet prominences there also are faculae. The plume prominences are distinguished from the jets in not being characterized by any signs of an eruptive origin. They often extend to an enormous height; they last longer than the jets, though subject to rapid changes of figure; and lastly they are distributed indifferently over the sun's surface. It would seem that in jets a part of the photosphere is lifted up, whereas in the case of plumes only the sierra is disturbed." (It is here of importance to remark that these eruptive prominences, particularly associated with spots, are of late becoming recognized as chiefly due to metallic vapors, in distinction from the "plume" forms, which are largely composed of hydrogen.) This account would be incomplete without a description of the remarkably solar explosion actually witnessed by Prof. Young on Sept. 7, 1871. Fig. 1 represents a cloud prominence he had been observing on the eastern limb of the sun. It was about 100,000 m. long by 54,000 m. high. He was called
away at 12h. 30m., and on returning at 12h. 55m. "found that the whole thing had been lit-

erally blown to shreds by some inconceivable up-rush from beneath." Fig. 2 represents the appearance when the up-rushing hydrogen had attained its greatest height, exceeding 200,000 m. "The whole phenomenon," he says, "suggested most forcibly the idea of an explosion under the great prominence, acting mainly upward, but also in all directions outward, and then after an interval followed by a corresponding in-rush." A strange circumstance remains to be mentioned: "The same afternoon a portion of the sierra on the opposite limb of the sun was for several hours in a state of unusual brilliance and excitement, and showed in the spectroscope more than 120 bright lines whose position was determined and catalogued—all that I had ever seen before and some 15 or 20 besides." Before passing from the prominences it may be well to indicate the laws of their numerical distribution, as determined by Secchi and others. This is shown in fig. 3. On the left side the results of Carrington's observation of 1,414 spots between 1853 and 1861 are indicated, and on the right the result of Secchi's observations of 2,767 prominences in 1871, the number of spots or prominences being of course shown by the length of the radial lines. The dotted line on the right-hand side represents in the same manner the distribution of the larger prominences, viz., those exceeding 1' or 27,000 m. in height. During a total eclipse there appears around the black body of the moon a halo or glory of light, bright, close to the place of the concealed sun, but gradually fading away outward, until its light is lost in the general tint of the sky. In this glory of light, which is called the solar corona, radiations are also sometimes seen, and under favorable atmospheric conditions complicated series of streaks can be seen extending to a considerable distance outward from the prominence region. Various theories were advanced in former times to explain the corona. According to one theory, it is a phenomenon caused by the solar light falling on our own atmosphere; another theory ascribed it to a lunar atmosphere. In the opinion of Leverrier and Fizeau (among others), the corona is an example of the interference of light (see Larmor), the phenomenon being analogous to the colored fringes seen on a screen in a darkened room when a solar beam is admitted through a chink. To this theory Airy raised the objection that if, in order to make the analogy perfect, the eye is placed in the position of the screen, no colored fringes are seen. It is shown that the corona is partly polarized, and hence partly consists of reflected light. It has been further proved that the plane of polarization passes through the sun and the observer. This was regarded by Airy as pointing to the existence of an atmospheric medium capable of reflecting light, and extending from the earth to the moon. But in more recent times astronomers began to perceive that no other theory can be admitted than that which regards the corona as a true solar appendage. (Of course, it must be admitted that a portion of the light around the eclipsed sun comes from our own atmosphere, which must necessarily be illuminated by the true corona.

**Fig. 1.—Prominence as it appeared at half-past 12 o'clock, Sept. 1, 1871.**

**Fig. 2.—As the above appeared half an hour later.**

**Fig. 3.—Relative Frequency of Prominences and Sun Spots.**
during eclipse, precisely as it is illuminated by the sun when there is no eclipse; but it will readily be understood that this portion of reflected light is very small in amount.) During the solar eclipse of August, 1869, Profs. Young and Harkness discovered that certainly one bright line exists in the spectrum of the corona, and two other lines were suspected. European astronomers expressed doubt as to the accuracy of this observation; but it was confirmed during the Mediterranean eclipse of December, 1870, when Young thus summed up his own and other observations: "There is surrounding the sun, beyond any further reasonable doubt, a mass of self-luminous gaseous matter, whose spectrum is characterized by the green line 1,474 Kirchhoff. The precise extent of this it is hardly possible to consider as determined, but it must be many times the thickness of the red hydrogen portion of the sierra, perhaps on an average 8' or 10', with occasional horns of twice that height. It is not at all unlikely that it may even turn out to have no upper limit, but to extend from the sun indefinitely into space." During the same eclipse, Brothers of Manchester and Willard of Philadelphia (the latter acting under the directions of Prof. Winlock of the Harvard observatory) photographed the corona successfully from two distant stations; Willard being near Jerez in Spain, Brothers near Syracuse in Sicily. The views thus obtained agreed so closely (save in circumstances depending on photographic conditions) as to leave no doubt that the corona is a solar phenomenon. Doubts were still expressed, and it was not until the solar eclipse of December, 1871, that these were finally removed. On that occasion the spectroscopic and photographic results were alike decisive. Jansen with the spectroscope not only recognized the bright lines before seen and others less bright, but also a faint solar spectrum, which, since our atmosphere during total eclipse is certainly not illuminated by sunlight, must have been reflected by matter in the solar corona, such as vaporous clouds, meteor flights, or the like. Mr. Davis, a photographer sent out at Lord Lindsay's expense, obtained five excellent photographs of the corona, all agreeing perfectly inter se, excepting in extent. This proved certainly that the features of the corona do not change as they would if the phenomenon depended on the passage of light rays athwart lunar inequalities, to fall upon scattered matter at a less distance than the moon. Again Col. Tennant obtained six photographs, similarly accordant inter se, and also agreeing perfectly with Mr. Davis's at Doda-betta, a station far removed from Davis's, Baicull. Since, also, Dodabetta is near the highest peak of the Neelgherries, about 9,000 ft. above the sea level, while Baicull is close to the seashore, it will be manifest that if the features of the corona depended on the illumination of our own atmosphere, the pictures of Tennant's series would have differed altogether from those of Davis's series. Thus, independently of the spectroscopic evidence, the photographs proved that the corona is a solar appendage, at least as far as those features shown in the two series extend. But they extend from the sun in places to a distance exceeding his own diameter, and amounting in fact to more than a million miles. There is reason to believe that the true solar corona extends much further, and that in reality the zodiacal light (see Zodi-acal Light) forms the outer part of the solar corona; so that if the light of the sun could be for a time obliterated without rendering his appendages invisible, we should see the corona merging gradually into the faint glow of the zodiacal light. Mr. Arthur W. Wright of Yale college has succeeded in showing that this light is not emitted from incandescent gas, but reflected from particles or small初次, and hence derived from the sun. Another important discovery made during total solar eclipses relates to a solar atmosphere underlying even the sierra. Secchi had observed in 1869 that close to the sun's limb the solar spectrum becomes continuous; this he considered to be due to the existence of a relatively very shallow atmosphere, consisting of the vapors which cause the dark lines of the solar spectrum. For if the brightness of the lines of these vapors corresponds very closely to the brightness of the ordinary solar spectrum for the parts near to the sun's edge, the dark lines of the latter spectrum would be cancelled, and so a continuous spectrum would be produced. For another reason, the present writer had adopted the theory that the atmosphere producing the absorption lines of the solar spectrum must be shallow, compared at least with the dimensions of the sun's globe; for he showed that a shallow and not a deep atmosphere is to be inferred from the darkening of the solar disk near its edge. The opinion thus advanced on theoretical grounds was shown to be correct by the observations of Prof. Young during the total eclipse of December, 1870; for, "directing his analyzing spectroscope to the part of the sun's limb which was to disappear last, he found that at the instant when totality commenced the solar spectrum was suddenly replaced by a spectrum consisting of a thousand soft bright lines." In other words, the vapors which by their absorptive action produce the dark lines of the ordinary solar spectrum were for the moment shining with their own light, and thus produced a spectrum of bright lines. This spectrum continued visible for a few seconds only, showing that the complex atmosphere producing it cannot be more than two or three hundred miles in depth. The observation was successfully renewed during the eclipse of December, 1871, and again during the annular eclipse of June, 1872.—How to account for the supply of the prodigious amount of heat constantly radiated from the solar surface has offered a boundless field of hypothesis. One conjecture
has been that the sun is now giving off the heat imparted to it at its creation, and that it is gradually cooling down; another ascribed it to combustion, and a third to currents of electricity. Newton and Buffon conjectured that comets might be the aliment of the sun, and of late years a somewhat similar theory (first broached by Mr. Waterston in 1853) has been investigated, viz., a stream of meteoric matter constantly pouring into the sun from the regions of space supplies its heat, by the conversion into it of the arrested motion. As the sun may indeed derive a small amount of heat from this cause, it deserves more attention than previous conjectures. But conjecture and hypothesis may be said to have given place to views which claim a higher title, as it is now becoming generally recognized, in accordance with modern physical theories of heat, that in the gravitation of the sun's mass toward its centre, and in its consequent condensation, sufficient heat must be evolved to supply the present radiation, enormous as this undoubtedly is. It appears to be susceptible of full demonstration that a contraction of the sun's volume of a given definite amount, which is yet so slight as to be invisible to the most powerful telescope, is competent to furnish a heat supply equal to all that can have been emitted during historical periods. According to this theory then (which is due largely to the development by Helmholtz of Mayer's great generalization), the sun's mass remains unaltered, and its temperature nearly constant, while its size is slowly diminishing as it contracts; so slowly, however, that the supply may be reckoned on through periods almost infinite as measured by the known past of our race, and which are in any case to be counted by millions of years. It would appear from early measurements of Secchi that the different portions of the solar disk do not radiate heat in uniform degrees, and his tables show that the equatorial regions are slightly hotter than the polar. It has been explained that the rapid decrease of brightness toward the edge of the sun obliges us to admit the existence of a shallow atmosphere around it. Prof. Langley has recently published tables from more extended measurements, showing the rate of absorption both of heat and light, the latter being greater than the former. As he does not now find the difference between the equatorial and polar heat observed by Secchi in 1853, the latter concludes from a comparison of his own observations with Langley's, that great changes occur in the distribution of the heat on the sun's surface. Prof. Langley has further shown that this atmosphere absorbs one half of the sun's total radiation, and he considers that its function in the solar emission is of great importance to us. A slight alteration in the thickness of this obscuring envelope would induce changes on the earth greater than those known to have occurred in its climate in past geological epochs, which may themselves not impossibly have been due to this hitherto unrecognized cause. M. Fizeau has found that the chemical rays are similarly reduced in amount toward the edge of the solar disk, a fact which is also abundantly shown by the darkening near the edge of photographic sun pictures, like those by Rutherfurd and De la Rue.—To sum up briefly the received hypotheses of the physical constitution of the sun: Of its internal structure we know nothing, but we can infer from the low density of the solar globe as a whole that no considerable portion is solid or liquid. The regions we examine appear to consist of cloud layers at several levels floating in a complex atmosphere, in which probably most of the elements are known to us, and certainly many of them exist in the form of vapor. Outside this complex atmosphere extend envelopes of simpler constitution, though into them occasionally arise the vapors which ordinarily lie lower down. The sierra, for instance, consists in the main of glowing hydrogen gas, and that gas, whatever it may be, which produces the line near the orange-yellow sodium lines. The prominence region may be regarded as simply the extension of the sierra. The inner corona is still simpler than the sierra so far as its gaseous constitution is concerned; but here meteoric and cometic matter appears, extending to the outer corona and to great distances beyond even the visible limits of the zodiacal. Returning to the photosphere, we find it subject to continual fluctuations, both from local causes of agitation and from the subjacent vapor acting by its elasticity to burst through it; the faculae, which are found to be above the general level of the photosphere, are taken to be heapings up of the luminous matter like the crested surges of the sea. All the strata are subject to great movements, which sometimes have the character of uniform progression analogous to our trade winds, and sometimes are violent and resemble in their effects our tornadoes and whirlwinds. Eruptive action appears to operate from time to time with exceeding violence, but whether the enormous velocities of outrush are due to true explosive action (which would compel us to believe that the sun is enclosed by a liquid shell, so as to resemble a gigantic bubble), or to the uprising of lighter vapors from enormous depths, as heated currents rise in our own atmosphere, is not as yet certainly known.

**SUN BIRD**

The name commonly given to the *promeropida*, a family of tenuirostral birds, with a long, slender, and usually curved bill, the nostrils placed at the base and covered with a scale, wings of moderate size, and short tarsi covered with broad scales. They inhabit the tropical regions of both hemispheres; the subfamily *promeropina*, including by far the most species, is confined to the old world, and the *carolina* to the new. The true sun birds belong to the former, and have a long, slender, curled, and sharp bill, sometimes finely serrated on the margins; the tail is long, the central
feathers often exceeding the rest. They are found in the islands of the Pacific and Indian oceans, and on the continents of Africa and Asia; they are the humming birds of the old

world, having similar habits and the same brilliant colors, but are larger. The genus *nectarina* (Illig.) contains more than 100 species, mostly African. The nest, of an elegant form, is usually suspended from the end of a twig, with an opening at the side; the eggs are two to four. The *carebina* or guiquits have a shorter, broader, and nearly straight bill, and long pointed wings; they are found in tropical South America and the West Indies; the plumage is very beautiful. The nest is protected by a long funnel or by two compartments against insects, birds, serpents, and lizards.

**SUNBURY**, a borough and the capital of Northumberland co., Pennsylvania, on the E. bank of the Susquehanna river, 42 m. N. of Harrisburg; and 114 m. N. W. of Philadelphia; pop. in 1870, 9,101. It has a daily and three weekly newspapers, and several manufactory and machine shops. It is connected by rail with Philadelphia and the Shamokin mining region, and about 200,000 tons of coal are shipped annually.

**SUNDAY SCHOOLS.** The earliest recorded Sunday schools were the schools of catechums, organized, according to Tertullian, in A. D. 180, though less formal instruction of Christian children and novitiates prevailed earlier. The schools of the catechums flourished till the 6th century. In 1527 Luther established Sunday schools in Wittenberg for the instruction of children who could not attend the day schools. In 1560 Knox inaugurated them in Scotland. In 1580 Archbishop Borrromaeus Milan established systems of Sunday schools throughout his diocese, and about the same time there were similar schools in France and the Netherlands. In the 17th century the clergy stated catechise the children in some parishes of England; and Joseph Alleine, author of the "Alarm," opened a Sunday school in 1668. There was a Sunday school in Roxbury, Mass., in 1674, and one in Plymouth, Mass., in 1650. About 1740 Ludwig Haecker established a school in Epuratah, Lancaster co., Pa., which continued until the building was taken for a hospital during the revolution. Modern Sunday schools, however, were originated by Robert Raikes, who in 1781 gathered poor children from the streets in Gloucester, England, and employed female teachers at a shilling a day for their instruction. The children were taught from 10 A. M. to 12; then, after an hour's recess, read a lesson and went to church. After church they repeated the catechism till after 5, and were then charged to go home at once and quietly. Raikes published an account of his work in the "Gloucester Journal," in 1788, which was republished in the "Gentleman's Magazine," and schools upon his plan were soon estab-
lished in the principal towns of England. Scotland had similar schools as early as 1782, and they were established in Ireland in 1785. The London Sunday school society was organized in 1785, and in 16 years it spent £4,000. In 1786 it was thought that there were 250,000 children in Sunday schools in Great Britain. Bishop Asbury established one in Hanover co., Va., in 1786, and Bishop White one in Philadelphia in 1791. In 1790 the Methodist Episcopal conference at Charleston, S. C., resolved to establish schools for whites and blacks. Katy Ferguson, a poor negro woman, is said to have established one in New York in 1793. Samuel Slater opened a Sunday school for his operatives in Pawtucket, R. I., in 1797; and Mrs. Isabella Graham and her daughter, Mrs. Divie Bethune, who had seen the English schools, opened one in a private house in New York in 1801. The important change from paid to volunteer teachers is said to have been adopted by the Methodists at Bolton, England, about 1786. The “Gratis Sunday School Society” was established in Scotland in 1797, and voluntary teaching was general in England in 1800. In 1803 the London Sunday school union was formed, to foster voluntary teaching. Soon the churches began to assume charge of Sunday schools, in the United States about 1809; and the instruction then became more exclusively religious. Schools were opened in the Protestant churches of all denominations in Great Britain and the United States, later among the Roman Catholics, and more recently among the Quakers. Since 1848 special attention has been given to mission schools for the vagrant children of large cities. In 1875 there were 140 Protestant mission schools in New York. As now organized, a Sunday school has a superintendent with various assistants and a number of teachers, each of whom has a class of scholars. The classes are of different grades, but generally study the same Scripture lesson, their study being separate, but all the classes uniting in worship. The session generally continues an hour or an hour and a half. Schools upon this plan have been introduced by English and American missionaries in all lands; but the system has been adopted in the national churches of continental Europe only within the last 20 years. The following table gives the fullest statistics accessible for 1874:

These societies also publish hymn books, books and papers explaining the Bible lessons, and books for the lending libraries, with which most schools are furnished. Sunday school publications are now issued by regular business houses, as well as by church boards and tract societies. (See Tract and Publication Societies.) Conventions of Sunday school teachers have been held in the United States since 1832. A world’s convention met in London in 1862. A German national convention was held in Hamburg in 1874. In 1875 there were in the United States 21 state conventions, and a national and international convention. Since 1866 a uniform series of Bible lessons has been widely used in the United States, and since 1872 has been adopted in Europe and in the missionary schools of Asia and Africa. Comments on these uniform lessons have been prepared by distinguished clergymen, translated into many languages, and issued in pamphlets and papers for teachers, and in “lesson leaves” for scholars, in many millions of copies.

SUNDERLAND, a marshy tract of British India, in Bengal, stretching across the lower part of the delta of the Ganges, between the bay of Bengal and the inhabited parts of the delta, from the river Hoogly to the island of Rana-bad, 108 m., with a breadth of about 75 m.; area, over 7,000 sq. m.; pop. very small. The soil is alluvial, and the whole district is cut up into innumerable wooded islands by rivers and creeks, many of them navigable for vessels of considerable size. The woods swarm with tigers, the waters with crocodiles, and other tropical animals abound. Salt is manufactured from the sea water to a sufficient extent to supply the demand of the lower provinces of Bengal. The Sunderbunds are included within the district of the 24 Pargannahs.

SUNDERLAND, a town and parliamentary borough of Durham, England, at the mouth of the river Wear in the North sea, 12 m. N. E. of the city of Durham and 240 m. N. by W. of London; pop. of the town in 1871, 98,385. The Wear passes through the borough, and is crossed by an iron bridge, high enough for large sailing vessels to pass, which connects Monk Wearmouth with the S. side of the river. The harbor is formed by the mouth of the river, and is protected by piers. The docks on the S. side of the river have an independent entrance to the sea. Ship building amounts in seasons of ordinary prosperity to more than
SUNDERLAND

70,000 tons. The entrances in 1873 were 8,091 British vessels, tonnage 1,705,925, and 1,257 foreign vessels, tonnage 268,611; clearances, 8,140 British vessels, tonnage 1,328,094, and 1,293 foreign vessels, tonnage 296,602. The value of exports was £21,015,190. The chief manufactures consist of earthenware and glass, and all kinds of articles required for fitting out vessels. Window glass and glass bottles are very largely manufactured.

SUNDERLAND. I. Robert Spencer, second earl of, an English statesman, born in Paris about 1641, died at Althorp, Sept. 28, 1702. After serving as ambassador to Spain and France, he became in 1679 secretary of state. In 1681 he went out of office, but was recalled in 1682, and exercised a controlling influence during the remainder of the reign of Charles II. Under James II. he remained secretary, and was also made president of the council. In 1687 he became a Roman Catholic; but he carried on a secret intrigue with the prince of Orange, and in October, 1688, was dismissed by James. On the arrival of the prince of Orange, Sunderland went to Rotterdam, where he was thrown into prison, but was released by order of William. He then went to Amsterdam, turned Protestant again, and after residing about two years at Utrecht returned to England, although excepted in the act of indemnity. On April 19, 1697, William appointed Lord Chamberlain and one of the lords justices; but on Dec. 25 he resigned. II. Charles Spencer, third earl of, an English minister, son of the preceding, born in 1674, died April 19, 1722. Professing republican principles, he entered the house of commons in 1695 as member for Tiverton, and continued in the next three parliaments. In 1705 he was sent to Vienna as envoy extraordinary and plenipotentiary, and in 1707 became secretary of state, but was dismissed in 1710. He was generally regarded as the head of the whig party, and on the accession of George I. he was made lord lieutenant of Ireland in 1715, lord privy seal, and in April, 1717, secretary of state. The house of commons implicated him in the criminal transactions of the South sea scheme; but he was acquitted by a vote of 293 to 172, though with loss of his office. He spent his remaining days in intrigues to effect the downfall of Walpole. By his marriage with the second daughter of the great duke he became progenitor of the present house of Marlborough, their son succeeding as second duke.

SUNDEW, the common name of plants of the genus drosera (Gr. ὀδοσέρη, dewy), which gives its name to the roserac, a small order of remarkable plants, one of which, the Venus's fly-trap, is described under Dionaea. There are about 100 species of drosera, distributed all over the world, except in some of the Pacific islands; they are perennials, and either stemless, with a rosette of leaves rising from the rhizome, or have stems with alternate leaves; with a few rare exceptions, the leaves bear numerous bristles or hairs, each of which exudes a drop of clear glutinous fluid; this exudation of the hairs, which glistens like dew drops, is recognized in the common and botanical names. Six species are found within the limits of the United States; they are all stemless, with the leaves circinate in the bud (i. e., rolled up from the apex downward), all in a tuft at the base, from the centre of which rises a naked scape bearing the flowers at the top in a one-sided raceme, the undeveloped apex of which droops, leaving the open flower apparently the highest. The white or rose-colored flowers, which open only in sunshine, have in our species their parts mostly in fives, the calyx and corolla withering and remaining in fruit; the globular ovary has three or five styles, so deeply cleft as to appear like six or ten, and ripening into a one-celled, three-valved capsule containing numerous seeds, with a pitted surface. All are found in bogs or wet sands, some very rare and others widely distributed. The most common is the round-leaved sundew (D. rotundifolia), which extends from Canada to Florida; its leaves, 1 to 2 inches long, and spreading upon the ground, have an orbicular blade narrowing abruptly into a petiole; the scapes, 6 inches or more high, bear white flowers with their parts sometimes in sixes. The long-leaved (D. longifolia), less frequent, but with a similar range, often grows in the water, when its caudex is several inches long; the leaves, more or less erect, have an oblong blade which tapers gradually into the petiole, and are from 1½ to 4 inches long; scape and flowers similar to the preceding. Both of these species are also natives of Europe, the first named extending from northern Spain to the arctic regions and throughout Russian Asia. The short-leaved (D. brevifolia) has wedge-shaped leaves only ½ inch long, and white flowers on a scape 3 inches or more high; this and D. capitata, formerly regarded as a long-leaved variety of it, are found only from Florida to North Carolina. The slender sundew (D. linearia) is our most local species, being found along Lake Superior and in a few other localities further west; its narrowly linear leaves are 4 to 6 inches long, the blade barely ½ inch wide; the scape, at first shorter than the leaves, but at length longer, has white flowers. The thread-leaved sundew (D. filifolia) occurs

Round-leaved Sundew (Drosera rotundifolia).
in wet sand along the coast, from Plymouth, Mass., to Florida; it has a bulb-like base or corm, from which rise the singular thread-like leaves, from 6 to 12, and sometimes 18 in. long, in which there is no distinction between blade and petiole, having the upper surface somewhat convex; the scapes, which are a little longer than the leaves, bear handsome rose-purple flowers more than half an inch across. —It was long known in a general way that numerous small insects were caught by coming in contact with these viscid glands, and about 1860 it was discovered that this was not accidental, but that the leaves were especially adapted to the work, and that though their motions are much slower than those of the related dionaea, they are none the less effective, and the droseras now rank among the plants which catch and digest insects for their own nourishment. Darwin, in his recent work on "Insectivorous Plants" (1875), gives in great detail the investigations of himself and others upon droseras and a few other genera, but two thirds of the work is devoted to drosera rotundifolia alone. The upper surface of the leaf is thickly studded with the glandular hairs already mentioned, to which Darwin gives the name of tentacles; the average number of those on 31 leaves was found to be 192; those on the central part of the leaf are short and erect, with green pedicels; toward the margin they are larger, inclined outward, and have purple pedicels; those upon the extreme margin project on the same plane with the leaf, and are commonly reflexed, while a few which spring from the top of the petiole are the largest of all, some being ½ in. long; each tentacle consists of a straight, hair-like pedicel or stalk, consisting of several rows of elongated cells filled with a purple fluid; the gland at the apex is mostly oval and complex, and secretes a colorless and extremely viscid matter, which may be drawn out into long threads. If a small object, organic or inorganic, be placed on the centre of the leaf, the tentacles nearest it begin to bend toward it; this impulse is transmitted to those farther off, until all, including the marginal ones, are closely inflected over the object, a process requiring from one to four or five hours. In case an insect alights upon or touches one of these glands, it is held by the secretion, and in its struggles comes in contact with other glands, which hold it until the tentacles can fold over it one by one and completely imprison it. The insects thus caught are actually digested, and the nutritive material absorbed to contribute to the growth of the plant; it is found that the secretion from these glands or

Leaf of Round-leaved Sundew, viewed laterally. (Magnified four times.)

Thread-leaved Sundew (Drosera filiformis).
been cut off at the dorsal and anal fins and then furnished with a short broad caudal; there are no ventrals, no air bladder, and no abdominal sac capable of distention; the dor-
sal and anal fins are more or less united to the caudal; the stomach is small, and immediately receives the biliary canal. The common sun fish (*O. molta*, Schn.) is almost circular, and the dorsal and anal project posteriorly, with the caudal between; on each side, near the centre, is a small pectoral, and in front of it the gill opening; the gills are arranged in comb-like fringes; it is also called moon fish and head fish. It grows 4 or 5 ft. in length and 3 or 4 ft. in depth, with a weight of several hundred pounds; the flesh is tough and remarkably elastic, owing to the great amount of yellow elastic fibre, intricately interlaced, almost to the exclusion of white fibre and true muscle; the liver is very fat, and its oil is used for lubricating purposes on board ship, and for sprains and bruises among fishermen. It is grayish above and whitish below, with a silvery lustre when alive, and phosphorescent at night. According to Mr. Putnam, in his paper read before the American association for the advancement of science in 1870, the young differ little from the adults in shape, and do not resemble *molaecanthus*, as Lütken and Steenstrup have said. It is sluggish in its motions, and is often seen asleep at the surface of the water. In some seasons it is common in summer in Massachusetts and New York bays, and feeds partly if not principally on medusa. There is probably no fish more infested by parasites, internally and externally. The name sun fish is also commonly given to many medusae (see jelly fish), and in this country to the bream (see Bream).

**SUNFLOWER**, the common name of plants of the genus *Helianthus*, a word of the same meaning. The genus belongs to the composite family, and consists of about 50 species, most of which are North American; they are coarse annual and perennial herbs, with rough stems and foliage, and some species bear tubers; the opposite or alternate leaves have three nerves; the solitary or corumbose heads are margined by conspicuous neutral ray flowers; the involucre imbricated; the persistent chaff of the receptacle embracing the four-sided akenes (popularly seeds), which bear at the top two chaffy and very deciduous scales, with sometimes two or more intermediate ones. In the common sunflower (*H. annuus*), from tropical America, the flat receptacle is 6 in. or more across, margined by conspicuous yellow ray flowers, while the central portion, or disk, is crowned with brownish tubular ones. The idea that the sunflower is so called because it always presents its face to the sun is erroneous; the name is more likely to be due to the resemblance of the flower head to the old pictorial representations of the sun as a disk surrounded by flaming rays. Few plants are so exhaustive of potash, the constituent in which most soils are deficient, as the sunflower, and its cultivation, sometimes recommended for various uses, would soon render fertile soils unproductive; for this reason it cannot become a profitable crop. It is raised in small quantities occasionally for the seeds (akenes), which make an acceptable variety in the food of poultry, and they are in repute among horsemen as a remedy for aches, a quart being given daily with the food. Though the seeds yield about 40 per cent. of an oil useful for burning, for soaps, and other purposes, equally good oil may be obtained from plants which do not so exhaust the soil. The abundant pith has been used by French surgeons as a moxa. A so-called double variety, in which the tubular florets of the disk are developed in the same form as those of the ray, is much more showy than the common kind.—The best garden sunflower is the many-flowered (*H. multiflorus*), a perennial, of doubtful nativity, growing 4 to
SUNFLOWER (Lat. solis ictus; Fr. coup de soleil; Ger. Sonnenstich; also called insolation, heat apoplexy, heat asphyxia, and solar asphyxia), an affection which suddenly attacks persons exposed to the continuous hot rays of the sun or other sources of heat. The symptoms vary considerably, according to the extent and nature of the injury. The patient is usually attacked in the midst of his employment, although sometimes he is not seized till in the night, especially if occupying heated and badly ventilated quarters. There is loss of consciousness, and generally stertorous breathing and convulsions, and in the worst cases there is extreme prostration of the vital powers, and the voluntary muscles are motionless from the paralyzed condition of the nervous system, the greatly impeded functions of respiration and circulation being the only signs of life. The attack usually comes on in the afternoon, partly because this is the hottest part of the day, and also because the subject has generally been laboring for many hours, and his vital powers are more or less exhausted. The attack may be immediately preceded by premonitory symptoms, such as pain and a feeling of fullness in the head and oppression at the pit of the stomach, sometimes attended with nausea and vomiting, and a feeling of weakness in the lower extremities, vertigo, and diminution of vision. In 60 cases reported to the New York hospital by Dr. H. S. Swift ("New York Journal of Medicine," 1854), the symptoms included superficial煮ated objects appeared of a uniform color, generally blue or purple, but sometimes red, and at others green. In light cases the insensibility may be momentary, but in severe cases the patient rapidly becomes asphyxiated or comatose. The pupils are sometimes dilated and sometimes contracted, and there may be dilatation and contraction at different stages in the same case. There is considerable and often very great increase in the temperature of the body. In cases observed at Bellevue hospital, New York, in July, 1868, it frequently rose to 109° F., and in one instance to 110°; and still higher temperatures are recorded. When it reaches 107° recovery is scarcely to be expected, although it took place in the one instance at Bellevue where it reached 110°. Vomiting during the unconscious period, and involuntary evacuation of the bowels, are very grave symptoms. Although in many cases, as has been observed, the symptoms vary with the extent of the lesions, in the more pronounced cases they are rather uniform, the patient being completely without sensation or motion, except that of respiration, which is stertorous, though less than in true apoplexy. The eyes are fixed and turned upward with a glassy appearance; the pupils are greatly contracted, and the conjunctive are congested. Sometimes the whole system of voluntary muscles will be convulsed, and more rarely the patients appear to be in a state analogous to somnambulism; but the more fatal cases are often entirely free from motion of the voluntary muscles. In reports of cases occurring in the British army in India, by Mr. Longmore, in which he designated foul air of badly ventilated quarters as an active cause, the pathological conditions found after death were markedly more those of asphyxia than of congestive apoplexy, there being excessive engorgement of the lungs, while the cerebral congestion was decidedly less. The blood remains uncoagulated after death, showing a loss of life in its organic constituents. Thus, the post-mortem appearances accord with the symptoms, illustrating, as Mr. Barclay has pointed out, the four different ways in which death may take place, and furnish a key to the rational treatment of the different cases. 1. The intense heat of the sun's rays, pouring down upon the head, combined with great bodily exertion, may produce a state similar to that of nervous concussion from accident, and death may take place more or less sud-
SUPERCARGO

2. When death does not quickly ensue, paralysis of the respiratory nerves may induce pulmonary congestion, terminating in asphyxia. 3. The cerebral may be much greater than the pulmonary congestion, and death may take place by coma. 4. Partial recovery may supervene, and the patient die in two or three days afterward, with serious effusion within the cranial cavity. Rather more than half the cases of sunstroke are fatal, death sometimes occurring in a few minutes, but oftener in a few hours, the average perhaps being from three to four, the patient remaining in a comatose state till the end of life.—The treatment has been a matter of much discussion, and for cases having marked apoplectic or comatose symptoms it is so still. Some contend that bloodletting may be advantageously employed, while others strongly oppose it in all cases, maintaining that there is always a degree of vital depression which forbids it. This is the position generally held by the surgeons of the English army in India. The principal remedies relied upon in nearly all countries are stimulation to the surface, especially along the spine, by sinapisms or blisters and electricity, and the administration of stimulant and purgative enemata containing alcoholic spirits; the bathing of the surface of the body with tepid or warm water containing ammonia or carbonate of soda; and the application of the cold douche to the spine and of cold to the head. The hair should be cut short, and in the worst cases blisters may be applied to the nape of the neck and along the spine. When the breathing is very difficult and the bronchial tubes are clogged with mucus, the patient should be often turned upon the side and face. Beneficial effects have sometimes been found from the inhalation of chloroform, but the use of this requires great caution. Prompt decision on necessity, and the services of a physician should be procured as quickly as possible; but cold to the head, sinapisms, and stimulating enemata may be employed before his arrival.

SUPERCARGO, a person who accompanies a cargo shipped to a foreign port, and is intrusted with the sale of it there, either as specially directed or to the best advantage, and with the investment of its proceeds in a proper cargo for the home or other market. As the supercargo's authority properly concerns the cargo, it is ordinarily dormant during the voyage, and is called into exercise by arrival at the foreign port; and though for the sake of the cargo and a market the supercargo may sometimes have the authority to determine the destination of the ship, yet he has none to interfere in the navigation of her, or in any respect to usurp the office and functions of the master. The powers and duties of a supercargo are not very specifically regulated by law or usage, but are determined in every instance by the express instructions of the shipper where such instructions are given, as they usually are. The supercargo is simply an agent, and is limited like other agents to the authority vested in him by his principal. Yet, by construction of the law, new authority is conferred upon the supercargo by the existence and force of necessity; and it has been expressly held that if by any sudden emergency it becomes impossible for the supercargo to comply with the precise tenor of his instructions, or if a literal execution of them would defeat the objects of the shipper and amount to a sacrifice of his interests, it then becomes the duty of the supercargo to do the best he can for the shipper; and his acts done bona fide and with a reasonable discretion, in such an exigency, are binding upon the latter. A supercargo, like a master or foreign factor, generally buys and sells in his own name, and his acts in a foreign port, even after the death of the owner of the cargo, and while that event was unknown to him, are binding upon all parties.

SUPERIOR, Lake, the uppermost of the great border lakes of the United States and Canada, and the largest body of fresh water on the globe. It is included between lat. 46° 50' and 49° N., and lon. 84° 50' and 82° 10' W.; greatest length from E. to W. 360 m.; greatest breadth, across its central portion, 140 m.; area, 32,000 sq. m. Its length of coast is about 1,500 m., its mean depth about 1,000 ft., and the level of its surface above the sea about 630 ft. The boundary line between Canada and the United States passes from Lake Huron up the St. Mary's river, the outlet of Lake Superior, through the centre of the lower half of this lake, to the mouth of Pigeon river on the N. shore, between Isle Royale and the Canadian coast. This island was allowed to fall on the American side of the boundary in compensation for one of the islands at the mouth of the St. Mary's river. The S. coast of the lake from the outlet to Montreal river belongs to the upper peninsula of Michigan. From this river to the river St. Louis the coast belongs to Wisconsin, and thence round to Pigeon river to Minnesota. Toward each extremity the lake contracts in width, and at the lower end terminates in a bay which falls into the outlet, the St. Mary's river, at the two opposite headlands of Gros Cap on the north and Point Iroquois on the south. Thence to the mouth of the St. Mary's at Lake Huron is about 60 m. Numerous streams flow into Lake Superior, but none of large size. High lands in general lie near the coast, the long slopes from which are directed away from the lake and the short slopes toward it. The rapid fall prevents the navigation even by canoes of most of these streams, but provides excellent water power, which is almost everywhere available. The principal rivers are the St. Louis, which enters at the head of the lake; on the N. shore, the Pigeon, Kamnisticquia, Black Sturgeon, Nipigon (the outlet of Nipigon lake), Pic, and Michipicoten; and
on the S. shore, the Tequamenon, Sturgeon, Ontonagon, Montreal, and Bad. The coast of the lake is for the most part rocky, and on the N. side is much indented by deep bays surrounded with high rocky cliffs, back of which the country soon rises in bleak and dreary mountains. Numerous islands are scattered about this portion of the coast, many rising precipitously to great heights directly up from the deep water. Some present castellated walls of basalt, and some rise in granitic peaks to various elevations up to 1,300 ft. above the lake. Nowhere upon the inland waters of North America is the scenery so bold and grand as on the N. shore of Lake Superior. The irregularities of the coast with the general depth of water here afford numerous good harbors, which however in this unfrequented region are as yet of little service, while on the opposite coast such places of refuge are much wanted. The determination of the coast lines by the wearing action of the waters upon rocks of different degrees of hardness is remarkably exemplified everywhere along the shores of Lake Superior, particularly in the precipitous walls of red sandstone on the S. coast, famous in till the earlier accounts of the lake as the “Pictured Rocks.” They stand opposite the greatest width of the lake and exposed to the greatest force of the heavy storms from the north. The effect of the waves upon them is not only seen in their irregular shapes, but the sand derived from their disintegration is swept down the coast below and raised by the winds into long lines of sandy cliffs. At the place called the Grand Sable these are from 100 to 300 ft. high, and the region around consists of hills of drifting sand. The principal bays are Thunder, Black, and Nipigon on the north, Tequamenon at the outlet, Keweenaw on the south, and Fond du Lac at the head. The largest islands are Isle Royale and Michipicoten. The most important places on the shores of the lake are Marquette, Mich., and Duluth, Minn. There are many varieties of excellent fish, the most valuable being white fish, sturgeon, and trout.—For the mineral productions of the Lake Superior region, see Copper Mines, vol. v., p. 928; Iron Ores, vol. ix., p. 407; Michigan, vol. xi., p. 497; Ontario, vol. xii., p. 685; and Silver, vol. xv., p. 57.

SURT, well-told town of British India, in the northern division of Bombay, in a collocalterate of the same name (pop. in 1872, 554,000), on the left bank of the river Taptee, 20 m. from its mouth in the gulf of Cambay, and 150 m. N. of Bombay; pop. about 70,000. It contains an English church, several handsome mosques and temples, numerous Hindoo and other schools, and the Banian hospital, founded and richly endowed by the Jains for the treatment and cure of diseased animals. The city is an organized municipality, with a revenue of nearly £50,000.—Surat is of great antiquity, and is mentioned in the ancient Sanskrit poem, the Ramayana. When the Mohammedans ruled Hindostan it was their chief port of embarkation on their pilgrimage to Mecca. The Portuguese sacked Surat in 1530. In 1613 the English obtained commercial privileges from the emperor Jehanghir, and established a factory here which became their chief station on the W. coast of India, and remained so till 1686, when it was removed to Bombay. In 1796 the population was estimated at 600,000, and it had then greatly declined in consequence of the loss of its trade. In 1800 the administration of the government was permanently assumed by the British.

SURETY, in law, a person who binds himself to fulfil, either wholly or in part, the engagement of the principal obligor. For those cases in which the surety expressly assumes the obligation technically known as a guaranty, see GUARANTY. When two parties join in making a purchase, or in giving a promissory note, each is in law equally liable to the party with whom the contract was made; but as between themselves, it is always competent for one to show that the transaction was wholly for the benefit and at the request of his co-obligor, and that he became bound as surety merely for his associate. If in such case the surety in face be compelled (as, according to the tenor of his obligation, he obviously may be) to pay the whole, equity declares that he is entitled to complete reimbursement from the principal, and that, in order to secure this reimbursement, the surety is entitled to the benefit of all the security which either the rules of law or the express acts of the parties have given to the obligee or creditor; and if, by any negligence or other acts, the obligee defeat these rights of the surety, he forfeits his right of action against him. If the creditor or obligee is fairly informed of the relation of principal and surety existing between the parties, he is bound to take care that no act of his shall destroy or lessen the surety’s right of indemnity from the principal debtor. If therefore he declare that he will look solely to the principal for payment, so that the surety is induced to omit taking security from the latter; or if he tell the surety that the debt has been paid so that he relinquish to the principal his security; the surety will be in both cases discharged from his obligation to the obligee. But the mere inaction of the creditor to pursue his remedies against the principal will not discharge the surety, nor will positive indulgence to the principal have this effect; but if the delay be granted in pursuance of any binding agreement with the principal, so that the surety cannot pay the debt and then proceed at once for indemnity against the principal, the creditor’s act releases the surety. And as the surety is entitled to the benefit of all securities given by the principal, he is discharged if the creditor’s inaction or negligence have rendered these securities valueless. In short, though the

creditor is not bound, so far as the surety is concerned, to pursue the ordinary legal remedies against the principal, yet he is bound, in respect to all remedies given him by way of pledge or security or by other act of the parties, to hold or pursue them diligently in behalf of the surety; and if he relinquish any such remedy without the knowledge or against the will of the surety, he shall lose his claim against the latter to the extent of the right surrendered. Question has often been made whether the creditor would not lose his right against the surety if the principal should become insolvent after a request by the surety (which was disregarded) that proceedings be immediately taken for collection; but it has generally been held that he did not, and that the remedy of the surety was to pay the debt and then proceed to collect of the principal.

SURF BIRD (aphriza virgata, Gray), a wading bird of the plover family, and subfamily cin-clina or turnstornes. The bill is about as long as the head, with vaulted obtuse tip and compressed sides; wings long and pointed, with the first quill the longest; tail moderate and even; tarsi as long as middle toe, robust, with small irregular scales; toes long, free at the base, sides of anterior ones margined, and hind one elevated, slender, and partly resting on the ground. It is about 10 in. long, with the wing 7 in.; dark brown above, lighter on the wing coverts, with white spots and stripes on the head and neck; upper tail coverts and basal half of tail white, the latter terminated with brownish black; under parts white, tinged with ashy in front, each feather having a brownish black crescent. It is found on the Pacific coast of North and South America, and in the Hawaiian islands, and is migratory.

SURGEON, a bird of the stork family. See JACANA.

SURGERY, or Chirurgery (Gr. χειρι, the hand, and λέγω, labor), that department of the art of healing which appertains to the diagnosis, prognosis, and treatment of all diseases which require manual or instrumental measures for their cure. The sphere of surgery is more limited and at the same time more accurately defined than that of medicine. Surgery divides tissues or parts improperly united, and unites those which have been divided when they should remain in union; separates whatever has become dangerous or inconvenient to the patient; removes foreign bodies, or parts of the body which from disease or loss of vitality have become foreign, whenever they exert a hurtful influence on the animal economy; restores to their cavity or replaces in their normal position portions of the body which have become displaced; checks the loss of blood from wounded or divided blood vessels; reduces inflammations, or removes the purulent or phlegmonous matter which may have been deposited by them; repairs and corrects deformities and distortions; and effects the replacement of lost tissues. Its means of accomplishing these results are the hand, lint, bandages, and apparatus of various kinds, cutting, crushing, and probing instruments, catheters, bongies, sounds, forcepts, specula, &c., and the various forms of canturies, direct and indirect, liquid and solid.—The earliest surgeons of whom there is any record were the Egyptian priests. According to Herodotus, we owe to them the use of the moxa and the adaptation of artificial limbs. Among the ancient Hebrews there is but little evidence of surgical skill, and that little was confined to the priests. In Greece, surgery is as ancient as the mythical period of its history. Chiron the centaur, born in Thessaly, and skilful in the application of soothing herbs to wounds and bruises, is the legendary father of Greek surgery. But Æsculapius, the son of Apollo, said by some to have been the pupil of Chiron, though others call him his predecessor and superior, won the highest fame in that early time for surgical skill. He is said to have been deified on account of his wonderful success about 50 years before the Trojan war. Temples were reared for his worship, which became the repositories of surgical knowledge, at Epidaurus, Rhodes, Cnidus, Cos, and Pergamus. Homer has immortalized his two sons, Podalirius and Machaon, the companions of Agamemnon in the Trojan war, where they rendered essential service in healing the wounds of the Grecian heroes. The Asclepiades, or reputed descendants of Æsculapius, retained the monopoly of surgery as well as medicine in their family. They had established in this period three schools of medicine, at Rhodes, Cnidus, and Cos. Pythagoras, in the 6th century B. C., established at Crotona a new school of medicine, in which his peculiar philosophy was probably applied to the art of healing; among its early pupils was Democedes, eminent as a surgeon, who when taken captive by the Persians reduced the dislocated ankle of Darius, or in some cases even breast of his queen Atossa, after the Egyptian physicians had failed. The want of anatomical knowledge, no dissections being allowed, was a fatal bar to any considerable progress in surgery. Hippocrates (about 400 B. C.) more than any of his predecessors advanced surgical treatment; he reduced dislocations and adjusted fractures, used the trephine, applied the forcepts in accouchement, made incisions into the kidney for the removal of calculi, performed amputations, and perforated the cavity of the ribs in empyema and hydrothorax. Interdicted from human dissection, he practised the dissection of the ape tribe as nearest to man in anatomical structure, and thus obtained much knowledge. For a century after the death of Hippocrates we meet few names of note in surgery. The founding of the Alexandrian school under Ptolemy Soter about 300 B. C. was another important epoch in the advance of the art. Herophilus and Erasistratus, the
two great leaders of the medical school of that university, if it may be so called, were eminent both as physicians and surgeons; with them commenced the practice of human dissections. The extirpation of the spleen, and the application of remedies direct to sero-
rhosities and tumors of that viscus and of the liver, were among the bold operations of Era-
sistratus. To him also belongs the invention and application of the catheter in cases of re-
tention of urine. The pupils of these eminent surgeons invented bandages of peculiar forms, and introduced the tourniquet and contri-
vances for reducing dislocations of the femur.
One of them, Ammonius, employed an instru-
ment for lithotriptic purposes, anticipating Civiale's process.—Rome in the first 700 years of its history produced no surgeon of note. Celsus, who flourished about the beginning of the Christian era, was the greatest of the sur-
geons of ancient Rome, and his observations on injuries of the head, on cataract, on the healing of fractures, and on the arteries, arterioly,
my, fractures and dislocations, amputations, and carbuncle, show considerable knowledge. Aretasen, the first to use the cantharides blister, Heliodorus, Rufus the Ephesian, all of whom flourished between A.D. 50 and 120, and after them Antyllus, added to the surgical knowledge of the time new views of the treat-
ment of injuries of the head, the resort to arteriotomy instead of venesection in sudden emergencies of inflammatory action, bronchot-
omy in some acute diseases of the throat, the radical cure of hydrocele by free incision of the parts, and a more thorough investigation of diseases of the kidneys and bladder. Galen
devoted more attention to medicine than sur-
ery, but his observations on hernia, on luxa-
tion of the femur backward, and on the appli-
cation of the trephine to the sternum in em-
pyema, are of importance. In the early period of Christianity surgery languished; the early Christians opposed dissection as strongly as the pagans, and by attributing the power of healing wounds to martyrs and their relics dis-
couraged all efforts at improvement in surgical science. The first eminent name among the surgeons of the dark ages is Aetius (500 to 550), whose surgical writings are numerous and valuable. He practised scarification of the extremities in anasarca, operated for aneurism, endeavored to dissolve urinary calculi by in-
ternal remedies, discussed hernia with great
ability, and wrote on encysted tumors, injur-
ies to nerves and tendons, diseases of the eyes, &c. Alexander of Tralles, a younger contemporary of Aetius, wrote treatises, now lost, on diseases of the eye and on fractures, which were highly commended for their ori-
ginality by some of his successors. Paulus
Egineta, in the 7th century, was a surgeon of eminent and considerable originality. His
sixth book has been considered by many as
the best body of surgical knowledge prior to the revival of letters. He recommended topi-
cal in preference to general bleeding, as more
effective in reducing local inflammation; re-
sorted to copious venesection to accelerate the painful descent of calculi through the ureters; opened internal abscesses with caustics; de-
lined the points for performing paracentesis in ascites; made his incision in lithotomy on one side of the raphe instead of the centre
as Celsus had recommended; practised both
laryngotomy and tracheotomy, the latter as a
means of carrying on respiration during oc-
culsion of the larynx; treated of fractures of the patella; and was the originator of the ob-
structive operation of embryotomy.—The Ara-
bian physicians, who rose into distinction as those of the West declined in reputation, did little for surgery. Rhazes (about 900) described for the first time spina ventosa and spina bifida, cauterized the wounds from the bites of rabid animals, opposed the use of the knife in can-
cer except when limited and when the whole tumor could be removed, and gave a clear and satisfactory description of the treatment of hernia. Avicenna (died about 1036) intro-
duced the flexible catheter. Alhucasis (died
about 1106) introduced an instrument for the cure of fistula lachrymalis, invented the pro-
bang, and in wounds of the intestine practised union of the divided parts by suture with suc-
cess.—In Catholic Europe medical practice and what of surgery remained was mostly in the hands of the clergy until, by the edict of the council of Tours in 1163, they were interdicted from all surgical practice. The Jews were at this period and for a century or two later in-
high repute as physicians, but they seem to have had a dislike to surgery. Gurn de Chau-
lac, a priest, compiled from the Greek and
Arabian authors the earliest work of modern
times on surgery, but with very little judg-
ment of what was worth retaining. For two
centuries and more surgery was mainly in the hands of the illiterate barber surgeons. The
revival of surgical science dates from the ap-
appearance of Vesalins (died 1564) as a teacher of anatomy in Italy, followed soon after by Fallo-
pus and Eustachius. Surgery was then for the first time put upon a sound and scientific basis, that of careful dissection, and Ambroise Paré, a French army surgeon who had educated him-
self in anatomical science, was the first of its great lights. He was surgeon successively to four kings of France, and was attached to the
French armies as surgeon-general down to 1569. To him we owe the revival and improvement of the practice of tying the arteries after op-
erations or wounds, instead of cauterizing them with hot iron or boiling oil. The pupils of Paré added little lustre to their master's name;
but in Italy at the close of the 16th century Fabricius ab Acquapendente flourished at Pa-
dua, and his Opera Chirurgica, the first really
valuable treatise on surgery of modern times, passed through 17 editions. He was the pre-
ceptor of Harvey. Wiseman, surgeon sur-
geon to Charles II., was the first eminent sur-
gical writer and practitioner in England. His recommendation of immediate amputation in military practice, when the preservation of the limb was impossible, has been followed from that time to the present. He left eight treatises on surgery, which are not without value even at the present day. The flap operation in amputation is claimed for James Young, an English surgeon contemporary with Wiseman, and also for two French surgeons, Verduin and Saburin, of the same period. In Germany during this century, Hildanus, Sculptetus, Furmann, and Heister were the principal surgical writers and practitioners. In Italy the principal names of note toward the close of the 16th and in the 17th century were Talis-cotius, the originator of the restorative surgery in Europe; Cesare Magatus, who greatly simplified the treatment of wounds; and M. A. Severinus, who banished the salves and plasters which in Italy had usurped the place of operations. The 18th century witnessed a still greater advance in surgical science. In England, Percival Pott, well known for his investigation of that form of caries of the vertebra known by his name (see Spinal Diseases), and the most judicious writer of modern times on fractures, amputations, injuries of the head, and diseases of the spine; John and William Hunter, the former the greatest master of the principles of surgery in the profession; Cheselden and Douglas, both famous as lithotomists; and the two Monros, father and son, are among the great names of the surgical profession. In France flourished La Peyronie, at whose instance Louis XV, in 1751 founded the academy of surgery; Jean Louis Petit, the greatest French surgeon of the 18th century; Ledran, Garangeot, and the illustrious Desault, the originator of clinical surgical instruction and the inventor of numerous admirable apparatuses for the treatment of fracture. Among the celebrated surgeons of other European countries were Molinelli, Morgagni, Scarpa, Bertrand, and Mosenti in Italy; Deventer, Albinus, and Camper in Holland; and Platner, Röderer, Rambilla, Theden, and Richter in Germany. During the 18th century the ligature of aneur-simal arteries of large size, the treatment of hernia and fistula in ano, the cure of fistula lachrymatis, and the skilful management of dangerous and difficult parturition, were the most important branches of surgery in which there was a material advance from the preceding century; the proper construction of instruments also received great attention. The 19th century has, however, done more for the improvement of this science than all the centuries which have preceded it. In England, Abernethy, Sir Astley Cooper, Liston, and others of the highest reputation have passed away, and others hardly less eminent remain: in France, Dupuytren, Roux, Lisfranc, and Larrey have had no superiors either before or after them. The following may with propriety be particularized as among the improvements of the age in surgery: the introduction of anesthesia; resection of the bones at the joints; the preservation of the periosteum and consequent development of new bone; partial amputations of the foot, as instanced in the operation of Lisfranc for the removal of the metatarsus, and of Chopart, Symes, Malgaigne, and Pirigoff for disarticulation of tarsal bones; the amputations at the thigh and shoulder joints; the ligature of arteries within the trunk and immediately at their departure from it; the resection and removal of portions or even the whole of the upper or lower jaw; the operations for cleft or defective velum palati or palatte vault; the opening by longitudinal section of the air passages at different points to avoid asphyxia; the resection and extirpation of the uterus, of the ovaries, and of the lower portion of the rectum; the introduction of the silver suture, especially in operations on the visera, as for recto-vaginal and vesico-vaginal fistula; the adoption of the immovable apparatus for fractures; the processes for reme-dying disunited fracture; the substitution of milder means for the trephine in all except the most serious cases; the improved treatment of ulcers and abscesses; the cure of the most formidable aneurisms by the ligature of the carotid, subclavian, axillary, humeral, and external and internal iliacs; the treatment of varicose veins; the successful treatment of calculus by lithotritry, in consequence of the great improvements made in the processes and instruments; the diagnosis and treatment of tumors, whether encysted, fatty, vascular, or malignant; the cure of strabismus, and the generally improved treatment in diseases of the eye, including the invention of the oph-thalmoscope by Helmholtz in 1851, and the reformation of ophthalmic medicine and surgery carried on by Von Graefe, Donders, Bowman, Toynbee, Wilde, Von Tröltsch, Politzer, and others; the restorative processes, by which the nose, lip, and other parts are re-formed from adjacent tissues; the treatment of harelip and of club-foot; and the notable advance consequent upon the conservative treatment of gunshot and other wounds of the brain.—As from the nature of their duties suits for malpractice are more often brought against surgeons than against physicians, it will be appropriate here to speak of their legal obligations, though the same laws apply to practitioners in any of the branches of medicine. In undertaking the treatment of a patient, the surgeon enters into a legal obligation and assumes legal liabilities, which, though seldom expressly defined, are yet, in the apprehension of the law, fixed and certain. The law holds that he contracts for the performance of that reasonable degree of learning, skill, and experience which the members of his profession ordinarily possess. Those also who, like occultists, aurists, or dentists, claim to be particularly conversant with and skilful in the treatment of the diseases of single organs, must be held
to a peculiar responsibility. The same is true of surgeons of great pretensions in large cities as compared with those residing in remote and thinly settled districts. In undertaking a case, the surgeon also contracts that he will apply the skill which he possesses, whatever be its degree, with reasonable and ordinary diligence and care. Extraordinary care is no more implied than extraordinary skill; nor is the practitioner supposed to guarantee a cure, though he may if he chooses contract to effect a cure, and then he must answer for a failure. The practitioner's skill in any case will ordinarily be required to embrace those phases and phenomena which usually characterize the dominant disease; and any mischance which connects itself immediately with these will involve the question of skill. His diligence and care will be exercised in watching for and guarding against the accidental influences which, if overlooked, may delay or even prevent the restoration of the patient. If he have brought ordinary skill and care to the treatment of his case, the surgeon is not responsible for want of success nor for mistakes in cases of real doubt and uncertainty. The surgeon's liability in cases of malpractice is ordinarily only a civil one, and the injury he does can usually be compensated by damages. But, in cases where death has followed the treatment, and it has seemed to be the direct consequence of the treatment, there have been, not unfrequently, charges of criminal malpractice preferred against the medical practitioner. To constitute a crime, there must be a malicious or criminal intent. This intent may exist in an actual design, or the law will infer it from gross rashness or want of circumspection.—Where no statutory prohibition intervenes, all regular and irregular practitioners are to be placed on the same footing. Leaving out of consideration cases of express malice, which would hardly be included under the designation of malpractice, our topic is reduced to those cases in which the charge is founded upon gross ignorance, gross negligence, or gross rashness. With particular reference to the charge of manslaughter, the law, especially in England, is that "if one, whether a medical man or not, profess to deal with the life or health of another, he is bound to use competent skill and sufficient attention; and if he cause the death of the other through a gross want of either of these, he will be guilty of manslaughter;" or as an eminent American authority, Mr. Bishop, states the law: "The carelessness in a medical man which, if death follow, will render him liable for manslaughter, is gross carelessness, or, as it is more strongly expressed, the grossest ignorance or most criminal inattention."

**SURICATE**, a carnivorous mammal of South Africa, coming near the lehmehoons. It is the *Rysema (suricata) capensis* (Ill.), and is sometimes called a porcupine. It is about a foot long, with a tail of 6 or 8 in., and about 6 in. high; it is nocturnal, dwelling in burrows which it excavates with its stout claws; the color is grayish brown, tinged with yellow, with obscure dark bands across the back. It is docile and intelligent, and is often domesticated for the destruction of vermin.

**SURINAM** or Dutch Guiana. See Guiana.

**SURINAM**, a river of Dutch Guiana, which rises in the mountains on the S. frontier, flows through the centre of the colony, and falls into the Atlantic about 10 m. below Paramaribo after a course of about 300 m. It has several tributaries, and is navigable for large vessels about 30 m. from its mouth.

**SURREY**, a S. E. county of England, bordering on Middlesex (from which it is separated by the Thames), Kent, Sussex, Hampshire, and Berkshire; area, 748 sq. m.; pop. in 1871, 1,090,270. That part of the county which lies on the Thames, with much of the land on the borders, is exceedingly fertile. Parts of the shire are famed for the beauty of their scenery. The principal streams are the Wey, Mole, and Wandle, which fall into the Thames. There are extensive market gardens and flower farms, where besides flowers medicinal herbs are raised in large quantities. Numerous canals and railroads intersect the county. Silk, woollen goods, hosiery, paper, earthenware, leather, and ale are manufactured. Besides Southwark, Lambeth, and other portions of London, the most important places are the three county towns, Guildford, Croydon, and Kingston, and Epsom, Reigate, Farnham, and Godalming.

**SURREY, Henry Howard**, earl of, an English poet, born about 1516, beheaded on Tower hill, London, Jan. 21, 1547. He was the eldest son of Thomas Howard, third duke of Norfolk, and passed his youth at the court of Henry VIII. In 1532 he married the daughter of the earl of Oxford, and went to France with the duke of Richmond. He assisted in the trial of Anne Boleyn in 1536, served in France in 1540, and was imprisoned for some wild irregularities in 1543. In 1544 he commanded in France, and earned the rank of field marshal. After the taking of Boulogne he became its governor, and continued the
war with advantage until January, 1546, when he met with a reverse. A panic among his troops caused a failure to intercept a convoy of provisions near St. Etienne, and his rival, the earl of Hertford, afterward the protector Somerset, induced the king to recall him to England. Surrey's comments on this action offended Henry, who imprisoned him for a short time in the tower. The Hertford faction lost no opportunity to excite the fears of the king, and on Dec. 12, 1546, Surrey with his father was again arrested on a charge of treason, for having quartered the royal arms with his own. Surrey in an eloquent defence proved conclusively his right to assume the royal arms; yet he was condemned and executed about a week before the death of the king. His works consist of sonnets, amatory verses, elegies, paraphrases from the Scriptures, and translations of the second and fourth books of the Æneid, and afford the first instance of the use of the sonnet and of blank verse in English poetry. The first edition of his sonnets was published by Richard Tottel in 1557. Editions of his works, with those of Sir Thomas Wyatt, and biographies, have been published by George Frederick Noris, D.D. (2 vols. 14t. 1815-16; new ed., 1871), Sir Harris Nicolas (1881), Prof. Child (Boston, 1854), and the Rev. R. Gilfillan (Edinburgh, 1856).

SURROGATE. See PROBATE.

SURRY. I. A S. E. county of Virginia, bounded N. by James river and S. W. by Blackwater river; area, 340 sq. m.; pop. in 1870, 5,585, of whom 3,192 were colored. The surface is moderately hilly and the soil fertile. The chief productions in 1870 were 85,965 bushels of Indian corn, 44,606 of peas and beans, 15,773 of Irish and 2,851 of sweet potatoes, and 1,901 of tobacco. There were 459 horses, 734 milch cows, 1,118 other cattle, 1,052 sheep, and 4,073 swine. Capital, Surry Court House. II. A N. W. county of North Carolina, bordering on Virginia, bounded S. by the Yadkin and drained by Ararat and Fisher rivers; area, about 500 sq. m.; pop. in 1870, 11,252, of whom 1,560 were colored. The surface is in part mountainous and generally hilly. Ararat or Pilot mountain in the southeast is the highest peak in this region. The chief productions in 1870 were 26,701 bushels of wheat, 18,029 of rye, 190,171 of Indian corn, and 5,921 of other grains. There were 14,707 of Irish and 15,568 of sweet potatoes, 254,386 lbs. of tobacco, 12,690 of wool, 81,238 of butter, 5,188 of flax, 68,658 of honey, and 9,681 gallons of sorghum molasses. There were 1,129 horses, 2,178 milch cows, 3,989 other cattle, 6,414 sheep, and 11,683 swine; 3 manufactories of cotton goods, 5 of chewing tobacco, and 4 flour mills. Capital, Dobson.

SURVEYING (Fr. surveir, to overlook), the art of measuring portions of the surface of the earth, either for the purpose of calculating the contents of areas, of laying out tracts of required extent, of establishing roads, or of preparing maps. The ancient science of geometry grew out of the practice of surveying, and now embodies the mathematical principles upon which the work is conducted. This science was cultivated by the Egyptians at a very early period, and many of the old Greek writers ascribe its origin to changes which annually took place from the inundation of the Nile, and to the consequent necessity of adjusting the claims of each person respecting the limits of lands. The progress of the art of surveying to its higher application in determining the figure of the earth has been traced in the article EARTH; and the operations in trigonometrical surveys upon a grand scale are described under COAST SURVEY. The systems of surveying may be classed according to its special objects; as land surveying, for determining the contents of areas, or dividing tracts into lots of smaller dimensions; topographical surveying, which includes the measurement of horizontal lines and angles, and the variations of level, so that the superficial inequalities may be graphically represented; hydrographical or maritime surveying, the object of which is the determination of the positions of channels, shoals, rocks, and the shore line; and mining surveying, for fixing the positions of the underground works in mines, so that these can be correctly mapped. Surveys extending over large territories involve the consideration of the curvature of the earth and the use of spherical trigonometry, and are called geodetic in contradistinction from ordinary surveying over more limited areas, which may with sufficient accuracy be conducted without reference to the figure of the earth, and which may be termed plane surveying. (See GEODESY.) The work is conducted by dividing the globe into small triangles, and then calculating the positions of the surveyors on the ground by means of trigonometrical measures. In the abstract, a survey of the earth is divided into triangles, and then calculated by means of trigonometrical measures. The number of triangles may be less than the number of sides. In using the chain it is to be kept as nearly horizontal as possible, or if the measurement is made on a slope the variation from the horizontal is to be determined and duly allowed. In case the corners are not visible from each other, intermediate points may be adopted and used for the terminations of lines from corners; the object being in every case to divide the tract into triangles of which the sides are all measured. Proof lines measured
from a corner of each triangle to the opposite side serve to rectify the other measures of the triangle, and if perpendicular to the side afford a convenient means of calculating upon the ground the area of the triangle. Perpendiculars to any line are readily laid out with a chain, as carpenters and masons draw right angles by what they call the 6, 8, and 10 rule, the popular application of the principle of the square of the hypotenuse being equal to the sum of the squares of the other two sides. The method is to measure from the point where the perpendicular meets the line, either along this line or along the perpendicular, a distance equal to six units of any kind, and then upon the other of these lines a distance of eight units. The two lines are perpendicular to each other when the two termini are just ten units apart. Convenient distances for this measurement might be 3, 4, and 5 rods or chains, or any similar multiples of these numbers, as 21, 28, and 35. Other trigonometrical methods readily suggest themselves. A number of convenient instruments of a similar form, known as the surveyor's cross, are in use for setting out perpendiculars by lines of sight, crossing each other at right angles; and a temporary substitute for them is easily made by sticking a pin in each corner of a square piece of board, and sighting across these in the direction of the line and at right angles to it. Angles in the field are determined by a chain, by measuring a "tie line" from a measured point on one side to another measured point on the other side. By this means the boundaries of a tract may be determined when it cannot be conveniently measured off in triangles. A great variety of expediency are adopted for overcoming natural obstacles and determining the extent and shape of inaccessible objects, systems of triangles being in such cases formed outside of and around such objects. Crooked lines are determined by means of perpendicular offsets measured from different points along a straight line run as nearly coincident to the crooked line as may be. In all the methods of surveying, the measurements, together with various incidental observations, are recorded, after some established system, in what are called field notes, and from these the results of the survey are afterward plotted to a convenient scale. — A more common system of surveying is that in which instruments for taking angles are employed in connection with the chain. A graduated horizontal circle, with a straight edge called an alidade turning upon its central point, which may be conveniently sighted along, furnishes the means of ascertaining the angular distance of two lines, the instrument being set at their intersection, and the alidade pointed in the direction of one and then of the other. This involves the principle of the engineer's transit, or of the theodolite. (See Theodolite.) With these instruments angles can be determined with great accuracy, especially when the observations are repeated by reversing the instrument and taking the mean, each including the reading of both verniers. With the transit and the chain for measuring distances, a tract of almost any dimensions is accurately surveyed by measuring the angles at its corners, and the correctness of the work is proved when the sum of all the interior angles is found equal to the product of two right angles, or 180°, by the number of sides of the tract less two; or if the instrument be used by the method called traversing, or "surveying by the back angle" (which consists in noting the angle which each successive line makes, not with the preceding line, but with the first line observed, which is hence called the meridian of the survey), then the reading, on getting round to the last station, and looking back to the first line, should be 360°, or 0°. A compass and chain may be employed in filling up the interior details of a large survey with the transit; and the compass may be used for determining the magnetic bearing of one of the lines unless this be astronomically ascertained by observations of the north star or of the shadows before and after noon. The compass is the instrument in most common use in ordinary surveying. The magnetic needle, wherever the instrument is set, establishes the meridian line, and from this, the sights of the instrument being turned to any other line, the angle of divergence is read on the graduated circle around the compass box. This instrument has been described under its own name; also the more perfect instrument, in which its inaccuracies are obviated, under the head of COMPASS, SOLAR. — The details of surveys are variously modified according to the extent of the area, character of the ground, &c. With the transit or compass, the boundary lines may be all followed out, the angles they make with each other determined, and their lengths measured by the chain; the points of crossing of roads, brooks, fences, &c., measured, and the bearings of these objects taken; and increased accuracy may be given to the work by running diagonal or proof lines, as in chain surveying. Additional checks are furnished by taking at each station the bearings of some marked objects, which when the work is plotted should severally fall at the points of intersection of the lines directed toward these objects from the several stations. Sometimes a tract may be surveyed from a measured base line, either a line within or without it, or one of the boundary lines, by placing the compass successively at each end of this line and taking the bearings of each corner; or without a compass the work may be very conveniently performed with approximate correctness by the plane table method, provided no angles are taken less than 30° nor larger than 150°. A drawing board covered with paper is set up at one end of a measured base line, and a ruler furnished with upright sights at each end, exactly over the drawing edge, is set with this
edge against a line needle stuck up in the board, and is then directed successively toward the corners of the tract to be surveyed and any other prominent objects, toward which from the needle lines are to be drawn on the paper. One of these lines should also be in the direction of the measured line. The instrument is then taken to the other end of the measured line, the needle is removed along the last line named on the board a distance corresponding, according to the scale adopted, to that of the measured line on the ground, and the board is so placed as to make the line toward the former start correct. The ruler is then again pointed to the same objects, and lines are drawn toward each from the new position of the needle. Their intersections with the former lines designate the places of these objects on the plane. The plane table is used in various other ways, as by moving it from one corner to the next, and placing it at each so that the last line drawn coincides with that in the ground. From any central point also radiating lines may be measured to the corners, and the distances measured and marked off according to the proper scale.—Rivers, brooks, and roads are surveyed by measuring a succession of lines following their general course, and taking offsets from the sides of the line. Streets are followed in a similar manner. Distances are sometimes measured upon roads, where expedition is more important than extreme accuracy, by various substitutes for the chain, some of which, as the odometer and pedometer, have been noticed under the former head. One may soon accustom himself to pace in straight lines, and with steps of uniform lengths, the most exact method being to regulate the natural step, rather than to try to attain and determine a certain length. The usual average step of a man is that of the English military pace, 2½ ft. The French geographical engineers accustom themselves to take regular steps of 5 m. of a metre, or 2 ft. 7¾ in.—The field work being completed, the figure of the tract surveyed is reproduced upon a diminished scale by what is termed plotting; and from this plot the contents are ascertained by a series of mathematical calculations applied successively to the several divisions, or by the method of calculation of latitudes and departures, for which a table of natural sines is required, unless "traverse tables" giving the latitude and departure for any bearing, as furnished in some books on surveying, are at hand. An approximate estimate of the number of acres included in the survey is sometimes made by drawing the plan upon sheet lead of uniform thickness, or upon Bristol board or heavy paper, cutting out the piece on the boundary lines, and weighing it in a delicate balance. The weight may then be compared with that of a similar piece that exactly comprises a definite number of acres, laid out upon the same scale.—The extensive territories of the United States are surveyed upon a peculiar system, planned with reference to the division of the lands into squares of uniform size, so arranged that any tract of 160 acres, or a "quarter section," may have its distinct designation and be readily found upon the map or recognized upon the ground by the marks left by the surveyors. Each great survey is based upon a meridian line run due N. and S. by astronomical measurements the whole extent of the survey in these directions; and upon a "standard parallel" or base line running E. and W., similarly established with great accuracy. Parallels to these lines are run every 6 m., usually with the solar compass corrected by frequent celestial observations; and thus, as nearly as the figure of the earth admits, the surface is divided into squares of 6 m. N. and S. and the same E. and W., each one containing 36 sq. m. or sections, into which the territory is further divided by meridians and parallels run at every mile; while the half mile being marked on these lines by setting what is called a quarter post, the points are established for the subdivision into quarter sections. The squares of 36 sq. m. are termed townships, often contracted to "towns;" and each line of them E. and W. is numbered either N. or S. from the base line, and each line of them N. and S. is termed a range and is numbered E. or W. from the meridian. The N. and S. lines bordering the townships are known as range lines, and the E. and W. as township lines. Each survey is designated by the meridian on which it is based, and of these principal meridians there are 6 designated by numbers and 18 by special names. The following table, compiled from information furnished from the general land office in August, 1876, gives the designation of the meridian for longitude W. from Greenwich, and the N. latitude or other description of the principal base lines:

The 36 sections of each township are numbered in order, beginning with the N. E. corner and then proceeding along the N. side of the township to section 6 in the N. W. corner; section 7 begins the next line of sections S., the numbers running E. to 12, and then beginning the third line with 13 and running W. to 18, and so on, bringing No. 36 in the S. E. corner of the township. The quarter sections are designated by their position as N. E., N. W., S. E., and S. W. Fractional sections of irregular shapes are admitted on the borders of lakes, rivers, &c. With these explanations any tract may be readily pointed out upon the government maps from its abbreviated description, or any locality in the wildest territory may be correctly defined; thus the S. W. qr. sect. 13, T. 66 N., R. 34 W., meridian Michigan, is traced directly to an old mining location near the N. E. extremity of Isle Royale, Lake Superior. The law which established this system, while it required that the N. and S. lines should be true meridians, also required that the townships should be six miles square. To satisfy both of these conditions is physically impossible, for the figure of the earth causes the meridians to converge toward the pole, thus making the N. line of each township shorter than its S. line; an inequality which becomes more and more marked the higher the latitude of the surveys. Provision is consequently made for correcting the errors thus caused, by establishing what are called correction lines, which are parallels bounding a line of townships on the north when lying N. of the principal base, or the S. line of townships when lying S. of the principal base, from which the surveys as they are continued are laid out anew, the range lines again starting at correct distances from the principal meridian. In Michigan these correction lines are repeated at the end of every tenth township, but in Oregon they have been repeated with every fifth township. The instructions to the surveyors have been that each range of townships should be made as much over 6 m. in width on each base and correction line as it will fall short of the same width where it closes on to the next correction line N.; and it is further provided that in all cases where the exterior lines of the townships shall exceed or shall not extend 6 m., the excess or deficiency shall be specially noted and added to or deducted from the western or northern sections or half of each township, according as the error may be in running the lines from E. to W. or from S. to N. In order to throw the excesses or deficiencies on the N. and on the W. sides of the township, it is necessary to survey the section lines from S. to N. on a true meridian, leaving the result in the N. line of the township to be governed by the convexity of the earth and the convergency of the meridians. Navigable rivers, lakes, and islands are “meandered” or surveyed by the compass and chain along the banks.—The in-
is healthful, and the soil generally good. The principal productions are the cereals and legumes, and the date, olive, argan, fig, almond, and grape. The mountains are rich in minerals, particularly copper and lead, and there are numerous mines which were anciently worked. The inhabitants, who are Shellooohs or Berbers and Arabs, are more austere and more warlike than others of the Moroccans, and use neither tobacco, liquors, nor coffee. They possess but few cattle or sheep. Tarudant, the chief city, a walled town with five gates, is in the valley of the river Sus, 44 m. from the coast. The N. part of Sus, above the river Gaz, is ruled by the governor of Tarudant under the authority of Morocco. Taouraout, S. of the Gaz, is governed by a nominally independent sovereign, and the remainder is under independent sheikhs.

SUSA (Gr. Ἴσος, the city of Illies), an ancient city of Persia, the Shushan (Heb., lily) of the Scriptures, the capital of the province of Susiana, and one of the residences of the court. It was between the Choaspes (the modern Kerka) and the Coprates (Abzal, an affluent of the Karun), enjoyed a fine climate, and was one of the largest cities of the Persian empire. Strabo says it was 120 stadms in circumference, and surrounded with a wall of burnt brick. According to Pliny, it was founded by Darius Hystaspis, though others make Tithonus, the father of Memon, its founder. It was for a long period the chief treasury of the Persian empire. In 225 B.C., when visited by Alexander, it possessed immense wealth, and from its plunder he gave largesses to his soldiers and presents of great value to his generals on the occasion of his marriage withBarsine and Parysatis. There has been considerable controversy as to the site of the ancient city, but the discovery by Str. W. F. Williams and Mr. W. K. Lewis of a gigantic tumulus and cemeteries of Greek inscription in the modern Sus, E. of the Kerka, establish that as the locality of Susa, over Shuster, which was formerly suggested as a probable site.

SUSIANA (also Susis and Cissia), an ancient province or region of Persia, of great extent, mountainous in the northeast, but mostly a plain, lying between the Zagros mountains and the Tigris, bounded N., by Media and S. by the Persian gulf. It nearly corresponded to the modern province of Khuzistan. It was drained by the Pasitigris (supposed to be the lower Karun), the Enlimes (the upper Karun), the Choaspes (Kerka), the Coprates (Abzal), the Hedyphus (Jerralh), and the Oroatis (Tab). Its earliest inhabitants were the Eylmei, probably the Elamites of Scripture, a portion of whom still occupied it in the time of Strabo; the other tribes mentioned as settled in the province are the Susii, who were agriculturists and had their villages on the plain, and the Cissii, Cossaei, Uxii, and Messabatae, all predatory mountaineers. (See Eylmais, and Khu-

SUSO, Heinrich, a German ascetic writer, also known as Brother Amandus, but whose real name was Von Berg, born in Ueberlingen, on Lake Constance, about 1300, died in Ulm, Jan. 35, 1363. He was educated in a Dominican convent at Constance, and at Cologne under the mystic Eckhart. After his mother's death he adopted her family name in his 18th year, and led a life of penance at the Constance convent till 1340, when he became an itinerant preacher of great influence, especially among women. His anniversary is celebrated by the Dominicans on March 2. Górrès, who translated his autobiography, regarded him as among the most fascinating writers of his class, and his Horologium Septem Haezerum (1480) ranked in the middle ages next to the "Imitation of Christ." His works, which were written in Latin, have been often reprinted and translated into several languages (modern German by Diepenbrock, Ratisbon, 1829 and 1888). A new edition of his Briefe, by Prega, appeared in 1867.

SUSQUEHANNA, a river of New York, Pennsylvania, and Maryland, having its source in Otsego lake, Otsego co., N. Y. It flows generally S. W. to the Pennsylvania line in Broome co., receiving the Unadilla and several smaller tributaries; near the Pennsylvania boundary it flows around the base of a spur of the Alleghany to Binghamton, forming what is called the "Great Bend;" after receiving the Chenango at Binghamton, its course is W. by S. till it again reaches the Pennsylvania line, where it takes a S. E. direction to Pittston, Luzerne co., receiving the Tioga and numerous small tributaries in its course; at Pittston it turns sharply S. W., passes Wilkesbarre, and receives near Sunbury the large affluent known as the West branch of the Susquehanna, which is more than 200 or 300 m. long, rising above Clearfield, and passing that town, Lock Haven, and Williamsport; then turning southwest, it receives the Juniata 14 m. above Harrisburg, and flowing thence S. E. enters the Chesapeake bay at Havre de Grace. Its length is a little more than 400 m. from Otsego lake to the bay, and from the junction of the two branches 153 m. The river is generally shallow, and its course much broken by rapids; in the spring, during flood, rafts and strong boats float down from Binghamton, but at other times it is not navigable. Immense quantities of timber are transported upon it. Canals have been constructed along its banks, on the main stream for 125 m., and on the West branch for 124 m. Its waters abound with fish. The lower waters of the Susquehanna are famous for a great abundance of ducks and other wild fowl.

SUSQUEHANNA, a N. E. county of Pennsylvania, bordering on New York, and drained by tributaries of the Susquehanna river, a portion of which lies in the N. part of the county; area, 800 sq. m.; pop. in 1870, 37,528. The surface is very hilly, and the soil fertile and
well adapted to grazing. Timber is abundant, and the export trade in pine lumber is very extensive. It is traversed by several railroads. The chief productions in 1870 were 40,522 bushels of wheat, 31,117 of rye, 811,218 of Indian corn, 628,061 of oats, 1,77,864 of buckwheat, 341,717 of potatoes, 98,459 tons of hay, 108,584 lbs. of wool, 2,360,649 of butter, and 93,560 of honey. There were 8,283 horses, 24,533 milk cows, 20,023 other cattle, 35,700 sheep, and 8,806 swine; 9 manufactures of agricultural implements, 82 of carriages and wagons, 10 of furniture, 4 of iron castings, 18 tanneries, 6 flour mills, 52 saw mills, and 5 woolen mills. Capital, Montrose.

SUSQUEHANAS. See Conestogas.

SUSSEX. I A N. county of New Jersey, bordering on New York and Pennsylvania, bounded N. W. by the Delaware river, and drained by the Flatkill, Paulinskill, Wallkill, and Pequest; area, 600 sq. m.; pop. in 1870, 23,168. The Blue mountains traverse the W. and the Humburg and Wawayanda mountains the E. part, and the remainder of the surface is very hilly; the soil is very fertile. The Hopatcong lake is in the S. part, and supplies the summit level of the Morris canal; and there are several other small lakes. The Sussex railroad passes through it. Franklinitke, iron ore, red oxide of zinc, and other minerals are found. The chief productions in 1870 were 64,552 bushels of wheat, 105,306 of rye, 422,776 of Indian corn, 268,477 of oats, 72,870 of buckwheat, 81,006 of potatoes, 40,383 tons of hay, 11,939 lbs. of wool, and 1,455,788 of butter. There were 4,230 horses, 17,376 milk cows, 5,338 other cattle, 3,976 sheep, and 14,414 swine; 8 manufactures of cheese, 1 of pig iron, 9 of castings, 5 of tanned and 5 of curried leather, 18 flour and 7 saw mills, and 6 distilleries. Capital, Newton. II. A S. county of Delaware, bordering on Maryland, Delaware bay, and the Atlantic, and drained by the Nanticoke and Pocomoke rivers and other streams; area, about 1,000 sq. m.; pop. in 1870, 31,696, of whom 5,438 were colored. The surface is almost level, and the soil fertile. It is intersected by the Delaware division of the Philadelphia, Wilmington, and Baltimore railroad, and the Jacob and Breakwater railroad. The chief productions in 1870 were 69,239 bushels of wheat, 1,122,693 of Indian corn, 58,779 of oats, 87,900 of Irish and 53,390 of sweet potatoes, 37,161 tons of hay, 23,566 lbs. of tobacco, 185,005 of butter, 23,517 of honey, and 32,347 gallons of sour gum molasses. There were 4,074 horses, 1,265 mules and asses, 6,127 milk cows, 4,250 working oxen, 6,968 other cattle, 12,213 sheep, and 18,409 swine; 1 woollen mill, 5 flour mills, and 29 saw mills. Capital, Georgetown. III. A S. E. county of Virginia, bounded N. E. by Blackwater river and intersected by the Nottoway; area, 400 sq. m.; pop. in 1870, 7,885, of whom 4,925 were colored. The surface is hilly and the soil fertile. It is intersected by the Atlantic, Mississippi, and Ohio, and the Richmond, Fredericksburg, and Potomac railroads. The chief productions in 1870 were 118,305 bushels of Indian corn, 21,357 of oats, 7,223 of Irish and 9,818 of sweet potatoes, 16,110 lbs. of tobacco, 1,883 of wool, and 21,528 of butter. There were 546 horses, 876 milk cows, 1,682 other cattle, 1,352 sheep, and 5,731 swine. Capital, Sussex Court House.

SUSSEX, a S. E. county of England, bordering on Surrey, Kent, the English channel, and Hampshire; area, 1,464 sq. m.; pop. in 1871, 417,407. The coast line is not much broken, the most remarkable projection being Beachy Head, 664 ft. above the sea. A range of chalk hills, called the North Downs, crosses the N. E. part of the county; and the South Downs, with an average height of 500 ft. and from 4 to 6 m. broad, run through its entire length nearly parallel to the coast. The principal rivers are the Arun, Adur, and Ouse. The county is purely agricultural, and wheat and hops are the chief products. The downs are principally used for pasturage, and are famous for their mutton. Sussex is remarkably rich in antiquities. It is divided into East and West Sussex, and has two county towns, Chichester and Lewes; the other towns of greatest importance are Brighton, Hastings, New Shoreham, Rye, Arundel, and Newhaven.

SUTHERLAND, a N. county of Scotland, bordering on the Pentland frith, Caithness, the North sea, Ross-shire, and the Mince; area, 1,886 sq. m.; pop. in 1871, 24,317. Several small islands which lie off the N. and W. coasts are included in the county. On these sides the coasts are generally high and bold, and are indented by numerous arms of the sea; but that on the east is flat with a low sandy beach. The interior is mountainous, the highest summit being 3,280 ft. above the sea. The rivers are all small with short courses, but there are numerous lakes. The principal crops are oats, barley, and potatoes. Sheep farming is extensively carried on. Game, including deer, is abundant. Dornoch, the capital, is the only town. Great improvements were made by the dukes of Sutherland, proprietors of most of the county, aided by parliament.

SUTHERLAND, George Granville Leveson Gower, duke of, born Jan. 9, 1758, died July 19, 1833. He was a son of the marquis of Stafford, belonging to a family of historic distinction since the 14th century. He early entered the house of commons, and was ambassador in Paris from 1790 to 1799. In 1799 he was raised to the peerage as Baron Gower. In 1803 he inherited the vast estates of his uncle, the duke of Bridgewater and of his father, which added to the Gower domain made him one of the richest men in the world. He extended his uncle's great picture gallery, and promoted the fine arts. He was created a duke Jan. 28, 1838. The Bridgewater estates passed to his second son Francis, afterward earl of Ellesmere, and the other property to the elder son,
George Granville Sutherland Leveson Gower (1786-1861), the second duke. The wife of the latter, Harriet Elizabeth Georgiana (born May 31, 1806, died Oct. 27, 1888), a daughter of the earl of Carlisle, and the queen's mistress of the robes for nearly 20 years, was celebrated for her beauty and accomplishments, and promoted anti-sluery and other philanthropical movements. The present and third duke is Sir George Granville William Sutherland Leveson Gower, born Dec. 19, 1828.

SUTLEJ, the most easterly of the five rivers of the Punjab, in British India. It rises in Thibet N. of the Himalaya mountains, about lat. 31° N., lat. 83° E., flowing N. W. out of Lake Mannasarowar, and in the early part of its course is joined by numerous tributaries. After a course of about 200 m. it turns W., and in about lat. 31° 10', lon. 75° 4', 550 m. from its source, it unites with the Beas, and the river thence flows S. W. and is called the Ghara until its junction with the Chenab, 300 m. below, when the united stream takes the name of Punjab, and joins the Indus after a course of about 50 m., in lat. 28° 58', lon. 70° 29'. The upper Sutlej is supposed to be the Hesdr us and the lower the Hyphasis of the ancients. In the upper part of its course the Sutlej is an impetuous torrent, and the scenery magnificent. In the Punjab plain it is from 7 to 30 ft. deep, and from 250 to 500 and 700 yards wide.

SUTTE (Sans, satti, from sat, pure), properly a chaste and virtuous wife, but commonly used to designate the self-immolation of a widow by burning herself with the dead body of her husband. The practice has existed for many centuries, not only in India but in other Asiatic countries. Diodorus Siculus gives an instance which occurred in the army of Eume- nides more than 200 years B.C., and in India it is certainly of great antiquity, though the period of its origin is unknown. It was more prevalent there than elsewhere, from the belief encouraged by the Brahms, and professedly derived from their most sacred books, that it conferred the highest merit not only on the widow herself, but on her dead husband. It was asserted by the Brahmanical writers that every woman who thus burned herself should remain in a region of joy with her husband 35,000,000 years, while otherwise she would have no place in paradise. The prevalence of the practice is to be attributed to belief in this view, rather than to any other influence. A careful study of the Vedas and the Institutes of Manu has shown, however, that these works not only do not command suttee, but impliedly prohibit the practice. Certain passages of the Vedas supposed to relate to it have been the subject of animated controversy among Anglo-Indian scholars. The practice prevailed long after the East India company came into power. The Mohammedan emperor Akbar prohibited it in his 4th century, but without much effect. In the first quarter of the pres-
some time a profitable trade with Indians and trappers, whose accounts of California prompted him in 1803 to cross the Rocky mountains: thence to Fort Vancouver and thence to the Sandwich islands, and thence to Alaska and along the coast of the Pacific, and on July 2, 1839, was stranded in the bay of Yerba Buena (now San Francisco). Penetrating into the interior amid great difficulties, he founded in the same year the earliest white settlement on the site of Sacramento, received a considerable grant of land, and in 1841 built a fort, calling it New Helvetia, which was afterward the first settlement reached by overland emigrants to California. The Mexican authorities appointed him governor of the northern frontier country; and subsequently under the American authorities he was justice of the peace (alcalde) and Indian agent. He acquired great influence and wealth, but was ruined in 1848, when gold was first discovered (February) on his property near Coloma, El Dorado co. His laborers deserted him, and his lands were overrun by the gold diggers. He never recovered them, though repeatedly advancing his claims, and has not received any indemnity excepting an annual allowance of $3,000 from the state of California. Since 1873 he has resided at Lititz, Lancaster co., Pa.

SUTTON, Amos, an English missionary, born at Sevenoaks, Kent, in 1793, died in Cuttack, India, Aug. 17, 1854. He was ordained as a missionary at Derby in 1824, and sent to Orissa, India, where he labored 30 years, visiting England and America once. He translated the Scriptures into Oriya, compiled an Oriya dictionary, grammar, and lesson book, wrote tracts, and translated many English works. In English he published "The Family Chaplin" (2 vols., Calcutta, 1831–2), "Narrative of the Mission to Orissa," "Orissa and its Evangelization" (Derby, Eng., and Boston, 1856), "Hymn Book for Mission Congregations," and a "Guide to the Saviour's Kingdom.

SUVAROFF, properly Suvaroff, Alexei Vasili'evitch, count, and Prince Italiski, a Russian soldier, born Nov. 24, 1729, died in St. Petersburg, May 17, 1800. He entered the army at a very early age, served in the seven years' war, and commanded with success in Poland against the confederates of Bar (1768–72), and subsequently against the Turks, the khan of the Crimea, and the Nogai Tartars, obtaining the rank of general-in-chief in 1783. In the campaign of 1787 against the Turks he raised the siege of Kinburn and was wounded, achieved another victory at Fokshani (July 21, 1789) together with the Poles, and on Sept. 22 routed the main Turkish army on the banks of the Rinnik, for which he received the title of count, and the surname Rinnikski. After repeated repulses he stormed Ismail in 1790, losing 20,000 men, massacred the Turkish garrison of 30,000 troops, and nearly reduced the town to ashes. He was next governor of Ye-katerinomoulov, Taurida, and the conquered territo ries on the Dniester. In 1794 he defeated Kosciuszko jointly with Fersen (Oct. 10), and carried Praga, a suburb of Warsaw, by assault (Nov. 10), pouring it with blood. The next day of this event he communicated to the empress in the following despatch: "Hurrah! Praga! Suvaroff!" and in reply the empress promoted him in these words: "Bravo! field marshal! Catharine." The caprice of Paul I. drove him from the service in September, 1798; but he was soon reinstated at the request of the emperor Francis of Germany, and in 1799 placed at the head of the united Austrian and Russian armies in Italy. He achieved many brilliant victories over the French, at Cassano, on the Trebbia, and at Novi, for which he was made Prince Italiski. He crossed the Alps to join Korsakoff, at the moment when Masséna's decisive victory over the latter at Zürich (Sept. 25, 1799) entirely changed the military situation, and he was recalled to Russia with the rank of generalissimo. An ovation prepared for him at St. Petersburg was countermanded by a caprice of the czar, and this undeserved mortification gave the death-blow to Suvaroff's shattered health. His autobiog raphy has been published under the title de Suvaroff tradée par lui-même, ou collection de ses lettres et de ses écrits, edited by Glinka (9 vols., Moscow, 1819). One of the best biog raphists of him is by Polevoi (German ed., Mitau, 1859).

SEWALL. I. A W. government of Poland, bordering on Lomza, Prussia, and the Lithua nian governments of Kowno, Wilna, and Grod no; area, 4,846 sq. m.; pop. in 1870, 524,480. It is level, well wooded, and drained by the Niemen, which constitutes its E. and N. fron tier. The principal towns are Suwalki, Augustowo, and Kalvarya. II. A town, capital of the government, 150 m. N. E. of Warsaw; pop. in 1867, 16,896, including about 6,000 Jews. It was founded by King Sigismund Augustus, and has been much improved. It contains many brandy distilleries, and the trade is active, especially in horses and cattle during the periodical fairs.

Sewanee, or Swaunee, a N. county of Florida, bounded N., W., and S. W. by the Swannee river; area, 790 sq. m.; pop. in 1870, 3,556, of whom 1,435 were colored. The surface is undulating, and the soil tolerably fertile. There are two or three small lakes and several swamps. The county is traversed by the Jackson, Pensacola, and Mobile railroad, and its branch from Live Oak to Lawton, Ga. The chief productions in 1870 were 50,384 bushels of Indian corn, 19,404 of oats, 17,670 of cotton, 10,741 of peas and beans, 511 bales of cotton, 61 hogheads of sugar, and 17,427 gallons of molasses. There were 1,875 milk cows, 2,156 other cattle, 369 sheep, and 3,946 swine. Capital, Houston.

SVEABORG, the principal fortress of Finland, Russia, on the gulf of Finland, in the province and 3 m. S. E. of the town of Helsingfors, the.
approaches to which it defends, and under its municipal authority; pop. about 4,000. It is built upon seven granitic islands forming an ellipse, all of them strongly fortified, and connected either by causeways or bridges of boats. The principal fort is on Vargó island, on the south, and comprises a strong castle and barracks, and magazines excavated in the rock. The total number of cannon is 2,000, but it generally mounts 800; and the usual garrison of the fortress varies from 6,000 to 8,000 men, though the casemates have accommodations for 12,000. The harbor within, to which there is but one entrance, has room for 70 ships of the line. The fortress was erected between 1749 and 1758 by Count Ehrenswerd, field marshal of Sweden (who is buried within it), as a defence against Russia. In 1808 it was besieged by the Russians, and after two months the Swedish commandant and admiral Cronstedt, though amply supplied with the means of defence, capitulated (April 7). Left in the possession of the conquerors by the peace of Sept. 17, 1809, it was called the "Gibraltar of the North," and has since been regarded as the strongest fortress of Russia on the Baltic. In August, 1855, it was severely but unsuccessfully bombarded by the allied fleet.

SVERTHKOFF, Nikolai, a Russian artist, born in St. Petersburg in 1818. He spent several years in Paris, and in 1832 became a member of the academy of St. Petersburg, and in 1855 a professor there. He excels in painting horses, costumes, and figures, and also as a sculptor. His principal works include "The Czar Alexander reviewing His Troops," "A Russian Team of three Horses," "A Russian Horse Market," and "A Relay of Post Horses."

SWABIA, or Swabia (Ger. Schwaben), a duchy of the German empire during its earlier period, and subsequently one of its ten great circles or divisions. The circle was bounded N. by the Palatinate of the Rhine and Franconia, E. by Bavaria, S. by Switzerland, and W. by France, the Rhine flowing on the borders of the two latter. It had an area of 18,000 sq. m., and was conterminous with the present kingdom of Wartenberg, the S. part of Baden, and the district of Swabia and Neuburg in Bavaria. It is one of the most beautiful and fertile tracts in Germany, and is traversed by the Danube from S. W. to N. E., and diversified by the mountain scenery of the Black Forest on the west and the Alps on the south. It was originally called Alemannia, and received the name of Swabia (from the Suevi, who inhabited parts of it) when the Alemanni were conquered by Clovis in 496. St. Columbanus introduced Christianity in the 7th century. Toward the end of the 11th century it was in a very flourishing condition, and in 1080 the emperor Henry IV. made the duchy of Swabia hereditary in the family of Frederick of Hohenstaufen. It subsequently became one of the most powerful and most civilized countries of Germany. In the Italian wars the reigning house of Swabia stood at the head of the Ghibelline party, and when Conradin was executed at Naples in 1268 the line became extinct. (See Hohenstaufen.) The various cities, prelates, and counts then made themselves independent, and since that time Swabia has not formed a separate state. Various confederacies, however, were formed at different periods, known in history under the name of Swabian leagues. The principal of these was the "great Swabian league" of 1488. The Swabian circle was definitely organized in 1568.

SWAINE, a S. W. county of North Carolina, separated from Tennessee on the north by the Great Smoky mountains; area, about 600 sq. m. It has been formed since the census of 1870 from Jackson co. The surface is generally elevated and mountainous; the soil is good and the county well adapted to stock raising. Capital, Charleston.

SWAIN, Charles, an English poet, born in Manchester in 1803, died near there, Sept. 22, 1874. He learned the business of dyeing, but at the age of 30 became an engraver. In 1828 he published "Metrical Essays," followed by "Poems of the Mind" (1831) and "Dryburgh Abbey" (1832), an elegy on Sir Walter Scott. His subsequent publications comprise "A Memoir of Henry Liversedge" (1855); "Rhymes for Childhood" (1846); "Dramatic Chapters, Poems, and Songs" (1847); "English Melodies" (1849); "Letters from Laura d'Anverne" (1853); and "Art and Fashion" (1863). Swain was known as the "Manchester poet." A collection of his poems has appeared in the United States (Boston, 1858; new ed., 1872).

SWAINSON, William, an English naturalist, born in Liverpool, Oct. 8, 1789. He served in the Mediterranean in the army commissariat department from 1807 to 1815, then travelled in South America with Koster, the German naturalist, and on his return settled in London. In 1820 he commenced the publication of "Zoological Illustrations, or original Figures and Descriptions of new, rare, or interesting Animals," since republished in 6 vols. 5to; and in 1821 of "Exotic Conchology" (4to; new ed., edited by S. Hawley, 1841). He has also produced a "Naturalist's Guide for collecting and preserving all Subjects of Natural History and Botany," etc. (1822); 12 volumes on natural history in Lardner's "Cabinet Cyclopeda;" two volumes on the "Birds of Western Africa" and one on the "Fly Catchers," in Jardine's "Naturalist's Library" (1837-78); "A Treatise on Malacology, or the Natural Classification of Shells and Shell Fish" (1840); and a series of "Ornithological Drawings," being selections of Brazilian and Mexican birds (1854-41). He assisted Sir John Richardson in the preparation of that part of his "Fauna Boreali-Americana," which relates to North American birds, and in connection with Mr. Shuckard prepared in 1840 "The History and Natural Arrangement of Insects." In 1841 he emigrated to New Zealand, and since his residence there he has published several works on
its social and political condition, and on the natural history of that colony and Tasmania.

SWALLOW, the general name of the diurnal fissirostral birds of the family hirundinidae, not including the swifts, many of which are called swallows. (See Swift.) The bill is short and weak, very broad at the base and suddenly compressed to the tip; the wings long, narrow, and acute; primaries nine or ten, the first the longest; tail more or less forked; tarsus very short and weak, generally naked, and covered with scales; toes usually long and slender, with the claws moderate, curved, and sharp; the gape very wide and usually provided with short bristles. The typical genus hirundo (Linn.), having more than 50 species, embraces several well known, elegant swallows both in America and the old world, remarkable for their great powers of flight. Their food consists of insects, which they take on the wing, usually in the neighborhood of water, with remarkable skill and grace; they drink on the wing, sweeping along the surface of the water, and often wash themselves by a sudden plunge. They fly at the rate of a mile a minute in their ordinary evolutions, but are rather awkward on the ground from the length of the wings and the shortness of the legs; they live more on the wing than any other birds, even feeding their young in the air; their sight is very acute; they fly low in damp weather, where the insects are most abundant, and are then supposed to foretell rain. They are most numerous in the tropics, migrating to and from temperate regions; in Great Britain they make their appearance from Africa, where they spend the winter, from the beginning to the middle of April, and depart toward the end of October, crossing the channel singly or in small parties; they often alight on vessels, and sometimes fall into the sea. In the United States they arrive about a month later and depart several weeks earlier. Most species prefer the neighborhood of man, building their nests in society in his dwellings and buildings; they form attachments to places, returning year after year to the same nests; they are docile and have been partially domesticated; a single bird probably collects about 1,000 insects in the course of a day. The nests are generally made of clay or mud mixed with straw and grass, of various forms, and attached externally to some building; many species breed in holes in sand banks, at the end of which is the nest of grasses and feathers; the eggs are five or six.—The best known species in the old world is the chimney or house swallow (H. rustica, Linn.); it is 6½ in. long, bluish black above, with a band on the chest, and the forehead, eyebrows, and throat, ruddy; lower parts rufous white, with a white spot on the inner web of each tail feather except the two innermost; the tail is very long and forked. As its name imports, it frequently builds its nest in chimneys a few feet from the top; it also nests in old walls and shafts of mines, and among the rafters of barns and sheds; the nest is cup-shaped, made of earth and straw and lined with feathers; the eggs are white, spotted with ash and red. The parents are very attentive to the young, and brave in their defence; they have two broods in a season, the second sometimes left to perish, not being able to quit the nest at the period of migration; the males are sweet singers, and very courageous. The analogue of this species in America is not the one commonly called chimney swallow with us (which is a swift), but the barn swallow (H. horrorem, Barton); it is about 7 in. long and 13 in. in alar extent, glossy steel-blue above, with concealed white in middle of back; it much resembles its European congener, though it has the pectoral collar interrupted in the middle, while in H. rustica it continues across. It inhabits North America from the Atlantic to the Pacific, appearing in the southern states from the middle of February to March 1, a few at a time, reaching New England in mild seasons by the middle of May. It is gentle and easily tamed. The nest is made of mud or moist earth mixed with grasses, and is attached to the beams and rafters of barns and outbuildings; it is generally about 8 in. long, 6 in. in the greatest diameter, and from beam to outside of shell 6½ to 4 in.; weighing often more than 2 lbs.; the eggs are four to six, small and long, white with a few spots of reddish brown; incubation lasts 13 days, both sexes assisting, and both occupying the nest at night until the young are hatched. This species collects in large flocks in midsummer on barns and sheds, telegraph wires, &c., chirping almost continually, and making short sallies in search of insects. They start for the south by the end of August or first of September, early on some fair morning; they do not fly high, and follow the shore or the course of rivers.—The cliff or fulvous swallow (H. petrochelidon lanijrons, Say) is about 5 in. long and 12½ in. in alar extent; the crown and back are steel-blue, separated more or less broadly by a grayish collar; the chin, throat, and sides of head dark chestnut; breast grayish brown;
belly white; steel-blue spot on throat; rump light chestnut, and forehead brownish white; tail slightly notched. It is found throughout North America from ocean to ocean; it

White-bellied Swallow (Hirundo bicolor).

is called republican swallow by Andubon, in allusion to the habit of associating to make their nests and rear the young. The nest is built under eaves and cornices, where it is partly sheltered from the rain; it is made of clay and sand, the entrance near the top, shaped like an earthen retort with the neck broken off; it is lined with straw and grass; the eggs are white with dusky spots; the nest is bravely defended by the parents. The white-bellied swallow or American house martin (H. bicolor, Vieill.) is 6½ in. long and 12½ in. in alar extent, of a glossy metallic green above and white below; it comes earlier in the spring than the others, but is not so common; the nest is made in a hollow tree, lined with

Sand Swallow (Cotyle riparia).

grass and feathers, and the eggs are white with a bluish tinge; it is as widely distributed as the others in North America, and some time before migrating southward gets very fat on

myrtle berries (myrica cerifera). For the largest of the American swallows, see Martin.—The bank, sand, or river swallow belongs to the genus cotyle (Boie); it is the C. riparia (Boie), and the smallest of the American species, being 4½ in. long and 10½ in. in alar extent. The bill is very flat, and extremely wide at base, gradually narrowing toward the tip; nostrils prominent and rounded; tail moderate, nearly even or very slightly forked; tarsi rather long, with a tuft of feathers near the toes behind. It is grayish brown above, sometimes approaching sooty, with paler margins; below pure white, with a band across the breast and sides like the back. It is generally distributed over America and Europe, wherever there is a sandy pit or river bank; it is the earliest to arrive in the spring, and less familiar than the other species; it hollows out a tubular gallery in the sand banks, often more than 8 ft. in length, at the end of which is a larger excavation for the nest; it is called sand or bank martin in Europe. There is no appreciable difference between the European and American birds.

SWAMMERDAM, Johannes, a Dutch entomologist, born in Amsterdam in 1637, died about 1680. He studied medicine with his father and at the university of Leyden. He gave considerable attention to the natural history of insects, and made many dissections and microscopic examinations and a large collection of specimens. He obtained leave at Amsterdam to dissect the bodies of those who died in the hospital, and invented the mode for the preparation of hollow organs now usually employed in anatomy. He published a "General History of Insects" (1669), "The Natural History of Bees" (1678), a "History of the Ephemeras" (1679), and other works. His entomological collection was divided at his death and sold in small portions. Boerhaave edited his works and wrote his life. An English translation of his entomological works by T. Floyd was published in 1758.

SWAN, a web-footed bird of the duck family, and the type of the subfamily cygninae, embracing some of the largest and most graceful of aquatic birds. The bill and feet are much like those of the ducks, the former being stout, of nearly equal width throughout, and with a comparatively small nail; the neck very long, and the legs short; wings long and powerful, second and third quills equal and longest; tail short and rounded; eyes small and near the bill. They perform long migrations, flying in single files uniting at an acute angle; the diet consists of grass, roots, and seeds, in search of which they submerge the head only, keeping it under water three to five minutes at a time; they also devour aquatic worms and insects, young frogs, and probably small fish; the intestines are long, as in the vegetable feeders; they are gregarious at all seasons, awkward on land, but rapid and high fliers; they are remarkably careful to keep their plumage, which
is generally white, free from dirt. The nest is bulky, of grass and coarse materials, placed on the ground among the rushes and near the water; it is sometimes raised a foot or more to avoid inundations; the male guards the nest, assists the female in the care of the young, and boldly defends them even against predaceous animals and man; the eggs are five to eight, and incubation lasts six weeks.—In the typical genus cygnus (Linn.) the bill is longer than the head, the base covered by a soft skin extending to the anterior half of the eyes, and the nostrils in the middle portion; lower part of tibia bare; tarsus much shorter than the foot, compressed and sealy; webs full; hind too small, much elevated, with a narrow lobe; tail of 20 to 24 feathers, rounded or wedge-shaped; sexes similarly colored, but the females the smaller. Wagler has divided the old genus cygnus into two, cygnus and olor, according as there is or is not a swollen fleshy tubercle at the base of the bill; in the former also the lamelle of the edges of the bill are visibly projecting, and in the latter not; in the former belongs the tame swan of Europe, and in the latter the wild-swan and both of the North American species. The European wild or whooping swan (C. ferus, Ray) is 4½ to 4⅔ ft. long, white, with the head and neck tinged with yellowish, and a black bill, yellowish at the base and without tubercle; it is a winter visitor in Great Britain, migrating northward in the spring to Lapland, Russia, Siberia, &c., where it breeds; the young are brownish gray. The male has a peculiar note resembling the word "hoop," repeated several times in succession, the intensity greatly increased by the convolutions of the windpipe, which, after penetrating the keel of the breast bone to its posterior portion, is bent forward again to the front of this bone before going to the lungs; this peculiarity is not found in the tame swan, which has a soft and plaintive voice. The swan is cruel and vindictive; the males fight savagely at pairing time, and the females with young attacks everything which approaches her nest; it can repel any bird, even the eagle, and in fighting the combatants try to drown one another by holding the rival's head under water, often with success. Though heavy fliers, they rise to a great height, uttering a loud, harsh, and trumpet-like note when salling high in the air; when enraged or alarmed they can swim faster than most can walk. This bird was sacred to Apollo, and was the bird of the Muses; it was fabulously celebrated for its melodious song, especially at the time of its death. The flesh is dark and tough. The European tame swan (C. olor, Gmel.) has a red bill, with black tip and sides, and a tubercle at the base; the trachea has no convolutions. It is generally distributed over Europe and America as an ornamental bird; it is large and handsome, a permanent resident in temperate Europe; in Great Britain from remote periods it has been protected by preservative laws; the male is called a cob and the female a pen; its life is said to extend to a century. The young have a gray plumage and a lead-colored bill. The flesh is said to have a flavor between that of the goose and the hare. The most prized are brought to the United States from Hamburg, and are generally what are called Polish swans (C. improbabilis, var.) from the Baltic shores, noted for having white cygnets.—The American or whistling swan (C. americanus, Sharpless) is 55 in. long and about 7 ft. in alar extent, with a bill of 4½ in.; the bill is as long as the head, high at the base, the feathers on the forehead ending in a semicircular outline; the nostrils far forward; tail of 20 feathers; the adult is pure white with bill and legs black, and an orange or yellowish spot in front of the eye; young birds are brownish, especially on the head; they are five or six years in coming to maturity. This species is spread over the North American continent from the Atlantic to the Pacific; many are shot in winter and spring on the coasts of Virginia, Maryland, and Delaware; when they are feeding, one always acts as sentinel; they fly in an angle, each in a single file, the leading bird as he gets weary retiring to the rear. The nest is described as made of moss, peat, and sticks, 5 to 6 ft. long, 4½ ft. wide, and 2 ft. high, with the cavity 1½ ft. in diameter; the eggs are brownish white, clouded with darker. The trumpeter swan (C. buceinator, Rich.) is about 5 ft. long and 7 ft. in alar extent, with the bill 4½ in.; bill longer than the head, the feathers on the forehead with a semi-elliptical outline; nostrils with the anterior extremity only as far forward as the middle of the commissure; tail with 24 feathers; the adults are pure white, the legs and bill entirely black, the latter without any red spot at base. It is found from the Mississippi valley to the Pacific, appearing on the lower Ohio about the end of October, and going south when the ice gets thick; it is very common in the fur countries, breeding as far north as lat. 61° N. The note is more sonorous than in the whistling swan; it is not so wary as the last named species;
it is the principal source of the fine down so much prized for mufffs and tippets.—A black swan, once considered as apocryphal as a white crow, inhabits Australia. The chenopis atrata (Wagl.), of that continent and Tasmania, is black except a few white primaries and a bright red bill; it is nearly as large as the common swan, and is now not unfrequently seen with it in the parks of Europe and the United States.

SWAN RIVER. See Western Australia.

SWANSEA (Welsh, Abertawe), a town of Glamorganshire, Wales, on the W. bank of the river Towy, where it falls into the bay of Swansea, Bristol channel, 60 m. W. N. W. of Bristol; pop. in 1871, 51,702. It is much resorted to for sea bathing. There are extensive anthracite mines in the neighborhood, which, together with the convenience of the port, have made it the principal seat of the copper trade of Great Britain. Copper ore is brought hither for smelting from Cuba, North and South America, Australia, &c. There are also iron, tin plate, and zinc works, potteries, and shipyards. The port was entered in 1873 by 6,855 British vessels, tonnage 877,241, and 1,165 foreign vessels, tonnage 197,062. There were cleared 6,612 vessels, tonnage 859,619, of which 1,258 were foreign, tonnage 216,527. The exports in the same year were valued at £1,855,712. The exports of coal in the year ending with February, 1875, were 30,592 tons, and the coastwise shipments 17,874 tons. There are extensive docks; the first floating dock was built at Swansea in 1852. Large vessels can come close to the town at flood, but at ebb the harbor is nearly dry.

SWEATING SICKNESS, a disease which often prevailed extensively in Europe and Asia during the middle ages, and which still frequently appears in Turkey and other parts of Europe and Asia. The older descriptions of it are somewhat vague, but from the general symptoms it is doubtless the disease which has been accurately described by Rayer and others, and is now called miliary fever, sudatoria, and miliaria, and is defined as an eruption of innumerable minute pimples with white summit.s, occurring in successive crops upon the skin of the trunk and extremities, preceded and accompanied with fever, oppression of respiration, and copious sweats of a rank, sour, fetid odor, peculiar to the disease. The base of the pimples and the skin around are red and irritable." Pathologists are not agreed as to its specific nature; some deny that a peculiar specific disease exists, as in smallpox or scarlatina. The fever which precedes the eruption is ushered in by intense chills, oppression of breathing, fainting, and pains in the head, loins, and limbs. In a few hours nausea and profuse sweating come on, but without relieving the other symptoms. The pulse is small and rapid, often hard and irregular. The tongue is coated with a foul yellow fur, and the bowels are constipated. From the 5th or 6th day to the 21st an itching sensation is felt in the mammary and epigastric regions and the inner surface of the arms, and the skin of those parts becomes red and rough, with numerous elevations about the size of common pin heads. In a short time the summits of these elevations become pearly white, the cuticle being elevated by a slightly opaque, sero-albuminous fluid. Several crops of elevations break out in succession for from three to seven days, followed by desquamation of the cuticle. In severe cases the eruption appears at the junction of the skin and mucous membrane, and is liable to become aphthous. Two forms are recognized, the mild and the malignant, the latter being accompanied by violent inflammation of some internal organ, and proving fatal sometimes in two or three days. The treatment consists in cooling drinks, bland diet, and frequent laving and sponging of the cutaneous surface.—The disease appeared in England in 1485, just after the battle of Bosworth, and disappeared suddenly at the beginning of the next year. It attacked people chiefly in the prime of life, and scarcely one per cent. recovered. It appeared again in the summer of 1506, but in a mild form. In July, 1517, it appeared in a very malignant form, sometimes terminating fatally in a few hours. It lasted for six months, and like the preceding epidemics was confined to England. In May, 1528, it again appeared in London. It lingered in the city till the next year, and was so fatal as to receive the name of "the great mortality." It finally extended over the northern half of the continent, and 2,000 persons fell victims to it in 21 days at Hamburg. In 1551 it made its last appearance in England, and continued six months.

SWEDBERG, Jesper, a Swedish clergyman, father of Emanuel Swedenborg, born at Falun, Aug. 28, 1635, died at Brunso, July 26, 1783. His father was a copper smelter named Daniel Isaksson. Swedenberg took his name from a small family estate. He was educated at Upsal, and in 1658 was ordained a priest and appointed chaplain to the king's regiment of cavalry life guards. In 1690 he was made pastor of Vinzaker, in 1692 professor of theology at Upsal, and soon after rector of the university. In 1691 he was one of a commission to revise the Swedish Bible, which work was completed in a year. In 1694 he published a psalm book, which was suppressed as pietistic. In 1702 Charles XII. made him bishop of Skara in West Gothland, in which office he remained till his death. In 1722 he produced the first Swedish grammar ever printed. About 1722 the Swedish congregations in London, Lisbon, and North America elected him their bishop.

SWEDEN (Swedish, Sverige), a kingdom of northern Europe, forming with Norway the Scandinavian peninsula, and lying between lat. 55° 20' and 69° N., and long. 11° 10' and 24° 10' E. It is bounded N. and W. by Norway, S. W. by the Skager Rack, the Cattegat, and the Sound, S. by the Baltic sea, E. by the Baltic
and the gulf of Bothnia, and N. E. by Finland. It is separated from Norway by the main chain of the Scandinavian system of mountains, along which a broad avenue cut in the forest, and having at certain intervals stone monuments, marks the line of division. This avenue is interrupted by the Norwegian gians, and its condition regularly reported to their storching or legislature. The extreme length of Sweden is 970 m., and its general breadth about 200 m.—The coast line, about 1,400 m. in extent, is deeply indented by numerous fiorls or gulfs. About 300 m. of the coast borders on the Skager Rakk, Cattegat, and Sound; the remainder is washed by the Baltic and the gulf of Bothnia. The W. shore along the Skager Rakk and Cattegat is rocky, but seldom elevated more than 30 or 40 ft. The S. shore as far as Sølvæsborg in Blekinge is low and sandy; then to northward it is, with some exceptions, lined by precipitous cliffs about 50 ft. high as far as Calmar sound. Along the Sound the coast is again low and sandy, but N. of it rises into higher cliffs, and at the outlet of Lake Mælar presents bold headlands 100 ft. high. N. of the mouth of the Dal and as far as the strait of Quarken rocky and sandy shores alternate; and the upper part of the gulf of Bothnia is characterized by low sandy beaches. The entire coast N. of Calmar is lined with numerous rocky and sandy islets, which render access difficult in many places. Off of the län of Calmar, and separated from it by Calmar sound, is the island of Öland; and N. E. of this lies Gottland, the largest island of Sweden. The Aland group, off the län of Stockholm, belongs to Russia.—The mountain chain which forms the spine of the Scandinavian peninsula has a much larger portion of its most elevated surface in Norway than in Sweden. Its southern part, the Langfield chain, is wholly in Norway, while the Dowrfeld and Kiolen chains form the boundary between the two countries, Sulitelma in lat. 67° and Sylfjell in lat. 63°, lie partly in each. The Norwegian side of these mountains is much more precipitous than the Swedish. In Sweden they form a plateau nearly 4,000 ft. high, from which occasional peaks rise to a greater height, but which in a breadth of 40 m. slopes gradually to an elevation of from 800 to 1,000 ft., and thence declines in hills of moderate elevation to the sea shore. S. of lat. 59° the country is very level, and the great plain of Scania, the most fertile tract of the peninsula, occupies a considerable portion of the southern extremity. The northern part of Sweden is rocky, with bleak, barren, snow-clad hills, and a stunted vegetation of birch, fir, and small pines, in the higher lands intermingled with dreary lakes and swamps. The great forest region lies S. of lat. 64°, where the surface is less elevated. Further S. it is more level, and the woods give place to cultivated fields.—Sweden abounds in beautiful lakes, which cover more than 14,000 sq. m. of its surface. Lake Wener has an area of about 2,000 sq. m., and, excepting Ladoga and Onega in Russig, is the largest lake in Europe. Its principal affluent is the Klar, which enters it from the north, and its waters are carried into the Cattegat by the Göta. At the Trolhätta falls on the latter, the river descends by rapids 108 ft. in 5 m. Lake Wetter is 80 m. long and has an area of 715 sq. m. Its surface is about 300 ft. above the sea, and in one part it is more than 400 ft. deep. It has many small afluents. The river Motala carries its waters through several smaller lakes into the Baltic. The Mælar lake, about 75 m. long, is a series of lakes connected by channels and having many branches. It contains more than 1,200 islands, most of which are of great beauty. Other principal lakes are Hjelm, connected with the Mælar, Sjiljan, Stor, Stor Uman, Horn Afrom, Stora Lulea, and Tornen, almost all in the north. None of the rivers of Sweden are navigable, excepting those which have been rendered so artificially. With the exception of the Klar and a few smaller streams on the W. coast and on the coast of the Baltic, nearly all of them have their source in the main mountain range and flow S. E. into the gulf of Bothnia. The largest is the Dal, which is formed by the junction near Fahnun of the East Dal and the West Dal, and enters the gulf of Bothnia near Gelle. At Elfkarleby, near its mouth, it forms a splendid cascade, which is surrounded by fine scenery. N. of this the principal rivers are the Ljusne, Indals, Angerman, Umea and its branch the Windel, Skelleftea, Pitea, Lulea, Ranae, Kalix, and Tornen. The last, with its branch the Muonio, forms the boundary line between Sweden and Russia. Most of these rivers have catacarts and rapids. The Angerman is 240 m. long, and is navigable for vessels of 600 tons 60 m. from its mouth.—The geological formations of Sweden are chiefly granites, gneiss, and metamorphic rocks. They compose most of the Scandinavian chain of mountains, and are in many places covered with Silurian strata, which sometimes are seen undisturbed from their original horizontal position. These are broken through and overflowed by trap; and the surface is generally covered with the drift formation and large bowlders. The metamorphic group abounds in metallic veins, which constitute a large portion of the wealth of the country. Among the metals produced are iron, copper, lead, zinc, silver, gold, nickel, cobalt, and manganese. The pyriticiferous slates are largely worked for alum and copper, and these, as well as the sulphurous ganges of the various ores, furnish unlimited supplies of sulphur. In 1872 there were produced 4,881 cwt. of alum, 1,914 cwt. of iron vitriol, 2,936 cwt. of copper vitriol, and 7,667 cwt. of sulphur. The most important iron mines are those at Dannemora and Osterby in the län of Upsal, Presberg in Wermland, Taberg in Jönköping, and in the län of Örebro, Getleborg,
Kopparberg, and Westmanland. Taberg is a mountain of magnetic ore 1,129 ft. high. At Gellwara, near the Lulea river, in Norrbotten, is also a mountain of nearly pure magnetic iron ore, with some specular ore. Swedish iron is not excelled by any in the world, and is largely used in the manufacture of steel. Nearly 500 iron mines were open in 1873; the total yield of rock iron ore was 18,170,000 cwt., and of bog iron ore 117,798 cwt. The principal copper mines are at Falun in Kopparberg, at Alvádberg in Östergötland, at Flögflora in Örebro, in Jämtland, and in Westmanland. Silver is mined in small quantities at Sala in Westmanland and in Örebro, and zinc near Askersund in Örebro and other places. In 1873 the yield of copper was about 5,000 cwt., of silver 16 cwt., of zinc 609,883 cwt., of nickel 24,420 cwt., and of manganese 6,718 cwt. Coal of inferior quality is found near Helsingborg in Malmö, and large veins of better quality have been discovered lately in other parts. The yield in 1873 was 2,406,486 cubic feet. Marble is quarried in Östergötland, and at Eldsfal in Kopparberg are the celebrated porphyry quarries, where many varieties of that stone are found. In 1872 14,781 mining licenses were issued in the kingdom. An interesting geological change in the coast line of Sweden is the gradual rising of the land along the gulf of Bothnia and the Baltic sea. This was first observed in the beginning of the 18th century by Celsius, who attributed it to the subsidence of the waters of the Baltic; but in 1807 Von Büch made a careful examination of the coast, and announced his conviction that "the whole country, from Frederikshald in Norway to Abo in Finland, and perhaps as far as St. Petersburg, is slowly and insensibly rising." According to later observations, the greatest rise is further N. at the top of the gulf of Bothnia, where it amounts to about 4½ ft. in a century; at Gefle, 90 m. N. of Stockholm, it is from 2 to 3 ft. in a century; at Stockholm it is scarcely 6 in.; and at Malmö the movement seems to be downward.—The soil is generally not very fertile, much of it being the result of the disintegration of primitive rocks, and containing a large proportion of silex. The productive soil constitutes about 55 per cent. of the entire area, the reindeer being sand barrens, rocks, and heaths. Of the productive parts about 13 per cent. are arable, 5 per cent. meadow lands and pasturage, and 82 per cent. forests. The climate of the Scandinavian peninsula is generally milder than that of other countries in the same latitude. The average winter temperature in the more populous portions of the country is but little lower than that of the state of New York. At Stockholm, in lat. 59° 20', the mean annual temperature is about 42°, that of winter 25° and of summer 62°; at Lund, lat. 55° 42', the annual mean is 45°, that of winter 30° and of summer 69°; at Falun, lat. 60° 36', the annual mean is 40°, that of winter 22° and that of summer 58-30°; and at the Russian frontier village Enonteki, lat. 68° 30', and at an elevation of 1,440 ft., the annual mean is 27°, the winter temperature 2° and the summer 59°. In Swedish Lapland there are two and a half months of summer. In Norland, in nine weeks, hay will have been cut twice and the year's seeding and harvest completed. At Stockholm the longest day is 18½ hours and the shortest 5½ hours; at Torneå 22 hours is the longest; and at Enonteki the sun remains above the horizon about seven weeks.—The pine and fir forests of Sweden furnish a great abundance of timber, which is largely exported. In the middle province there are also considerable quantities of ash, linden, willow, maple, and the weeping birch, one of the most beautiful of northern forest trees. In the southern province the oak attains great size and beauty, and the beech and elm are common. With the exception of the cherry there are few fruit trees N. of the 60th parallel, and scarcely any trees grow N. of the 64th parallel. Barley is cultivated in all parts of Sweden, and rye, wheat, oats, beans, peas, and potatoes are successfully grown in the middle and southern provinces. Apples and pears grow in the southern districts, and cranberries and other berries in the northern. The gooseberry grows all over the country. Tobacco is raised in the vicinity of Stockholm. Root crops are largely cultivated. The agricultural crops in 1874 were as follows, in imperial bushels: wheat, 4,000,000; rye, 20,000,000; barley, 12,000,000; oats, 30,000,000; potatoes, 52,000,000. Large quantities are also raised of peas, beans, mixed grain, buckwheat, hemp, and hay. During the year ending Sept. 30, 1873, 11,832,049 bushels of cereals were exported from Sweden; and the total imports of grain, flour, and meal during the same time were 2,326,581 bushels. The crops of 1874 were below the average, and the imports of grain were larger than in 1873.—The fauna of Sweden is not so numerous as that of some of the other northern countries of Europe. The principal quadrupeds are the brown bear, wolf, lynx, fox, glutton, deer, reindeer, elk, marten, otter, bear, sable, hare, and squirrel. Bears, elk, deer, and beavers are now scarce. Wild reindeer are sometimes met with in the northern provinces. Lemmings occasionally come down in droves from the Kioten mountains and lay waste the country in their path. Among the indigenous birds are the eagle, eagle owl, falcon, hawk, swan, goose, eider duck and other species of wild ducks, gull, ptarmigan, capercaillize and other grouse, woodcock, blackcock, and snipe. The sheltered coasts of the Baltic and the gulf of Bothnia are the resort of immense flocks of sea fowl. The lakes, rivers, and seas abound with fish. Many of the river eels, fine salmon, trout and grayling are caught in every mountain stream, and pike and perch abound. The turbot, cod, mackerel, ling, and herring are taken in considerable quantities, and lobsters, crabs, and
oysters are abundant. Great numbers of the *strömming*, a small fish about as large as a sprat, are caught in the gulfs of Bothnia and Finland, and cured. It is said that more than 80 kinds of salt and fresh water fish are sold in the markets of Gothenburg. The domestic animals are mostly small and of inferior quality, but efforts are making to improve the breeds, particularly of sheep. Fine animals are imported from foreign countries, and there are public breeding establishments. In 1870 there were in Sweden 1,966,500 horned cattle, 1,595,000 sheep, and about 428,500 horses.—The three great divisions of Sweden, Gothenland (Sw. *Götaland*), Svealand, and Norrland, are subdivided into 24 län or districts, the extent and population of which in 1874 were as follows:

| Total of Sweden | 171,150 | 4,207,972 |

Gothenland (the region originally inhabited by the Goths) lies S. of lat. 59°, and comprises also the islands of Oland and Gotland; Svealand, the original country of the Svenskar or Swedes, extends from Gotland northward to about lat. 60° 15' at its eastern extremity, and lat. 63° 15' at the western; and Norrland is the whole northern part up to the Norwegian frontier of Finland. In 1874 Sweden had 89 towns, only one of which, Stockholm, the capital, had more than 100,000 inhabitants (147, 249). Of the others, Gothenburg had 61,599, Jönköping and Malmö from 25,000 to 30,000 each, and Carlserona, Gefle, Upadal, Lund, and Jönköping from 12,000 to 18,000 each.—Be-

39½ cts., or three eights of the specie dollar and 1½ of the riksgald. The riksdaler banco hence became the official money of accounts. All three (the specie, banco, and riksgald) were divided into 48 skilling, and the skilling into 12 rundstyks. In 1854 the diet adopted a decimal system, which was put into operation Jan. 1, 1855. In this system the riksgald dollar (20½ cts.) is the unit; it is called the riksdaler rykommitt, and divided into 100 öre. In 1872 a convention was signed at Stockholm by the plenipotentiaries of Sweden, Norway, and Danmark, for the introduction of a common system of coinage into the Scandinavian kingdoms. This was ratified by Sweden, and the new coinage was put into circulation on Jan. 1, 1875. The basis is gold, with silver and bronze for the smaller coins, the unit being the kronor or crown (20½ cts.) of 100 öre. The gold coins, which are an alloy of 90 parts gold and 10 copper, are the 10-crown piece and the 20-crown piece. The silver coins have an alloy of copper, and consist of pieces of one and one half crowns, and of 4 öre, 5 öre, and 10 öre respectively. The bronze coins are of 95 parts copper, 4 tin, and 1 zinc, and are of the respective values of 1, 2, and 5 öre.

In weights, the Swedish pound, which is the unit, is equal to 0.937 of the pound avoirdupois; it is subdivided into 100 orts of 100 korns each; 100 pounds make a centner, and 100 centners a mylsta. In length, one Swedish foot is equal to 0.974 of an English foot, and is divided into 10 inches of 10 lines each. The Swedish mile is equal to 6,6235 English miles; the square mile to 43.87 English square miles. The measure of contents has the Swedish cubic foot for its unit, divided into 10 cans of 100 cubic inches each.—Sweden and Norway form a single kingdom, but have separate internal administrations, the king residing alternately in each country. (See Norway.) The government is a limited monarchy, hereditary only in the male line. The king is sole executive of the realm, commander of the land and sea forces, and head of the church, and has the right to preside in the supreme court of justice. He must be a member of the Lutheran church. His person is inviolable, and his action exempt from censure, but he is required in Sweden to advise and consult with a council of state composed of ten members, two of whom, called ministers of state, hold the portfolios of justice and of foreign affairs, and eight of whom are called councillors of state; of the latter, five are the chiefs respectively of the departments of marine, war, finance, ecclesiastical affairs, and the interior, and three have only consultative voices. All the members of the council are responsible for the acts of the government. In practice the king submits all measures excepting military and diplomatic affairs to his councillors, but he is not bound to follow their advice. If he proceeds to unconstitutional measures, they must make a formal protest or be held responsible before a high court convened for their trial. During the absence of the king in Norway, Sweden is governed by a regency named by him, consisting of a prince of the blood or a minister of state and three councillors. In case of his absence in a foreign country, or of the minority of the sovereign, the two kingdoms are governed by a joint regency consisting of ten Swedes and ten Norwegians. The law-making power is vested in a legislature called the diet, which previous to the amendment of the constitution in 1866 consisted of four houses, respectively of the nobles, clergy, burghe rs, and peasants, but is now divided into an upper and a lower chamber. The upper chamber has one member for every 30,000 of population (in 1874, 128), who are elected for nine years and receive no salary. Each member must be more than 35 years old, and must have possessed for at least three years previous to election real estate of the taxed value of 80,000 riksdalers, or an annual income of 4,000 riksdalers. There are only 6,000 Swedes eligible to a seat in this chamber, whom about 1,750 reside in the country. Members are elected indirectly, in cities by the municipalities and in the country by the 25 provincial assemblies. These assemblies, called landting, are selected by electors chosen by the people in the communal or parish elections, in which each property owner, male or female, is allowed one vote to each 100 riksdalers of taxable income. In the cities no one can cast more than 100 votes, the number authorized by 10,000 riksdalers of income. The lower chamber consists of one representative for every 10,000 inhabitants of towns, of one deputy for every rural district whose population is less than 40,000, and two deputies for those of more than 40,000. In 1874 the number of members was 194, of whom 56 represented the towns and 138 the rural districts. They are elected for three years, and receive each a salary of 1,200 riksdalers for the session of four months and travelling expenses. They are chosen generally by direct vote, although they may be by indirect vote at the option of a district. Every male Swede 21 years of age and over, who owns real property of the assessed value of 1,000 riksdalers, or holds a five years’ lease of property of the value of 6,000 riksdalers, or pays an income tax on 800 riksdalers is entitled to vote in their election; and if he is 25 years old and has possessed these property qualifications for one year preceding the election, he may be elected a member. The diet assembles every year, on Jan. 15, without special convocation. The king appoints the president and vice president of each chamber. The diet appoints: 1, a lawyer as procurator general to superintend the execution of the laws by judges and officers; 2, a committee of 48 members, every third year, to report whether the members of the supreme court deserve to retain their positions; and 3, a committee of six members, also
every third year, to watch with the procurator general over the liberty of the press. Laws for changing or abolishing rights of the nobility require the consent of an assembly of nobles, and ecclesiastical laws can be enacted, changed, or abrogated only with the consent of a general church assembly. The king has the right of absolute veto on any measure passed by the diet. The judiciary consists of the supreme court of the kingdom, composed of 16 judges in two divisions, which interprets the laws and renders justice in the name of the king, who when he presides has the right of two votes; three royal courts of justice, sitting at Stockholm, Jönköping, and Christianstad; a royal court of military justice; and a supreme court of admiralty. There are also throughout the kingdom petty courts, of which the clergy are often magistrates. The estimate of receipts and expenditures of the administration for the year 1875 is as follows:

**GROSS RECEIPTS.**

Ordinary revenue, including land tax, receipts from railways, telegraphs, forests, tonnage dues, &c. 25,185,000

Extraordinary:
Customs 19,500,000
Posts 6,400,000
Stamp 3,500,000
Impost on spirits 12,000,000
Rent on beet sugar 62,000
Income tax 2,800,000 - 39,040,000

On account of the public debt:
Cash, interest, &c. 11,087,909
Loan of 1873 for construction of railways 9,487,909
Remainder of do. and now loan 14,000,000 - 34,474,809
Total receipts 99,240,909

**EXPENSES.**

Ordinary:
Royal household 1,905,000
Justice 8,940,409
Foreign affairs 699,365
Army 11,800,000
Navy 4,500,100
Interior 11,561,500
Church and public instruction 15,830,000
Defence 10,490,000
Pensions 1,309,150 - 51,586,500

Extraordinary, loans for railway construction, army and fleet, and supplemental budget to 1874 29,447,105

On account of the public debt:
Liquidation of loans for railway construction 11,057,155
Loan for construction of private railways 2,000,000
Various expenses 6,408,545 - 18,966,081
Total expenses 99,240,909

At the close of 1873 the total public debt amounted to about 122,800,000 crowns. From this must be subtracted credits of about 32,240,000, which leaves the actual debt about 89,540,000 crowns. The whole of this debt was contracted for railway construction, and all in Germany, with the exception of two loans of about 30,000,000 crowns in the aggregate, which were negotiated in London. All the loans are paid off gradually by means of a sinking fund. In 1872 the diet authorized the emission of a new loan of 24,000,000 riksdalers, at 4 per cent., to continue the construction of the railways; but the budgets of 1872 and 1873 having exhibited surpluses, only 6,650,000 had been issued up to May, 1874. Sweden has but one colony, the island of St. Bartholomew in the West Indies, the administration of which costs 25,000 crowns per annum. The army of Sweden is composed of five classes of troops, the edsvåde or enrolled troops, the indelta or military colonists, the beväring or conscripted troops, the militia of Gotland, and volunteers. The active army consists of the first two of these classes. The edsvåde are enlisted usually for six years; they comprise a body of about 6,000 men, among which are the royal life guards, the artillery, the engineers, and one regiment of hussars. The indelta consists of about 25,000 men, 31,000 of whom are infantry, the remainder cavalry. This body, which was established by Charles XI., is peculiar to Sweden. The men are cantoned in military districts, where they are provided for by the holders of crown lands in those districts. Each man has also assigned to him a house and a piece of land, which he cultivates for himself. The infantry are exercised annually 30 days and the cavalry 46 days. The remaining three classes constitute the reserve. The beväring are drawn by annual levy from the whole male population between the ages of 20 and 25. The right to purchase substitutes was abolished by the diet in 1872. In 1873 this body numbered 86,101 men. The militia of Gotland have a separate command, and cannot be obliged to serve out of the island; they number usually about 8,000 men. The volunteers were first organized in 1861. In time of peace they are subject only to their own rules, although their commanders are chosen by the king; but in war they may be compelled to serve under the military authorities. About 20,000 were enrolled in 1873. The effective force of the kingdom in 1873, including all the five classes, amounted to 150,773 men. The navy was entirely reorganized in 1873, and now forms a single body called the royal fleet, with two stations, at Stockholm and Carlskrona. It consisted in 1874 of the following vessels: steamers—1 ship of the line with 66 guns, 1 frigate with 22 guns, 2 corvettes with 14 guns, 4 monitors with 8 guns, 10 small monitors (4 constructing) with 10 guns, 12 gun boats with 21 guns, 4 vessels without guns, 1 transport with 1 gun, and 2 despatch boats with 5 guns; sailing vessels—1 frigate with 36 guns, 5 corvettes with 102 guns, 1 brig with 10 guns, and 1 schooner with 8 guns; rowing vessels—4 mortar boats with 5 guns, 44 gun boats with 98 guns, and 40 launches with 49 guns; in all, 133 vessels with 455 guns. The navy is officered by 2 rear admirals, 6 commanders, 20 captain-commanders, 43 captains, 43 lieutenants, and 26 sous-lieutenants; it has an effective force of about 7,000 men, and a reserve of 35,000 men. The Lutheran is the established church of Sweden, but all sects are tolerated. Previous to 1873,
when the church assembly assented to the act of the diet permitting civil marriages and marriages by dissenting ministers, no one not confirmed in the Lutheran faith could be legally married. Every Swede who does not claim to belong to some one of the dissenting sects must be confirmed at the age of 14 or 15 and partake of the sacrament, upon which he receives a certificate from his pastor. If he neglects the requirement, he is subject to many inconveniences. He is not entitled to the same burial rites as a confirmed person. The clergy, who must be graduates of one of the universities, are generally moral and high-toned, and exercise a controlling influence in society. In the country parishes they are often magistrates as well as pastors. They receive in general a liberal income from permanent funds, tithes, and fees, but some are poorly paid. They are usually elected in parish meeting and commissioned by the king. The head of the church is the archbishop of Upsal, who has under him 11 bishops, respectively of Linköping, Skara, Söderköping, Kalmar, Carlskrona, Halmstad, Härnösand, and Visby. The archbishop and bishops are nominated by the king from a list of candidates presented by the dioceses. Ecclesiastical matters are discussed in convocation, but are subject to the decision of the king.—Public instruction is gratuitous and compulsory, and it is rare to meet with any one who cannot read and write. Primary schools exist in every parish, excepting in the northern districts, which are so thinly peopled as to render movable schools necessary. Children who do not attend schools under government supervision must furnish evidence of private education. In 1870 nearly 97 per cent. of the children from 8 to 15 years of age attended the public schools. The whole number of common schools in the kingdom was 7,303, with 555,595 pupils; of these 1,164 were movable schools. In 1871 the number of male teachers in the common schools was 5,029, of whom 52 were clergymen and 1,057 church clerks; the number of female teachers was 2,776. The amount paid for the support of common schools in 1871 was 3,537,968 riksdalers, of which 2,573,927 was contributed by parishes, 842,907 by the state, and 121,138 was derived from interest on endowments. In 1870 there were 93 high schools for boys, with 756 teachers and 12,755 pupils. No high schools were provided for girls till 1873, when one was established at Carlskrona. There are also technical schools and day and evening schools in the several cities. The universities of Upsal and Lund have faculties of theology, law, medicine, and philosophy. In 1873 the former had 1,611 and the latter 563 students. Preparations are nearly completed for founding a free university at Stockholm. There is a military school at Carlberg, a higher military academy for officers of engineers and of artillery at Mariestad, and a school for naval cadets at Stockholm. Libraries and collections of art, natural history, &c., exist in all the cities, and are free to the public on certain days, and there are many literary and scientific societies in the kingdom. Almost every parish, every prison, and all the large industrial establishments have their libraries. In 1875 there were 271 newspapers and periodicals published in Sweden, of which 12 were daily and 16 were illustrated. The early history of Sweden is confused and mythical. When Odin and his Swedes entered the country, they found a great part of it in the possession of the Goths, who had dispossessed the Lapps and Finns, and the kingdom which he founded comprised only a portion of Svealand, or the central province. (See Denmark, Northmen, Norway, and Odin.) The dynasty of the Ynglings, founded by Frey-Yngve, son of the pious Njord, Odin's successor, ended, it is supposed, before the 8th century, with Ingjald Illrak. He was succeeded by Ivar Vidfamne, who ruled over both the Swedes and the Goths. In 839 a young man or Abbanus a monk of Corbie, visited Sweden and converted the pagan Swedes, but did not succeed in establishing Christianity. About the year 1000 Olaf Skotkonung (the lap-kings, so called because he received homage when an infant) was baptized, and a bishopric was erected at Skara, but Svealand would not receive Christian teachers for more than a century afterward. Constant disputes and often open war existed for centuries between the Goths and the Swedes, and their political union was not completed until the reign of Waldemar, son of BirgerJarl (Earl Birger), who was made king in 1250. Finland had in the mean while been conquered and Christianized. In 1279 Magnus Ladulás (Barnlock, so called because he protected the people's granaries from the rapacity of the nobles) ascended the throne and reigned with ability till his death in 1290. Then followed a long period of dissenison between his three sons. In 1319 Magnus Smek, an infant, became king, and in the next year succeeded by right of his mother to the throne of Norway. He established his son Hacon in Norway, and induced him to marry Margaret, daughter of Waldemar, king of Denmark. The three Scandinavian states being thus allied, he attempted by the aid of the kings of Norway and Denmark to abolish the senate, but was deposed and Albert of Mecklenburg was elected king in 1363. A war ensued between him and the kings of Denmark and Norway, which ended in Albert's defeat, and on July 20, 1397, by the "union of Calmar," Margaret, "the Semiramis of the North," became queen of the confederate monarchy of Sweden, Norway, and Denmark. She retained possession of the triple government till her death in 1412, and was succeeded by her grandson Eric of Pomerania (XIII.). The union of Calmar was maintained with great difficulty for more than 100 years, though in 1494-6
SWEDEN

It was seriously perfiled by the efforts of the Swedes under the leadership of Engelbert, a patriotic Dalecarlian miner, and but for his assassination by the treachery of a Swedish noble in 1436 would have been overthrown. In 1439 Eric was deposed, and his nephew Christopher of Bavaria chosen king; and on his death in 1448 Knudsson, who had been regent at the deposition of Eric, succeeded him. Anarchy ensued under him and his successors till 1520, when Christian II. of Denmark became king. He exasperated the people by his cruelty, and they found a leader in Gustavus Ericsson, a noble of high rank, better known as Gustavus Vasa. (See Gustavus I.) Christian had executed as traitors and heretics many of the principal nobles, among them the father of Gustavus, and a great number of peasants. The resistance of the Swedes under Gustavus to the government of the Danish king was successful, and in 1520 they elected the latter king. In 1523 they induced the reformation. At his death in 1560 he was succeeded by his son Eric XIV., who was deposed on account of alleged insanity in 1568 by his brother John III. (See Enco XIV.) John reigned till his death in 1592, when his son Sigismund, who had been elected king of Poland and had become a Roman Catholic, succeeded him, the late king's brother, Duke Charles, being regent till he could leave his kingdom of Poland. Sigismund determined to establish Romanism in the kingdom, against the will of the people, and showed himself so reckless and unscrupulous, that in 1599 he was deposed, and in 1604 his uncle Charles IX., who had acted as regent, was raised to the throne. (See Charles IX.) His reign was one of tranquillity in the kingdom, and in 1611 he died, leaving the throne to his son Gustavus Adolphus. (See Gustavus II.) After a reign of 21 years, the greater part of which was spent in wars with Poland and Russia for the possession of Ingria, Livonia, and other territories on the Baltic, and in the defence of Protestantism in Germany, while his affairs at home were managed successfully by the wise Oxenstiern, Gustavus closed his glorious career at the battle of Lützen in 1632, and his daughter Christina, then six years of age, succeeded him. (See Christina.) Oxenstiern was invested with the chief management of affairs; Baner, Torstenson, and other Swedish generals won new victories; and the kingdom for a time prospered, and by the peace of Westphalia in 1648 received western Pomerania and other accessions of territory. After Christina's coming of age, her want of fixed principles and the violence of her disposition soon plunged the country into debt and trouble, and in 1654 she abdicated in favor of her cousin Charles X. His reign of six years was marked by brilliant campaigns against the Danes and in Poland, and acts of great personal bravery; but his victories brought no advantage to Sweden, and only wasted her resources. (See Charles X.) He died in 1660, and was succeeded by his young son Charles XI., during whose minority a peace was concluded by which the kingdom had 10 or 12 years of tranquillity. In 1676 began a war with the elector of Brandenburg and the Danes, which was continued with varying success, though for the most part with disaster, till 1679, when the peace of St. Germain, leaving the Danes at the mercy of the Swedes, enabled the latter to regain more than they had lost. An advantageous peace was concluded between the two kingdoms, and confirmed by the marriage of Charles to Ulrica, the daughter of the Danish king. During the remainder of his life he devoted his attention assiduously to the settlement of the troubles existing between the nobles and the peasants, and in 1693 prevailed upon both parties to give him the power to alter the constitution as he pleased. He died in 1697, bequeathing to his son Charles XII. this absolute power. (See Charles XII.) The warlike career of this remarkable but reckless king, who humbled Frederick IV. of Denmark and Peter the Great of Russia, and dethroned Augustus II. in Poland, but succumbed at Poltava, well nigh reduced his country to ruin. At his death in 1718, his sister Ulrica Eleonora, wife of Frederick of Hesse-Cassel, after renouncing absolute authority and accepting a constitution from the nobles which restored their power, was elected by the diet to the succession. She soon surrendered the government to her husband, whose reign was a period of humiliation, during which Sweden made peace with her enemies on most disadvantageous terms, and gave up most of her Transylvanian possessions, including Livonia, Esthonia, and Ingria, which had been occupied by Peter the Great. War with Russia in 1741 resulted in defeat, and the cession in 1743 of eastern Finland. Frederick died childless in 1751, and was succeeded by Adolphus Frederick of Holstein-Gottorp, bishop of Lübeck, whose election as successor had been made by the empress Elizabeth of Russia a condition of the peace of 1723. French influence corrupted the senate during his administration, and involved the country in a disastrous war with Prussia. After a turbulent reign of 20 years he died in 1771, and was succeeded by his son Gustavus. (See Gustavus III.) The revolution of August, 1772, by which Gustavus attained absolute power, and the wars which followed with Russia and Denmark in 1787, and the act of safety of 1789, which abolished the senate, were the most marked events in the Swedish history of that time. He was assassinated in 1792, and his son Gustavus IV. (See Gustavus IV.) ascended the throne; but as he was a minor, his uncle the duke of Södermanland (Sodermanland) was appointed regent. In 1809 the king's imprudence and tendency to insanity led to his compulsory abdication, and his uncle was declared king under the title of Charles XIII. (See Charles XIII.) The peace made
with Russia at this time deprived Sweden of Finland. A new constitution was decreed, and the prince of Holstein-Augustenburg was elected heir to the throne as crown prince. The sudden death of this prince in April, 1810, led very unexpectedly to the nomination of Bernadotte, prince of Ponte Corvo (see Bernadotte), as crown prince, whose success in securing admission to Sweden (the rest of Swedish Pomerania being given up) endeared him to the people. In 1818, on the death of Charles XIII., he ascended the throne as Charles XIV. John. During his reign Sweden prospered, commerce, the arts, and manufactures made rapid progress, and the moral and social condition of the people was greatly advanced. His son Oscar I. succeeded him at his death in 1844, and encouraged the moral, social, and political progress of the country. (See Oscar I.) At his death in 1852, he was succeeded by his son Charles XV., who had been regent since 1837 in consequence of King Oscar's illness. (See Charles XV.) During the Crimean war Sweden and Norway remained neutral. Many constitutional reforms were effected during Charles's reign. On his death in 1872 without male offspring, he was succeeded by his brother Oscar II., who has continued his liberal policy. (See Oscar II.)

SWEDEN, Language and Literature of. The Swedish is one of the Scandinavian tongues, and as such belongs to the Germanic (or Teutonic) branch of the family of the Indo-European languages. (See Germanic Races and Languages.) Though Old Norse proper was the speech of the whole Scandinavian peninsula and of Denmark until the 11th century, its dialects varied considerably even in the most primitive times, and out of one or more of those ancient dialects the modern Swedish was developed. The change was so slow that the Icelandic lays and sagas were still understood at the Swedish courts as late as the 14th century. (See Iceland, Language and Literature Of.) In its earlier stages the Swedish was influenced by the German through the commercial connection of Sweden with the Hansa towns, by the Latin through the Catholic priesthood and the monastic institutions, and by the Danish through the political union of Sweden and Denmark subsequent to the pact of Calmar (1397). The reformation again subjected it to German influences, but it was less affected by them than was the Danish. The language was greatly purified and a multitude of foreign vocables driven out by the efforts of the zealous Icelandic scholars of the latter half of the 17th and first quarter of the 18th century. But later in the last century the French tastes prevalent at the court and in the literature introduced a large number of Gallic words, many of which, however, have been since absorbed by genuine Scandinavian derivatives. Several dialects are now spoken. In the northern provinces the approximation to the Old Norse or Icelandic forms is much more marked than in the southern, where Danish and German influences have been felt; the southern dialects of Scania and Blekinge have great similarity to the Danish, and that of Dalecarlia presents the greatest departure from the written language, while that of Södermanland approaches it the nearest. Swedish is also the language of the educated classes, and partly of the press, in the Russian grand duchy of Finland.—The Swedish alphabet has 28 letters, the same as in English, with the omission of w (in Swedish formerly the equivalent of e, by which it is now generally replaced) and the addition of å, ä, ö. Formerly the German character was mostly used in Swedish works, but now the Latin character prevails, though the former is still sometimes to be found. A letter peculiar to the Swedish is ä, which is pronounced almost like the English o in note. The vowels a, e, i, å, and ö are pronounced as in German; o has two sounds, either similar to that of the English o in more, but intermediate between o and u, or equivalent to the English a in full. The sound of u is intermediate between the German u and ä. Y is pronounced almost like the German ü. G before e, i, y, å, ö, has a sound like the English y in you. J has the same sound. D, g, h, and t before j, ö and f before v, are mute. K before e, i, y, å, ö, is soft and pronounced like ch in much. Sk before the same letters, and the combinations skj, sj, stj, are pronounced like the English sh. The indefinite article en (masculine, and feminine, det in the nenter, and de in the plural for all genders; but it is also expressed by only adding in the singular number en or n to masculine and feminine substantives, and et or t to the neuter, and in the plural ne, na, a, en; or, thirdly, both these ways may be combined, as den mannen, the man, det bordet, the table, de hastarme, the horses. Substantives have a distinct case ending only in the genitive, which is formed by the addition of s. The plural of substantives is formed by adding or, ar, er, or en; and in some words the singular and plural are alike. The adjectives are formed after two declensions, the first of which has a separate form for the neuter gender, while the second has only one form for all the three genders. The second person singular pronoun is used in conversation only among intimates or when addressing inferiors; otherwise the title of the person addressed, or Herr (sir, Mr.), Fru (madam), or Mansell or Fröken (miss), with the verb in the third person, must be used; thus: Have you seen the book? Hur Herrn (Has the Mr.) sett boken? Verbs have a strong and a weak form of conjugation, and two simple tenses, present and imperfect. The passive is formed by adding s to the active; as, att skåra, to cut, at skäras, to be cut; jag kallar, I call, jag kallas, I am
called. Throughout the verbs the singular is the same in all three persons; in the plural the first and third are alike, and the second ends in en. Among the best grammars of the language and those of the 14th century, Svecensk Språklara (5 vols., Stockholm, 1850-1875); Strömberg, Svecensk Språklara (Stockholm, 1858); Funk, Praktischer Lehrzug zur schnellen und leichten Erlernung der schwedischen Sprache (Leipsic, 1879); and May, "A Practical Grammar of the Swedish Language" (4th ed., Stockholm, 1878). Among the best lexicons are Dalin's (2 vols., Stockholm, 1850-1854), and especially Kindblad's (3 vols., Stockholm, 1840-1873).—Literature. The literary history of Sweden has been very conveniently divided into periods. I. 1250 to 1600. The earliest writings extant in the Swedish language are the ancient provincial laws, of which the oldest compilation, that of the province of Westergötland, was probably made about the middle of the 13th century. The poetical spirit of the nation was first developed in the Räpmvisor, or heroic ballads, and a little later in the Riddarvisor, or chivalric ballads. Of these several collections have been edited; a few of them may perhaps be ascribed to the latter part of the 13th century, but the greater part of them belong to the 14th and 15th centuries. Of great influence, and upon the written language were the romances of chivalry, mostly translations and imitations of those then popular in central Europe. As many of them were translated between 1300 and 1312 by order of Euphemia, queen of Norway, they are collectively called Drottning Euphemiens Visor, "Queen Euphemia's Songs," though many are in prose. The only noteworthy productions of the 14th century are De stora och de gamla Kronikarna, "The Great and the Old Chronicles," narrating the leading events of Swedish history; a translation in the language of St. Bathilde, the "Legend of the Nun Elisif," by Bishop Hermann; some lyrics composed by Bishop Thomas; the "Revelations" of St. Brigitta, abbess of Wadsena, and her daughter Sjelinna Tröst, "Soul's Trust," a paraphrase of a Latin treatise. The literary monuments of the 15th century are principally the Codex Vatzenensis, a collection of legends, essays, letters, and diaries, made by the nuns and monks of Wadsena; an anonymous judicial treatise, Domaregolverna, "Rules for Judges," and a curious political work, Om Ronunga- och Hofdinding-styrelsen, "On the Government of Kings and Rulers," based upon the book of an obscure Latin author, Aegidius Romanus. Printing was introduced into Stockholm in 1453, the first book printed being a collection of fables styled Dialogus Creaturarium Moralia tus. II. 1520 to 1600. The religious contests of the 16th century gave a theological or rather polemical character to almost the entire literature. Two brothers, Olaus Petri (1497-1552) and Laurentius Petri (1495-1575), are almost the only literary representatives of this period; they made translations of the Bible, wrote chronicles, and composed verses. A liturgy known as Rödboken, the "Red Book," and other minor Roman Catholic productions, called forth a mass of unimportant polemical writings. All the prose and poetry of this period deserving of mention are some chronicles of the reign of Gustavus Vasa by R. Ludvigsson (died 1594), P. Svart (died 1562), and S. Elofsson; a few hymns translated from the German, and some popular ballads; a dull religious drama, Judas Redivivus, by Rondellius; some hymns and a love song by King Eric XIV. ; and a Viaa, or lay, by J. af Hoja (died 1538). III. 1600 to 1718. The learned foreigners who flocked to the court of Christina, among them Descartes, Bochart, the younger Heinensis, Gronovius, Pufendorf, and Scheffer, gave an impetus to higher culture in Sweden; but as they wrote in Latin, they did little for the development of the vernacular literature. The investigations of the Icelandic literary monuments by Olof Verelius (1618-1882), Olof Rudbeck (1630-1702), and Johan Peringsköld (1654-1720), causing the publication of Icelandic texts, principally the Eddas, were of more importance in this respect. The historical writings of Eric Tegel (died 1698), A. Girs (died 1650), Wilskindi (1620-1727), Werrving (died 1697), and Adlerfeldt (1671-1709) exhibit a considerable improvement in the use of language, though they can hardly claim to be much more than heavy compilations of facts and materials. The continued religious controversies, at this time between Lutheranism and Calvinism, called into the field but few theologians who wrote in any language but Latin. The exegetical works and ecclesiastical histories, among which those of Paulinus (died 1646), Rudbeckius (1581-1646), and Winstrop (died 1679) stand preeminent in the literature of learning, were also written in Latin, as well as the works that appeared on other subjects of scientific research. In jurisprudence the names of M. Vexoniumius and J. Stjernhök (1596-1675) are well known; in geography and travels, Count E. Dahlberg (1625-1703) published a Specia Antiqua et Rudierna, with 353 maps and engravings of Swedish towns and castles; in classical philology, Gezelius, Lagerlöf, and Freinshemius distinguished themselves; and in botany, Rudbeckius paved the way for Linnaeus. But the progress made in the literary use of the vernacular is almost wholly due to the few who attempted romance and poetry. In poetry Georg Stjernhjelm (1598-1672) held the foremost place. His most complete poetical work is Hercules, a sort of didactic epic in hexameters, exhibiting large imaginative power and much poetic skill. Of his masques the best is Den fange Cupido, "The Captive Cupid." Stjernhjelm was the first writer of sonnets in Swedish. The drama existed generally of dull imitations of Olaus Petri and Rondellius, the chief writers being the historian
Messeneius, who attempted to exhibit the whole of Swedish history in a series of dramas, S. P. Brask (1618–68), and A. J. Prytz (1590–1655). More classically dramatic in form, but scarcely better in style, are the Rebecca of J. Beronius and the Rosimunda of U. Hjärne, while but little more praise can be bestowed upon the dramatic allegories of J. P. Chronander. The lyric writers may be divided into the Italian and the German school. To the former belonged G. Dahlstjerna (1658–1709), author of the Kungskald, a half heroic, half elegiac poem in ottava rima on Charles XI., and of an unsuccessful translation of Guarini's Pastor fido; and G. Rosenhane (1619–84), whose longest metrical attempt, Tenerid, is a collection of 100 sonnets. The chief representatives of the German school were S. Columbus (1642–79), whose lyrics and pastoral is now nearly forgotten; L. Johansson (died 1674), whose Helicos Blomster, "Flowers from Helicon," published under the pseudonym of Lucidor, is a collection of elegies and erotic songs, which are less remarkable than his hymns, and P. Lagerlòf (1648–99), author of a love song of great popularity in its day. The many-sided Spegel, some of whose hymns are worthy of mention, wrote two heavy and monotonous poems, borrowing his titles from the two epics of Milton. C. Arorell is known as the author of a volume of Oferskrifter, or epigrams, a few of which are of merit. IV. 1718 to 1772. These years embrace a time of great literary activity. The natural sciences, under the influence of the world-famous Linné or Linnaeus, occupy the first place. (See Litteratur.) That great naturalist was surrounded by a crowd of pupils, a large number of whom became celebrated; among them P. Forskal (1736–63), who undertook a scientific journey to Egypt and Arabia, and whose researches were published by Niebuhr; and C. Bjerkander and J. G. Wahlbom, who illustrated the flora of northern Europe. P. Artedt (1705–35) wrote a treatise on ichthyology, which Linnaeus edited in 1738. To physiology belong the Economia Regni Animalis and Regnum Animale of Swedenborg (1688–1772). The entomological works of C. F. de Geer (1720–78), in French, are still esteemed. Eminent in chemistry were Torbern Olof Bergman (1735–84), who laid the foundation for the science of crystallography; A. F. Cronstedt (1732–65), the discoverer of nickel; and J. G. Wallerius (1709–85). Much attention was paid to mining by M. von Bromel (1679–1731), Swedenborg, and others. Olof Rudbeck the younger (died 1740) distinguished himself in several sciences; he published among others a work on ornithology in three volumes. N. Rosén von Rosenstein (died 1773) was the reformer of medical science in Sweden. Astronomy was illustrated by such names as A. Celsius (1721–94), N. S. Klingestjerna (1689–1785), and P. W. Wargentin (1717–83); mechanics by C. Polhem (1661–1751) and Swedenborg; and mathematics by J. Faggot, C. Falkengren, E. O. Runeberg, and others. Jurisprudence was represented by D. Nehman (died 1769) and O. Rabenis (1730–72), S. Alnander, J. Benzelius, P. Munch, L. P. Halenius, P. Muhrbeeck, and J. Serenius were the chief writers in the various departments of theology; but the science produced no very eminent man except Swedenborg. (See SWEDEN.) The best known metaphysician was the Cartesian A. Rydelius (1671–1738); the system of Wolf was supported by P. Högström, N. Wallerus, and C. Mesterton; that of Locke by A. Schönberg (1773–1811), F. Kryger (1707–77), and Runeberg. Johan Ihre (1707–80) won fame by his Glosarium Seco-Gothicum, a Swedish dialect lexicon, and by his researches concerning Ulfilas and the Moso-Gothic language. The Icelandic scholars of the preceding generation were followed in the earlier portion of this period by J. F. Perringefjöld (1688–1729), E. J. Björner, Count G. Bomdorff (1682–1764), G. C. and N. R. Brocman; but before the middle of the 18th century the taste for Icelandic studies had greatly declined. In geography and travels, T. Tuneld's description of Sweden and J. J. Björnstahl's travels through Europe deserve mention. In history, as in polite literature, Olof Dalin (1708–63) stands at the head of this period. His Journal Den Svenska Argus, "The Swedish Argus" (1732–44), an imitation of the English "Spectator," exerted a weighty influence upon the prose style of the language and the literary taste of the nation; and his Svea Rikes Historia, "History of the Swedish Realm," though wanting in critical ability, is eloquent and pleasing. A more rigorous examination of evidence characterizes the Swedish histories of A. af Botin (1724–90) and P. Schönström. The history of Charles XII. by G. Norberg (1677–1744), and the "Memoirs of Christina" by J. Arckenholtz, written in French, have been of great assistance to succeeding writers. O. Celsius the younger (1716–94) wrote histories of the reigns of Gustavus Vasa and Eric XIV., and rendered a great service to Swedish letters by establishing the Tidningar om de lärdes Arbeten, "Journal of the Works of the Learned," the first critical periodical in the language. A. A. von Stjernman, C. G. Warmholtz (1710–84), E. Benzelius (1675–1749), B. Bergius (1723–84), G. Wallin (1686–1770), and S. Lœnbom (died 1776) were laborious critics, editors, and collectors, and brought to light or illustrated a great number of early Swedish monuments. Dalin's allegorical epic, Den Svenska Friheten ("Swedish Freedom"), his tragedy Brynhilda, and his comedy Den Afjudenske ärvide ("The Jealous Man is sharp-witted"), are generally pleasing, though without much depth or vigor. H. C. Nordenflycht (1718–63), a lady, left a high name as a writer of lyrics. Count C. H. von Linne (1703–1778) was the author of a tolerably fallacious pastoral, Atis och Camilla, and Count G.
F. Gyllenborg (1731–1809) composed lyrics, elegies, satires, and fables, in a smooth and correct, but too often prosaic style. Poets of less note were Odel (died 1773), U. Rudenschöld (1698–1783), O. Bergkint (1733–1805), and O. Kolmodin (1690–1753). Subsequent to the time of Dalin the dramatic compositions, as those of E. Wrangel, H. Hasselius, O. Celsius the younger, and others, were lifeless imitations of Galilean prototypes. Such was the case too with the tedious romances of J. H. Mörk (1714–1800), the first Swedish novelist. Molière, Voltaire, Boileau, La Fontaine, Marmontel, and Fencolin were translated and sedulously imitated. V. 1772 to 1800. The earlier portion of this period took its impress to a great extent from the character of the sovereign, Gustavus III. His influence was not beneficial to the higher walks of literature, but he founded the "Swedish Academy of Eighteen" (1780), and otherwise sought to encourage letters. The pupils of Linnaeus continued to be the chief scientific men of the time, and labored earnestly for the advancement of science; among them especially C. P. Thunberg, A. Alzénus, A. Guettard, E. Hahelinus, O. Swartz, A. J. Retzius, and C. Qvensel. As chemists and mineralogists, the period furnished C. V. Scheele (1742–1805), regarded as one of the founders of organic chemistry, J. G. Gahn (died 1818), to whom several chemical discoveries are due, J. J. Ankarström, and S. Rinman. D. Manderhjelm (died 1810), F. Mallet, and H. Nicander were widely known for their astronomical labors. Juridical writers were M. Calonius (died 1817), L. Tengvall, and others. Medical writers were O. af Acrel (died 1807) and D. Schulz von Schlenzken (1792–1823). There was little literary activity in the theology of the age, but the labors of A. Knöös in dogmatics and S. Ödman (1750–1829) in exegetics were of high reputation in their day. An aesthetico-metaphysical writer was Thomas Thorild (1759–1819); another name of note in aesthetics is C. A. Ehrensvärd (1745–1800). The philosopher B. C. H. Höjter (1767–1812) based his system upon those of Fichte and Schelling. D. Dyrberg and C. B. Wadström (1746–1799) wrote on geography and travels. Sven Lagerbrings Stea Rika Historia, though often inaccurate, was looked upon as a national work by his contemporaries, and its author was richly rewarded by the Swedish state. His other writings are numerous. E. M. Fant (1754–1817) compiled a Diplomatarium and an extremely valuable collection of Scriptores Rerum Scoticarum. Jonas Hallenberg (1748–1834) wrote a universal history from the beginning of the 16th century, and many other works, historical, archeological, and philological. H. G. Porth (1739–1804) investigated the history and antiquities of Finland. Special periods or departments of Swedish history were illustrated by C. G. Nordin (1740–1812), O. Knös (died 1804), J. A. Reh binder, S. L. Gahn, and U. von Troil (1748–1809). G. Gezelius (1736–1809) compiled the first noteworthy biographical lexicon of distinguished Swedes. Undeceived by the direct influence of Gustavus III., the French taste now became almost entirely prevalent. Gustavus himself wrote some dramatic pieces of much merit, but all frigidly French. The favorite poets of his court were Kellgren, Leopold, and Oxenstierna. J. H. Kellgren (1751–95) was famous in his time in almost every branch of the poetic art; C. G. af Leopold (1756–1829), sometimes styled the "Voltaire of Sweden," wrote mainly didactic poems in the style of Pope, and serious lyrical pieces; Count J. G. Oxenstierna (1750–1818) was the translator of Milton, and author of some descriptive poems. The lyrics of M. Choreus (1774–1806), the Spastara and Medea of B. Lidner (1759–93), the poet of the passions, and the translations from Virgil, Horace, and Ovid by G. G. Adlerbeth (1751–1818), are still read with pleasure. A few poets escaped the general contagion. Foremost among these was Carl Michael Bellman (1740–95), a song writer of the highest powers, who set his songs to appropriate melodies himself. Two of his friends, C. I. Hall man (1792–1800) and O. Kexel (1748–96), were comic dramatic writers of worth. The verse of a female writer, A. M. Lenngren (1754–1817), possesses unusual grace and smoothness. A curious book of travels entitled Min Son på Gagejon, "My Son in the Galley," by J. Walenberg (1746–78), is partly in verse, and abounds in a coarse but lively wit. The last years of this period, comprising the reign of Gustavus IV., exhibited little literary life. Freedom of the press was abolished in 1788, and a systematic censorship enforced. The Swedish academy was suspended for some months in 1795, Thorild was banished, Leopold was ordered away from the capital, and Höijer was not allowed to write. VI. 1809 to the present time. With the political revolution of 1809, the literature of Sweden was endowed with a new spirit, and greatly developed by a general use of the vernacular instead of Latin or French. Schools have largely improved both in number and character, and libraries have increased. The chemist Johan Jakob Berzelius (1779–1848) was a luminary of the scientific world scarcely less lustrous than Linnaeus. (See Berzelius.) As botanists the reputation of three men has extended beyond their native land: Elias Fries (born 1794), K. A. Agardh (1785–1850), and G. Wahlberg (1780–1851); while C. J. Hartman and N. Lilja are later laborers in this department. A geologist of great note was A. J. Erdman (died 1869). Zoology has a famous cultivator in Sven Nils son, also the author of ethnographical and antiquarian works which have exercised a lasting influence on archeological studies. Other zoologists of note are Thorell, Stolpe, Zetterstedt, Sundevall, and Malmgren. Entomology has been treated by J. W. Dalman (died 1828), C. J. Schönberg, and J. W. Zetterstedt (died 1874),

SWEDEN (LANGUAGE AND LITERATURE) 513
C. G. Thomsen, whose Scandinavian Coleoptera (1857–70) is well known, and T. Thorell, author of a valuable work on European spiders. The chief laborer in ornithology, besides Nilsson, has been C. J. Sundevall (died 1879). Among the botanists, H. Svanberg, and among physiologists, Z. Nordmark (died 1828), F. Rudberg, F. W. von Ehrenheim (died 1828), A. J. Angström (1814–74), and A. G. Theorell (died 1875), have gained considerable eminence. Medical science furnishes the names of A. O. Retzius (died 1860), his brother M. C. Retzius, and J. Hyvasser. Prominent legal scholars have been L. G. Rabenius and his son, T. Rabenius, E. Bergfalk (also known as a political economist), J. J. Nordström, F. Schrevelius, C. Nauman, J. O. Lindblad, J. G. Carlén (died 1874), and C. J. Schlytte (born 1795), the able editor of Sweden's ancient provincial codes. Sweden has a native philosophical school, whose founder, C. J. Boström (died 1866), developed the most purely idealistic system that has appeared. The Fichte-Schelling school is represented by the historian Geijer, the poet Atterbom, S. Grubbe, and N. F. Björk (died 1897); while Hegel's theories have found defenders in E. S. Bring and J. W. Snellman. The Boströmian philosophy has recently been ably expounded by G. Nybléus in a most important work on the history of Swedish philosophy (1873). Purely aesthetic are Atterbom, Hammarstén, and A. Törneros. Swedish geography and statistics are much indebted to W. Thom and C. af Forsell. F. W. Palmblad, G. Thomé, Rist, P. Læstadius, J. Berggren, G. von Heidenstam, Hedenborg, G. von Dübén, A. Klinkowström, C. D. Arfwedson, F. Bremer, O. A. Gosselman, and N. J. Andersson are prominent names in the literature of travels; and of late C. W. Paljukull (died 1872), by his account of Iceland, and A. E. Nordenskýold, by his arctic researches, have gained an extended reputation. The study of Icelandic and its literature has been promoted by the labors of A. A. Afzelius, A. J. D. Ostattingius, Carl Säve, A. O. Lindfors, and G. Cederschjöld. A. Uppström published a critical edition of Ulfils. In other philological departmants M. Norberg (died 1896), C. M. Agroll (died 1840), O. F. Tullberg, J. Berggren, C. Landberg, and P. J. Pettersson (died 1874) have distinguished themselves. The chief names in doctrinal theology are H. Reuterdahl, M. E. Ahlman, G. Knös (died 1887), L. G. Anjou, F. G. Hedberg, A. Wiberg, and N. Ignell. Particularly attractive from the union of cantor, faith, and dialectical power are the popular religious works of P. Vikner. Among rationalists V. Rydberg is the most famous. In exegesis, the prominent writers are B. J. Bergqvist, J. H. Thammander (died 1885) and Björn Agardh; in pastoral theology the most noted are A. G. Knös and A. Z. Pettersson; in ecclesiastical history, Reuterdahl, L. G. Anjou, and J. J. Thoméus (died 1845). Among theological literature may also be included the elabo- rate work of Bäckman, Försök till en Svensk Psalmhistoria (1873). The teachings of Sweden have been zealously followed by J. Tybeck, C. U. Beurling, and A. Kahls. In Swedish history first place is due to Eric Gustaf Geijer (1783–1847), whose works and elements of historic composition. Anders Fryxell (born 1795) and Strinnholm also rank high as historians. Minor historical writers are P. A. Granberg, G. A. Silfverstolpe (1772–1824), J. F. af Lundblad (born 1791), A. Cronholm, A. A. Afzelius, C. G. Styffé, H. Järta, A. I. Armås, F. F. Carlsson (born 1811), G. Swedenius, and J. Hellstenius. Political literature is chiefly devoted to questions of internal government, and one of its prominent works is a study on "The Swedish Parliament" (Den svenska Riksdagen, 1873) by Rydlin; recent political writers of high reputation are P. E. Svedbom (died 1857) and A. Söhlman (1824–74), successive editors of the Aftonbladet, the most influential journal of the capital, the A. Hazelius (died 1871), and M. J. Crusenstolpe (1795–1865). The works on Swedish statistics by E. Sidenbladh and C. E. Ljungberg are highly esteemed. The foremost archaologists of the period are N. Sjöborg, J. G. Liljegren (died 1837), A. E. Holmberg, B. E. Hildebrand, H. Hildebrand, Montelius, C. G. Brunius, and R. Dybeck. Works on Swedish literary history have been published by P. H. Hammarsköld (1785–1827), P. Wieselgren (born 1830), J. E. Rydqvist, J. Lénström, and Ljunggren. The Biographisk Lexikon a biographical dictionary of celebrated Swedes, edited by Palmblad and subsequently by Wieselgren, is in 25 volumes. This is the brightest age in the annals of Swedish poetry. F. M. Fränzén (1772–1847) has gained a lasting renown by his naive and idyllic lyrics. J. O. Wallin (1779–1839) revised in 1819 the Swedish psalm book, a collection of religious verse hardly excelled in modern hymnology, and added 117 psalms by himself and 73 by Fränzén, inferior to none in the book. J. D. Valerius, best known by his bacchanalian songs, and J. M. Silfverstolpe (1777–1831), rather a translator than an original poet, both belonged to the earlier part of the century. Two new poetic schools, of vast influence upon polite literature, arose at the beginning of this period, the romantic and the Gothic. The former was represented by the journals Polycem (1810–12), edited by J. C. Askellöf (1878–1848), and Forsorje, whose members are sometimes styled Forsorjor or phosphorists. At the head of this school stood F. D. A. Atterbom (1790–1853) as a poet, and Palmblad and Hammarssköld as critics. Atterboms long poem, Lycksaltigheten O ("The Island of Bliss"), his Blommanor ("The Flowers"), and many of his other lyrics, are characterized by depth of fancy and feeling. Other Forsorje were C. F. Dahlman (1791–1844), author of Mollbergs Epis- tol, an imitation of the songs of Bellman; C. E. Fahlcrantz (1790–1866), a successful hu-
morist in his *Noa's Ark*, but less happy in his religious epic, *Anagurias*; and J. C. Nyberg (Svärdström, born 1785), a female writer of considerable ease and grace, better known as Euphrosyne. The Gothic school, which has left a more permanent impress upon poetry, developed its theories through a society, the *Göthiska Förbund* (the "Gothic Union," 1811), and a journal, *Runa* (1811—24). It sought its sources of inspiration in the ancient literature and mythology of the North. Foremost among its members, and foremost among all the poets of Sweden, stands Esaias Tegnéer (1782—1846). (See Tegnéer.) The historian Geijer was another member of the *Göthiska Förbund*; his lyrics are original, strong, and clear. There is more novelty and force than good poetic taste in *Aurume* ("The Gods of the North"), *Tirving*, and the historical tragedies of P. H. Ling (1776—1859), who is better known out of Sweden as the founder of a new system of medicine or medical gymnastics. Far better in style was C. A. Nicander (1793—1899), author of *Runesverdet* ("The Esaias Sword") and other poems. Influenced by one or other of these two schools, but to a certain extent independent of both, are E. J. Stagnelius (1793—1823), whose dramas, such as *Martyrverna* ("The Martyrs"), epical poems, as *Wladimir*, and minor pieces, are marked by an admirable spirit and great beauty of diction; Erik Sjöberg (1794—1828), better known by his assumed name Vitalis, who, like Nicander and Stagnelius, died early; A. Lindelblad (born 1800), a composer of religious and secular lyrics in the spirit of Tegnéer; and A. A. Grafstrom (1790—1865), whose poetical development was strongly influenced by Fränzén. The highest rank among living poets is held by Johan Ludvig Runeberg (born 1804), a native and resident of Finland, in whose *Fänrik Ståls Sögner* ("Ensign Stal's Stories"), a series of patriotic lyrics on the Swedish-Russian war of 1808—9, are displayed an energy of expression and a depth of poetic thought unknown to Swedish literature since the death of Tegnéer. C. W. Böttiger (born 1807), the son-in-law of Tegnéer, has written some musical dramas and minor pieces, distinguished by a lively fancy and a cultivated taste. O. P. Sturzen-Becker (1811—69) wrote lyrics after the manner of Heine, and humorous sketches. Other poets are W. von Braun (1813—60), whose humor is striking, but too often broad and coarse; Ny- born (died 1865); C. W. A. Strandberg, whose pseudonymous name is Talis Qualis, and who has translated Byron and written some lyrics of great excellence; B. E. Malmström (1816—60), Sätterberg, J. M. Lindblad; Tekla Knös, a poetess, whose claims to fame have been sanctioned by the Swedish academy; G. Siff- verstolpe, Wennström, V. E. Norén, Z. Toperliu, a Finlander (born 1818), E. Sehlstedt (died 1874), and many others. Charles XV. and his brother and successor Oscar II. are poets of some merit; the latter's translation of Hörder's *Cid* has great excellence. Tragedies and historical dramas have been written by J. Bör- jesson (1790—1866), one of the *Förbund*; whose *Erle XIV* is one of the masterpieces of the Swedish drama; C. E. Hylten-Cavallius, Dahlgren, and Kullberg; and comedies by A. Blanche (died 1868), Jolin, Cramér, F. Hedberg (at present the leading writer for the stage), Granlund, Beskow, and others. No romances stand higher than those of three female writers, Fredrika Bremer (died 1863), whose first work (1828) was styled *Tecknig- gar ur Heardsaglifet* ("Sketches of Every- Day Life"); E. S. Carlén (born 1807), a pro- lific and popular author of novels of society; and Baroness Knorrning (died 1883). All of these are widely known both in Europe and America through numerous translations. Of the imitators of Sir Walter Scott, the high- est name is perhaps the learned and versatile V. F. Palmblad (1788—1852), celebrated as a geographer, critic, biographer, and politician of the ultra conservative school, whose *Aurora Königsmark* was one of the earliest readable fictions in Swedish. Equally versatile was C. J. L. Almqist (1793—1866), whose tales, and especially a collection called *Tornronens Bok*, are rich in variety and fancy. Other romancers are Count P. G. Sparre (born 1790); F. Cederberg (born 1874), author of *Otter Trolling* and *Uno von Trosenberg*, historical fictions of much interest; C. F. Ridderstad (born 1807), an imitator of the Dumas school; Kjellman- Göransson, Zépil, Bjursten, O. P. Sturzen- Becker; C. A. Wetterberg (born 1804), a pop- ular writer of sketches and tales under the as- sumed name of Onkel Adam; G. H. Melin (born 1809); and Viktor Rydberg, statesman, metaphysician, and essayist, who has produced at least one powerful work of fiction, *Den siste Attenaen* ("The last Athenian"). Claude Gé- rard (a pseudonym) and Mrs. M. S. Schwartz (born 1819) enjoy at present the greatest popularity as novelists. As translators may be mentioned C. A. Hagberg, author of an ac- curate and spirited version of the complete works of Shakespeare; Andersson, translator of Goethe; and N. Lovén, who has rendered the poems of Dante and Camoens into Swedish verse. Most of the higher efforts of lit- erature in English, French, German, Italian, and Danish, especially in fiction, have been translated within the last 30 years. Sweden supports 271 newspapers, one of which, *Svenska Veckobladet*, has a circulation of 60,000 copies. On the whole the last 15 years has been a period rather of political than of litera- rian activity, yielding comparatively few works of high aesthetical value. 

**SWEDENBORG, Emanuel**, a Swedish philoso- pher, born in Stockholm, Jan. 29, 1678, died in London, England, March 29, 1772. He was the son of Jesper Sandberg, bishop of Skara (see *Sandberg*), the name being changed to Swen- denborg in 1719 on the occasion of the enno- bling of the family. This advancement enti-
tied him, as head of the family, to a seat in the house of nobles of the Swedish diet, but did not confer the title of baron, as has been supposed. Emanuel was sent to Upsal, completing his studies in 1709. After two years of travel in England, Holland, and France, he went to reside at Greifswald in Pomerania, then a Swedish town, and busied himself with scientific research. He also wrote some Latin fables, which were published under the title of *Camena Borea*. A collection of Latin poems, written by him during his travels, was also published about the same time in a volume entitled *Ludus Heleonius*. In 1716 he returned to Sweden and established a periodical called *Didelus Hyperboeas*, devoted to mathematics and mechanics, which appeared irregularly for two years. During this time he had become intimate with Christopher Polhem, an eminent engineer, and Polhem introduced him to Charles XII., who appointed him assessor extraordinary of the college of mines, and associate engineer with Polhem. For two years Swedenborg maintained close personal relations with the king, and assisted him much in his military operations. During the siege of Fredericshald, at which Charles met his death, Swedenborg constructed, under Polhem's direction, the machines by which several vessels were transported overland from Strömstad to the Ídefjord, 14 miles. At the king's suggestion, it is said, Polhem betrothed his daughter to Swedenborg; but as the young lady preferred another man, Swedenborg relinquished his claim and never married. From 1717 to 1722 he published pamphlets on scientific subjects; among them one describing a method of determining longitude by means of the moon. In 1721 he made a short tour on the continent, visiting mines and smelting works. On his return in 1722 he was promoted to be full assessor of mines, and for the next 12 years he devoted himself to the duties of that office, refusing the professorship of mathematics at Upsal in 1724. In 1734 he published *Opera Philosophica et Mineralia* in three large folio volumes, illustrated with numerous plates, viz.: vol. i., *Principia*; vol. ii., *De Ferro*; vol. iii., *De Cupro et Orichalco*. In the same year also appeared his *Prodromites de Infinito*. In 1736 he began another tour of travel, which, with study and writing, occupied him for several years. In 1740-'41 he published his *Öconomia Regni Animalia*, in two parts, and in 1744-'5 his *Regnum Animale*, in three parts. Between 1729 and 1741 he was elected successively a member of the academy of sciences at Upsal, corresponding member of the imperial academy of sciences at St. Petersburg, and member of the academy of sciences at Stockholm. His series of scientific publications ended in 1745 with the treatise *De Cultu et Amore Dei*, &c., in which is set forth, under the form of a prose poem or allegory, his theory of the process of creation. Thereafter, as he says, he was called by God to the work of revealing to men a new system of religious truth. For that end he was permitted to converse with spirits and angels, and beheld and heard wonderful things. The account of his benevolent efforts to reveal the truths of a new system of religious truth, which had never been revealed before, is in his treatise *De Cultu et Amore Dei*.
more had I been permitted. When you come into eternity, you will see all things as I have stated and described them, and we shall have much to say concerning them to each other." He then received the holy supper from Fer- lius, and presented him with a copy of his Arona Oelestis. A day or two afterward he peaceably breathed his last. His body was buried in a vault of the Swedish church in Prince's square, a little east of the tower. A eulogium was pronounced upon him in the Swedish house of nobles in October, 1773, by Samuel Sandels, which accords him high praise, not merely for learning and talent, but also for uprightness and fidelity in the discharge of his duties as a public functionary. Several of his acquaintances have also left written testi- mony to his virtuous character.—Swedeborg's scientific works have long since ceased to be of practical value, but are still highly interest- ing as collections of facts, and as exhibiting their author's peculiar method of philosophi- zing. The system he followed was substantial- ly that of Descartes, of whom he continued to the end of his life to speak with admiration, and this led him to conclusions resembling in some striking points those of Spinoza, who was likewise a Cartesian. His "Economy of the Animal Kingdom" is the best of his many productions anterior to his theological career. In it he attempts to deduce a knowledge of the soul from an anatomical and physiologi- cal knowledge of the body, and evolves many doctrines which he afterward elaborated in his theological works. Indeed, some of his disciples hold that his seership was the natural result of his intellectual and moral develop- ment, and by no means an abnormal condition of mind. According to his own account, it came upon him gradually, and neither aston- ished nor alarmed him, although in its early stages he was subject to great mental excite- ment, the phenomena of which may have given rise to exaggerated stories of his insan- ity. The works written by him subsequent to this change in his mind are quite as system- atic and coherent as his earlier productions, and only his claim to a divine mission, and his frequent descriptions of what he saw and heard in the spiritual world, mark them as pec- uliar. They are consistent from first to last, and though they appeared at intervals during a period of 27 years, they nowhere deviate from the fundamental principles laid down at the outset.—The general features of Swedeborg's theology are presented in his treatise called the "True Christian Religion." He teaches that God is one in essence and in per- son, and has been revealed to men as the Lord Jesus Christ. In the Lord is a trinity, not of persons but of principles, and it is these prin- ciples which are spoken of in the Scriptures as Father, Son, and Holy Ghost. The Father is the divine love, the Son the divine wisdom, and the Holy Ghost the divine operation or energy acting upon the universe. The Lord is

infinite, eternal, self-existent, omnipresent, om- niscient, and omnipotent, and not only the creator but the sustainer of all creation, which without him would cease to exist. For the sake of redeeming mankind he assumed a nat- ural body born of the Virgin Mary, and glo- rified it or made it divine, so that it is now invisible to men, and also usually to the an- gels except as the sun of heaven. Redemp- tion consisted, not in suffering vicariously the punishment of men's sins (for that could not be done, and, if it could, would be useless), but in actual combats, by means of the as- sumed humanity, with the powers of hell, and overcoming them. This victory restored to man spiritual freedom, which had begun to be impaired by diabolic possessions as nar- rated in the Gospels, and enabled him to work out his salvation. This he does by looking to the Lord, with faith in him, by repen- tance, and above all by living according to the commandments of the decalogue. The chief points that Swedenborg insists on in religion are faith in the Lord and the avoidance of evils as sins against him. Upon everything else, such as outward worship, prayer and meditation, and works of eleemosynary chari- ty, he lays but little stress. The essence of charity is love to the neighbor and occupa- tion in some useful employment. The Word, he says, is the divine truth itself, written to reveal the Lord to man and to serve as a me- dium of conjunction between earth and heav- en. This Word consists of the books of Gen- esis, Exodus, Numbers, Deuteronomy, Leviti- cus, Joshua, Judges, Samuel, Kings, the Psalms, the prophecies, the four Gospels, and the Apoc- alypse. The other books bound up with these in our Bibles are not the Word, although good and useful to the church. The distinction be- tween the two consists in this: that the Word contains an internal or spiritual sense, which the rest of the Bible has not. This spiritual sense is symbolic, and may be discovered by the application of the law of symbolism re- sulting from the universal correspondence of natural with spiritual things. Thus, the gar- den of Eden and all things mentioned as ex- isting in it symbolize the human soul and its affections and thoughts; and the disobedience of Adam and Eve, the alienation of mankind, at a remote period from their original state of innocence. Hence, too, the decalogue for- bids not merely outward sins, but the inward spiritual sins corresponding to them, and the Psalms and prophecies relate not merely to David and the Jews, but to experiences of the human soul independent of dates and locali- ties. At the same time the literal sense alone can be relied on as a basis of doctrine, and Swedenborg is careful to cite it profusely in support of his teachings. The reason he gives for his mission is that the knowledge of true doctrine had been lost and the church de- stroyed by a false theology and accompanying evils of life. By the promulgation of the
truth revealed to him a new church has been established by the Lord, and thus the prophecies in the Apocalypse of the descent of the New Jerusalem have been fulfilled in their symbolical sense. The second coming of the Lord, predicted in Matt. xxiv., has also been accomplished in the same way, a last judgment having been effected in the spiritual world in the year 1757, so that we are now living under a new dispensation. The treatise on "Heaven and Hell" embodies Swedenborg's teachings on the nature of those two realms, and their relations to this world. They exist, he says, not in some other region of space, but within the natural world, as the soul of man exists within his body, being in fact in the souls of men and resting in them as our souls rest in our bodies. At death the body, which is the material envelope of the soul, is cast aside, never to be resumed, and consequently its resurrection is not to be looked for. The soul is the man himself; and is an inalienable being, whole in itself, and rises into a conscious perception of the spiritual world, of which the man had previously been unconsciously an inhabitant. He sees and feels and possesses all the other senses, and retains all his personal characteristics. After a longer or shorter preparation in an intermediate state called the world of spirits, which lies between heaven and hell, he is drawn by his own elective affinity to the place where he belongs, and remains there to eternity. Both heaven and hell consist of innumerable societies, each composed of human beings of similar and concordant affections; and both are divided into three distinct regions, according to the degrees of perfection or depravity of their inhabitants. The Arcana Celestia, Swedenborg's largest work, is mainly an exposition of the internal or symbolical sense of Genesis and Exodus, with accounts of his experiences in the spiritual world, and various doctrinal teachings interspersed between the chapters. "The Apocalypse Revealed" and "The Apocalypse Explained" are similar expositions of the Apocalypse. In his "Conjugal Love" Swedenborg expounds his doctrine of the relations of the sexes. Males, he says, are masculine and females feminine in soul as well as in body. The masculine element is love clothed with wisdom, while the feminine is wisdom clothed with love. Hence the characteristic of man is wisdom or understanding, and that of woman love or affection. Marriage is the conjunction of two souls who complement each other, and by their union make one complete being, just as the will and the understanding make the individual. Hence the only true marriage is of one man and one woman, and it exists in the next world as well as in this. Polygamy is a degraded state, but not a sin with those whose religion permits it; but adultery is destructive of the spiritual world, and closes heaven against those who confirm themselves in it. The treatises on the "Divine Love and Wisdom" and the "Divine Providence" embody Swedenborg's spiritual philosophy, and exhibit the symmetrical relations of the various parts of his religious system. Love, he says, is the life of man. God alone is Love itself and Life itself, and angels and men are but recipients of life from him. He is very Man, and our humanity is derived from him, so that it is literally true that we are created in his image and likeness. His infinite love clothes itself with infinite wisdom and manifests itself in ceaseless operation, producing, maintaining, and reproducing the boundless universe, with all its innumerable parts and inhabitants. In like manner men, being made in the image of God, also have love or the will, and wisdom or the understanding, and the two produce in them their finite operation. It being the nature of love to desire objects upon which to exercise itself, God could not but create the universe. The creation of this and other solar systems, all of which are inhabited, was effected by a spiritual sun, which is the first emanation proceeding from God, and which is seen in the spiritual world as our sun is seen by us. By means of this spiritual sun natural suns were created, and from them atmospheres, waters, earths, plants, animals, and finally man. Angels, spirits, and devils are men who have been born and died on this or some similar planet. Hence, all things were created from God, and not out of nothing. The spiritual world is related to the natural as cause is to effect, and the supreme first cause of all is God himself. These three, end, cause, and effect, constitute three distinct or discrete degrees, which are repeated in various forms in all created things, and on a grand scale in the universe as a whole. Creation, being from God, is, like the individual man, an image of him, and hence is in the human form in its greatest and least parts, and with more or less approximation to perfection. As we are finitely men, because God is an infinite Man, so all animals, plants, and even minerals wear a resemblance to man, and throughout all nature there is an incessant effort to evolve the human form. In the sight of God and the angels, larger and smaller bodies of human beings and the societies of heaven and hell appear organized like men, and Swedenborg calls the universe the Grand Man (Maximus Homo). As infinite love was the end and infinite wisdom the cause of creation, so the divine life and power are constantly active in sustaining and directing it. This activity is the Divine Providence, and it reaches to every smallest particular of nature and humanity. Man has freedom, because without it he could not be an adequate recipient of the divine love, and by the abuse of his freedom he has introduced evil into the world. The Divine Providence seeks, without destroying this freedom, to lead man back to the integrity. Hence all the wonderful dealings of God with man recorded in the Scriptures;
hence the incarnation; and hence the various forms of religion which exist in the world, all of which embody more or less the essentials of salvation, namely, the worship of God and abstinence from evils as sins against him. The smaller treatises of Swedenborg are mostly extracts from his larger works, with amplifications and additions. — The fullest account of him and his writings is that of William White (2 vols., London, 1807, since republished in one volume). See, also, "Documents concerning Swedenborg," by R. L. Tafel (London, 1875 et seq.). All of his theological and some of his scientific works have been translated into English. The theological works have also been reprinted in Latin by Dr. J. F. I. Tafel, of Tübingen, Germany, and partially translated and published in French, German, Italian, Danish, and Swedish. Societies for promoting their circulation are in operation both in the United States and in Europe. The principal writers who have undertaken the exposition of Swedenborg's doctrines in England are John Clovæs, Robert Hindmarsh, C. A. Tulk, Samuel Noble, J. J. G. Wilkinson, and Jonathan Bayley; in France, E. Richer and J. F. Les Boys-des-Guays; and in the United States, George Bush, Theophilus Parsons, E. H. Sears, Henry James, B. F. Barrett, W. B. Hayden, and Chauncey Giles. For an account of the ecclesiastical organization based upon Swedenborg's doctrines, see New Jerusalem.

SWIFT BRIER. See Eglantine.

SWIFT GUL. See Liqueidamar.

SWIFT POTATO. See Potato, Swift.

SWIFTWATER, a central county of Wyoming, extending across the territory from Montana on the north to Colorado and Utah on the south; area, about 35,000 sq. m.; pop. in 1870, 1,916. It is crossed by the Wind River and Rocky mountains, and is watered in the north by the Big Horn river and its head streams, and in the south by the Sweetwater and Green rivers. It contains deposits of coal and gold. The S. part is crossed by the Union Pacific railroad. In 1870 there were 3 saw mills and 4 quartz mills. Capital, South Pass City.

SWIFT WILLIAM. See Pink.

SWEET. See Swet, or Sweet, Anne Sophie, a French writer, born in Moscow in 1782, died in Paris, Sept. 10, 1807. She was the granddaughter of Gen. Boltin, a translator of the Encyclopédie into Russian, and daughter of Solimoff, one of the founders of the academy of sciences at Moscow, and private secretary to Catharine II., at whose court she was brought up. In 1798 she married Gen. Svetchin (born in 1758, died Nov. 23, 1850) to please her father, who was banished from St. Petersburg and died soon afterward at Moscow. Her mother having died, the education of her younger sister (the future princess Gregory Gagarin) devolved upon her, in addition to that of her husband's adopted daughter. At the same time she gathered round her the most eminent Russians and French emigrants, who cultivated her society even after the sudden removal in 1801 of her husband from his offices as military commandant and provisional governor of St. Petersburg. Her delicate health and her sorrow for the loss of her father increased her proneness to religious meditation, which was still further developed by her filial relations with the count Joseph de Maistre, French ambassador at the Russian court, although her final conversion in 1815 to Roman Catholicism was more directly ascribed to the writings of the abbé Fleury. As soon as the prescriptive measures against the Jesuits were announced, she publicly avowed her change of religion; and as it was feared that her ascendency over the emperor Alexander might become as great as that of Mme. Krudener, she was compelled to depart from Russia by vexatious proceedings against her husband on this and subsequent occasions. She spent the winter of 1816-'17 in Paris. In 1818 she and her husband were at St. Petersburg, and she never returned again to Russia excepting once about 19 years later. After spending several years in Italy, she settled permanently in Paris in 1825. De Falloux, her literary executor, has published Mme. Svetchine, sa vie et ses œuvres (2 vols., 1859, vol. ii. comprising her Pensées, &c.); her Lettres (2 vols., 1862); Journal de sa conversion (1865); and Lettres inédites (1866). Harriet W. Preston has translated the "Life and Letters of Madame Sweetchine" (Boston, 1867; 8th ed., 1870), and "The Writings of Madame Sweetchine" (1869). See also Mme. Sweetchine's correspondence with Lacordaire (Paris, 1864), and with Lagrange (1875). 

SWIETEN, Gerard van, a Dutch physician, born in Leyden, May 7, 1700, died in Schönbrunn, Austria, June 18, 1772. He was a favorite pupil of Boerhaave, and after a few years' practice became professor of medicine at Leyden; but on account of his adherence to the Roman Catholic faith he was compelled to resign. In 1745 he went to Vienna as physician-in-chief to the empress Maria Theresa, and professor of medicine and anatomy; and he held several other important offices there. His great medical work, Commentarii in H. Boerhaavii Aphorismos de Cognoscendia et Curandia Morbis (5 vols. 4to, Leyden, 1741-'72), was translated into German, English, and French.

SWIFT, the general name of the Cypselidae, a subfamily of birds formerly placed among the swallows, but by modern ornithologists ranked as a separate family coming near the humming birds, on account of certain anatomical peculiarities, and particularly of the absence of singing muscles in the lower larynx. The swiflets resemble the swallows in habits and in their general form; the bill is more suddenly curved, unprovided with bristles at the base; nostrils very large, oblong, with an elevated margin; wings extremely long, curved and narrow, with ten primaries; tarsi short and weak, and more or less feathered; toes short and thick, and all four are or may be directed forward; claws
strong and curved; ten feathers in the tail. They are very swift and graceful fliers, feeding exclusively on insects, which they capture on the wing; they are migratory like the swallows, but do not mingle with them and are less hardy; most of them nestle in hollow trees, holes in buildings, or crevices in rocks; some species rear two or three broods in a season.

In the genus \textit{cypselus} (Illig.) the second quill is the longest, and the tarsi are feathered to the base of the toes; it is peculiar to the old world. The common European swift or black martin (\textit{C. apus}, Illig.) is 7/\text{in.} long, with a forked tail; it is blackish brown above with a green gloss, and the throat grayish white. It appears in Great Britain in May, departing in August. The extreme shortness of the legs renders walking and rising from a flat surface almost impossible, but the stout toes and sharp claws form admirable clinging organs for climbing in and out the holes where the nests are placed. The white-bellied swift (\textit{C. melba}, Illig.) is 8\text{\textfrac{1}{2}} in. long, grayish brown above and white below, the legs covered with brown feathers; it is common in southern Europe, especially in mountainous regions. —In the genus \textit{chactura} (Steph.) or \textit{acanthylis} (Boie) the tail is very short, about two fifths of the wings, slightly rounded, the shafts stiffened and extending beyond the feathers as rigid spines; first quill the longest; legs covered with a naked skin. The species are found in North and South America, Australia, and the East Indies; they live in flocks, and breed usually in holes of trees, but sometimes in crevices in rocks, and the eggs are usually four. The American swift or chimney swallow (\textit{C. pelagica}, Baird) is 5\text{\textscreen{1}} in. long and 12\text{\textscreen{3}} in. in alar extent; it is sooty brown above with a greenish tinge, a little paler on the rump, and considerably lighter from the bill to the breast; it is found from the eastern states to the slopes of the Rocky mountains, arriving from the south by the end of April or beginning of May, and departing during the first half of September. This species naturally makes its nest in hollow trees, but in the neighborhood of man builds in such chimneys as are not used in summer for fires; the nest is made of twigs snapped off from a dead tree during flight, fastened together by viscid saliva, without soft lining, and is generally placed from 5 to 8 ft. from the entrance; the eggs are pure white. They pass in and out the chimney with great rapidity, making a whirring sound like distant thunder; there are sometimes 200 in a single chimney. —In the genus \textit{collocalia} (Gray) the bill is very small, wings very long, tail moderate and nearly even, and tarsi naked. The esculent swift or swallow (\textit{C. \[hirundo\] esculenta}, Gray) is the principal maker of the celebrated nests so highly esteemed by the Chinese as articles of food. (See Birds' Nest, Edible.) The eggs are two in this genus. There are many other species of swifts, both in the old world and the new.

\textbf{SWIFT}, a W. county of Minnesota, bordering S. W. on the Minnesota river, and intersected by the Chippewa and Pomme de Terre rivers; area, about 750 sq. m. It has been formed since the census of 1870. The surface is rolling, with numerous small lakes; the soil is good. The St. Paul and Pacific railroad traverses the county. Capital, Benson.

\textbf{SWIFT}, Jonathan, a British author, born in Dublin, Nov. 30, 1667, died there, Oct. 19, 1745. He was of purely English descent; his father, dying before the birth of his son, left his family in dependent circumstances. In his 16th year he entered Trinity college, Dublin, where from his insufficiency in some respects he received his bachelor's degree only \textit{speciali gratia}, in February, 1685; but he remained in college studying for a master's degree till the revolution of 1688 drove him to England, where he became private secretary to Sir Wil-
lism Temple, whose wife was related to his mother. He employed his leisure hours in study, and acquired a remarkable familiarity with public affairs. In 1692 Swift took his master's degree at Oxford, and two years later, finding Temple unwilling to make any definite provision for him, he went to Ireland. In October, 1694, he was ordained, and soon after received the prebend of Kilroot, in the diocese of Connor; but in a few months he returned to his secretaryship. Temple, dying in January, 1699, left him a legacy, coupled with the task of editing his posthumous works (London, 1699). Swift next became chaplain to Lord Berkeley, one of the lords justices of Ireland, whom in 1699 he accompanied to Dublin, acting as his secretary during the journey. He was supplanted in the secretarysthip by a person who subsequently interfered so that the rich deanship of Derry, at Berkeley's disposal, and to which Swift deemed himself entitled, was given to another. Swift explained to the earl and his secretary, "Confound you both for a couple of soundrels!" and left the castle. But he soon came back, and became the new dean of Derry (Dr. Bolton) being required to resign to him the vicarage of Laracor and several other livings, amounting altogether to nearly £400 a year. In 1700 Swift assumed his parochial duties at Laracor, and shortly after received the prebend of Dunlavin in St. Patrick's cathedral, Dublin, and in February following took his doctor's degree in Dublin university. In 1701 he made the first of a number of annual visits to England, and published anonymously in London his "Discourse on the Contests and Dissensions between the Nobles and Commons of Athens and Rome," vindicating the conduct of the whig leaders, Somers, Halifax, Harley, and Portland, in respect to the partition treaty. It was generally attributed to Somers himself or Burnet; but Swift avowed the authorship in the succeeding year, and was immediately admitted into the society of the statesmen he had defended, and into that of Addison, Steele, Arbuthnot, and others of the leading wits of the time. Some trifles in prose and verse had shown an original vein of humor, but he had signalled failed in a series of "Pindaric Odes." In 1704 appeared his "Battle of the Books," written at Moor Park in 1697, in support of Sir William Temple's views in the controversy respecting the relative merits of ancient and modern learning. This was succeeded by the "Tale of a Tub," a satire upon the Roman Catholics and dissenters. It is one of Swift's most perfect and labored efforts, but its impure irreligious tendency proved an insurmountable obstacle to his hopes of high preferment. In 1708 he published his "Argument to prove the Inconvenience of Abolishing Christianity," a master-piece of grave irony: "Sentiments of a Church of England Man with respect to Religion and Government;" the humorous attacks on Partridge the almanac maker, entitled "Predictions for 1708, by Isaac Bickerstaff," and "Letters on the Sacramental Test," in which he differed with the whigs, and this may partially explain his subsequent abandonment of that party. In 1709 he published the only work to which he ever attached his name, "A Project for the Advancement of Religion and the Reformation of Manners." Failing to receive preferment from the whigs, he went over to the Tories in October, 1710; and for several months the "Examiner," a weekly paper established by St. John and others in the interest of the ministry, was the vehicle for bitter attacks from his pen upon prominent whig statesmen. About this time he formed the society of Brothers, composed of 16 influential Tories, of which he was the most active member. His powerful pamphlet on the "Conduct of the Allies," published in November, 1711, which had a considerable influence in bringing the war to a close, raised his reputation to the highest pitch, and he found himself in a position to confer substantial favors. But he himself, while dictating, as Dr. Johnson has observed, the political opinions of the English nation, remained unrewarded; and the efforts of Harley and St. John, now become Lords Oxford and Bolingbroke, aided by Mrs. Masham, were unavailing to procure him a bishopric, the queen, under the advice of Archbishop Sharp and other prelates, positively refusing him any higher preferment. On the failure of an application in his behalf for the vacant see of Hereford, through the opposition of the duchess of Somerset, whom he had lampooned, Swift threatened to withdraw his support from the ministry, but was pacified by his appointment, in February, 1718, to the deanship of St. Patrick's cathedral, Dublin, the income of which amounted to £700. He had scarcely got settled in his deanship when he was summoned back to England to reconcile the difficulties between Oxford and Bolingbroke. About this time he wrote his "Public Spirit of the Whigs," which reflected so bitterly upon the Scottish nation and nobility that the latter in a body presented a complaint to the queen. In June, 1714, appeared his "Free Thoughts on the State of Public Affairs;" and on the dismissal of Oxford a few weeks later he declined the flattering overtures of Bolingbroke, in order to be of service to the disgraced minister. The death of the queen immediately after this event and the overthrow of the Tories sent Swift back to Ireland, where he remained during the next 12 years.—Swift's history was painfully involved with that of three young ladies. One was Miss Jane Waring, sister of a college friend, of whom he became enamored in Belfast, he called her Varina. His offer of marriage she at first declined on account of her own ill health and his insufficient income; and the hopelessness of settling differences on both sides led to a cessation of their intercourse. While secretary for Sir William Temple, Swift had con-
ceived a strong friendship for Esther Johnson, daughter of a woman who was for many years an attendant upon Temple's sister, Lady Giffard. Swift's account of Esther is that "her father was a younger brother of a good family in Nottinghamshire, her mother of a lower degree." Swift on his first settlement in Ireland invited this young lady (named Stella in his poems) to Laracor, and with a friend, Mrs. Dingler, she came and resided near him. They were intimate, saw each other often, and corresponded when apart; and she attended to his household in his absence. Subsequently, in London, he became acquainted with Hester Vanhomrigh, a spirited, intelligent, and accomplished girl, whom he kindly noticed and aided in her studies. She conceived for him a passion so earnest that she proposed marriage, which he declined, but without discouraging her advances; and after the death of her mother she went to Ireland (1714) to dwell in his vicinity. Vanessa (the name he gave her), ignorant for a time of his relations to Stella, endured his allusions with hope of a favor change, till in 1717 she retired with her sister to Marley abbey to live in deep seclusion. Meantime Stella urged her claims, and won his consent under the stipulation of perpetual secession; and they were married privately in the garden of the deanery in 1716. Their relations had been, and because of this secession continued to be, equivocal. Vanessa's sister being ill, Swift several times visited the abbey; but receiving no other encouragement, and tormented by suspicion and impatience, Vanessa wrote to Stella to ascertain the nature of her intimacy with Swift. The dean, getting possession of the letter, rode directly to Marley abbey, flung it upon the table before Vanessa with a frown which struck her dumb with terror, and instantly departed. The unhappy woman survived this shock but a few weeks, and Swift, overcome by shame and remorse, retired for two months to solitude in the south of Ireland. After her death appeared his poem "Cadmus and Vanessa," describing the manner in which Swift (personified as Cadmus, an anagram of Decanus, the dean) received the early advances of Miss Vanhomrigh. Five years later Stella herself died, without any public recognition of her marriage.—Swift published in 1720 "A Defence of English Commodities, being an Answer to the Proposal for the Universal Use of Irish Manufactures," followed in 1724 by the celebrated "Drapier's Letters," in opposition to the royal grant authorizing Wood to coin £108,000 in halfpence and farthings for general circulation in Ireland. The author denounced the whole system of government in Ireland with a vigor and point which aroused a powerful popular feeling in his favor. His effigy was produced on signs and medals, and distributed broadcast in innumerable prints; and so powerful became his influence with the lower classes that Walpole, when meditating legal proceedings against him, was told that it would require 10,000 men to arrest him. In 1726 appeared his "Gulliver's Travels," a series of satires on human nature and society, the most original and extraordinary of all his productions, and that by which he will be known while the language lasts. In 1726 and 1727 he made visits to England, renewing his intimacy with Pope, Gay, Bolingbroke, Arbuthnot, and others of his early friends; but after the death of Stella he never left Ireland. For several years he wrote with vigor and increasing bitterness on Irish affairs, and amused himself with composing verses, the humor of which is more than equalled by the fierceness and obscenity of the satire; but by 1736 his health became so undermined by frequently recurring attacks of deafness and vertigo, to which he had been subject from an early age, as to preclude further literary labors. His infirmities rapidly increased after this, and in a corresponding degree his memory and intellect decayed. In the latter part of 1740 he was entirely left him, and frequent fits of passion at length terminated in furious lunacy. This subsided in 1742, and he passed the last three years of his life in a condition of speechless torpor. He was interred in the cathedral, amid extravagant demonstrations of popular respect. He bequeathed the bulk of his property, amounting to £10,000, to found a hospital for insane persons. Swift was tall and well made, with a swarthiness complexion, and a cast of face that would have been heavy but for the pleasing expression of his eyes.—Some posthumous works of Swift were published long after his death, including "A History of the four last Years of Queen Anne;" "Polite Conversation," a satire on the frivolities of fashionable life; and "Directions for Servants." A complete edition of his writings was published in 19 vols. by Sir Walter Scott, whose biography of him is still the standard one. That by Dr. Johnson, in his "Lives of the Poets," reflects too closely the dislike which the biographer always entertained for Swift. There is also a copious life by Thomas Sheridan, and an account of his latter years by Dr. Wilde of Dublin, written on the occasion of the remains of Swift and Stella being exhumed, during some repairs in St. Patrick's cathedral, in 1855. The character of Swift is the subject of an elaborate essay by Thackeray, included in his "British Humorists." See also the "Life of Jonathan Swift," by John Forster, including numerous poems and other matter hitherto unpublished (London, 1875 et seq.).

SWIMMING, the art of keeping the body afloat and propelling it by means of the hands and feet. The swimming of man is artificial, but as the specific gravity of the human body is very little greater than that of water, it can be floated with little difficulty. The support is greatly increased by propulsion, just as a thin flat stone is prevented from sinking by
projecting it with force against the surface of the water. In learning to swim, the first essential is confidence; the pupil then learns to keep the body afloat; and when he knows how to apply the extremities to the water with a view to propulsion he can swim. Confidence is best assured in this way: Let the pupil wave out breast deep, face about, and toss an egg or a white pebble into the water between himself and the shore and plunge after it. In struggling to reach it he will find himself buoyed up by the water, and will learn that it is easier to swim than to sink. This was Dr. Franklin’s suggestion, and the most recent manuals recommend it. Some teachers inspire confidence and at the same time teach the propulsive movements by holding the pupil on the flat of the hand and then removing the support, leaving him to float and propel himself. The use of corks, bladders, and life preservers retards instruction, and is now nearly obsolete. The pupil learns first to swim on the chest. He assumes as nearly as he can a horizontal position, with the breast propped to the water and the heels as near as possible to the surface. To effect propulsion, the arms and legs are simultaneously flexed and drawn slowly toward the body, and then are simultaneously and rapidly extended. The two hands should be kept flat, the fingers closed, the thumb placed by the side of the first finger, and the pupil should reach forward with his hands as far as he can, for the farther forward he reaches the faster will he swim. He then draws both legs well up, and while each hand is brought around, one to the right and the other to the left, he strikes out simultaneously and strongly with his legs. The secret of a good stroke is to kick out with the legs wide apart. The propelling power is secured by the legs being brought from a position in which they are placed wide apart to one in which they are close together like the blades of a pair of scissors. In this position the heels should touch each other, and in drawing up the legs the toes should be pointed backward to avoid the resistance of the water against the insteps. It is a fallacy to suppose that the speed of the swimmer in any degree depends upon the resistance of the water against the soles, or that large flat feet are aids, unless it may be in treading water. Breast swimming is the commonest and easiest method, and the only one possible for long distances. But the prone position of the body presents a large resisting surface; the arms and legs are spread out on either side of the trunk, and so are applied but partially as propellers, the most effective part of the stroke corresponding say to a quarter of an ellipse, while the remaining three quarters are devoted to getting the arms and legs into position, which wastes power and increases friction. To obviate these difficulties, scientific swimmers have recently adopted the side stroke. The swimmer throws himself on the left side (a good swimmer on either side), and advances the left arm in a curve, making it act as a catwater, while the right arm directed downward and backward and the legs make a powerful stroke. The right arm and legs thus give three limbs moving simultaneously in the same direction, the left arm always moving in an opposite direction. The right arm and legs are flexed and carried forward while the left arm is forced backward, and vice versa. The strong backward stroke of the three limbs gives a powerful forward impulse, and as the body is on the side, as on a keel, the resistance is much reduced. The overhand stroke is similar, only in reaching forward the arm is brought out of the water, and the swimmer, advancing the right and left sides of the body alternately, secures greater continuity of motion and materially reduces the friction. Both these methods are much faster but more exhausting than breast swimming, and are practicable only for short distances, in saving life and in races. The speed attained by these strokes is indicated by the recent record of professional swimmers in London; in baths 400 yards have been swum in 5 m. 10 sec., 500 in 7 m. 27 sec., and 1,000 in the Serpentine in 16 m. 43 sec. With a strong favoring tide in the Thames a mile has been swum in 11 m. 43 sec., two in 23 m. 18 sec., three in 35 m. 22 sec., four in 48 m. 19 sec., and five in 64 m. 23 sec. Swimming on the back is more easily learned than breast swimming, and the body being more nearly horizontal, it is not difficult to swim by using the legs only, with the arms folded over the chest. In treading water, the swimmer’s body is in an upright position, with the head well out, and a rapid movement of the feet as in ascending steps is the sustaining and propelling power; the hands may be out of the water or may be used to assist in propulsion. Both these methods arereliefs in long swims. In diving, the hands are brought together in front to cleave the water and protect the head, and the legs are kept straight, the heels touching each other. If the diver desires to come almost instantly to the surface again, he has only to direct his hands upward above his head. To float on the back, the swimmer suffers the back of the head to be submerged, the face only being above water; the hands are extended and the legs partially flexed and spread so as to offer the greatest possible floating surface. In attempting to save a drowning person, the swimmer should approach him from behind, and keep him from sinking by raising him by the hair, or by placing the hands under his armpits, taking care that the struggler does not seize him, or both may be drowned. An exhausted or cramped swimmer may be supported by placing his hand on the shoulder of another swimmer. As salt water is more buoyant than fresh, it is easier to swim in it. The best time for the exercise is in the forenoon between breakfast and luncheon, when the stomach is neither full nor empty. For swimming matches the training
is like that for any other exercise, which, ac-

The year 1875 is memorable for extraordinary
swimming feats. On April 10 Paul Boyton of
New Jersey attempted to cross the English
channel from Dover in a swimming costume
invented by Capt. C.S. Merriman of New York.
He was in the water nearly three hours, prop-
pelling himself with a paddle having a blade at
each end, accomplishing as the tide and waves
carried him about 27 m.; and after toasting about
three hours more in the surf, he was taken on
board a steamer. On May 29 he successfully
crossed from Cape Gris Nez to South Foreland,
3 m. from Dover, by his course about 38 m., in
23 hours. These were hardly swimming feats,
but the usefulness of the costume and means of
propulsion in saving life and property on the
water was fully demonstrated. On July 3
Webb swam from Blackwall pier to Gravesend,
20 m., in 4 h. 42 m. 44 sec. On July 23, at
Chester, Pa., in a match with Coyle, J. B.
Johnson swam 101 m. in 3 h. 10 m. On Aug.
12 Webb made his first attempt to cross the
channel. He swam out from Dover 183 m. in
6 h. 45 m., when on account of the roughness of
the sea he was taken on board a lugger. On
Aug 24-25 he successfully crossed from
Dover to Calais, the tide making his course a
zigzag of about 50 m., in a little less than 22 h.
He had no other covering than a coating of
porepoe oil, and received no refreshment but
hot coffee, beef tea, cod-liver oil, and an
occasional sip of brandy, which he took while
treading water. On Sept. 1 Agnes Beckwith,
14 years old, daughter of a teacher of swim-
mimg, swam from London bridge to Green-
wich pier, about 5 m., in 1 h. 7 m. 45 sec. On
Sept. 4 Emily Parker, 14 years and 6 months
old, sister and pupil of Harry Parker, the
champion swimmer of London, swam the same
distance. A number of illustrated treatises on
swimming with instructions may be found in
Walker’s "British Manly Exercises" (London,
1844; latest ed., 1874), and in "Animal Loco-
motion, or Walking, Swimming, and Flying," by
J. Bell Pettigrew (London and New York,
1875). Sergeant Leahy has published "The
Art of Swimming in the Eton Style," with a
preface by Mrs. Oliphant (Norwich, 1875), and
Capt. Webb "The Art of Swimming," edited
by A. G. Payne (London, 1875).
under their respective names. To the west of the Alps, between France and Switzerland, extends the Jura range of mountains. (See Jura.) There are many points of view whence the semicircular array of peaks, presented at once to the eye, extends for more than 120 m., and comprises between 200 and 300 distinct summits, capped with snow or bristling with bare rocks. Of the heights commanding such panoramas, the Rigi is probably the finest and is one of the most accessible. (See Rigi.) The Faulhorn, in the Bernese Oberland, affords a fine view of the High Alps rising close at hand. For a near view of Alpine scenery, among the spots which afford a concentration of the grandest objects are the valleys of the Bernese Oberland, and those which descend from Monte Rosa in Valais. In these districts the glaciers are seen to great advantage. A description of the Swiss Alpine passes, the carriage roads, including those recently opened, and the railway over the St. Gotthard pass now (1876) in course of construction, is given in Alps. Of the Alpine defiles, the ravine of the Via Mala, on the upper Rhine in Grisons, is one of the most sublime scenes. The gorge of the Schöllenen on the St. Gothard, that of Gondo on the Simplon, and the glen in whose depths the baths of Piffers are rank, also deserve mention. The canyons or gorges of Switzerland are the reservoirs which feed some of the largest rivers of western Europe, including the upper Rhine, which flows within and along the boundary line of Switzerland, and then enters Germany, and the Rhône, which rises among the glaciers of the St. Gothard range near the Furca, receives the Visp, Borgne, and Dranse, and on quitting the canton of Geneva becomes a French river. The next largest river in Switzerland is the Aar, which rises in the Bernese mountains, receives the Saane, Reuss, and other affluents, and carries the waters of 14 cantons to the Rhine. The Ticino flows through the canton of that name, and passes through Lago Maggiore into Italy; and the Inn waters a part of the canton of Grisons. There are numerous waterfalls, among which are the fall of the Aar, at Handeck, in the canton of Bern; the Staubbach or Dust fall, in the Bernese Oberland; the Giesbach, on the lake of Brienz; the fall of the Salleneche, known as the Pissevache, near Martigny, Valais; Reichenbach falls, near Meiringen, Bern; the fall of Planazzo, on the Splügen, Grisons; the Tourtemagne fall, near the Simplon road, in Valais; and the falls of the Rhine, near Schaffhausen. There are several lakes, and the more important, Biene, Constance, Geneva, Lago Maggiore, Lucerne, and Lugano, are described in separate articles.—The more marked geological features of Switzerland are noticed in the articles Alps and Jura; and the glacial phenomena which have been most carefully studied, and which throw so much light upon the dynamics of geology, are specially treated in the article Glacier. No country possesses greater interest for geologists than Switzerland, whose formations are exhibited upon the grandest scale, and reveal in the most striking manner the metamorphism to which rocks are subject, of converting strata of comparatively recent formation into schistose and crystalline rocks; but its mineral resources, including iron, lead, and copper, are of no great importance. Anthraxite of inferior quality is found in several places. The salt mines near Basel and those at Bex (Vaud) are the most important. Gypsum is found with the salt, and slate is extensively quarried. There is a large number of mineral springs, many of which are famous as watering places. The most celebrated are Leuk (Valais), St. Moritz in the valley of Engadine (Grisons), Pfiffers (St. Gall), and Baden and Schinzbach (Aargau).—The climate is more severe than might be expected from the geographical position of Switzerland. On the highest summits snow and ice are perpetual. On the lower mountains and the table land snow falls in greater abundance than in other countries of the same latitude in Europe. In Valais the fig and grape ripen at the foot of ice-clad mountains, while near their summits the rhododendron and the lichen grow at the limit of the snow line. Ticino has the climate of Italy, yet the weather is more changeable. Switzerland on the whole is very healthful, with the exception of a few places in swampy or very narrow and deep valleys. In the middle ages the country of the Jura suffered much from earthquakes, which have entirely ceased for several centuries; but floods, avalanches, and snow storms still threaten the inhabitants with frequent dangers. About two thirds of the surface consists of lakes and other waters, glaciers, naked rocks, and other uninhabitable heights. Some districts are very fruitful, yet the grain raised is not sufficient for the supply of the population. The vine is cultivated most extensively of the Jura and in the valleys of the Rhine, Rhône, Reuss, Limmat, and Thur, and in some places ripens at 2,000 ft. above the sea. The annual production is valued at about $6,000,000. Flax and hemp are extensively grown. Irrigation is judiciously managed, and in general agriculture is making progress. The forests cover about 17 per cent. of the soil, and although their cultivation is imperfect, the production of timber exceeds the home consumption. Fishing still yields considerable produce, but hunting is not practised to the same extent as formerly, and in some of the cantons it is forbidden by law. Chamois are still found in the Alps; other animals are bears, wolves, wild boars, and roebucks; foxes and hares are numerous, and otters are found in some of the lakes. Switzerland is celebrated for its rich and excellent pastures; the finest breeds of cattle are those of the Simmental and Saanen (Bern), Greyére (Fribourg), Zug, and Schwytz. In 1866 there were 993,000 horned cattle (about one fourth milch cows), 100,000 horses, 447,-000 sheep, 375,000 goats, and 304,000 swine.
The sheep and swine do not supply the home demand. The best cheese is made in Gruyere and in Urseren (Uri), and in the valleys of the Emmen, Sane, and Simmen.—While Switzerland is mainly agricultural, certain classes of manufactures are prosperous and important. The chief seats of the cotton manufacture are Aargau, Appenzell, St. Gall, Zug, and Zürich. The number of mills in 1870 was 168, and of spindles 2,059,350, employing 20,000 operatives, besides 38,000 hand-loom weavers. This estimate includes 6,000 workers in Appenzell and St. Gall employed in the manufacture of embroidery alone, to the annual value of $2,000,000. Basel employs 6,000 persons in the manufacture of silk ribbons, to the annual value of $8,000,000, and 12,000 operatives in Zürich make silk stuffs of the annual value of $8,000,000. In Bern, Geneva, Neufchâtel, Solothurn, and Vaud 36,000 persons produce annually 1,600,000 watches, valued at $17,600,000. The movements of many of these are exported to be cased in other countries. Wood carving is carried on in most of the cantons. Vaud produces annually 80,000 musical boxes. The exports of Switzerland to the United States for the year ending Sept. 30, 1874, amounted to $12,270,868, including watches to the value of $2,423,993. The value of the foreign trade in 1868 was set down at $93,600,000 of exports and $84,000,000 of imports. The principal articles of import are grain, flour, wine and cider, iron, raw cotton, coal, and petroleum. The aggregate length of railway lines, Jan. 1, 1874, was 916 m. They are all private roads, with the exception of the Bern railway, which belongs to the state. The aggregate length of telegraph in 1873 was 6,322 m., with 715 stations.—Switzerland consists of 22 cantons, or, as three cantons, Unterwalden, Appenzell, and Basel, are divided into two independent half cantons each, of 23 states, the area and population of which are as follows:

Total: 15,886,2,692,847, 1,084,525, 2,566,935

Fourteen of these divisions have capitals of the same names; those of the remaining eleven are as follows: Aargau, Aarau; Appenzell Outer Rhodes, Trogen and Herisau, alternating; Basel Country, Liestal; Grisons, Coire; Thurau, Frauenfeld; Ticino, Lugano, Locarno, and Bellinzona, alternating; Upper Unterwalden, Sarren; Lower Unterwalden, Stanz; Uri, Altorf; Valais, Sion; Vaud, Lausanne. Of the entire population 94.3 per cent. were natives, and 5.7 foreign, including 68,000 Germans, 62,000 French, and 18,000 Italians. The number of communes in 1870 was 3,052, of which 5 had a population of more than 20,000, 7 from 10,000 to 20,000, 31 from 5,000 to 10,000, and 251 more than 2,000. The number of houses was 387,148, and of families 557,018. The excess of females over males was about 59,500. The number of births in 1871 was 81,629, and of deaths 77,908. The population has increased since 1816 about 50 per cent., more slowly than that of the United States and Great Britain, but in a much larger ratio than that of France. Geneva, Basel, and Neuchâtel have increased nearly 100 per cent.; Lucerne and Bern more than 50; Zürich nearly 50. Since 1860 every canton except Appenzell Inner Rhodes shows an increase of population. Of the entire population in 1870, 1,090,447 were wholly or partly supported by agriculture; the manufactories employed 216,468, and the handcrafts 241,425. The difference of language points to the difference of origin of the inhabitants of the several cantons. The N., N. E., and central cantons speak a German dialect; French prevails in Vaud, Geneva, and Neuchâtel, and in parts of Valais, Fribourg, and Bern; Italian in Ticino and in a part of Grisons; and Romansh, a corrupted dialect of the Latin, in a part of Grisons. The population speaking these four languages is classified by the census of 1870 as follows: German is spoken in 384,538 families, French in 183,575, Italian in 80,079, Romansh in 8,778, and other languages in 48. A majority of the inhabitants are Protestants, but the Roman Catholics are most numerous in 11 cantons and one half canton, viz.: Appenzell Inner Rhodes, Fribourg, Geneva, Lucerne, St. Gall, Schwyz, Solothurn, Ticino, Unterwalden, Uri, Valais, and Zug. They have five bishops, viz.: of Basel, Coire, Fribourg, St. Gall, and Sion. There are also priests with the functions of prefects apostolic to minister to scattered Catholics. In 1872 the pope erected Geneva into a new diocese, but the cantonal government denounced the measure as contrary to law. In 1873 the pope made it an independent vicariate apostolic, and the bishop of Fribourg resumed the former additional title of Lausanne, but the federal council refused to recognize it. It was several times a parish of Geneva, especially in the cantons of Aargau, Bern, Gene- va, and Solothurn, passed into the possession of the Old Catholics. The Jesuits and Re-demptorists are excluded by the federal con-
stitution from Switzerland, and the number of the convents of other religious orders has been somewhat reduced during the present century; in 1874 it amounted to 88. The constitution of 1874 forbids the founding of new convents. The Protestants belong mostly to the Reformed church. Since 1857 deputys of the Reformed cantonal churches meet annually in a Helvetic conference. Faculties of Protestant theology are connected with the universities of Bern, Zürich, and Basel, and there are also several theological schools in French Switzerland; in Bern a faculty of Old Catholic theology was established in 1874. Basel is the seat of the greatest missionary and Bible society of continental Europe, while the religious societies of French Switzerland have their centre in Geneva. Free churches (Presbyterian or Independent) have been formed during the present century by secession from the state churches, and are especially numerous in the cantons of Geneva, Neuchâtel, and Vaud, in each of which they have a theological school. The Methodists and Baptists have congregations in several cantons, and the former also a book concern at Zürich. In 1870 the number of Jews amounted to 6,996. Switzerland has three full universities, at Basel, Bern, and Zürich. The former was founded in 1460, the two latter since 1852. All are organized after the model of the German universities, governed by a rector and a senate, and divided into faculties, of which Basel has four, Zürich five, and Bern six. There are also four academies, at Geneva, Lausanne, and Neuchâtel, each with three faculties, and Fribourg with two faculties; three lyceums, at Lugano, Einsiedeln (Schwyts), and Sion; and nine theological schools. The academy at Geneva (called also university), founded in 1563, the scene of Calvin's and Beza's teaching, has hitherto lacked a medical faculty. This will soon be added, completing the university. All the academies except that of Fribourg are Protestant, all the lyceums Catholic. The number of gymnasia and cantonal schools is 47. The federal constitution of 1848 provided for the establishment of a federal university (the three above mentioned being cantonal institutions); but the conflicting claims of several cantons as to its location, and of the Reformed and Roman Catholic churches as to its organization, have prevented the execution of the plan. A federal polytechnic school was founded in 1854 at Zürich, and has attained a high degree of prosperity and celebrity. In 1874 it had 73 professors and 676 students, and 275 pupils who study one or more branches at their option. The number of public schools amounts to about 7,000, educating upward of 400,000 pupils. There is a federal military academy at Thun (Bern). The expenses of public instruction are partly paid by the communities, partly by special school funds, and partly by appropriations of the cantonal governments; and the constitution requires that all children must attend school from their 7th to their 14th year. Many private educational institutions have gained a world-wide celebrity since the days of Pestalozzi and Fellenberg, who conducted establishments of this kind at Yverdon (Vaud) and Hofwyl (Bern). Considerable attention is given to musical instruction, and in 1874 the federal singing societies numbered 8,552 members. The Alpine valleys are remarkable for their peculiar local melodies. (See BISE des Vaches.) The number of periodicals published in Switzerland in 1872 was 412, of which 266 were in German, 118 in French, 16 in Italian, 5 in Romansh, 1 in English, and 6 in German and French. The aggregate number of copies issued was 90,800,000.—The first federal constitution of Switzerland, which superseded the federal contract of Aug. 7, 1815, and changed the federal union of states into a federal republic, was promulgated Sept. 12, 1848. A revised constitution was submitted to the people on April 19, 1874, and, having received the constitutional majority, came into force on May 29. It provides that all the rights of sovereignty which are not expressly transferred to the confederacy are exercised by the 26 cantons and half-cantons. Among the prerogatives of the federal government are the rights of declaring war, of concluding peace or treaties, and of sending diplomatic representatives. The formation of separate alliances between the cantons, without special permission, is prohibited. The constitution of every canton is guaranteed, if it is republican in form, if it has been adopted by the people, and if it can be revised on the demand of a majority of the citizens. All Swiss are equal before the law, and the former relation of subjects as well as all privileges of place or birth are abolished. There shall be complete and absolute liberty of conscience and of creed. No one can incur any penalties whatsoever on account of his religious opinions. The father or guardian has the right to dispose of the religious education of the children up to the age of 16 years. No one is bound to contribute to the expenses of a church to which he does not belong. The free exercise of worship is guaranteed. Civil marriage is compulsory, and a subsequent religious ceremony is optional. The cantons have the right to maintain peace and order between different religious communities, and to prevent encroachments of ecclesiastical authorities upon the rights of citizens. No new bishoprics can be created without the approval of the federal government. Liberty of the press, of petition, and of association is guaranteed; but the Jesuits and all religious orders and associations which are affiliated to them are prohibited; all functions, clerical and scholastic, are forbidden to Jesuits, and this interdict can be extended to any other religious order whose action may be deemed dangerous to the state. The confederacy has the right of sending away dangerous foreign-
ers. The legislative power is vested in the federal assembly, which consists of a national council and a council of states (Ger. Stände-

ratl; Fr. conseil des états). The national coun-

cil consists of deputies of the people, in the ratio of about one for every 20,000 persons, so that every canton and every independent half canton has the right of electing at least one councillor. On the basis of the census of 1870 the council consists of 135 members. The national council is elected for the term of three years, and every citizen who is 20 years of age has the right of voting, and any voter, not a clergyman, is eligible. Natural-
edized citizens may be elected after being citi-
zens for five years. The council of states has 44 members, two for every canton and one for every half canton. The members of the national council are paid out of the fed-
eral treasury, those of the council of states by the cantons. The executive power is exer-
cised by a federal council, consisting of seven members, who are chosen for a term of three years by the federal assembly (the national council and the council of states in joint ses-

sion). They divide among themselves the seven departments of foreign affairs, of the post and telegraph, of justice and police, of finance, of war, of the interior, and of commerce and duties, each member taking one department and being at the same time the substitute in a second department. The president and vice-

president of the federal council, who are also president and vice president of the confedera-
tion, are chosen for one year only, and by the council itself from among its own members, and are not reeligible till after the expiration of another year. The federal court, which is also chosen by the federal assembly for a term of six years, consists of nine members and nine substitutes, and has its seat at Lausanne. The constitution may at any time undergo a revision in the regular way of legislation; if the two councils disagree, or if 50,000 citizens demand it, the question of a revision has to be submit-
ted to a direct vote of the people. The re-

vised constitution, in order to become effect-

ive, must be adopted by a majority of all citi-

zens of Switzerland as well as by a majority of the cantons. The cantonal constitutions may be divided into two classes: 1. Pure democracies, in which the rights of sovereig-
ty are exercised by a general assembly of all citizens, which meets once a year, mostly in April or May, votes upon laws, fixes the taxes, and elects the cantonal officers. The execu-
tive is called Landratl, and consists of the cantonal officers and the councillors elected by the several political communities. This is the constitution of Uri, Appenzell, Unter-
walden, and Glarus. 2. Representative de-
mocracies, in which the people elect a legisla-
tive assembly, called the grand council, which chooses from its own number the executive, called little council. In many cantons the people have the right of vetoing every bill

passed by the grand council. In most of the cantons the members of the grand council re-

ceive no pay. Instead of printed law books, some of the smaller cantons used until recently

written traditions; but now nearly every canton has its printed code of laws. Many old Germanic elements are to be found in Swiss law; the Roman law has had a predom-

inating influence only in a few border can-
tons. The institution of the jury, which was first tried in Geneva, has since been intro-
duced into several other cantons. The federal capital is Bern. The finances of Switzerland are in a very favorable condition. In 1873 the entire revenue, the greater part of it de-

rived from duties and the postal system, was 

$7,152,704, and the expenditures were $7,154,-

712. Since 1848 duties are levied only on the frontiers of the republic, and not, as be-

fore, on the limits of each canton. A por-
tion of the customs dues, as well as a great portion of the postal revenue, are paid over to the cantonal governments, in compensation for the loss of such former sources of income. In extraordinary cases, the federal government may levy a rate upon the various cantons after a scale settled for 20 years. The public debt at the close of 1873 amounted to $5,650,000, and the federal property to $5,691,000. The aggregate income of all the cantons in 1868 amounted to $8,320,000, the aggregate ex-

penditures to $8,680,000. Schaffhausen and Appenzell Inner Rhodes had no public debt; many other cantons formerly without debt have of late contracted one for the purpose of building railways. In the majority of can-
tons the public property exceeds the debt. In 1868 the aggregate property belonging to the cantonal governments amounted to $54,-

770,000, and the aggregate debts to only $33,-

660,000. —The military establishment of Swit-

erland is based upon purely democratic prin-
ciples. The fundamental laws of the republic forbid the maintenance of a standing army within the limits of the confederation. Every able-bodied citizen is actually a defender of the republic. The federal army consists of citizens from 20 to 44 years of age, and is divided into three classes according to age. The first class, comprising men from 20 to 34 years of age, constitutes the active field army; the second class, 34 to 40 years, the reserve army; and the third class, 40 to 44 years, the sedentary militia. The constitution of 1874 considerably extends the federal control in military matters. Both the army and the war material are at the disposal of the confed-

eration, which in cases of emergency has the exclusive right to dispose of the men who do not belong to the federal army. All the laws relative to the army are enacted by the con-

federation, which also provides for the educa-
tion of the troops. The Thun military acade-
my furnishes the army with the highest class of officers and with instructors for the lower grades. There are special schools for different
branches of the service, especially for the artillery and riflemen. All the different classes are required to devote a certain number of days in each year to battalion and brigade drills and field manoeuvres. The Swiss are accurate marksmen with the rifle, and meet constantly to practise and engage in trials of skill. There are clubs and societies in almost every valley and parish, and frequent matches; besides which a federal rifle match is held every year. The number of riflemen in the army list of 1874 was 13,918. Annual contests in wrestling also are held in many parts of Switzerland.

In September, 1874, the field army numbered 84,369 men, the reserve army 50,069, and the militia 65,981; making, with administrative troops and the sanitary corps, a total of 201,257. The first inhabitants of Switzerland are supposed to have been of Celtic origin, and to have immigrated from the northeast. Their collective name was Helvetians. (See HELVETI.) The high valleys near the sources of the Rhine, in the present canton of Grisons, were occupied by a tribe akin to the Tyrrhenians or Etruscans, called the Rhaetians. In 113 B.C. two tribes of Helvetians, the Tigurini and Tugeni (from which are derived the names of Zürich and Zug), joined the Cumbr and Teutons in their inroads into Italy. In this war the Helvetian Divico, in 107, completely routed the Romans under their consul L. Cassius Longinus. After the defeat of the Cumbr in 101, the Helvetians returned unmolested to their mountains, followed, it is believed, by the scattered remnants of the Cumbr, to whom the foundation of the town of Schwyz is ascribed. In the time of Caesar an entire tribe of the Helvetians, instigated by their leader Orgetorix, determined to conquer seats in Gaul, destroyed their towns and villages, and under the command of Divico crossed the Saône; but they were conquered by Caesar at Bibracte (Auctun), and driven back to their country. Soon afterward the Helvetian tribes were gradually subdued by the Romans, and even the Rhaetians, who were the last to maintain their freedom, were compelled at length to yield. For several centuries Switzerland remained a province of the Romans, who introduced their manners, laws, and civilization, and founded several towns, as Augusta Rauracorum (Augst, near Basel), Curia Rhetorum (Coire), Vindonissa (Windisch, in Aargau), Aventicum (Avenches, in Vaud), and Eburodunum (Yverdon). In the 2d, 3d, and 4th centuries the country was often harassed by the invasion of German tribes, especially the Alemanni; the Celtic and Roman elements of the population mostly perished, the towns were sacked, and the country laid waste. In the 5th century the Burgundians, Alamanni, and Goths divided the country among themselves; but their dominion was short, and in the 6th century they were all brought into subjection by the Franks. Christianity, which had already be-

gun to take root in Burgundian Switzerland, became under the rule of the Franks the religion of the entire country. Many bishoprics and convents were founded, and the bishops and many abbeys obtained great political influence. Though wholly incorporated with the empire of the Franks, the country was in point of administration divided into two parts: the one, extending from the lake of Constance and the Rhine to the Aar and St. Gothard, was called Rhaetia and Thurgania; and the other, comprising the present cantons of Geneva, Valais, Neuchâtel, Bern, Fribourg, Solothurn, &c., was called Little Burgundy.

Under the weak reign of Charles the Fat (died 888), Switzerland, like many other parts of the empire, was lost to the Franks. The N. part came into the possession of the duke of Alemannia (Swabia), and thus became part of the German empire, while the S. part belonged to Burgundy. During the invasion of Germany by the Hungarians in the 10th century, many towns, as St. Gall, Basel, Zürich, and Lucerne, were fortified, and rose in importance. During the reign of the emperors of the house of SAXONY the country was mostly held as fiefs by the vassals of the empire, in particular by the bishops and abbots, the counts of Kyburg (Zürich), Hapsburg and Lenzburg (Aargau), and Rapperswyl and Topgenburg (St. Gall); later also by the count of Savoy and the duke of Zähringen. Many of these noble families became extinct during the crusades; and the power and prosperity of the towns rose still higher, Bern and Fribourg even becoming free cities of the German empire. Zürich, Bern, and Basel formed an alliance, and tried to make themselves independent. Yet the independence of Switzerland did not proceed from them, but from the three ancient cantons of Schwyz, Uri, and Unterwalden, the inhabitants of which are believed to have descended from immigrants from Sweden, and which had never been conquered. The three cantons of Schwyz, Uri, and Unterwalden had been the German emperor, near whom their rights were guarded by a Vogt, first a count of Lenzburg, and afterward a count of Hapsburg. The elevation of Rudolph of Hapsburg to the imperial throne of Germany in 1273, and his conquest of Austria and other possessions of Ottocar of Bohemia, greatly increased the influence of the house of Hapsburg in Switzerland. Albert, the son of Rudolph, sought to incorporate the Swiss with Austria. Bern and Zürich at once resisted successfully; but in Schwyz, Uri, and Unterwalden he succeeded for a time. The convention entered into by 33 distinguished men of the three cantons on the Grütli or Rüti, a meadow on their common frontier, during the night of Nov. 7-8, 1307, led, on Jan. 1, 1308, to the expulsion of the Austrian officers and the destruction of their castles. The legend of Tell belongs to this period. The relation of the three cantons to the German empire remained at
first unchanged; but the war of Austria for reestablishing its rule in the emancipated cantons, which lasted with many interruptions for about 300 years, ended with severing also the ties which bound Switzerland to Germany. The Hapsburgs also lost their possessions lying between the Alps and the Rhine, and their old family castles of Hapsburg and Kyburg. The league of the three old cantons, which had first been formed in 1291 and renewed in 1308, was again established as a perpetual confederacy in 1315, after the great victory over the Austrians at Morgarten on the confines of Schwytz and Zug. In 1382 Lucerne joined the confederacy which received the name of the Four Forest Cantons (Vierwaldstaette). Zürich came in in 1351, Glarus and Zug in 1352, and Bern in 1353, when the eight united cantons erected the "perpetual league of the eight old places of the confederacy," so called because no new members were added to the confederacy till 1481, and these eight enjoyed many privileges till 1798. Other victories over Austria were gained at Sempach (Lucerne), July 9, 1386, and at Näfels (Glarus), April 9, 1388; after which the Swiss became aggressive, and at length, notwithstanding their defeats at Arbedo (Ticino) in 1422 and at St. Jacob (Basel) in 1444, annexed a considerable portion of Austrian territory. These protracted conflicts awakened such a fondness for warfare that many Swiss soldiers entered foreign armies, where until a very recent period they earned the questionable reputation of being the most loyal defenders of the cause which they espoused, even if it were that of despotism. Foreign enlistment without permission was forbidden by the federal government in 1860. There were occasional internal dissensions; and Zürich from 1440 to 1450 seceded from the confederacy. As at this time Schwytz had a predominating influence in the council of the confederacy, its cantonal colors (white and red) were adopted as the confederate ensign, and the party name Swiss (Schwyzer) became the designation of the entire people. In 1475 the cantons joined France, Austria, and some of the Alsatian free towns in the league against Burgundy. The Swiss gained a great victory over Charles, duke of Burgundy, at Granson, in March, 1476; the confederates annihilated his army at Morat in June; and the war terminated with the defeat and death of the duke at Nancy in January, 1477. (See Observations Relative to the Administration of the Rhine.) By the admission of Basle, Fribourg, and Fribourg into the confederacy in 1481 threatened a civil war, which was averted by the exhortations of the hermit Nicholas von der Flue. Other internal dissensions were terminated by a war against the German emperor (1498), which was concluded by the peace of Basel in 1499, and Basel and Schaffhausen, for faithful assistance, were admitted as members of the confederacy, to which Appenzell was added in 1513. The number of cantons thus rose to 13, and remained so till 1798. The Swiss conquered Lombardy for Duke Maximilian Storza in 1512, and routed the French at Novara in 1518, but in 1515 lost the great battle at Marignano. They found France willing to conclude with them an advantageous peace in 1516, which was kept till 1798. The reformation of the 16th century led to open war between the Reformed and Catholic cantons, but soon after the battle at Cappel (Zürich) in 1531 peace was concluded, and every canton left at liberty to introduce or to oppose the reformation. (See Reformation, vol. xiv., pp. 246-27.) Geneva freed itself, with the aid of Bern, from Savoy, and in 1536 became a Protestant republic, but without being admitted into the confederacy. Vaud was conquered by Bern from Savoy in 1536 and reformed; but on the other hand, the Catholic cantons of Lucerne, Uri, Schwytz, Unterwalden, Solothurn, and Fribourg formed in 1536, by the advice of Archbishop Charles Borromeo of Milan, the "golden league" for the common defence of the Catholic religion. The religious split continued a prolific source of dissension between the cantons. In 1597 the canton of Appenzell, in order to prevent a religious war, was separated into two independent half cantons, the Catholic part being called Inner Rhine, and the Reformed Outer Rhodes. In 1602 the Reformed were expelled from Valais, and in 1620 Protestantism was forcibly suppressed in the Valtellina. In Grisons a bloody civil war was kindled, in which other cantons also took part, and which made the country one of the chief seats of the war between France, Spain, and Austria. As the federal courts of Germany still made claims on Switzerland as belonging to the German empire, the Swiss sent the burgomaster Weltstein of Basel as their representative to the peace congress of Westphalia, which at that time was one of the great events of history (1648); pronounced Switzerland entirely independent of Germany. From this time until the outbreak of the French revolution in 1789, the history of Switzerland presents few events of general importance. It had no foreign war, and the occasional religious contests at home were generally of short duration. The most important of them was the second war of Taggenburg in 1712, when 150,000 Swiss were in arms against each other. Other internal commotions arose out of the oligarchic form of government which was gradually established in the cantons of Bern, Fribourg, Solothurn, and Luzern, and of the oppressed condition of the subject territories whose inhabitants were excluded from all political rights. In 1798 two French armies marched, without any respectable pretext, into Swiss territory, captured on March 5 the city of Bern, plundered its armory and treasury, and on April 12 proclaimed at Aarau the one and indivisible Helvetic republic, divided into 18 cantons, with Aarau as the federal capital. By the new constitution Bern was divided into four
SWITZERLAND

cantons, the subject districts of Baden, Thurgau, Lucano, and Bellinzona were erected into cantons, Zug, Uri, Schwyz, and Unterwalden united into the one canton of the Forest Towns, and Appenzell, St. Gall, and the valley of the Rhine formed into the canton of Sconstis. Geneva, Bienne (Bern), and several other portions of Swiss territory were incorporated with the French republic. The resistance of the old forest cantons proved useless, and the new constitution was gradually introduced. Overthrown on the entrance and advance of the allied armies under the command of Suvoroff, it was reestablished after the victories of the French under Masséna. The withdrawal of the French troops in 1802 led at once to revolutions in almost every canton, and a general diet, consisting of an equal number of deputies from the formerly governing and the governed districts, was convoked at Schwytz; but again France interfered, 12,000 French troops subdued the old cantons, and deputies from all the cantons were ordered by Bonaparte to assemble at Paris for the purpose of reorganizing Switzerland. On Feb. 19, 1803, Bonaparte transmitted to them the act of mediation, by which the former cantonal system was restored, although the relation of subject districts remained abolished. To the 13 old cantons 6 new ones were added, viz.: St. Gall and Grisons, which had formerly been allied with the confederacy without being members, and Aargau, Thurgau, Ticino, and Vaud, which had been subject districts. At the head of the confederacy was again placed a diet (Ger. Tagesstzung), consisting of commissioners, voting according to instructions. It was to assemble in turn in the cities of Bern, Zürich, Lucerne, Basel, Fribourg, and Solothurn, and the burgomaster of the temporary capital (Ger. Vorort), under the name of Landmann of Switzerland, was to preside at the diet and to attend to all the current affairs of the year. In the democratic cantons the sovereign popular assemblies were reestablished; in the others grand and little councils, the former being elected by a direct vote of the people, and the latter by the grand council. This new constitution was on the whole well received, and under it Switzerland for ten years enjoyed peace at home and abroad. After the battle of Leipsic the troops of the allied powers marched through Switzerland. Bern and others of the aristocratic cantons severed their connection with the Helvetic government instituted by the act of mediation, and civil broils ensued in a number of cantons. Yet the attempt to restore the former order of things had soon to be given up, and a new constitution, adopted by the federal diet on May 27, 1815, and sworn to at Zürich on Aug. 7, acknowledged all the 19 cantons constituted by the act of mediation, and added three new ones, Geneva, Valais, and the Prussian principality of Neufchâtel. This constitution was ratified by the great powers of Europe, which also declared the perpetual neutrality and inviolability of the confederation (Nov. 20). The territory of Switzerland was enlarged by portions of land ceded by France (the Dappes valley), Savoy (Carouge and several villages on the lake of Geneva and on the Rhône), and Austria (Rházüns, the Frickthal, Laufenburg, and Rheinfelden). The cantons of Solothurn, Grisons, Schwytz, and Appenzell Inner Rhodes adopted the constitution only with reluctance, and the most conservative cantons were coerced into submission by force of arms. According to the new confederation the cantons guaranteed to each other their constitution, and united for the common defence of their independence. The diet was to assemble annually on June 1, alternately at Bern, Lucerne, and Zürich, and to it was reserved the right of declaring war, concluding peace, and forming alliances with foreign powers. The cantons retained the right of forming with foreign states special military agreements. The existence of the convents and cathedral chapters was guaranteed by a special article. The administration of federal affairs, during the time that the diet was not in session, was left to the temporary capital. In 1817 Switzerland, on the invitation of Alexander of Russia, joined the holy alliance, and from 1823 to 1828 it conceded to the urgent requests of the great powers of Europe a restriction of the liberty of the press and of the right of asylum. The aristocracy recovered in most cantons part of their former prerogatives, and several capital towns greatly enlarged their influence at the expense of the country people. The French revolution of July, 1830, led to violent political agitations in Switzerland. In several cantons the country people rose against the capital towns, and forced them to reorganize the cantonal constitutions on a more liberal and democratic basis. In the canton of Basel a permanent division into two independent half cantons, Basel City and Basel Country, was effected in 1832. In November some of the most conservative cantons, Uri, Schwytz, Unterwalden, Neufchâtel, and Basel City, formed the "league of Sarnen," and threatened to send no more commissioners to the federal diet if the commissioner from Basel Country were admitted. The federal diet interfered; the separate league was declared dissolved, and the refractory cantons had to submit to the federal authority. Altogether, liberal cantonal reforms were introduced in about two thirds of Switzerland. Encouraged by success, the progressive party conceived also the plan of revising the federal constitution, with the view of effecting a closer political union. The diet, on July 17, 1832, pronounced in favor of the revision; yet, when the amendments adopted by the diet were subjected to a direct popular vote, they were voted down by a coalition of the Catholic and radical parties. The large number of political refu-
gees, who gathered in Switzerland in consequence of the revolutionary movements of 1830, involved the country in serious difficulties with the great powers, which complained of the liberty granted to them by the federal diet. The latter endeavored to conciliate the powers by several resolutions restricting the liberty of the refugees (in 1834 and 1838), and even by the expulsion of some of the leading men among them (1836); yet the diplomatic collisions continued. The demand of the French government in 1838 for the expulsion of Louis Napoleon, who had been since 1832 a citizen of the canton of Thurgau, was declined by Switzerland, and almost led to a war, which was only avoided by his voluntary departure. An occasion for new religious contests was given by the conference at Baden in 1834, at which delegates of Bern, Basel County, Aargau, Thurgau, Lucerne, Solothurn, and St. Gall undertook to regulate the relations of the Roman Catholic church in a manner which was rejected by the pope and the bishop of Basel as contrary to the rights and the spirit of the church. The articles of the conference provoked several insurrections, especially in the canton of Aargau, the government of which, to punish the revolted Catholic districts, decreed in 1841 the abolition of all the convents. Against this measure most of the Catholic cantons and the ambassador of Austria protested, as a direct violation of that article of the constitution of 1815 which guaranteed the continuance of convents and chapters. Upon the representations of the federal diet Aargau restored four female convents, a concession which did not satisfy Austria and the Catholic cantons; but the federal diet by 12½ votes dismissed the subject from its docket (Aug. 31, 1843). A cause of still greater trouble was a motion, made by Aargau at the diet of 1844, for the expulsion of the Jesuits from Switzerland. It was laid on the table by the Catholic Vorort Lucerne resolved (Oct. 24, 1844) to call the Jesuits to a cantonal institution, a great excitement spread throughout Switzerland. Two volunteer expeditions (December, 1844, and March, 1845) were undertaken for the purpose of overthrowing the government of Lucerne, but both were unsuccessful. On the other hand, the governments of Vaud, Bern, and Zürich, which had voted against the expulsion, had to give way to others which were in favor of the project. As thus the danger threatening the existence of the schools of the Jesuits increased, the cantons which either had called Jesuits to cantonal institutions, or which patronized them (viz., Lucerne, Uri, Schwyz, Unterwalden, Zug, Fribourg, and Valais), strengthened a separate alliance (Son- derbund) which had already been formed in 1843, and appointed a council of war for the emergency of a civil contest. A motion of Zürich at the diet of 1845 to declare the Sonderbund dissolved received only 10½ votes, but a change of government of Geneva and St. Gall secured for the motion a majority of 123 votes. The Protestant cantons (Neuchâtel), one Protestant half canton (Basel City), and one Catholic half canton (Appenzell Inner Rhodes) voted with the cantons of the Sonderbund. In September another resolution declared the expulsion of the Jesuits from all Switzerland. The diet collected an army of nearly 100,000 men under the command of Gen. Dufour, and on Nov. 4 resolved to execute the decree of July 20 by force of arms. The Sonderbund had raised a force of 30,000, which was to be supported by a Landsturm of 47,000 men. The isolated Fribourg was first attacked, and surrendered after an insignificant skirmish. On Nov. 23 the army of the Sonderbund was routed at Gisikon, near the frontier of the canton of Lucerne, the council of war, the government of Lucerne, and the Jesuits fled, and all the seven cantons submitted. In this war Lucerne was the head and centre of the seven Catholic cantons. Austria, France, and Prussia had openly declared during the war their sympathy with the Sonderbund, and in 1848 issued a joint note to Switzerland, demanding that the cantons of the Sonderbund be evacuated, and no change be made in the constitution of 1818, except by the consent of all the cantons. But the revolutions of 1848 drew off the attention of the great powers from Switzerland, and gave the latter an opportunity to hasten a thorough reformulation of the federal constitution. The committee of revision began its labors on Feb. 17, 1848, and on June 27 the draft of the constitution was submitted to a direct vote of the people. A majority of the cantons and a large majority of the total population voting in favor of it, it was promulgated Sept. 12. In the same year the canton of Neuchâtel declared itself independent of Prussia, which entered against this act an ineffectual protest. On Sept. 2, 1853, the royalists of Neuchâtel made an attempt to overthrow the government of the canton and to reestablish the sovereignty of the king of Prussia. The movement was at once suppressed (Sept. 3), but led to serious complications with Prussia, which demanded the unconditional pardon of the captured royalists. The demand was supported more or less by all the great powers of Europe; and when the federal council refused to accede to it, Prussia broke off diplomatic relations, and made some warlike demonstrations. When, however, France and England promised their intercession with Prussia in behalf of a recognition of the independence of Neuchâtel, in case Switzerland would release the royalist prisoners, their advice was followed by the federal council. Prussia in 1857, at a conference of the great powers in Paris, resigned for ever its claims to Neuchâtel. In 1860 Switzerland protested against the annexation of Savoy to France, as a violation of the treaties of 1564 and 1816, by which the neutrality
of the districts of Chablais and Faucigny had been guaranteed. It demanded from France the cession of these two districts, but as it received little aid from the great powers, its representations were of no effect. The boundary question between Switzerland and Italy, submitted to the arbitration of George P. Marsh, United States minister to Italy, was decided on Sept. 23, 1874, in favor of Italy, definitely fixing the Swiss frontier at the point called the Craviali Alps, and was promulgated as obligatory on the two countries, June 11, 1875. In 1875 Switzerland and Italy concluded a new commercial treaty for ten years.

—The principal works on the history of Switzerland are: Geschichte der schweizerischen Eidgenossenschaft, by Johannes von Müller and others (7 vols., 1780–1829), to the end of the 18th century; continued in a French translation by Monnard and Vulliemin to the 19th century (19 vols., Paris, 1837–51); Heinrich Zschokke's Geschichte des Schweizerlandes (Zurich, 1823; English translation by Francis George Shaw, embracing Emil Zschokke's continuation to 1848, New York, 1855; new ed., 1875); Bluntschli's Geschichte des schweizerischen Bundesrechts (2 vols., Zürich, 1846–52); and A. Morin's Précis de l'histoire politique de Suisse (5 vols., Geneva, 1855–73).

SWITZERLAND, a S. E. county of Indiana, bordering on Kentucky, from which it is separated by the Ohio river; area, 220 sq. m.; pop. in 1870, 12,134. The surface is undulating and the soil fertile. The chief productions in 1870 were 132,865 bushels of wheat, 15,020 of rye, 309,183 of Indian corn, 27,970 of oats, 126,116 of potatoes, 19,446 tons of hay, 20,964 lbs. of wool, 174,821 of butter, and 17,342 gallons of sorghum molasses. There were 3,526 horses, 2,626 milch cows, 3,225 other cattle, 8,473 sheep, and 9,407 swine; 7 manufactories of carriages and wagons, 7 of cooperage, 1 of woollen goods, 6 flour mills, and 8 saw mills. Capital, Vevay.

SWORD, a weapon used in war and encounters, commonly made like a large knife, and sometimes pointed like a dagger. The ancient Egyptians possessed the art of imparting to bronze extraordinary hardness and elasticity, and employed this material for swords and daggers. Wilkinson describes the former as straight and short, from 2½ to 3 ft. in length, having generally a double edge and tapering to a sharp point. The Greeks had several varieties of swords of bronze, and at a later period of iron; and as seen upon coins, vases, &c., they appear to have been short cut-and-thrust blades, leaf-shaped or tapering from hilt to point, and provided with a scabbard, which was attached on the left side to a belt suspended from the shoulder or round the waist. The Lacedaemonian sword was curved on the sharp side, while the back was blunt, and the end was pointed obliquely toward the back. The Romans first used the Gallic sword, which had no point and was sharp on one side only; but after the battle of Cannæ they adopted the Spanish sword, which was short and straight, made for cutting and thrusting. The Gallic sword was worn on the left side, the Spanish always on the right. The swords used by barbarian soldiers and by gladiators were curved. The most famous swords were the Damascene blades of the middle ages, made probably of East Indian wootz, on the shores of the Mediterranean. (See DAMASCUS BLADES.) Next to these the swords of Toledo in Spain attained celebrity. Milan also was famous for its excellent swords during the middle ages. A manuscript psalter of the time of King Stephen gives a representation of two men grinding a sword blade, and there is no doubt of the early manufacture of swords in England. In the 17th century those made by the Germans were in good repute, and about the year 1689 unsuccessful efforts were made to establish the manufacture in Cumberland, England. In 1786 Mr. Gill of Birmingham, competing with German and English makers for supplying the East India company, produced a large number which bore the required test of bending till the length of the blade was reduced from 36 to 29½ in. Swords are still made at Toledo of as good quality as ever, but the manufacture employs only 70 or 80 hands. The best of cast steel is required for good swords. The bars are hammered down by two men striking alternately; and if the blade is to have concave sides or other peculiarities of shape, these are obtained from the dies in which it is swaged. When shaped, it is hardened by heating in the fire to dull red and dipping point downward in a tub of cold water. It is tempered by drawing it through the fire until it acquires a blue color, and is then set or straightened by springing it with
the tongs in any required direction as it is held in a sort of fork standing in the anvil. After this it is ground upon a stone with a face adapted to that of the sword, flat or otherwise; is slightly heated to restore the temper impaired by grinding; and is finally polished with emery and crocus. The small sword used in fencing, is a slender one, the thrust only, and is the dress sword. The broad sword, called sometimes the back sword, has but one edge.

**SWORD FISH**, the name of the *xiphiasida*, a family of marine spiny-rayed fishes, allied to the mackerels, so called from the prolongation of the snout into a long, horizontally flattened, sword-like weapon. The sword consists of the vomer and intermaxillary bones, supported at the base by the frontals, nasal, and upper jaw. In form this fish resembles the mackerel; the scales are very small; the jaws proper, and sometimes the sword, are crowded with small, acute teeth, often hardly perceptible; the laminae of each branchial arch are united into a band-like organ, with only superficial marks of separation, as in no other bony fishes; branchiostegal rays in the typical genus *xiphias* (Linn.) seven. The spiny dorsal begins near the head, high and sickle-shaped, extending nearly to the tail, and followed by a small soft fin; the anal is similar, but much shorter; ventrals wanting, or represented only by a pair of spiny rays on the throat; caudal deeply forked, on the sides having one or two large cutaneous folds; the pectoral appendages are collected into bundles and connected by areolar tissue, the branches forming two trunks inserted into the intestine close to the pylorus; the stomach caecal and conical, and the air bladder large; the lower jaw in the young is proportionally longer than in the adult; the sclerotic forms a bony box, with a circular opening in the front for the cornea, rendering the eyes very movable. They are very swift swimmers, and feed on mackerel and other fishes collecting in shoals. The common sword fish (*X. gladius*, Linn.) attains a length of 12 to 20 ft., and is found in the Mediterranean and on both sides of the Atlantic; it uses its sword to destroy its enemies, and sometimes strikes at vessels, burying its weapon deep in their timbers. There are no ventral fins, and the sword is about three tenths as long as the body. It occurs on the North American coast from Nova Scotia to New York, being common in the summer in Vineyard sound and between No Man’s Land and Block island; it is silvery white below, and tinged above with blackish blue, the sword dark brown above and lighter below. It is fond of pursuing the shoals of mackerel, and may be detected by the dorsal fin projecting above the water. They are taken by means of harpoons. The flesh is esteemed as food, both fresh and salted.

**SYBARIS**, an ancient Greek city of Lucania, in Italy, on the coast of the Tarentine gulf, between the rivers Crathis (now Crait) and Sybaris (Coscile), a short distance from the sea. It was founded by an Aeolian colony about 720 B. C. The surrounding country was very fertile, and having large accessions from native Italian tribes, freely admitted to citizenship, the city rose rapidly to great wealth and power. When most prosperous, about 200 years after its foundation, Strabo says it was 50 stadia in circumference, ruled over 25 subject cities, and could muster an army of 900,000 men; while the knights in their religious processions numbered 5,000, or four times as many as the same class of citizens in Athens. Sybaris founded Posidonia, Laus, and Scidrus, and traded extensively. Its citizens were famed for effeminacy and love of luxury. Atheneus said no craft was permitted in the city which made a noise that might disturb the citizens; yet the arts conducive to pleasurable life were amply fostered. The aristocracy ruled till about 510 B. C., when Telys, a demagogue heading a democratic party, drove out the wealthier citizens and rulers, and raised himself to the position of tyrant. Of the exiled nobles 500 took refuge at Croton, and Telys demanded their surrender. This was refused, and a war ensued in which a large army of Sybarites was beaten by one third the number of the Crotonitans, who sacked Sybaris, and turned the course of the river Crathis so that the city was inundated and buried in the deposits that the river brought down. Sybaris was never restored; its site is now a malarious marsh, and its exact position cannot be determined. Its surviving inhabitants, after remaining for many years at Laus and Scidrus, founded near it, with Athenian colonists, the city of Thurii.

**SYBEL, Heinrich von**, a German historian, born in Düsseldorf, Dec. 2, 1817. He studied in Berlin under Ranke, graduated in 1841 at Bonn, and was professor there in 1844-5, then at Marburg till 1856, and subsequently at Munich, where he founded the first historical seminary established in Germany. He resumed his chair at Bonn in 1861, and in 1875 was appointed director of the archives at Berlin. In 1862-6 he was a member of the Prussian chamber, and in 1867 of the constituent Reichstag of the North German confederation. His works include *Geschichte der Revolutionszeit 1759-95* (9 vols., Düsseldorf, 1853-7); *Entwicklung der Periode von Ferdinand der Große*, new ed., continued to 1800, 5 vols., Düsseldorf, 1874 et seq.; *Kleine historische Schriften* (2 vols., Munich, 1862-9); *Die deutschen und auswärtigen Universitäten* (enlarged ed.,
Bonh, 1874); and Klerikale Politik im neun-
achtnten Jahrhundert, in defence of Prince Bis-
marek's policy (1874; English translation by

SYCAMORE, a name properly belonging to a
species of fig (Ficus sycomorus), the anaphore of
the Greeks, and the plant so called in the
Scriptures. The tree is common in Egypt; its
light and durable wood was formerly used for
mummy cases, and it is now planted as a shade
tree and for its fruit. In the sacred dramas in
the middle ages, the true sycamore not being
at hand, the large maple was used to represent
the tree into which Zaccheus climbed, and that
in which the Virgin hid with the infant Jesus
to avoid the fury of Herod. From this use the
name sycamore was transferred to the maple
(acer pseudoplatanus). (See Maple.) In the
United States the plane or buttonwood tree
is frequently called sycamore, as the leaves
resemble in shape those
of the sycamore maple.

SYDENHAM, Floyer, an
English scholar, born in
1710, died April 1, 1787.
He was educated at Ox-
ford, where he took the
degree of M. A. in 1734.
He translated the great-
er part of Plato's works
(8 vols. 4to, 1759-'88).
Thomas Taylor comple-
ted the translation in
1804. Sydenham also
published "A Dissertation
on the Doctrine of Heraclitus" (1775), and
Onomasticon Theologi-
um (1784). His suffer-
ings from poverty in his
old age, and his death
in the debtors' prison,
led to the foundation of
the literary fund.

SYDENHAM, Thomas, an English physician,
born at Winford Eagle, Dorsetshire, in 1624,
died in London, Dec. 29, 1689. He graduated
at Oxford, and in 1648 obtained a fellowship
in All Souls' college, and studied there some
years, visiting France in the mean while and
attending the lectures of Barbery. About
1660 he went to Westminster, and soon ob-
tained a large practice and great reputation.
Abandoning the routine system then in vogue,
he based his practice on principles which recog-
nize that there is in the human system a
re recuperative power, the vis medicatrix naturae,
and that this should be aided, not thwarted.
He was the first who treated smallpox with
cooling remedies, or intermittent fever with
cinchona. The preparation known as Syden-
ham's landanum was one of many valuable
additions which he made to the materia med-
ica. A collective edition of his works in Latin
was published in London in 1785 (English
translation, 1686).—In 1843 a society, com-
frontage on the N. and N. E. The greatest
length of the city is 3½ m. N. and S., and its
breadth 2½ m. E. and W. The total length
of the streets is 115 m., and the number of
houses 14,500. The main streets are laid out
at right angles, but many are crooked and
narrow, giving the city the appearance of an
old English town. It is well supplied with
water and lighted with gas. Public traffic is
conveyed by about 600 omnibuses and hack-
ney coaches, and 35 steam ferry boats connect
with the transmarine suburbs. Most of the
public buildings, banks, and warehouses are
of freestone in the Italian composite style.
The exchange in the Corinthian, the govern-
ment house in the Tudor, and the university in
the perpendicular English style, are fine speci-
mens of architecture. The new post office,
open in September, 1874, and the town hall,
which is very large, are imposing edifices.
Other noteworthy buildings are the new rail-
way station, the courts of justice, the parlia-
ment buildings, and the treasury. There are two cathedrals, Anglican and Roman Catholic, and about 120 other churches and chapels. There are three theatres, spacious markets, and several parks and gardens. Hyde park contains 40 acres, the Domain 188 acres, and the botanical gardens, the finest in the colonies, 38 acres. Prince Alfred park, Belmore park, and Moore park (500 acres) have all been recently laid out on the S. and S. E. sides of the city. Sydney is the residence of an Anglican bishop, who is the metropolitan of the Australian dioceses, and of a Roman Catholic archbishop. Connected with the university, whose degrees confer the same rank as those of the English universities, are St. Paul's Anglican college, St. John's Roman Catholic college, a Presbyterian college, and a Wesleyan college. There are also a normal school, a nautical school, many public and private schools, a free museum, a free public library, an observatory, three daily newspapers, and twelve weekly and eight monthly periodicals. Since 1855 a branch of the royal mint has been established here. The harbor is completely landlocked, and the largest vessels can come close to the wharves; and extensive ship yards and dry docks furnish every facility for repairing vessels. The port is well defended by several forts and batteries. The entrances at Port Jackson in 1872 were 1,032 vessels, tonnage 418,164; clearances, 854, tonnage 360,735. The exports to the United States for the year ending Sept. 30, 1874, amounted to $335,465. —Sydney was founded in 1788, and named in honor of Viscount Sydney, the colonial secretary of state. It was incorporated in 1842. In 1875 an intercolonial industrial exposition was held there.  

SYDNEY, a port of entry and the capital of Cape Breton co., Nova Scotia, the chief town of the island of Cape Breton and its capital was found in 1785, situated in the midst of the island, 193 m. N. of Halifax; lat. 46° 18' N., lon. 60° 9' W.; pop. in 1871, 2,900. The harbor is one of the finest in the world. In the vicinity are rich mines of bituminous coal, which are connected with the town by railway. There is considerable trade with Newfoundland and St. Pierre. Sydney contains an iron foundry, a tannery, a boat factory, ship yards, three branch banks, a court house, a masonic hall, a weekly newspaper, and churches of six denominations. The value of imports for the year ending June 30, 1874, was $70,354; exports, $358,935.

SYDW, Karl Leopold Adolf, a German theologian, born in Berlin, Nov. 28, 1800. He studied under Schleiermacher, and was chaplain at Potsdam from 1837 to 1846, and for the last 30 years has been pastor of the Neue Kirche at Berlin. He was arraigned in 1872 for heresy, and was censured and fined, but retained his pastorate. Jointly with F. A. Schulze he has translated into German a collection of Channing's works (15 vols., Berlin, 1850-63).
that the popular will, as expressed in public opinion or otherwise, is the supreme law, independent of all other, divine or human; and that in the political order accomplished facts, as such, have the force of right. Next came errors relating to the constitution and rights of the family, especially such as aim at refusing religious bodies all control over or share in education; the denial to the church as founded by Christ of all proper authority or jurisdictional rights, distinct from or independent of the state; the denial of power in the church to bind the conscience by any laws of hers, save only in so far as these are promulgated by the state; the denial of any validity to spiritual penalties decreed against secret societies in states which tolerate their existence, or of force in excommunications pronounced against persons usurping property belonging to the church, to religious orders, or ecclesiastical corporations, &c. This bull and the syllabus are to be taken as one authoritative act, the 80 errors designated in the latter being grouped under ten different heads, including pantheism and its adjuncts naturalism and absolute rationalism, moderate rationalism, and religious indiffer-entism; 20 propositions adverse to the constitution and rights of the church, 17 on civil society and its relations to the church, 10 on Christian marriage, 2 on the temporal prince-ship of the pope, and 4 on modern liberalism in its bearings on religion.—The appearance of both these documents created much excitement in France, where Jules Baroche, the minister of public worship, issued on Jan. 1, 1865, a circular letter to the French bishops forbidding the publication by them of the syllabus and of the doctrinal part of the bull. The liberal French press and the government journals also attacked these wide condemnations as "an act subversive of social order," "a monstrous error in politics as well as in the intellectual and moral order," "an attempt to restore an absolute theocracy, to set up a tyranny over everybody and everything." The minister de-clared the doctrine of the pope to be "contrary to the principles on which the empire reposed," and the Journal des Débats translated and analyzed the propositions condemned. Bishop Dupanloup replied to the latter, pointing out over 70 mistranslations and misconcep-tions; while nearly all the French prelates, including Archbishop Darboy, replied to the former, denouncing the ministerial prohibition. The bishop of Belley and the cardinal-arch- bishop of Besançon read both documents from the pulpit, and were prosecuted by the gov-ernment. Elsewhere, though the proceeding of Pius IX. was generally condemned by the secular press, the civil governments did not feel called upon to interfere with the bishops, for whose special guidance the syllabus had been drawn up. In the beginning of 1871 Dr. Schulte, professor of canon and German law in the university of Prague, in a pamphlet ent-titled "The Power of the Roman Popes over Princes, Countries, Peoples, and Individuals," assumed that the syllabus with all its 80 prop-ositions was an utterance ex cathedra, as de-fined by the council of the Vatican. This assumption, as well as the whole argument of Dr. Schulte, was assailed by Bishop Fessler of St. Pölten in Lower Austria, who had been secretary of the council, in his "True and False Infallibility of the Popes" (Vienna, 1871; English translation, London and New York, 1875), for which he received a congratu-latory letter from Pius IX. In the autumn of 1874 the doctrines condemned in the syllabus were brought prominently before the public by Mr. Gladstone's pamphlet, "The Vatican Decrees in their Bearing on Civil Al-le Giance." From the syllabus and the bull Quanta cura he selected 18 propositions bearing principally on the liberty of the press, of conscience, worship, and speech, on the essential rights of both church and state, and their mutual subordination, on education, marriage, the abolition of the pope's temporal power, tolerance, and the reconciliation of the papacy with modern liberalism. The interpreta-tion of the various propositions by Mr. Glad-stone, and his conclusions therefrom, drew forth replies from Dr. Newman, Cardinal Man ning, and other Roman Catholic writers, who accused him of mistranslating several proposi-tions and misstating their sense. With regard to the doctrinal authority both of the bull Quanta cura and of the annexed syllabus, it is generally admitted by Roman Catholic theo-logians that the former has the character of an ex cathedra utterance, while the specific char-acter of the latter is still a matter of dispute. All agree that the propositions condemned are erroneous, and that the condemnation should be accepted by all Catholics as final, while it is maintained by some that the syllabus has the same official and doctrinal value as the bull itself, and by others that the list of errors is only compiled for the convenience of bishops and theologians, each proposition bearing only that censure pronounced on it specially in the original document. 

SYLVESTHER, the name of two popes, besides an antipope. 1. Sylvester I., Saint, born in Rome about 270, died there, Dec. 31, 335. He suc-ceded Pope Melchiades Jan. 31, 314, and concurred with the emperor Constantine in convening the council of Nice. (See Nice, COUNCILS OF.) He is frequently mentioned in his-tory in connection with the "donation" said in the false decretals to have been made to him by Constantine of Rome and its tempo-ralities. His feast is held on Dec. 31. II. Sylvester II., Gerbert, born at Aurillac in Au-vergne about 929, died in Rome, May 12, 1003. He was a Benedictine monk of St. Gérald, Auvergne, studied under Hatto, archbishop of Vich in Catalonia, and at Rheims, and opened in that city a university course under the patronage of the emperor Otho II., which became famous throughout Europe. He constructed
SYLVIUS

SYMBOLS

terrestrial and celestial globes to illustrate his lessons, and a steam organ to explain his lessons on music; and he is said to have introduced the use of the Arabic figures in arithmetic, and to have invented the first wheel and weight clock. He was subsequently appointed abbot of Bobbio by Otho II.; but being unable to agree with the monks, he returned to Rheims after the death of Otho, resumed his teaching, and became secretary to Archbishop Adalberon of Rheims, and his successor through a contested election. He was deposed by Pope John XVI., and fled to the court of Otho III., who made him archbishop of Ravenna and had him elected pope, April 2, 999. He displayed uncommon zeal, talent, and severity in his administration. His universal knowledge caused him to pass for a magician. His letters, numbering 149, were published by Papire Masson (4to, Paris, 1821), and by André Duchesne in vol. ii. of his *His- toria Francorum Scriptores*. His complete works are published in vol. xxxix. of Migne's *Patrologie latine*.—See Bovius, *Silvester II.* (4to, Rome, 1829); Hock, *Gerbert, oder Paulus Sylvester II. und sein Jahrhundert* (Vienna, 1877, French edition, 1878); and Milman, "Lat- in Christianity," vol. iii.

SYLVIUS, *Jacobus*, the Latinized name of a French anatomist, *Jacques de Bois*, born at Louville, near Amiens, in 1478, died in Paris, Jan. 13, 1555. He graduated as A. B. in 1531, delivered lectures, and was appointed professor of medicine in the royal college of France in 1550. He is said to have originated the practice of injecting the blood vessels to facilitate their dissection. The oblique fissure separating the anterior and middle lobes of the cerebrum is called from him the fissure of Sylvius.

SYMBOLS, *Chemical*, abbreviations of the chemical names of the elements, which are combined into formulas, with or without quantitative signs, to represent the composition of compound bodies. The idea of representing the names of chemical substances by conventional signs or abbreviations appears to be a very old one. The alchemists were in possession of a set of hieroglyphics by which the metals and the four so-called elements, fire, air, earth, and water, and indeed many other substances, were designated. At a later period, as chemical knowledge became more consolidated, various modifications of the alchemistical not- ition were from time to time proposed, and adopted to a greater or less extent. Among these should be specially mentioned the system of notation offered in 1787 by Hassenfratz and Adet, as an appendix to Guyton de Morveau's revised system of nomenclature, since its failure enables us the better to ap- preciate the peculiar excellence of the system which now prevails. Here was a system of symbols by no means devoid of ingenuity, and much more complete than any previous meth- od, published in connection with a new sys-
a compound. Thus \( 3\text{H} \) signifies three atoms of hydrogen, and \( 3\text{H}_2\text{O} \) three molecules of water, one molecule of water being composed of two atoms of hydrogen and one of oxygen. The prefixed numeral however only includes those symbols which are not separated by a \(+\) sign or a comma, or which are included in parentheses; as \( 2\text{KCl}, \text{PtCl}_4 \), which is the formula of potassic-platinic chloride, and which contains two molecules of chloride of potassium united to one molecule of tetrachloride of platinum. Two molecules of potassic-platinic chloride would be written \( 2(2\text{KCl}, \text{PtCl}_4) \). A numeral placed at the right of a symbol and a little below (or sometimes above) multiplies that symbol only. Thus, the formula of sulphuric acid, \( \text{H}_2\text{SO}_4 \), signifies that it contains two atoms of hydrogen, four of oxygen, and one of sulphur. A numeral placed in the same position with regard to any number of symbols placed in parentheses has the same function. Thus \( (\text{K}_2\text{NH})\text{CO}_3 \), which is the formula of normal ammonic carbonate, indicates that two molecules of the compound basyle ammonium, \( \text{H}_2\text{N} \), are united to one molecule of the oxion \( \text{CO}_3 \), or carbonic. A capital letter with a dash above it is often used to stand for a compound instead of an element, as \( \alpha \) for acetic acid, \( \text{C}_2\text{H}_4\text{O}_2 \); \( \beta \) for oxalic acid, \( \text{C}_2\text{H}_4\text{O}_4 \). Other symbols and abbreviations are also given in the article Aromatic Theory.

SYME, James, a Scottish surgeon, born in Edinburgh in 1790, died there, June 26, 1870. He received his diploma as surgeon in 1821, and in 1823 became a fellow of the royal college of Edinburgh, and in 1843 of the English college of surgeons. From 1821 to 1833 he lectured on surgery, and in 1833 was appointed to the chair of clinical surgery at Edinburgh. He originated or aided in establishing many improvements, including the resection of diseased joints in place of amputation (a practice already introduced by Roux in 1812), the process for amputation of the foot at the ankle joint (known as "Syme's operation"), and the removal of large tumors of the lower jaw by excision of the entire bone. His works include "The Excision of Diseased Joints" (1831), and "Principles of Surgery" (1832), both republished in Philadelphia (1866).—See "Memorial of the Life of James Syme," by Robert Paterson, M. D. (Edinburgh, 1871).

SYMMACHUS, Cellius, a pope and saint, born at Sinagia in Sardinia about 440, died in Rome, July 18, 514. He was appointed archdeacon of the Roman church by Pope Felix III., and was elected to succeed Anastasius II., Nov. 25, 498. A strong minority of Enutychians, headed by the patrician Festus and favored by the Greek emperor Anastasius I., elected at the same time the archpriest Laurentius, who had consented to sign the Henoticon of the emperor Zeno. The claims of the two parties were referred to the arbitration of Theodoric, king of Italy, who decided in favor of Symmachus, Laurentius being appointed bishop of Nocera.

A council held in Rome in March, 499, having enacted decrees against all bribery and intrigue in papal elections, the opposition was renewed, and Laurentius secretly returned to Rome. Symmachus was accused of peculation and adultery, and Rome became the scene of rioting and bloodshed. A council of all the Italian bishops was convened at Rome in 503, and Theodoric hastened thither to secure tranquillity. The pope was unanimously acquitted of the charges brought against him. In France the bishops declined to acknowledge the competency of a local synod to sit in judgment on their superior, and a third council met in Rome in 503, to which the emperor Anastasius (whom Symmachus had excommunicated) sent representatives, who accused the pope of Manichaeism and of promoting sedition. Symmachus, through his legate Ennodius, declared that he had freely submitted to the judgment of the former bishops, proved that he had combated Manichaeism, and promised to restore the emperor to his communion as soon as the latter ceased to protect Eutychianism. With the council ended the schism in Rome, but Anastasius persecuted all who sustained Symmachus. The latter published a treatise in which he refuted the charges against his doctrine and morality. His feast is held on July 19.

SYMMACHUS, Quintus Aurelius, a Roman author of the 4th century A. D. He was educated in Gaul, and, after being quaeestor and praetor, was appointed in A. D. 365 corrector of Lucania and the Bruttii. In 372 he was proconsul of Africa, in 384 prefect of Rome, and in 391 censuer. He was a sincere pagan, and labored to maintain his faith. His extant works are 10 books of epistles containing 965 letters, and fragments of orations which Angelo Mai discovered in one of the palimpsests of the Ambrosian library, and others from a Turin and Vatican manuscript. The first edition of the epistles was published in the pontificate of Julius II. One of the best is that of Sciccius (4to, Mentz, 1608).

SYMMES, John Cleves, an American soldier, born in New Jersey about 1750, died at Hamilton, Butler co., Ohio, May 28, 1829. He entered the army as ensign in 1802, fought in the war of 1812, settled at Newport, Ky., and wrote and lectured on his theory that the earth is hollow, open at the poles, and capable of being inhabited within. He published "Theory of Concentric Spheres" (12mo, Cincinnati, 1829). For an abstract of Symmes's theory and arguments, see the "Atlantic Monthly" for April, 1873.

SYMPHONY (Gr. συν, with, and φων, voice), a term originally signifying merely a concordance of tones, but applied successively to certain vocal compositions, to compositions partly vocal and partly instrumental, to short introductory or intermediate instrumental passages in compositions which are predominantly vocal, and finally to elaborate and extended com-
positions for instruments only and in the sonata form. In this sense the word is now generally used. The germ of the modern symphony may be found in the suites prefixed by Scarlatti to his operas, which he designated as the symphony, consisting of three movements: 1, allegro; 2, andante; 3, allegro. But it was not till the time of Haydn, called the father of the symphony, that this kind of composition took its present form. He added a fourth movement, the minueto, and elaborated the whole structure of the symphony. He composed 118 works of this kind. The form that Haydn fixed upon was adopted by Mozart and Beethoven, the latter especially giving a breadth, dignity, and grandeur to his symphonies that have made them the masterpieces of this form of musical art. In the final movement of his ninth or choral symphony he introduced vocal music, an example which has not been followed by later composers. Mendelssohn, Gade, Reinecke, Liszt, and Raff are among the more modern composers of works of this class.

SYMPLEGADIES. See Argonauts.

SYNAGOGUE (Gr. συναγωγή, assembly, place of assembly; Heb. בת הַסְּכֵנֶסֶת, house of assembly), a building set apart for worship and the performance of public religious rites in Jewish congregations. Corresponding to the word church in Christian terminology, the term is also applied to the Jewish community in general. The earliest synagogues, established in the times of Persian and Greek rule in Judea, were also for deliberative purposes. (For the "great synagogues" or assembly see Hebrews, vol. viii., p. 591.) In subsequent centuries they were also used as seats of popular as well as higher instruction. In modern Jewish communities this is mostly imparted in a separate building, called גַּם מִדְרֵשׁ (hagged). The synagogue generally a high building, facing the four cardinal points, and provided with seats and desks on the floor for the male members of the congregation, and with galleries for the females. The east wall, which all must face during the recital of certain prayers, encloses the "holy ark," אַרְון הַסְּכֵנֶסֶת (aron hakkedesh), in which Hebrew copies of the Pentateuch, written on vellum, are deposited; and opposite it, near the centre, is the platform בִּנְאָה (binah) on which the reading from the same is performed by the reciter or cantorḥasan, or by a special reader וֹאָרְקְר (korah). Sermons or lectures are delivered from a smaller platform adjoining the "holy ark," יִשְׁרְבַּר הָאָרְקָה (shabbat har ake), by the rabbi or a special preacher or lecturer. The offices of reciter, reader, and lecturer are often united in the same person. Of late the use of the choir has become frequent, and the internal arrangements of the synagogues have been more and more assimilated to those of Christian churches.

SYNESIUS, a philosopher of the fifth century, born in Cyrene, Africa, about 379, died at Ptolemais about 450. He was of an ancient Greek family, studied at Alexandria under Hypatia, and at Athens, and on his return to Cyrene devoted himself to literary pursuits. Famine having come upon Cyrene about 397, Synesius was sent to Constantinople to solicit aid, and was successful. After three years’ stay in the Byzantine capital, he returned to Cyrene, and soon afterward, under the influence of a Christian wife, renounced paganism. In 410, on the death of the bishop of Ptolemais (now Tolmesta in Barea), Synesius was chosen to the see, although he had not been baptized, was married, and held opinions not regarded in the church as orthodox. He accepted the post with reluctance, was baptized, and after seven months of preparation entered upon his episcopal duties. He was a Neo-Platonist before he became a Christian, and during his episcopate explained Christian dogmas in the light of his philosophy, inclined to the preexistence of the human soul, believed in its immortality, held the resurrection to be a myth, and conceived the Trinity as a triple-headed energy displaying the innate nature of the "unity of unities." His works consist of epistles, treatises, and hymns. The best complete collection of them is that of Petrucci, in Greek with a Latin translation, editions of which appeared at Paris in 1612, 1639, and 1640. A new and more critical edition was published by Krabinger (2 vols. 8vo, Berlin, 1851). Many editions of the hymns have been published with translations into various tongues. A French version first appeared in 1581, and new ones in 1836 and 1839. See also Migne’s Patrologie grecoque, vol. lxvi.; and Kolbe, Der Bischof Synesius von Cyrene (Berlin, 1870).

SYPHAX, a Numidian prince, born about 250 B.C., died in 201. In 213 he was king of the Massesylans, the westernmost tribe of the Numidians, and was at war with Carthage, in which he was encouraged by the Romans. Carthage, however, induced Gala, king of the Massesylans, to declare war against him, and Syphax was defeated by Hasdrubal and Gala's son Masinissa. Syphax fled to Mauritania and collected a new force, but was again defeated by Masinissa. He subsequently regained possession of his throne, and Hasdrubal, to prevent his yielding to the overtures of Scipio for an alliance, gave him his daughter Sophonisba in marriage. On the death of Gala, Syphax with Carthaginian aid wrested the throne from Masinissa, and made him a fugitive. When Syphax landed in Africa in 204, Syphax joined the Carthaginians with an army of 60,000 foot and 10,000 horse. He encamped in the vicinity of the Romans, and during the siege of Utica held prolonged negotiations with Scipio; but the latter suddenly fell upon his camp in the night, set fire to its straw huts, and nearly destroyed his army. Syphax raised two more armies, but both were defeated, and he was finally made a prisoner and sent to Rome. According to Polybius, he appeared in Scipio's triumphal procession; but according to Livy, he died at Tibur a few days before.
SYPHON

SYPHON, an inverted U-shaped tube used to draw liquids over the containing walls of reservoirs. It acts upon the principle that the flow will be in the direction of that leg which contains the greatest vertical height of liquid. The instrument will act only when the bend at the top is not higher above the level of the water in the reservoir than the atmospheric pressure at the locality is capable of sustaining a column of the liquid acted upon, which for water could only be a little over 33 ft. at the sea level, and at a height of 15,700 ft. less than 20 ft. (See PUMP, vol. xiv., p. 82.) If the liquid is mercury, the bend of the syphon could not be more than 29 or 30 in. above the level in the reservoir at the sea level. In practice the outer or discharge leg is usually longer than the one immersed in the liquid; but the only requirement is that its orifice shall be lower than the level of the liquid. It is convenient to have a suction pipe attached to the outer leg for producing exhaustion, the lower orifice in that leg being closed at the time.

SYRA, or SYROS. I. A Greeck island, included in the Cyclades, 20 m. N. W. of Paros; area, 45 sq. m.; pop. in 1870, 26,480. It is of very irregular outline, with steep and rugged coasts. The chief productions are wheat, barley, cotton, figs, silk, and especially wine, whose praises have been sung by Homer. II. SYRA, NEW SYROS, or HERMOPOLIS, the capital of the island and of the Greek nomarchy of the Cyclades, situated at the head of a bay on the E. coast, near the site of the ancient city; pop. in 1870, 20,996. It is the seat of a Roman Catholic bishop, and of the Greek bishop of the Cyclades. It is the principal commercial port of Greece and an important station for steamers. The imports in 1873 amounted to £791,500, and the exports to £172,337. The old part of the town, originally built on a hill as a protection against pirates, is inhabited chiefly by Roman Catholics, and the lower part by Greeks. At the close of the Cretan war in 1869, the port was blockaded by Hobart Pasha.

SYRACUSE (It. Siracusa or Siragosa). I. A province of Sicily, on the E. coast, bordering on Catania and Catanisetta, and the Mediterranean; area, 1,429 sq. m.; pop. in 1872, 294,885. It is chiefly mountainous, but the south is a plain. The principal rivers are the Anapo, Abissos, and Ragusa. These valleys of these rivers, the bases of the mountains, and the districts along the coast are very fertile, and contain excellent pastures and some good timber. Agriculture and cattle raising are the chief occupations. The principal products are grain, barley, olives, wines, fruit, flax, and hemp. Among the mineral products are marble, agates, stalactites of various colors, and bitumen. The province is divided into the districts of Syracuse, Noto, and Modica. II. A city (anc. Syracusae), capital of the province, on the E. coast, 30 m. S. S. E. of Catania, and 81 m. S. by W. of Messina; pop. in 1872, 22,179. It is fortified, and maintains a garrison, but is commanded by the heights of Acharadina. It is the seat of a bishop, and has a fine cathedral, partly on the site and partly composed of the ancient temple of Minerva, numerous palaces, and several churches and convents. The streets are narrow, and there are extensive ruins of amphitheatres, baths, &c. The city has some trade in wine, oil, brandy, fruits, salt, saltpetre, sulphur, and a little grain. The ancient Syracuse was the largest city of Sicily; its walls, flanked by towers, were about 22 m. in circuit, and the number of inhabitants in its most prosperous period is stated by different writers at 500,000, 900,000, and even 1,200,000. It really consisted of five towns adjoining each, other, but separated by walls, viz., Ortygia, Acharadina, Tyche, Neapolis, and the Epipolae, and hence was sometimes called Pentapolis. The original city was Ortygia, on an oblong island about 2 m. in circuit, between the Greek and Greek harbor on the west and the Little harbor on the east; after a time it was connected with the mainland by a causeway, and was then spoken of as Ortygia on the peninsula. Acharadina, which was next in age, was on the other side of the Little harbor, and extended along the sea coast for about 3 m., E. of the port of Troglia, without the limits of the city; it was built partly on the lowlands along the shore, and partly on the heights which rise in a wall of rocks some little distance inland. N. W. of Acharadina and on the same range of heights stood Tyche, separated from it only by a double wall and a highway between; it extended northward about 2 m., and at its W. extremity were several heights named the Epipolae, which were enclosed by Dionysius the Elder and formed one vast fortress. S. of Tyche, and opposite Ortygia, on the lowlands and extending to the wall of Acharadina, at the foot of the heights, was Neapolis or the new town. W. and S. of Ortygia, around the marshy shores of the great harbor as far as the rocky peninsula of Pleurymia, were suburbs and gardens. After the Roman conquest, as the city declined in wealth and population, its limits became more restricted; at the time of Augustus it occupied only Ortygia and the lower part of Acharadina, and since its capture by the Saracens it has been confined to the Ortygian peninsula. The heights of Acharadina now present only a surface of rock, the ancient buildings and the soil having been alike removed. The sea has undermined the shore, the walls have disappeared, and over the elevated and extensive plain only steps hewn in the rock or a few courses of stone give evidence of the vast population which once inhabited it. On the peninsula and the lowland portion of Acharadina and Neapolis, evidences of the former greatness of Syracuse are more abundant. Near the borders of Tyche, Acharadina, and Neapolis is the ancient theatre hewn out of the rock and now much overgrown with bushes; it is 440
ft. in diameter, contained 60 ranges of seats, all cut in the rock, and could accommodate 24,000 spectators. Not far from this are the ruins of an amphitheatre of the Roman period. Nearer to Ortygia are the ruins of the palace of Agathocles, and on the peninsula are traces of several other palaces. The lautumia or latomia, originally quarries cut in the wall of rocks which formed the face of the heights of Achradina, and excavated to the depth of 60 to 80 ft., are still perfect. Some of them were used as prisons; in one the Athenian prisoners were confined on the surrender of Nicias, and most of them perished. Near the site of the ancient theatre, on one side of the quarry, is that remarkable prison cut in the rock, now called the "ear of Dionysius." There are also catacombs of great extent containing subterranean streets of tombs, in which Greek and Roman, Christian and Saracen, have all found burial. The remains of a great aqueduct begun by Gelon and improved by Hiero also exist. Near the left bank of the Anapo, outside the walls and S. W. of the city, are the ruins of the temple of Jupiter Olympius. The celebrated fountain of Arethusa, long in a ruinous condition and used by washerwomen, has been repaired and beautified by the city authorities; a wall separates it from the sea. There are also remains of several baths, one of them with a spiral staircase. In the museum of the modern city are preserved statues, vases, coins, and inscriptions gathered from the ruins.—Syracuse was founded by the Corinthians, under Archias, about 734 B. C. Within 70 years it began to send out colonies, among which were Acrae (664), Casmena (about 644), and Camarina (599). In 486 an oligarchy called the Geomori, or Gamori, who had usurped the government, were overthrown. They withdrew to Casmena, but Gelon, despot of Gela, restored them to power, reserving for himself the supreme government. (See Gelon.) Hiero, his successor (about 478), was a patron of literature and the arts. His brother Thrasybulus succeeded him in 467, but his tyranny soon caused his expulsion, and a popular government was instituted. (See Hiero.) In 415 the Athenians formed a league against Syracuse, and besieged it the following year. The Spartans came to the aid of the Syracusans, and in September, 413, a great naval battle was fought, in which the Athenians, under Nicias and Demosthenes, were defeated, their ships destroyed, about 30,000 men killed, and 10,000 made prisoners. In 405 Dionysius the Elder, taking advantage of the popular alarm at the aggressions of the Carthaginians, made himself despot of the city, concluded a peace with Carthage, and ruled vigorously but tyrannically for 18 years. He fortified the town, and in 397 commenced war against the Carthaginians, and defeated them. Twelve years later he had extended his dominion over the greater part of Sicily and a part of Magna Graecia. He was succeeded in 367 by his son Dionysius the Younger, whose tyranny and debauchery brought about his expulsion by Dion in 357; he regained his power in 346, but was finally expelled by Timoleon in 343. (See Dionysius.) The restoration of liberty to Syracuse by the latter was followed by unexampled though brief prosperity; and 26 years later Agathocles acquired despotic power over the city, and used it for 28 years to plunge her in new and destructive wars. (See Agathocles.) After his death (289) a short respite was had, but soon new tyrants assumed the sway, till in 270 Hiero II. obtained supreme power, and maintained a firm
SYRACUSE

and judicious administration for 54 years. In 293 he made a treaty with Rome, whose steadfast ally he thenceforward became. During his reign Syracuse attained to its highest splendor. With his death (216) a great change took place. His grandson and successor Hieronymus abandoned the alliance of Rome for that of Carthage, and after his death the Carthaginians brought about an open rupture with Rome, which led to the siege of Syracuse by Marcellus (214-212), a siege rendered illustrious by the patriotic efforts of Archimedes, but which finally resulted in the capture and plunder of the city. The magnificent works of art then carried as plunder to Rome gave the first impulse to the love of Greek art among the Romans. Syracuse fell into decay, and lost in wealth and population. Augustus in vain endeavored in 21 B. C. to restore it by sending a Roman colony. In the 4th century A. D., though much decayed, it was still one of the largest cities of Sicily. It was filled into the hands of the Goths at the overthrow of the western empire, but was recaptured by Belisarius in 553, and remained a fief of the Byzantine emperors till 787, when, after a siege of nine months, it fell into the hands of the Normans, who massacred its inhabitants, destroyed its fortifications, and burned the city. In 1088 Count Roger of Sicily made himself master of Syracuse. It was partially rebuilt and fortified by Charles V., but in 1542, 1693, and 1757 it was nearly destroyed by earthquakes. On April 8, 1849, during the Sicilian insurrection, it surrendered to the Neapolitan fleet, and in 1860 it espoused the cause of Garibaldi.

SYRACUSE a city and the county seat of Onondaga co., New York; at the head of Onondaga lake, on a creek of the same name, 147
\text{m.} by the New York Central railroad W, by N. of Albany and 1604 m. E. of Buffalo; Int. 43° 3' N., lon. 76° 9' W.; pop. in 1850, 22,271; in 1860, 28,119; in 1870, 45,051, of whom 18,990 were foreigners, including 5,069 Germans and 5,172 Irish; in 1875, 49,808. The main portion lies in the valley of the creek, while the E. part is on two ridges, the summits being about 200 ft. above the lake. It is very regularly laid out; but few of the streets are less than 60 ft. wide, and many of them 90 ft., well shaded, with occasional small ornamented squares. The business portion is substantially built of brick; but the great majority of the dwellings are of wood, surrounded with lawns and gardens. The court house, of Onondaga dressed limestone, besides the usual court rooms, contains the library of the court of appeals (6,000 volumes); it cost $40,000. The city hall is of brick, on the N. side of a little park. The state armory, on Armory park (about two acres), is of brick, covers an area of 35,000 sq. ft., and cost $85,000. The Onondaga County savings bank is a fine building of Onondaga limestone in the renaissance style, costing $300,000. The Syracuse savings bank, in course of construction, is of Ohio buff sand-

stone with trimmings of New Jersey red sandstone. The first Presbyterian church, the costliest in the city, is of Fulton brown stone in the middle Gothic style, with a lofty spire. Syracuse university is on an elevation in the S. E. part of the city, with diversified grounds comprising 50 acres. The building is of rough dressed limestone aslar, with fine cut trimmings in the Italian style, is 80 ft. by 180, and three stories above the basement. On a beautiful elevation just W. of the corporate limits of the city stands the New York state asylum for idiots, an elegant structure in the Italian style erected in 1855. (See Insuy, vol. ix., p. 174.) The principal cemetery is Oakwood, comprising about 150 acres, in a fine natural situation in the S. E. quarter of the city. It has been handsomely laid out, and contains many fine monuments.—Syracuse is an important railroad centre; 38 passenger and 60 freight trains arrive and depart daily. The diverging lines are as follows: the Oswego and Syracuse; Syracuse, Phoenix, and Oswego; Syracuse and Northern; New York Central; Syracuse and Chenango; Syracuse, Binghamton, and New York; and the Auburn branch of the New York Central. The Erie canal passes through the city, and the Oswego canal runs N. from near the centre. In 1874, 110,000 tons of freight, exclusive of wood and lumber, cleared at the collector's office. The controlling interest has always been the manufacture of salt. The springs were first visited by Jesuit missionaries in 1654, who made some salt and carried it to Quebec. From this time to the settlement of the whites in 1787 it was manufactured by the Indians and was an article of traffic. The manufacture has steadily increased since the settlement. In 1797 the state took control of the springs and passed laws for the regulation of the business. From 1797 to 1806 inclusive, 78,000 bushels were made; 1807 to 1816, 267,000; 1817 to 1826, 608,000; 1827 to 1836, 1,594,000; 1837 to 1846, 3,058,000; 1847 to 1856, 5,083,000. In 1874, 6,029,300 bushels were manufactured on the reservation, mostly in the city. There are 20 salt companies, which manufacture both by solar and artificial heat, employing a vast amount of capital and hundreds of men. There are about 90 other manufactories, producing articles in 1874 to the value of about $14,000,000. The most important are a blast furnace, Bessemer steel works, two rolling mills, three engine and boiler works, five founderies and machine shops, a bolt and nut factory, a manufactory of mower and reaper knives, a railroad journal-box factory, seven planing mills and saw, door, and blind factories, two fruit-canning establishments, an extension table factory, five manufactories of musical instruments (organ pipes, &c.), one of picture frames, one of glass, two of matches, one of agricultural implements, one of mowers and reapers, three of saddlery hardware, three of boots and shoes, seven of ready-made clothing, many of cigars, two of
its was made by Ephraim Webster, an Indian trader, near the mouth of Onondaga creek, in 1785. In 1789 Asa Denny's grist mill, located in that part now known as the first ward, then called Salt point, and began the manufacture of salt. It soon took the name of Salina, and became the most important place in the county. The first settlement in the central portion of the city was made in 1797. It increased slowly, and assumed successively the names of Bogardus Corners, Milan, South Salina, Cossitt's Corners, Corinth, and Syracuse (in 1824). It was incorporated as a village in 1825. The Erie canal having been completed in that year, the rival villages of Salina and Syracuse rapidly increased in population, and in 1847 were consolidated in the city of Syracuse.

SYRIA (Turk. Suriistan; Arab. Esh-Sham), a territory of Asiatic Turkey, bounded N. by Adana and Marash, E. by the Euphrates and the Syro-Arabian desert, S. by Arabia, and W. by the Mediterranean, between lat. 31° and 37° 20' N., and lon. 34° and about 40° E.; area, about 60,000 sq. m.; pop. about 1,000,000. It includes parts of the vilayets of Syria (capital Damascus; area, inclusive of a part of the desert, 66,000 sq. m.; pop. in 1871, 518,750) and Aleppo, the latter including Marash and some districts E. of the Euphrates (area, 40,750 sq. m.; pop. 532,714). Besides the large gulf of Iskanderun (the ancient gulf of Issus), at the extreme north, which extends between Syria and Asia Minor, the coast is indented by several small bays, as those of Tripoli, Beyrut, Saida, and Acre. The principal rivers are the Jordan, the Asi or Assy (the ancient Orontes), the Litany (Leontes), the Yarmuk (Hieromax), the Barada (supposed to be the Scriptural Abana), and the Awaj (Pharpar). The Euphrates drains the N. E. border. The only important lakes are the Dead sea and the lake of Tiberias or Gennesaret. The Taurus range forms a part of the N. boundary, and separates Syria from Asia Minor. The two parallel chains which extend from Adana, from N. to S., the Libanus or Lebanon and the Anti-Libanus, are offsets of the S. W. continuation of that range known to the ancients as the Amanus (now Alma Dagh). The W. or Lebanon chain runs parallel to the coast, and seldom more than 12 m. distant from it, to the plain of Edraelon below Mt. Tabor; it is broken by the passage of the Orontes and the Leontes. Its highest summits are 10,000 ft. above the sea. This chain contains the remnant of the ancient "cedars of Lebanon." Separated from this by a beautiful and fertile valley, Celia-Syria, from 10 to 20 m. in width, is the Anti-Libanus chain, a narrow tongue, though in its loftiest summit, Mt. Hermon, rivalling the highest peaks of the Lebanon range. E. of Hermon a chain of low mountains stretches eastward past Damascus; below it the country is hilly, and, viewed from the deep depression of the Jordan valley, seems mountainous. The mountains of Gilead E. of
the Jordan form the culminating point of these hills. Further E., in the Hauran, is a lofty table land, waterless, and with vast black bowlders and rocks scattered over its face. The most remarkable feature of the topography of Syria is the extraordinary depression of the valley of the Jordan. The valley of Cæle-Syria (now El-Bukaa), between the Libanus and the Anti-Libanus, is about 2,500 ft. above the sea; it formerly contained Helopolis or Baalbek, and other great cities. Near its southern termination it divides into two branches, one cutting through the Lebanon range in the narrow gorge through which the Leontes finds its way to the sea, the other striking off southward and descending rapidly for 15 m. to the source of the Jordan at the base of Hermon. The continuation of the latter, the valley of the Jordan, descending with a steady but rapid slope, at the plain of Huleh is at the sea level; at the lake of Tiberias it is about 650 ft. below it; and within 60 m. of direct distance, though by the circuitous channel of the river 200 m., at the Dead sea, it is about 1,300 ft. below the Mediterranean. No similar river valley is known. Among the level tracts of Syria are the great plain of Edraelon, that of Sharon, and the arid sandy plain of Gaza. Around Damascus, an oasis in the desert, vast plains of sand extend E. and S., and cover the region that contains the ruins of Palmyra.—The geology of Syria is interesting. In the extreme south are only primitive rocks, the variegated granite of the Sinai peninsula; the deep chasm of the Dead sea, with its bitumen pits, salt mountains, and warm springs, belongs to the carboniferous era; the calcareous and sandstone formations of Hermon and Lebanon abound in fossils of the era of the new red sandstone; and the porphyry and basalt of the Hauran give evidence of their igneous origin. The soil is exceedingly fertile wherever there are sufficient rains, or irrigation can be practised; but where there is no water, it is sandy and utterly barren. The region around the Dead sea is thoroughly impregnated with salt and alkalies, and is entirely devoid of vegetation. In the south and east there are vast sandy wastes. The mineral productions of Syria are iron of excellent quality, a little quicksilver and some coal in the south, and in the Dead sea region salt and bitumen. Good salt is also made on the shores of the Mediterranean.—There are few countries of the same extent in which the climate is so varied as in Syria. On the slopes of Lebanon it is cool and pleasant in the summer months, and in the winter heavy rains fall, but the cold is not severe. In the valley of the Jordan the summer heat is equal to that of the hottest portion of the tropics, and on the coast the summers are also very hot and unhealthful. In winter Beyrout and some of the other cities of the coast are favorable for invalids. In Jerusalem the heat is oppressive during the day in summer; rain seldom falls between the end of April and the beginning of October, and there are few clouds, and hence everything is parched till the rainy season. Damascus is colder in winter than the western slopes of Lebanon, and snow frequently falls; yet the orange and fig thrive there. The average range of heat in the hottest part of summer at Jerusalem and Damascus is from 84° to 86° F. In Aleppo the annual range is very great, the thermometer falling below zero in winter and rising above 100° in summer.—The implements and modes of agriculture are nearly identical with those in use 2,500 years ago. Still the crops, wherever there are rains or irrigation can be practised, are large. Wheat, barley, durra, and spelt are largely produced, as well as rice, lentils, peas, &c.; cotton, hemp, silk, madder, indigo, sesamum, castor oil, tobacco, potatoes, capsicum, melons, cucumbers, and artichokes are also important crops. Figs, olives, mulberries, grapes, almonds, apricots, peaches, pomegranates, oranges, lemons, dates, and other fruits abound. Vineyards are numerous on the mountain slopes and in the hill country of Judea; the grapes are large and luscious, and the wine made from them is excellent. Storax is produced for the market. In the vicinity of Damascus are extensive fields of roses, the petals of which furnish the attar of commerce. The sycamore, Indian fig, carob, mulberry, and pistachio trees grow abundantly, both wild and cultivated. Scammony and sumach are gathered about Mt. Lebanon for exportation. The cedar, pine, and fir are found in extensive forests on the mountains, though the true cedar of Lebanon, once so highly prized for building purposes, is nearly extinct. The arbutus, terebinth, laurel, and several species of juniper occur on the table lands, and also dwarf oaks which produce the best gall nuts. The domestic animals are horses, of which the wandering tribes possess breeds of extraordinary speed and beauty; cattle, generally small and inferior; asses and mules, large and very serviceable; sheep and goats of several kinds, the broad-tailed variety of the former being found only in N. Syria; camels throughout the country, and the domesticated buffalo on the coast and in the valley of the Orontes. Jackals, foxes, and hyenas are common in the desert mountains; the Syrian bear has his home in Mt. Lebanon; wolves and wild boars in the northern forests, and the latter also occasionally further S.; deer are also found in the north, and antelopes in the desert regions; and hares, porcupines, and jerboas are abundant. There are no poisonous serpents. Silkworms are reared extensively in the mountainous districts. Turtles and tortoises are found in considerable numbers. Fish are abundant in some of the inland lakes, though not plentiful along the coast of the Mediterranean. The manufactures are few and coarse. Beyrout is now the chief commercial city, and within 40 years its population has increased from 5,000 to 70,000.—
The inhabitants are of a great variety of races and religions. The ruling race are the Osmanli Turks, though they are but an insignificant portion of the Mohammedan population who are mostly Arabs; they are bigoted and hostile to Christians, and are strict in their adherence to the Sunna or orthodox Islamism. There are four sects usually considered Mohammedan dissenters, though not all of them can properly be reckoned as Mohammedans. The Metu-

als are the followers of Ali, the son-in-law of Mohammed, and are allied to the Shiias of Persia; they number about 30,000, and are found W. of the Orontes and on the S. part of the Lebanon range. The Ansaries or Nas- sarians, inhabiting the mountains extending from the N. extremity of Cæle-Syria to the gorges of the Orontes at Antioch, and numbering about 30,000, keep their religious views a secret. The Ismaelians, occupying the moun-

tains W. of Hamah, are few, and were originally Shiias; they are the descendants of the people known in the time of the crusades as Assassins. The fourth sect is the Druses, in the Lebanon and Anti-Libanus, numbering about 70,000, and the most fanatical of all. The largest of the nominally Christian sects is that of the Maronites, who are found chiefly in the Lebanon, though they have small communities in all the principal towns from Aleppo to Nazareth. Their number in 1874 was about 140,000. (See ANSARIES, ASSAS-

SINS, DRESSES, and MARONITES.) The orthodox Greeks (Greeks in religion, but not generally in blood), numbering about 150,000, are scattered throughout the cities and more level portions of Syria, and engage in agriculture and trade; they have their worship in their own language. There are dissenters also from the Greek church, the Syrians or Jacobites, a mere handful, dwelling mostly N. and N. E. of Damas-

cus. The Greek Catholic and Syrian Cath- olic churches acknowledge the pope, though in some particulars they approach more nearly to the Greek than the Roman church; they are about 50,000 in all, and embrace a large number of the more wealthy Christians in Syria. The Armenians are 50,000 or 60,000 in number. There are about 25,000 Jews in Syria; those in Palestine are immigrants from foreign countries, while those of Aleppo and Damascus are descendants of Jewish families who have resided there for many centuries. There are Mohammedan schools in the cities, and the Christian sects also maintain some schools. The children of the wealthy are fre- quently sent to France or England for education, but the great mass of the people are very illiterate. Of late years, however, great im- provements have been made in education by means of schools established by Greeks, Cath- oles, and especially by Protestant missionaries.

—The central part of Syria is designated in the Hebrew Scriptures as Aram Dammesek, or the Aram of which Damascus was the capital. The empire of the kings of Damascus gradually extended eastward over a part of the plain of Mesopotamia and westward to the mouth of the Euphrates, and was finally overthrown by the Assyrians under Tiglath-pileser, about 740 B. C. From the head waters of the Orontes southward, all of Palestine W. of the Jordan, and probably Gilead and the Hauran E. of it, were peopled by the Canaanites. The Phenicians settled mainly along the coast of the Mediterranean, and became the earliest commercial nation of the world. Sidon, their first metropolis, is said by tradition to have been founded by Sidon, the oldest son of Ham; and colonies from it went forth to Tyre and Arvad (Aradus), and thence to all portions of the Mediterranean and beyond. Phos- nicia attained its greatest power about 1050 B. C., and it enjoyed uninterrupted prosperity for full 300 years, but was at last conquered by the Assyrians, and subsequently by the Babylonians and Persians. The southern parts of western and portions of eastern Palestine were inhabited by a tall race, the Anakim and Rephaim, traces of whose cities yet remain in the Hauran. The S. W. coast was occupied by the Philistines, and the region adjoining the Dead sea to the east by the Semitic Ammon- nites and Moabites. (See PALESTINE.) The equally Semitic Israelites emigrated from Egypt to Palestine about 1500, or according to some authorities about 1300 B. C., and thencefor- ward for about 1,500 years exerted a powerful influence in its history. (See HEBREWS.) The theocracy under which they existed for several centuries was terminated by the election of Saul as king early in the 11th century B. C., and the kingdom was divided (about 975) in the reign of Rehoboam, the grandson of his successor David. The ten tribes, or Israel as they were distinctively termed, were conquered and carried into captivity by the Assyrians in 721, and their place was supplied by colonists from Babylonia, Hamath, and elsewhere, who became the Samaritans of a subsequent era, and a few families of whom still exist on their ancient site. The kingdom of Judah fell be- fore Nebuchadnezzar 133 years later, but after a 70 years' captivity the people were restored to their own land, and the second temple was built. Syria from this period, until Grecian power became paramount there, was governed by a Persian satrap resident at Damascus. The battle of Issus, in 333, led to the subje- cction of Syria proper, Phoenicia, and Palestine to Alexander the Great. On his death, and after a long struggle of succession on the par- tition of his empire, the Ptolemies in Egypt received Palestine and Cæle-Syria, and Seleuc- dium Nisibin and Syria. He founded Antioch, near the mouth of the Orontes, and made it his capital; and for several centuries it was the greatest of oriental cities. The kingdom of Syria continued flourishing un- der the Seleucidae till the beginning of the 2d century B. C. Antiochus the Great wrested Palestine and Cæle-Syria from Egypt. The
revolt of the Jews under the Asmonean family against Antiochus Epiphanes, after a struggle of 28 years, ended in their independence (142). (See ANTIOCHUS, DEMETRIUS SOMER, HEBREWS, and Seleucus.) About 63 B.C. Syria became a Roman province, and subsequently was divided into several provinces; the Herodian family ruled over Judea and some adjoining districts, while northern Syria and the coast were under Roman proconsuls. After the destruction of Jerusalem by Titus (A.D. 70), the whole of Syria, including Judea, was ruled by a Roman prefect, and Antioch was the capital. It continued under the Roman and Byzantine empires till its conquest by Chosroes II in the beginning of the 7th century, followed by that of the Mohammedans in 632-3. In 654 Damascus again became the capital of Syria, and in 661 of the great Mohammedan empire. The capital was removed to Cufah in 750, and afterward to Bagdad, and Syria thenceforth became only a province of the empire of the caliphs. About the middle of the 10th century the rival Mohammedan dynasties of the Fatimites in Egypt conquered it, and in the latter part of the 11th the Seljuk Turks made it a part of their empire. The cruelties perpetrated by these fanatics on Christian pilgrims visiting the Holy Land led to the crusades. Jerusalem was taken by assault (1099), and the whole of Syria except Damascus and a part of Mesopotamia conquered by the Christian princes, and divided into principalities. Godfrey was chosen ruler of Jerusalem, Bohemond reigned at Antioch, Baldwin at Edessa, and the count of Toulouse at Tripoli. Their rule was of short duration; after repeated attacks by Nurreddin and his successors, it was overthrown by Saladin in 1187. The crusades, which followed resulted only in their remaining for a few points, in the temporary acquisition of Jerusalem by treaty in 1229, and the final occupation of the whole country by the Mamelukes in 1291. (See Egypt.) For a long period the country was the prey of the two contending Tartar powers, Tamerlane and his successors and the Mameluke sovereigns of Egypt. In 1517 it was conquered by Sultan Selim I., and from that time to our own it has formed a part of the Ottoman empire. In 1832 Ibrahim Pasha conquered Syria for his father Mehemet Ali, pasha of Egypt; but in 1841, after the armed intervention of England and her allies, it was restored to the sultan. In the summer of 1860 an insurrection occurred on the part of the Mohammedans at Damascus, in which many Christians were slain, the Dutch consul killed, and the American consul wounded. At the same time sanguinary disturbances, such as had frequently occurred before, broke out in Mt. Lebanon, between the Druses and Maronites, and a predatory conflict of several months' duration followed, in which nearly 150 villages were destroyed. France and England finally interfered, the outbreak was suppressed, and the prime movers were brought to punishment, but not until more than 15,000 men had been killed, and tens of thousands of people were homeless and destitute, and compelled to take refuge in the cities of the coast.

SYRIAC LANGUAGE AND LITERATURE. The Syriac language belongs to the northern branch of the Semitic family. (See SEMITIC RACE AND LANGUAGES.) It is an Aramaic dialect, which rose to a literary language under the name of Syriac in the Christian schools of northern Mesopotamia. In writing it various forms of character are used, all of them of kindred origin, and coming from the same source whence are derived the other Semitic alphabets. The oldest character is the Palmyrene, represented by sundry inscriptions dating from the time of Christ. Next in age is the Estranghelu alphabet, commonly employed by the Syrians till the 8th or 9th century. The common
modern Syriac alphabet is an adaptation of the Estranghelu to an easier and more rapid style of writing; it began to come into use in the 5th and 6th centuries, and by degrees crowded out its predecessor, which was at last employed only for headings and similar purposes. The Estranghelu is also the parent of the Cufic, from which the modern forms of the Arabic are derived. Finally, we have the Nestorian character, still in common use with modern Nestorian Christians; it is heavier and squarer than the last named, and less altered from their common mother, the Estranghelu. All the Syriac alphabets contain the same 22 characters with the Phonetic and the Hebrew.

The Syriac contains, many Greek and Latin words, chiefly nouns; it has also partly filled out the scanty structure of the Semitic verb with forms of periphrastic origin. Thus, besides the usual perfect and imperfect (or preterite and future), each of which is capable of standing for time past, present, or future, it has a distinctive present, formed by a participle and following pronoun; an imperfect, formed of a participle and the verb to be; a pluperfect, formed of the perfect (or preterite) and the verb to be; and even a future, with the adjective ready, about to. Of the Syriac conjugations, the verb has but three, each with its passive; the second and third are hardly distinguished in meaning, both expressing intensive or causative action. The dual number has entirely disappeared. The ancient Syriac was a vernacular dialect during the first centuries after Christ; after being raised to the rank of a cultivated literary language, it maintained itself as such, unaltered, throughout the whole period of growth of the Syriac literature; and it is still the sacred language of the scattered bodies of Christians in Asia representing the ancient Syriac church. It is no longer properly used, however, even by the better instructed among them. The vernacular dialect of the once powerful and active sect of Nestorians has been lately, by the efforts of the American missionaries at Urumiah, raised to the rank of a printed language, with a Christian literature, school and scientific books, periodicals, &c. (See Nestorians, and Perkins, Justin.)—The Syriac literature is Christian, composed under Greek influence and after Greek models; and besides the important part it has played as the intermediary between Greek and Moslem science and philosophy, it is a source of valuable historical information. The oldest Syriac work still existing is the translation of nearly the whole Bible, of unknown authorship, commonly called the Peshito; it is supposed to have been made not later than about A. D. 200. The earliest authors whose names, with fragments of their works, have come down to us, are a few years older; they are Bardesan and his son Harmonius. Besides philosophical works, they composed the first hymns in the language, and fixed its poetic style, giving it a properly metrical form, dependent on accent and number of syllables, with occasional rhyme; it was the first time that any Semitic dialect had been subjected to such rules. But the most prominent early Syriac author is St. Ephraem, or Ephraem Syrus, of the middle of the 4th century; with him begins the full career of the Syriac literature, which continued uninterruptedly until the 9th century. A great part of this literature has been lost, and what remains has as yet been but partially worked up and made accessible. It may be said to have done its principal work in the 6th and 9th centuries, in introducing classical learning to the knowledge of the Arabs. The grammatical study and culture of the Syriac began after the founding of the famous school of Edessa, long a chief centre of oriental learning, in the 5th century. The works of previous laborers in this field were effaced by those of Jacob of Edessa, of the 7th century, whose authority gave the classical and sacred dialect its final form. From his time the series of native grammarians and lexicographers is almost unbroken; of most note among the former are Elias of Nisibis (11th century), John Bar-Zugbi (beginning of the 19th century), and Bar-Hebraeus, known also as an Arabic author by the name of Abulfaraj (13th century); of the latter the most important are Bar-Ali and Bar-Bahlul, of the 9th and 10th centuries. Bar-Hebraeus, who is distinguished by both his Syriac and Arabic works, and in various departments of knowledge, is the last great name in Syriac literary history. The study of Syriac was introduced into Europe in the 15th century, and the names of Ambrosius, Widmanstäd, the two Ecclesellenses, and Assemani are prominent among its cultivators. The only comprehensive dictionary is that contained in Castell’s polyglot lexicon, and published separately by Michaelis (Gottingen, 1739). The best Latin grammar of Hoffmann (Halle, 1827), an English abridged translation has been published by Cowper (London, 1858); it has also been worked over and much extended and altered by Merx (1867). The German one of Uhlemann (Berlin, 2d ed., 1857) includes also a chrestomathy and glossary; this, too, has been reproduced in English in this country by E. Hutchinson (2d ed., New York, 1875). Among the other chrestomathies published, the most useful are those of Rodiger (Halle, 1838) and Kirsch, edited with a glossary by Berstein (Leipsic, 1892). A complete lexicon was begun by Bertholet, but interrupted by his death; his collections and Quatremére’s have since passed into the hands of Dean R. Payne Smith, who is now (1876) publishing a very full and learned dictionary. Besides Dean Smith, Cowper and Cureton are the best English cultivators of the study, and the latter especially has done great service by the publication of extracts from the precious collection of MSS. some time since acquired for the British museum from the convent of St.
SYRINGA

María Deípara in Egypt. A grammar of the dialect of Urumiah, by the Rev. D. T. Stoddard, was published in 1856 by the American oriental society. Nóldeke has produced a fuller and more learned one, founded on this and on the texts published by the missionaries, entitled Grammatik der neusyrischen Sprache (Leipzig, 1869). Dr. Adalbert Merx has published a Neusyrisches Lexicon: Texte im Dialekte von Urumia (Breslau, 1874).

SYRINGA. See LILAC, and PHILADELPHUS.

SYRIA. See SYRA.

SYRTIS MAJOR and SYRTIS MINOR, the ancient names of two large gulfs on the N. coast of Africa, now called respectively the gulf of Sidra and the gulf of Cabes or Gabes. These gulfs were dangerous on account of their shallowness, the number of quicksands, and the uncertainty of the tides. The Greater Syrtis, or gulf of Sidra, is on the N. coast of Tripoli, and extends from the promontory of Boreum (near Ras Ternah) on the E. side to that of Cephalo (Ras Ksar Hamet) on the W. The distance between the two promontories is about 270 m., and the greatest extension of the gulf inland is 110 m. The Lesser Syrtis, or gulf of Cabes, indents the E. coast of Tunis, between the island of Jerbah on the south and Caput Vadorum (Ras Kapudah) on the north; its width is about 100 m., measuring from these points. The region between the two gulfs, formerly called Syrтика, is mostly a narrow sandy or marshy strip of land, now belonging to Tripoli. In ancient times it was peopled by the Lophobagi, Macra, Paylli, Nasamones, and other Libyan tribes, besides Egyptians and Phenicians on the coast. Cyrene and Carthage contended for it, the latter winning, it is said, through the self-sacrifice of two brothers, the Phileni.

SZABADKA (Ger. Maria-Theresiopel), a town of S. Hungary, in the county of Bác, 96 m. S. S. E. of Pesti; pop. in 1870, 56,323. Its inhabitants are mostly agriculturists, but there is also considerable trade in cattle, tobacco, and other products.

SZABOLOS, a N. E. county of Hungary, in the Trans-Tibiscan circle, the Theiss constituting the N. and part of the W. frontier: area, 2,304 sq. m.; pop. in 1870, 265,584, chiefly Magyars. It is a wide, sandy plain, with large marshes, especially in the north and west, but the soil is fertile. The chief products are cattle, grain, tobacco, and wine. Capital, Nagy-Kálló.

SZÁLLA. See Zala.

SZALAY, László, a Hungarian historian, born in Buda, April 18, 1818, died in Salzburg, July 17, 1864. He studied at the university of Pesti, where he published Statusförftek könyve ("The Book of Statesmen"), a collection of political biographies. In 1848 he was sent by the Batthyányi ministry as envoy to the provisional central government of Germany at Frankfurt, whence he soon after retired to London, and subsequently resided in Switzerland, until allowed to return to Hungary about the beginning of 1851, where he became a prominent member of the diet at Pesth. His principal work is Magyavoroszág története ("History of Hungary," 6 vols., Leipsic and Pesti, 1850-59; German ed., 1860 et seq.);

SZATMÁR, or Szathmár. I. A N. E. county of Hungary, in the Trans-Tibiscan circle, bounded N. by the Theiss, and intersected by the Szamos; area, 2,260 sq. m.; pop. in 1870, 280,568, chiefly Magyars. The E. part is mountainous, and contains the gold and silver mines of Nagy-Bánya; the remainder is level and partly marshy. The climate is healthful and mild, and the soil fertile, producing corn, maize, hemp, flax, wine, and tobacco. Cattle, swine, sheep, and bees are raised in great numbers.

SZECSENYI, István, count, a Hungarian statesman, born in Vienna, Sept. 21, 1791, died by his own hand at Döbling, April 8, 1860. He was the son of Count Francis Széchenyi, the founder of the national museum at Pesti, served in the last campaigns of Austria against Napoleon, and in 1825 took his seat in the upper house of the Hungarian diet. He contributed the sum of $30,000 toward the foundation of the Hungarian national academy, and was its vice president; and as leader of the national party he carried through a great series of public enterprises. To popularize his schemes of reform, he published Hitel ("Credit," Pesti, 1880), and Világ ("Light," 1822). Frightened by Kossuth's radical agitation, he wrote against him his Kelet népe ("People of the East," 1840), and combated him in the diet of 1847; but in 1848 he yielded to the current, and entered the Batthyányi-Kossuth cabinet as minister of public works. On the outbreak of the war he became insane, and was taken to an asylum at Döbling near Vienna, in which, though he recovered after some time, he spent the remainder of his life. In March, 1860, his abode and papers were searched by the Austrian police, and shortly after he shot himself.

SZEGEDIN (Hun. Segegd), a city of Hungary, capital of the county of Csengrid, on the right bank of the Theiss, opposite the mouth of the Maros, 55 m. W. of Arad and 96 m. S. E. of Pesti; pop. in 1870, 70,179, chiefly Magyars
and Slavs. It stands in a marshy plain, and is divided into the town proper and the upper and lower suburbs. The river is crossed by a bridge of boats, and the town is defended by an old fortress built by the Turks in the 16th century, which contains extensive barracks, a house of correction, and a church of its own. There are six Roman Catholic churches, a Catholic gymnium, and a beautiful Greek church. Cloth, tobacco, soda, and soap are manufactured, and river boats are built. It is connected by rail with all parts of the country, and carries on an extensive trade. In the summer of 1849 it was the seat of the Hungarian diet till it was taken by the Austrians early in August.

SZEKLER. See Transylvania.

SZOLNOK. I. Middle, a county formerly belonging to Transylvania, and now to Hungary, bounded S. E. by Transylvania; area, 875 sq. m.; pop. in 1870, 118,659, chiefly Wallachs. It is mountains, and watered by tributaries of the Szamos. Capital, Sziglgy-Somlyo. II. A town of Hungary, in the county of Heves, on the Theiss, 56 m. E. S. E. of Pesth; pop. in 1870, 15,847, chiefly Magyars. It is connected with Pesth, Arad, and Debreczin by rail, and has considerable trade and important fisheries.

TABERNACLE

T, the 20th letter and 16th consonant of the English and other alphabets derived from the Roman, the 19th of the Greek (ταυ), and the 9th of the Hebrew (תא). It is of the dienti-lingual class, and represents the sound produced by a forcible emission of the breath after placing the tongue against the roof of the mouth near the roots of the teeth. This forcible emission of the breath is the principal distinction between the sounds of t and its sonorous counterpart d. In etymology it is interchangeable with d, and sometimes with th, p, s, and l. By itself it has but one sound; but combined with h, it forms a simple sound, hard or soft in quality, distinct from that of either component; as the th in thigh, which the Anglo-Saxons represented by ð, the Greeks by θ (theta), and the Hebrews by τ (tau); or as in thy, which the Anglo-Saxons represented by þ. This sound is wanting in all the other European languages except Spanish (d, z, and c before e or i), modern Greek (θ and d), Danish (d between vowels, very faint), and Welsh (dd). In French t is dropped in many words from the Latin where it is preceded and followed by a vowel; as in père, mère, vie, from pater, mater, vita; also from the termination of many words. In English, before i and another vowel, t has the sound of sh, as in nation; in French, of s; in German, of ts.—As a Greek numeral τ stood for 300, π for 300,000. Among the Latins T represented 160, and with a dash above it (𐌊) 160,000. As an abbreviation it stands for theologia, as in S. T. D., sacrae theologiae doctor; and in ancient writings, monuments, or coins, for Titus, Titius, Tullius, and sometimes tribunus. (See D.)

TABASCO, a S. E. state of Mexico, bounded N. by the gulf of Mexico, E. by Campeche, S. by Guatemala and Chiapas, and W. by Vera Cruz; area, 2,918 sq. m.; pop. in 1871, 89,707, chiefly Indians. The coast is indented by several bays and lagoons, and there are islands toward its N. E. extremity, the most important of which are Laguna, Carmen, and Puerto Real. The surface is generally flat and in some places marshy, and there are several small lakes. The rivers, with the exception of the Usamintza and Tabasco, are generally small, and they all overflow at certain seasons. The climate is hot and unhealthful; and between September and March gales render navigation dangerous even on the rivers. Oak, cedar, ironwood, and mahogany abound. Cacao, coffee, pepper, sugar cane, palmetto, tobacco, maize, and rice are cultivated; in some places indigo grows spontaneously; and wild bees afford large supplies of wax and honey. Capital, San Juan Bautista.

TABERNACLE (Lat. tabernaculum, tent; Heb. ṣeb, tabernacle), the sanctuary which the Israelites carried with them through the desert, and which, after the conquest of Canaan, was set up in various towns of Palestine until the time of Solomon, when it was replaced by the temple of Jerusalem. It was constructed, by order of Moses, by Bezaleel and Aholiab, and set up for the first time on the first day of the first month in the second year after leaving Egypt. Its framework consisted of 48 perpendicular gilded boards of acacia wood, which were kept together by golden rings and fixed into silver sockets. Over these boards four coverings were spread. The entrance, at the east end, was closed by means of a splendid curtain, supported by five columns. A curtain divided the interior into two rooms, the sanctuary and the holy of holies. In the sanctuary was placed, on the north, the table with the 12 loaves of show bread (see Sīrew Bread); toward the south the golden candlestick; and in the middle the altar of incense. In the holy of holies stood the ark of the covenant. The tabernacle was surrounded by a kind of courtyard which was 100 cubits long and 50 cubits wide. The typical significance of the tabernacle has been, ever since the times of Philo and Josephus, a subject of investigation. The most important treatises on the subject in modern times are by Creuzer, Symbolik des mosaischen Cultus (2 vols., Heidelberg,
TABERNACLES

1897—9), and Friedrich, Symbolik der mosaischen Stiftshütte (Leipsic, 1841).

TABERNACLES, Feast of (Heb. 'hag hašmōth), one of the three great festivals of the Jews, observed after harvest, and beginning on the 15th day of the month Tisri. It commemorated God's protecting care over his people while they dwelt in the wilderness. It was also a harvest feast or thanksgiving. It continued eight (among the exiled Jews nine) days, the first and last (in exile the first two and last two) of which were the most important. To the ceremonies of the festival belongs the waving toward the four quarters of the world of fine fruits and leafy branches, with the singing of liturgical songs, commonly called, from the repetition of the words hosia' na (Oh save!), Hosanna. On the seventh day this was repeated, for the last time, with greater solemnity. During the first seven days the living in booths was obligatory, which is still partially observed by the Jews in most countries. Sacrifices took place in the temple, and in later times also a ceremony of "pouring water" on the sacrifices, and a great libation of grapes from the outer court, with dances by torchlight.

TABOR, Mount (Gr. ἀραβίθηνος, now Jebel et-Tur), an insulated eminence in the plain of Esdraelon, about 6 m. S. E. of Nazareth, in Galilee, commonly regarded as the scene of the transfiguration of Christ. It is about 1,800 ft. high, composed entirely of limestone, and its sides are covered up to the summit with the valonia oak, wild pistachios, myrtles, and other shrubs. Its summit is a plateau about 600 yards in extent from N. to S. and 800 yards across. All around this plain are traces of an ancient wall, and below it on the S. E. side of the hill are the ruins of a fortification, a gateway of Saracenic architecture called "the gate of the wind," and a small vault where the Latin monks from Nazareth annually celebrate the transfiguration. Among the ruins of a church on the N. side of the mountain the Greeks observe the same festival. Tabor is several times mentioned in the Old Testament, and upon it Deborah and Barak assembled the warriors of Israel previous to the battle with Sisera. There was upon it a city of the Levites of the tribe of Zebulon, which was taken and fortified by Antiochus the Great, 218 B. C. In 65 B. C. a battle was fought near it between the Romans under the proconsul Gabinus and the Jews under Alexander the son of Aristobulus, in which 10,000 Jews were slain. Tabor is not named in the New Testament, and was first mentioned as the place of the transfiguration in the 4th century. At the foot of it the crusaders several times fought the Moslems, and Napoleon gained a victory over the Turks.

TADORITES. See HUSSEITE.

TABRIZ, Tabrie, or Tabrīz, a walled city of Persia, capital of the province of Azerbaijan, in lat. 35° 4' N., lon. 46° 15' E., near the river Aji; pop. about 120,000. It stands on a wide plain, 4,944 ft. above the sea, enclosed on all sides but the west by low mountains or hills. The vicinity is very fertile, and beautified by innumerable fruit gardens, celebrated for their peaches and apricots, and producing grapes from which is made a wine resembling Marnala. The wall of sun-dried bricks is about 3½ m. in circuit. The streets are narrow and tortuous, and the houses low and flat, but there is a large square, and the bazaars are numerous and spacious. The most remarkable buildings are the citadel, a lofty structure with massive brick walls; the Blue mosque, built in the 17th century by Abbas the Great, but now in ruins; and the villa of the heir apparent to the Persian throne, who resides here as governor of Azerbaijan. Tabriz is one of the most important commercial cities in Persia. It is on the caravan route between the interior and Trebizond and Tiflis, and carries on a large foreign trade, also maintaining manufactories of silk and cotton goods.—According to Persian tradition, Tabriz was founded by Zobeida, wife of Haroun al-Rashid; but the town existed in antiquity, and under the name of Gazar was the capital of the Median province of Atropatene. At a later period it was the capital of Tiridates III., king of Armenia. It was visited by Marco Polo about 1293, and in 1820 there appear to have been Venetians settled there, and a Genoese factory in 1841. The present number of European inhabitants probably does not exceed 100. Tabriz has frequently been captured by the Turks, and it has often been damaged by earthquakes. The Anglo-Indian telegraph line passes through the city.

TACHÉ, Alexandre, a Canadian archbishop, born at Kamouraska, Lower Canada, in 1822. He graduated at the college of St. Hyacinthe, became an Oblate of the Immaculate Conception, and in 1843 asked to be sent to the Red River mission. He was ordained priest at St. Boniface, and devoted himself to the Indian tribes beyond the civilized regions of Canada, especially along the valley of the Saskatchewan. He was among the first to penetrate into the unexplored portions of the northwestern territory, and contributed toward the colonization and progress of Manitoba. He was consecrated.
TACITUS

coadjutor to Bishop Provencher of St. Boniface, Nov. 28, 1851, and succeeded him, June 7, 1853. In September, 1871, he was made metropolitan. During the troubles attendant on the Riel insurrection in 1869–70 he exerted his influence to prevent the effusion of blood; and after the surrender of Riel and the latter's election to the Dominion house of commons, the archbishop resisted successfully all attempts of the authorities to punish him as a traitor.

He has established a college and theological seminary at St. Boniface opposite Portage la Prairie, and besides numerous interesting reports on the Indian missions printed in the "Annales of the Propagation of the Faith," has published *Vingt années de missions dans le nord-ouest de l'Amérique* (Montreal, 1866), and *Esquisse sur le nord-ouest de l'Amérique* (1869).

TACITUS, Caius Cornelius, a Roman historian, born probably about A. D. 55, died probably after the accession of the emperor Hadrian (117). He was early appointed to a public office under Vespasian, and married a daughter of Julius Agricola. He held a priesthood under Domitian, and was *consul suffectus* under Nerva. Nothing positive is known of his subsequent career. He was famous as an orator and a lawyer, and the rhetorical studies of his earlier years led him to compose his first work, the *Dialogus of Otororibus*, which contrasts strongly with his later writings for diffuseness and negligence. His *Vita Juliae Agricola* is the masterpiece of ancient biography, and specially valuable for the account it gives of the early condition and history of Britain. The *Germania* (De Origine, Situ, Moribus et Populis Germaniae) appeared soon after, both probably in 98. It is based on the works of Pliny and the most trustworthy sources then available; and as such is of great importance to students of German antiquities. Numerous theories have been broached in regard to the author's purpose in writing it, but there is every reason for supposing that one of his main objects was to remind the Romans of the virtues of their former days, and to warn them of the dangers threatening them from the north. Its geographical and historical accuracy has often been attacked, and as often successfully vindicated, though he has frequently exaggerated or idealized the customs and morals of the German people. About the year 105 appeared the first portion of his history of Rome after the time of Augustus, embracing *Historia* of the years 69–96, or from the last days of Galba to the death of Domitian. Only the first four books and a part of the fifth, reaching to the year 70, are extant. Next appeared the *Annales*, a concise history of the events from 14 to 68. Its original title was *Ab Excessu D. Augusti Libri*. Of the original 16 books, only nine complete and parts of three others are extant. The portions relating to the last two years of Nero are wanting. Tacitus is commonly known to Thucydid; but the latter has none of the psychological characteristics of the former. There is a greater resemblance between Tacitus and his forerunner Sallust. His style is remarkable for its vigor and conciseness. A melancholy and almost tragic earnestness pervades his pictures of imperial history. Numerous interpolations disfigure his writings, especially the last portion of the *Annales* and the *Historia*. The *editio princeps* of Tacitus, which is far from complete, was printed at Venice in 1469 by Vindelin de Spira; and of the numerous subsequent editions that of Ernesti (Leipsic, 1752), successively revised by Oberlin, Bekker, Walther, Ruperti, and others, and Halm's (Leipsic, 1874), are esteemed the best. The best translations are: in German, by Roth (Stuttgart, 1855–77); in French, by Louandre (Paris, 1888) and Durand de la Malle (1874); and in English, by Church and Brodribb (London, 1864). German literature abounds with hermeneutical treatises on Tacitus; Pfitzner's *Die Annales des Tacitus kritisch beleuchtet* (Halle, 1889) is very thorough.

TACITUS, Marcus Claudius, a Roman emperor, born at Interamna (now Terni), Umbria, about A. D. 20, died at Tyma, in Cappadocia, in April, 276. Previous to the assassination of the emperor Aurelian in March, 275, he held various important civil offices, the last being that of consul in 273, and was well known for his love of letters, his great wealth, and his integrity. In September, 275, Tacitus was unanimously elected emperor by the senate. He instituted a few domestic reforms, and attempted to revive the authority of the senate, but died within little more than half a year from the commencement of his reign. According to one account, he was assassinated by his soldiers when on an expedition against the Goths in Asia Minor. He claimed descent from the historian Tacitus, whose works he ordered to be placed in all public libraries, and to be multiplied to the extent of ten copies a year at the public expense.

TACKMAHACK, or Balsem Poplar. See Poplar.

TACONIC SYSTEM, or Taghkaule. See United States (geological part).

TADEMA, Laurens Alma, a Dutch painter, born at Drouryp, West Friesland, Jan. 8, 1836. He studied under Leys at Antwerp in 1861, and became known as a painter of classical subjects. His wife, the countess Pauline Dumoulin, died in 1869, and in 1870 he married an English woman and removed to London. His works include "Venantius Fortunatus and Radegond" (1862), "How they enjoyed themselves in Egypt 3,000 Years ago" (1863), "The Mummies" (1867), "The Siesta of Ancient Romans" (1869), "The Vintage Celebration at Rome" (1870), "The Last Plague of Egypt" (1872), and "The Picture Gallery" (1874).

TADOMOR. See Palmyra.

TADOLINI, Adamo, an Italian sculptor, born in Bologna in 1789. He studied in the academy of Bologna, and settled in Rome. In 1812 he received for his "Dying Ajax" the grand
TADPOLE

prize instituted by Canova, under whose di-
rection he executed from 1813 to 1829 many
works, including a statue of Washington. His
subsequent productions comprise "Venus and
Amor," "The Abduction of Ganymede," "Fran-
cis de Sales," "A Bacchante," and "The Arch-
gel St. Michael," a colossal marble group for
which an American is said to have paid $40,-
000 (1869).

TAPOLE. See Pooc.

TAEL, a Chinese measure of weight, equal to
14 oz.avoirdupois. The Chinese government
does not coin gold or silver. All payments are
made in bullion or foreign coins, by weight;
hence the tael (Chin. liang) has become a money
of account, and 720 taels are received at Hong
Kong and Shanghai as equivalent to 1,000
Mexican dollars. Taking the value of the Mexi-
can dollar as fixed by the secretary of the
treasury of the United States, Jan. 1, 1875,
the tael would be equivalent to 1-386 United
States dollars. The name is sometimes applied
to the money of Japan, Siam, and Sumatra,
and is probably of Malay origin.

TAMARIN. See Cape Matapan.

TAFILET, or Tafilet, a division of Morocco,
consisting of the oasis of the same name, lying
S. E. of the Atlas mountains, between lat. 30°
45' and 31° 10' N. and lon. 3° 3' and 3° 25'
W.; pop. estimated at 100,000. The oasis of
Tissimi lies N. of it, and that of Sahara N. E.
Tafilet is a fertile plain watered by two rivers,
both of which are lost in the sands of the
desert. Rain seldom falls. Wheat and barley
are cultivated on the banks of the rivers, but
dates are the chief product. Large herds of
sheep and goats are kept, and stalls and car-
pets are manufactured. There are mines of
lead and antimony. The oasis is divided into
degree districts, Sfstalet, Rorhfa, Iffii, Shiffa,
and Tanaajjut. The most important town is Ab-
am, about 240 m. E. S. E. of Morocco, but
the official centre is Rissani, a few miles N. E.
of Aouam. The inhabitants are mostly Shellochs.
A considerable trade is carried on with other
parts of Morocco, and with Algeria.—Tafilet,
which is mentioned by the earliest Arab chroni-
clers, is probably identical with the kingdom
of which Sigilmassa, founded A. D. 750, was
the capital. In 1648 a king of Tafilet founded
the dynasty which still rules Morocco.

TAGANROG, a city of southern Russia, in
the government of Yekaterinoslav, on a prom-
ontory formed by the sea of Azov, 18 m. from
the mouth of the Don and 27 m. N. W. of
Azov; pop. in 1867, 25,027, including many
Armenians and Greeks. It is strongly forti-
died, and despite the shallowness of the harbor
it is the principal port of the sea of Azov.
The exports in 1873, chiefly wheat, amounted
to 28,797,889 rubles, and the imports to 8,048,-
639. The town has four large squares. The
principal buildings are the cathedral, the admi-
ralty, the marine hospital, the quarantine, the
exchange, the theatre, and the palace near the
Greek monastery of Jerusalem, built by Alex-
nder I., who died and has a monument here.
It was originally founded in 1696, but the pres-
city dates from 1768. Taganrog was much
damaged in 1855 by the bombardment from
French and English gunboats, as well as the
neighboring seaport Mariupol (founded in 1779
by Greeks; pop. about 6,000), which is under
the municipal authority of Taganrog.

TAGLIACOZZI. See Tallacottis.

TAGLIONI. 1. Filippo, an Italian ballet mas-
ter, born in Milan in 1777, died near the lake
of Como, Feb. 11, 1871. He was successively
connected with the theatres at Stockholm,
Cassel, and Warsaw till 1835, when he returned
to Italy. The most celebrated of his numerous
ballots is the "Sylphide." He married a daugh-
ter of the Swedish tragedian Karsten. II.
Maria, a dancer, daughter of the preceding, born
in Stockholm about 1804. In 1822 she first
appeared at Vienna, in 1827 at Paris, and in
1832 at Berlin. In the last year she married
Count Gilbert de Voisin. She retired in 1847,
and has since lived at her villa on the lake of
Como, or in one of her palaces at Venice.
She gained her greatest triumphs in La baga-
dere, La Sylphide, and La fille du Donahue. III.
Paul, brother of the preceding, born in Vienna
about 1808. After performing with his sister
in various theatres, he married the dancer
Amalia Galster, with whom he made tours in
Europe and the United States. His career as
a dancer ended in 1847, when he became ba-
lett master at the royal theatre in Berlin. He
has since produced Sardanapal, Undine, and
other celebrated ballets.—His daughter Maria,
born in Berlin in 1834, excelled as a dancer,
but in 1866 retired from the stage, on her
marriage with Prince Joseph Windischgrätz.

TAGUS (Span. Tajo; Port. Tejo), a river of
Spain and Portugal, the longest in the penin-
sula, and dividing it into two nearly equal parts.
It rises in the Sierra de Cuenca, in the prov-
cince of Ternel near the border of Guadalaja-
ra, and flows N. W. for about 35 m.; then nearly
W. 20 m., receiving the waters of the Molina;
then S. W. a little more than 70 m., the Guan-
diela and other streams augmenting it; then
nearly W. till it becomes for about 20 m. the
boundary of Portugal, its principal affluents
being the Jarama, Cedron, Guadarrama, Al-
berche, and Alagón. Entering Portugal, it in-
clines more and more to the southwest, receiv-
ing below Abrantes the Zerezere, and from that
point is navigable for vessels of 150 tons. In
the lower part of its course are numerous is-
lands, and for about 20 m. it spreads out into
a table-like basin, 8 m. or more in width; but
as it approaches Lisbon the hills on either side
close up the valley, and at its mouth it is not
over a mile wide. The banks of the Tagus are
generally rugged and precipitous, and the adja-
cent plains are dry and barren. Lisbon, San-
tarem, and Abrantes in Portugal, and Talavera
de la Reyna, Toledo, and Aranjuez in Spain,
are on its banks. Its length is about 549 m.

TAHITI. See Society Islands.
TAHLEQUAH, the capital of the Cherokee nation, Indian territory, in the valley of Illini and a tributary of the Arkansas, 170 m. W. N. W. of Little Rock, Ark., and 15 m. E. of the Missouri, Kansas, and Texas railroad; pop. about 300. The capital, of brick, cost $20,000, and is in the centre of the public square. There are two schools and a weekly newspaper (Cherokee and English).

TAINÉ, Hippolyte Adolphe, a French author, born in Vouziers, April 21, 1828. He was educated at the Bourbon college, was connected with the normal school of Paris for five years, and since 1854 has been professor of the history and aesthetics of the school of fine arts. His Éssai sur Tite Live (1854) received a prize from the French academy. His other works are: Voyage aux eaux des Pyrénées (1855); Les philosophes français du XIX siècle (1856); Essai de critique et d'histoire (1857; second series, 1865); La Fontaine et ses fables (1860); Histoire de la littérature anglaise (4 vols., 1864); Idéalisme anglais: étude sur Carlyle (1864); Le positivisme anglais: étude sur Stuart Mill (1864); Philosophie de l'art (1865); Philosophie de l'art en Italie (1866); Voyage en Italie (2 vols., 1866); Notes sur Paris (1867); L'idéal dans l'art (1867); Philosophie de l'art dans les Pays-Bas (1868); De l'intelligence (2 vols., 1869); Philosophie de l'art en Grèce (1870); and Notes sur l'Angleterre (1874). Most of his works have been translated into English by Durand, Van Laun, Hayes, Fiske, and Stevens. In 1875 Taine began the publication of Les origines de la France contemporaine, with a volume on the Ancien régime, which is to be followed by one on the revolution.

TAIT, Archibald Campbell, an English clergyman, born in Edinburgh, Dec. 22, 1811. He was educated at the university of Edinburgh and at Balliol college, Oxford, and was afterward public examiner of the university. He was prominent in the opposition to the tractsarians. In 1842 he succeeded Dr. Arnold as head master of Rugby school, where he remained eight years. In 1850 he was made dean of Carlisle, in 1856 bishop of London, and in 1868 archbishop of Canterbury. He has published "The Dangers and Safeguards of Modern Theology" (London, 1861), "The Word of God and the Ground of Faith" (1863), and two volumes of sermons.

TAIT, Peter Guthrie, a British mathematician, born about 1826. He graduated at Cambridge, was fellow of St. Peter's college, became professor of mathematics in Queen's college, Belfast, and in 1859 was elected professor of natural philosophy in the university of Edinburgh. He has published "A Treatise on Dynamics of a Particle," in conjunction with William J. Steele (Svo, Cambridge, 1856); "Value of the Edinburgh Degree, an Address" (Svo, Edinburgh, 1866); "Elementary Treatise on Quaternions" (Svo, Cambridge, 1867); and "Thermodynamics" (Svo, Edinburgh, 1868). He has also, in conjunction with Sir William Thomson, published "An Elementary Treatise on Natural Philosophy" (Svo, London, vol. i., 1867).

TALAVERA DE LA REYNA (anc. Talabriga), a town of Spain, in the province of Toledo, on the Tagus, 64 m. S. W. of Madrid; pop. about 9,000. It is a place of great antiquity, and was the scene of many conflicts between the Moors and Christians. On July 27 and 28, 1809, a battle was fought in the immediate vicinity, between the French, under Victor, Jourdan, and Sebastiani, and the British, under Sir Arthur Wellesley. In the decisive contest of the 28th, 50,000 French were driven back by 16,000 British troops.

TALBOT. I. An E. county of Maryland, bounded W. by Chesapeake bay, and S. and E. by the Choptank river; area, 250 sq. m.; pop. in 1870, 16,137, of whom 6,066 were colored. The surface is generally level, and the soil highly fertile. The Maryland and Delaware railroad terminates at the county seat. The chief productions in 1870 were 302,078 bushels of wheat, 515,122 of Indian corn, 38,525 of oats, 41,770 of Irish and 10,725 of sweet potatoes, 29,938 lbs. of wool, 99,008 of butter, and 990 tons of hay. There were 3,298 horses, 8,309 milch cows, 3,678 other cattle, 6,044 sheep, and 9,411 swine; 3 manufactories of carriages and wagons, 5 of clothing, 3 ship yards, and 7 saw mills. Capital, Easton. II. A W. county of Georgia, bounded N. E. by Flint river and drained by several large creeks; area, 524 sq. m.; pop. in 1870, 11,913, of whom 7,157 were colored. The surface is hilly and the soil good. It is crossed in the southeast by the Southwestern railroad. The chief productions in 1870 were 18,372 bushels of wheat, 200,645 of Indian corn, 12,940 of oats, 27,786 of sweet potatoes, and 7,020 tons of hay. There were 691 horses, 1,325 mules and asses, 3,021 milch cows, 3,435 other cattle, 1,035 sheep, and 2,508 swine. Capital, Talbotton.

TALBOT, William Henry Fox, an English author, born at Chippenham, Wiltshire, Feb. 11, 1800. He was educated at Harrow and Cambridge, represented the liberal interest of Chippenham in the first reform parliament, 1832-'4, and became chief sheriff of Wiltshire in 1840. In 1833 he began the experiments which in 1840 resulted in the discovery which laid the foundation for the photographic art. (See Photography.) For this discovery he received in 1842 the medal of the royal society; and although he patented his process, he left it open to the public. Of late years he has devoted himself to deciphering cuneiform inscriptions. He has published "Legendary Tales in Verse and Prose" (London, 1830); "Hermes, or Classical and Antiquarian Researches" (2 parts, 1838-'9); "Antiquity of the Book of Genesis" (1839); "The Pencil of Nature," in which he details his experiments and discoveries in photography (6 parts, 1844-'6); and "English Etymologies" (1846).
TALC, a siliceous mineral occurring in two forms, crystalline and massive. The massive variety was formerly called steatite (soapstone), and was regarded as a distinct species; but it has the same chemical composition as crystalline tace, viz., $4\text{MgO} \cdot 5\text{SiO}_2 \cdot \text{H}_2\text{O}$, or silica 62-14, magnesia 32-92, and water 4-94 per cent., being a hydrous silicate of magnesia. Talc is commonly in the form of lamellar crystals, which cleave perfectly in one direction, but are usually too incompletely developed to allow of an exact determination of their crystalline system; but hexagonal prisms and plates are occasionally found. They are optically biaxial. The lamellae are very flexible but not elastic, and are unctuous to the touch. Talc is very soft, being only 1 on the scale of 10; sp. gr. from 2-6 to 2-8; lustre pearly; color apple-green to white, also greenish gray to dark green, subtranslucent. Talc, either in a foliated or lamellar form, or massive as stenite, is common, forming extensive beds in some localities. It is often associated with serpentine, talcose, or chloritic schist. Steatite or soapstone is known in different localities as potstone (Topfstein), lapiz ollari, roncaserite, and French chalk (croute de Briangan). There are extensive quarries at Grafton, Athens, Westfield, and Marlborough, Vt.; at Franconia, Pelham, and Keene, N. H.; at Middlefield, Chester, and other places in Massachusetts; in Maryland near Baltimore, in Virginia near Washington and in London co., and in Guilford co., N. C., and numerous other places, in metamorphic rocks. It is used for making stoves, ovens, and hearths; for sizing-rollers in cotton factories, on account of its not being affected by acids; and sometimes as a lubricant for journals. It is also used for slate pencils and crayons, and for the stoppers of chemical vessels. The American aborigines use it for culinary purposes, and the Chinese for the carving of idols.

TALENT (Gr. ταλάντος; Lat. talentum), a term originally applied by the ancient Greeks to a balance for weighing, afterward to the substance weighed, and finally to the weight itself. In the system of weights in use the talent was the highest denomination, and was equivalent to 60 minas, each of which was equal to 100 drachmas, and each of these to 6 oboli. The values of these weights remained constant in relation to each other, while that of the units of the measure varied in different times and in different places. The system of money being based upon the weight of silver, the names of the weights employed came to be used as money values, in the same way as the English pound originally represented a pound weight of silver. No coins however are known to have been made larger than the tetradrachma, and the mina and talent were moneys of account only. The determination of the weights of the different talents in terms of our modern standards is a subject involved in great difficulty, and there is a marked disagreement among scholars. The oldest talent was the Babylonian, which was carried into the Phoenician and Greek countries, and may with great probability be assumed as identical with the oldest Greek talent, called the Egeinetan. The Hebrew talent differed but little if at all from this. The Euboic talent, also probably derived from the East, was in use in Attica previous to the time of Solon, and is often called the old Attic; it continued in use after the time of Solon, and hence was also called the commercial talent. Solon, in order to relieve the debtor class, reduced the talent so far as money was concerned, and the talent established by him, called the new Attic or Attic silver talent, is the one always meant in the classical authors when the context does not indicate a different one. The ratio of these talents to each other was as follows, in whole numbers: 15 Egeinetan talents were equal to 18 Euboic or commercial talents, and to 25 Solonian or Attic silver talents. Their weights compared with our avoirdupois weight were probably as follows: the Egeinetan equalled 95 lbs.; the Euboic, 79 lbs. 2 oz. 291-63 gr.; the Attic silver talent, 57 lbs. The value of these talents in pure silver, taking the American trade dollar, containing 378 gr. of pure silver, as the standard, would be as follows: the Egeinetan talent equals $1,759-26; the Euboic, $1,466-68; the Attic silver talent, $1,055-56. The coins in actual use fell below this standard both in weight and in purity, and varied in different ages. For approximate calculation the coin value of the above named talents may be assumed as equal to $1,700, $1,400, and $1,000 respectively. Various other talents are named by the ancient writers, the comparative values of which have been treated in the works of Böckh and of Hussey. The gold talent of the Greeks, or the Sicilian talent, the one always meant in Homer, contained about 4 oz. and 71 gr. of avoirdupois gold.

TALFORD, Sir Thomas Noon, an English author, born at Doxey, a suburb of Stafford, Jan. 26, 1795, died in Stafford, March 13, 1854. He was called to the bar in London in 1821, and in 1833 was made serjeant at law. From 1835 to 1841 he was member of parliament for Reading, and again from 1847 to 1849, when he was made a judge of the court of common pleas. In parliament he was distinguished by his efforts in behalf of the rights of authors, for whose benefit he introduced in 1837 the copyright act which, somewhat modified, was passed in 1842. His tragedy of "Ion" (1835) was acted with great success under the direction of Mr. Macready, and was followed by "The Athenian Captive" (1838), "Glencoe" (1840), and "The Castilian" (1854). The last was not acted, and "The Athenian Captive" and "Glencoe" were but moderately successful on the stage. His other works include memoirs and correspondence of his friend Charles Lamb (1837 and 1838, subsequently published as one work), and "Final Memoirs" (1848).
TALLACOTIUS, Gasparo (Tagliacozzi, or Tagliacozzio), an Italian surgeon, born about 1546, died in Bologna, where he was professor of anatomy and surgery, in 1590. He attained high renown for his medical lectures, but is remembered for what has been named from him the Taliacotian operation for the restoration of lost noses, ears, &c. Though this operation was not original with him, yet he carried it to greater perfection and was more successful than any of his predecessors. His process was fully detailed in his work De Curtorum Chirurgia per Insitionem Libri II. (2 vols. fol., Venice, 1597; new ed., Berlin, 1831). (See Autolyst.)

TALLAHERO, a N. E. county of Georgia, drained by affluents of the Ogeechee and Little rivers; area, 185 sq. m.; pop. in 1870, 4,796, of whom 2,987 were colored. The surface is hilly and the soil generally fertile. Granite, gneiss, sulphuret of iron, and magmatic ore are found. It is intersected by the Georgia railroad. The chief productions in 1870 were 9,418 bushels of wheat, 78,815 of Indian corn, and 3,024 bales of cotton. There were 543 horses, 2,120 cattle, 1,220 sheep, and 3,714 swine. Capital, Crawfordsville.

TALLADEGA, a N. E. county of Alabama, bounded W. by the Coosa river and drained by Choccolocco creek and other streams; area, about 700 sq. m.; pop. in 1870, 18,064, of whom 9,595 were colored. The surface is moderately hilly and the soil fertile. The Sola, Roma, and Dalton railroad traverses it. The chief productions in 1870 were 69,821 bushels of wheat, 284,788 of Indian corn, 42,821 of oats, 14,469 of sweet potatoes, 5,697 bales of cotton, 5,784 lbs. of wool, and 53,167 of butter. There were 922 horses, 1,786 mules and asses, 5,383 cattle, 2,355 sheep, and 6,947 swine; 4 tanneries, 3 currying establishments, and 2 saw mills. Capital, Talladega.

TALLADEGA, a city and the capital of Talladega co., Alabama, on the Selma, Rome, and Dalton railroad, 78 m. N. by E. of Montgomery; pop. in 1870, 1,935, of whom 1,019 were colored; in 1875, about 3,000. It is the seat of the state institution for the deaf and dumb and the blind, of a Presbyterian female seminary, and of Talladega college. The college was incorporated in 1869, and is sustained by the American missionary society. It admits both sexes and colors, and has in operation preparatory, theological, and normal courses, and grammar, intermediate, and primary departments. In 1874-5 it had 13 instructors and 247 students. Talladega has two weekly newspapers and six churches, and trade in cotton, wheat, &c. On its site, Nov. 8, 1813, Gen. Jackson gained a victory over the Creeks.

TALLAHASSEE, a city and the capital of Florida, county seat of Leon co., on the Jacksonville, Pensacola, and Mobile railroad, at the junction of a branch to St. Mark's, 155 m. W. of Jacksonville and 21 m. N. of the gulf of Mexico; lat. 30° 29' N., lon. 84° 18' W.; pop. in 1870, 2,023, of whom 820 were white and 1,203 colored; in 1875, about 2,500; including suburbs, 4,000. It is beautifully situated on high ground, and is regularly laid out in a plot a mile square, with broad streets and several public squares, shaded with evergreens and oaks. The abundance and variety of flowers and shrubs give it the appearance of a garden. The business portion is of brick. The public buildings are the capitol (completed in 1826), a large three-story brick edifice, with pillared entrances opening east and west; the court house, a substantial two-story brick structure; and the West Florida seminary, a large two-story brick building, on a hill commanding a view of the entire city. In the vicinity are beautiful springs, the most celebrated of which is Wakulla, an immense limestone basin, 16 m. distant. The surrounding country is fertile. The city contains the car and machine shops of the railroad company, and has the only cotton factory in the state. The seminary has separate male and female departments, and is supported by the proceeds of the "seminary lands" granted to the state by Congress. There are several free public schools, two weekly newspapers, and Baptist, Episcopal, Methodist, Presbyterian, and Roman Catholic churches.—The site of Tallahassee was selected as the seat of the territorial government in 1822; it was laid out in 1824, and incorporated as a city in 1827. In 1843 the entire business portion, then of wood, was destroyed by fire.

TALLAHATCHEE, a river of Mississippi, the principal tributary of the Yazoo, rising in the N. E. part of the state, and flowing in a circuitous but generally S. and S. course 250 m. to its junction with the Yalobusha river to form the Yazoo. It is navigable by steamboats more than 100 m.

TALLAHATCHEE, a N. W. county of Mississippi, intersected by the Tallahatchee river; area, about 750 sq. m.; pop. in 1870, 7,652, of whom 4,687 were colored. The surface is level and in many places swampy, and the soil fertile. The Mississippi and Tennessee railroad touches the N. E. corner. The chief productions in 1870 were 208,425 bushels of Indian corn, 13,620 of sweet potatoes, and 6,760 bales of cotton. There were 842 horses, 954 mules and asses, 5,500 cattle, 908 sheep, 7,406 swine, and 6 saw mills. Capital, Charleston.

TALLAPOOSA, a river of Georgia and Alabama, which rises in Paulding co., Ga., flows S. W., S., and W. 250 m., and unites with the Coosa, forming the Alabama, about 10 m. N. of Montgomery. Its principal affluent is the Little Tallapoosa. It is navigable for steamboats more than 40 m. above the Coosa.

TALLAPOOSA, an E. county of Alabama, intersected by the Tallapoosa river, and drained by its branches; area, 700 sq. m.; pop. in 1870, 16,963, of whom 4,190 were colored. The surface is hilly and the soil in some parts fertile. The Savannah and Memphis railroad traverses
it. The chief productions in 1870 were 48,485 bushels of wheat, 267,764 of Indian corn, 33,359 of oats, 26,286 of sweet potatoes, 5,446 bales of cotton, and 10,439 lbs. of wool. There were 1,224 horses, 1,198 mules and assos, 2,251 cattle, 3,539 sheep, 12,799 swine, and 26 flour mills. Capital, Ludeville.

TALLEYRAND-PÉRIGORD, Charles Maurice, prince de, a French statesman, born in Paris, Feb. 13, 1754, died there, May 17, 1838. He was the eldest son of the count de Talleyrand-Périgord, and, having been lamed by accident when about a year old, was neglected by his family. In 1766 he was placed by an uncle in the college of Harcourt at Paris, and though he there greatly distinguished himself, a family council in 1769 decided that in consequence of his incurable lameness he should give up his birthright to his younger brother, and become a churchman. He was sent immediately to St. Sulpice, and graduated with much distinction at the Sorbonne in 1774. He was then presented at court, and received in commendam the abbey of St. Denis in the diocese of Rheims and several other livings. Despite his notorious licentiousness, he was ordained priest soon afterward, and displayed uncommon business tact and brilliant conversational powers. From 1780 to 1785 he held the post of general agent of the French clergy. He mingled in the financial discussions of the time, became acquainted with Mirabeau, Calonne, and Necker, and was noted for his prudence and skill as a speculator. In 1787 he was one of the assembly of notables, and in 1788 was made bishop of Autun, which gave him a yearly income of 60,000 francs. When the states general were summoned in 1789, he was elected one of the deputies of the clergy, insisted that his colleagues should join at once the representatives of the third estate who had assumed the name of 'national assembly,' figured conspicuously among Mirabeau's friends, and proved a strong supporter of every liberal measure. It was he who moved the celebration of the great patriotic feast, styled the "federation," on July 14, 1790; and in his capacity of bishop, at the head of 200 priests, wearing the national colors over their white robes, he officiated in that solemnity upon the great altar erected in the midst of the Champ de Mars. In the assembly he reported a plan for the reorganization of public instruction, and advocated the abolition of ecclesiastical tithes, the assumption by the government of the lands belonging to the clergy as national property, and the establishment of a civil constitution for that order; and on this constitution being adopted, he consecrated such priests as consented to take the oath to it. This, added to his many deficiencies as a Catholic bishop and his political course, caused him to be excommunicated; but he was secularized by the pope, on condition that he should wear a lay habit and abstain from all clerical functions. In April, 1791, he attended Mirabeau in his last moments, and was charged by the great orator to deliver in the assembly a speech he had prepared upon testamentary powers and the rights of succession. On the dissolution of the constituent assembly, Sept. 30, 1791, Talleyrand was sent, under Chauvelin, on a fruitless mission to England. After the king's fall he retired to England; but, while a warrant was issued against him in Paris by the committee of public safety, he received-peremptory orders from the ministry (January, 1794) to leave England in 24 hours. He then sailed for the United States, where though speculation he accumulated a fortune, and carefully studied American institutions and commerce. Before the adjournment of the convention, on motion of Chénier, acting under Mme. de Staël's influence, his name was erased from the list of emigrants; he returned to Paris, found himself a member of the academy of moral and political sciences, was one of the original members of the constitutional club, and in July, 1797, was called to the ministry of foreign affairs. On Bonaparte's return from Italy, Dec. 5, he welcomed him, introduced him to the directors, delivered a speech in his honor at his great official reception, and promoted his subsequent designs. While the young general sailed for Egypt, the diplomatist was to go to Constantinople to reconcile the sultan to the invasion of one of his provinces; he neglected this mission, and continued in office till July, 1799, when he was forced to resign. When Bonaparte returned from Egypt, he again propitiated the conqueror, procured an interview between him and Sieyès, and prevailed upon Barras to resign, thus greatly contributing to the success of the coup d'état of the 18th Brumaire. He was rewarded by his reappointment, in November, 1799, as minister of foreign affairs, which office he held till August, 1807, and aided in the reestablishment of the peace in Europe, taking part in the successful conclusion of the treaties of Lunéville, 1801, and Amiens, 1802.

On June 29, 1809, Pius VII., at Bonaparte's request, released Talleyrand from excommunication; and yielding to Bonaparte's injunction, he married Mme. Grant, with whom he had lived for several years. The pope's refusal to allow this lady to be presented to him filled Talleyrand with resentment; and he is said to have counselled the partition of the Papal States. He prompted the seizure of the duke d'Enghien, and hastened his execution. After the establishment of the empire he received the office of grand chamberlain, and in 1806 the princiapality of Benevento in Italy. Having vainly advocated an alliance with England, and feeling the growing coldness of the emperor, he resigned his ministerial office, Aug. 9, 1807, and received the title of vice grand elector, to which a large salary was attached. Thenceforward he was only occasionally consulted by his sovereign, but gave very free expression to his views on great political ques-
tions, and was in consequence deprived of his office of chamberlain in 1809; but this only stimulated his sarcastic criticisms against the imperial policy. As early as 1812 he is said to have foretold the approaching overthrow of Napoleon, and his influence was looked upon at home and abroad as the most influential statesman of the day and the leader of the new revolution. A last interview between him and the emperor in the beginning of 1814 completed the estrangement between them; and Talleyrand, though still a dignitary of the empire and one of the council of regency, thought of nothing but ruining his master. He secretly sent word to the allied sovereigns to hasten toward Paris; and when that city surrendered, March 30, he offered his hotel to the emperor Alexander. His management secured the appointment by the senate, on April 3, of a provisional government, and its formal declaration on the day following Napoleon's dethronement. While Marshal Marmont was prevailed upon to sign at Essonne (April 3) a convention that baffled Napoleon's last hopes of resisting, Talleyrand welcomed the count of Artois to the French metropolis, April 12, and remained the head of the new government. On the arrival of Louis XVIII. he was appointed (May 12) minister of foreign affairs, holding in fact the premiership in the cabinet; and on June 4 he was made a peer of France. He negotiated the first treaty of Paris, May 30, 1814; and four months later he was sent as minister plenipotentiary to the congress of Vienna, where he failed in protecting the interests of France as well as he desired. He was surprised there by the sudden return of Napoleon from Elba, and participated in the declaration that "outlawed the enemy of nations." He was excepted from the amnesty granted to those who had previously deserted the emperor, went to Ghent, where he joined the exiled king Louis XVIII., accompanied him to France when he returned there after the battle of Waterloo, and resumed, July 8, 1815, the premiership in the cabinet and the ministry of foreign affairs; but being disgusted by the hard terms imposed upon France by the allied powers and by the reactionary tendencies of the new chamber of deputies, he resigned his office at the end of a few weeks. According to another account, having become obnoxious to the emperor Alexander, he was dismissed; but through the duke of Richelieu's entreaties he received the title of grand chamberlain of France, with a salary of 40,000 francs. He still visited the Tuileries, but was coldly received; he retained his seat in the chamber of peers, and delivered there several opposition speeches; but his influence was greatest in social intercourse, his salon being the gathering place of politicians of every shade of opinion. After the revolution of July, 1830, he was appointed ambassador to England with a princely salary, and negotiated a treaty, April 22, 1834, by which France, England, Spain, and Portugal united for the pacification and settlement of the two peninsular kingdoms. He resigned his office, Jan. 7, 1835, and retired to private life. The most remarkable of his essays is his Mémoires sur les relations commerciales des États-Unis vers 1797.

He left personal memoirs, which according to his will were not to be published till 30 years after his death. In 1868 Napoleon III. obtained from the heirs a further postponement of 22 years; and in 1872, it having been announced that the memoirs were about to be published, the duke de Montmorency, custodian of the manuscript, refused to violate the pledge given to the late emperor. On the day before his death Talleyrand wrote a letter to the pope enclosing a "retraction" written two months before. The "retraction" deplores his acts which had afflicted the church; and the letter says that his memoirs will explain to posterity the writer's conduct during the revolution.

**TALLIEN, Jean Lambert**, a French revolutionist, born in Paris in 1769, died there in November, 1820. He was the son of the house steward of the marquis de Bercy, who gave him the means of a classical education. In 1791 he started a transient newspaper, L'Ami du Citoyen, and became a member of the Jacobin club, and in 1793 clerk of the commune of Paris and deputy to the convention from Seine-et-Oise. He took his seat among the montagnards, voted for the death of Louis XVI., and was one of the bitterest opponents of the Girondists. He was sent on a mission to Bordeaux in 1793, and became acquainted with Mme. de Fontenay, whom he married. (See CHIMAY.) At her instigation he denounced Robespierre and procured his execution, which made him the leader of the Thermidorians. Through his influence Fouquier-Tinville, Carrier, and Lebon were doomed to punishment; and through his energy the revolutionary attempt of the 1st Prairial was baffled. As commissary of the convention with the army of the west in 1795, he ordered all the royalist prisoners made by Hoche on the Quiberon peninsula to be shot. On the 18th Vendémiaire he was among the defenders of the convention against the rebellious sections of Paris. After the establishment of the directorial government he was a member of the council of 500, and shared in the republican coup d'état of the 18th Fructidor. In 1798 he accompanied Bonaparte to Egypt as one of the committee of scientific men, and held there a high administrative office. While returning to France he was taken prisoner by the English, and welcomed to London by the whig party. In 1806 he was appointed companion to Alicante; but sickness obliged him to return to Paris, where he received a paltry pension from Napoleon, which he lost in 1811. Mme. Tallien, from whom he was divorced in 1802, had borne him four children.
TALLOW, the solid fat of various terrestrial animals, chiefly quadrupeds, which has been separated from the membranous cellular tissue by melting. The ruminants, particularly oxen and sheep, furnish the tallow of commerce. Russia, South America, and Australia furnish the largest proportion. That is esteemed best which is procured from animals that have fed upon dry fodder; hence that of Russia, where animals feed for eight months upon dried grass, is especially valued. Texas and particularly southern California formerly furnished large quantities to commerce. Formerly tallow that had been simply "tried out" or "rendered" was extensively used for candles; very little is now so used, but instead of it the stearine which has been separated from the other constituents is made into candles, which are of more uniform quality and higher melting point. (See Stearine Acid.) Tallow is also largely consumed by soap manufacturers (see Soap), and in the dressing of leather. Tallow consists of several compound acid radicals united with the basic radical of glycerine. Of these, stearine is found in largest quantity, with more or less of palmitine and oleine, depending upon the kind of tallow. In the process of soap making the tallow is decomposed, the potash or soda combining with the stearine, &c., and setting glycerine free.—Vegetable tallow is obtained in China in great quantities from the solid sebaceous covering of the seeds of Stillingia sebifera, a tree that is extensively cultivated in that country. (See Tallow Tree.) The tallow, which is brittle, white, opaque, and tasteless, is preferred to animal tallow for making candles. It is regarded as nearly pure stearine. In the United States, the wax-like covering of the berries of the Myrica cerifera is in some localities used for the same purposes as ordinary tallow, under the name of bayberry tallow. It is hard, of olive-green color, and has a fragrant spicy odor. It is also used to a limited extent in pharmaceutical preparations.

Tallow Tree (Stillingia sebifera), a Chinese tree, belonging to the spurge family (Euphorbiaceae), growing from 20 to 40 ft., with long and flexible branches, and long-petioled leaves, much resembling those of the poplars, save that they are entire; the flowers are in dense terminal spikes, the upper part of which consists of sterile flowers, with a few fertile ones at the base; the fruit a small three-lobed capsule with one seed in each cell; the seeds are covered with a white tallow-like substance, which gives the tree its common name, and which the Chinese use for candles. This tree is abundantly naturalized in Georgia and South Carolina near the coast, and in Florida on the St. John's. The time and manner of its introduction do not seem to be known; Michaux in 1803 speaks of it as being in cultivation in Charleston and Savannah, and as also growing spontaneously at that time; and Elliott (1824) speaks of the abundance of the fruit, of which no use is made, though it contains much oil. The seeds produce two oily substances: the tallow-like coating which envelopes them, and an oil within the kernel itself. To obtain the first, the capsules are cracked without bruising the seeds, the shells separated, and the seeds treated with boiling water and the tallow skimmed off; after this, the seeds are crushed and pressed for their oil. The tallow when fresh is creamy white, but it becomes brown on long exposure; the Chinese convert it into candles, which receive a final dip in a mixture of the same substance with some insect wax, which gives them a hard surface and preserves their form in hot weather; the oil is used for lamps; the refuse of the process is used for fuel and for manure. The wood is hard, and is used by the Chinese to make blocks for printing.—Another species, S. sylvestrica, popularly known as queen's delight, is an herb, 2 or 3 ft. high, with alternate, nearly sessile, oblong-lanceolate, serrate leaves, and a dense terminal yellowish spike of male flowers with a few fertile ones at the base; it is found in light dry soils from Virginia to Florida. The root in large doses is emetic and cathartic; in small doses it is regarded by some southern physicians as influencing the secretions, and it is useful in syphilis and skin diseases.

TALMA, François Joseph, a French actor, born in Paris, Jan. 15, 1763, died there, Oct. 19, 1826. He received a collegiate education, and in 1787 appeared at the Théâtre Français in the part of Sédé in Voltaire's Mahomet. He early turned his attention to the substitution of contemporary historical dresses for the fancy costumes then worn, a reform which had been previously and unsuccessfully attempted by Lekain, and which Talma finally effected. His first original creation was the principal part in Joseph Chénier's Charles IX. Besides the parts he performed in Laffosse's Monluens, Racine's Iphigénie and Britannicus, and Voltaire's
Echips, he won great applause in Chénier's Henri VIII., and above all in Ducis's Hamlet, Othello, and Abufar; and under the empire he frequently played before royal audiences. During the restoration some of his most popular performances were political manifestations in disguise; especially in Jouy's Sylla, in which his striking resemblance is open Napoleon to all great sensation. Since 1796 he had devoted his undivided attention to tragedy; but in 1823 he appeared as Damvillo in Casimir Delavigne's comedy L'école des veillards, in which he proved a worthy associate of Mlle. Mars. He represented and may be said to have created more than 70 characters. His last and perhaps most perfect creation was the part of Charles VI. in Delavigne's tragedy, and in which he made his last public appearance in June, 1826.

In 1855 a statue by David d'Angers, representing Talma in his great part of Sylla, was placed in the Tuileries garden. He left an interesting pamphlet Réflexions sur Leshin et sur Part théâtral (8vo, 1815; reprinted in 1856 and 1865). His memoirs by Moreau, by Tissot, and by Duval appeared in 1826; by Largerie, by Lemercier, and by Regnault-Warin, in 1827; and his autobiography, edited by Alexandre Dumas, in 1849-50 (4 vols. 8vo).—His wife, originally Mlle. Vanhove (born at the Hague, Sept. 10, 1771, died in Paris, April 11, 1860), was one of the most remarkable actresses of her day, but retired from the stage in 1811, nine years after her marriage.

TALMAGE, Thomas De Witt, an American clergyman, born in Boundbrook, N. J., Jan. 7, 1822. He graduated at the New York university in 1853, and at the New Brunswick (N. J.) theological seminary in 1856, and ordained pastor of the Reformed Dutch church in Belleville, N. J. He was pastor of the Reformed Dutch church in Syracuse, N. Y., from 1859 to 1862, when he was called to the second Reformed church in Philadelphia; and in 1869 he became pastor of the Central Presbyterian church in Brooklyn, N. Y., in which office he still continues (1876). In 1870 his congregation erected a new church, semicircular, of wood and iron, and capable of seating 3,400 persons. This building, known as the "Brooklyn Tabernacle," was enlarged in 1871 so as to seat 500 more, but was destroyed by fire Dec. 22, 1872. On Feb. 22, 1874, a new "Tabernacle" was dedicated, built in Gothic style, of brick, but retaining the semicircular arrangement, and seating 5,000 persons. It is the largest Protestant church in America. Since the erection of the former tabernacle the church, at Mr. Talmage's instance, has been free, being maintained wholly by voluntary offerings, with no pew rents. In 1872 he organized in the building formerly occupied by the church a lay college for religious training. It is open to persons of all denominations, and gives instruction in philosophy, logic, and general literature, and in natural and systematic theology, sacred history, the evidences of Christianity, the interpretation of Scripture, and sacred rhetoric. Mr. Talmage is a very popular lecturer, but has latterly seldom appeared in that capacity. His sermons are delivered extempore, but are reported, and published in several religious journals in the United States and Great Britain. He has edited a religious newspaper, "The Christian at Work," since 1874, and has published four volumes of "Sermons" (New York, 1872-5); "The Almond Tree in Blossom" (Philadelphia, 1870); "Crumbs Swept Up" (1870); "Abominations of Modern Society" (New York, 1872); "Around the Tea Table" (Philadelphia, 1874); "Old Wells Dug Out" (New York, 1874); "Sports that Kill" (1875); and "Every-Day Religion" (1875).

TALMUD (late Heb., study), the collective name of the Mishnah and Gemara, containing the oral law and other traditions of the Jews. (See Mishnah, and Hebrews, vol. viii., pp. 593-5.) In a limited sense the term is used of the Gemara alone. The Mishnah constitutes the earlier text of the Talmud, which the Gemara elucidates, not so much in the manner of a running commentary as by furnishing additional textual paragraphs with explanatory remarks, given in the name of renowned scholars. Authority is placed against authority, and discussions in the form of dialogues are frequent. The arguments show keenness, but are often fanciful in the extreme. There are two Gemaras (or Talmuds), the Palestinian (Yerushalmi, of Jerusalem) and the Babylonian (Babli). The former contains comments on 39, and the latter on 36 treatises of the Mishnah. The Babylonian, which is later, is the principal authority. The Mishnah is in the Hebrew dialect used after the exile; the Gemara in an Aramaic idiom, very corrupt, especially in that of Jerusalem. The rabbis cited in the Mishnah and the Gemara are the representatives of Jewish religious learning during about six centuries, beginning shortly before the time of the Maccabees. The chief commentator is Rabbi Solomon ben Isaac, known under the abbreviation Rashi. The best compendium of Talmudical decisions is the Mishneh torah of Maimonides. The editions of the Talmud, mostly in 12 folio volumes, including the most important commentaries and notes, are very numerous. They are so arranged that the Mishnah and Gemara, in square Hebrew characters without vowel points, occupy the centre of the page, and the chief commentaries and notes (Rashi's, Tosaphoth, &c.), in a mediaval style of writing, the margins all around. Other commentaries are generally added at the end of each treatise. One of the fullest is the Warsaw edition of the Talmud of Babylon (1859 et seq.). An important essay on the Talmud was published by Emanuel Deutsch in the "Quarterly Review" (1869; reprinted in his "Literary Remains," New York, 1873), and another by M. Grünbaum some months later in the "North
American Review." The best Talmudical lexicon is J. Levy's Wörterbuch über die Talmudim und Midraschim (Leipsic, 1873 et seq.), based, like its predecessors, on Nathan ben Jehiel's Arukh, composed about 1100.

TAM, an E. central county of Iowa, intersected by the Iowa river; area, 720 sq. m.; pop. in 1870, 16,318. The surface is undulating and the soil highly fertile and well timbered. There are rich valleys along the streams, and good water power. It is intersected by the Chicago and Northwestern railroad. The chief productions in 1870 were 1,054,167 bu. of wheat, 1,108,371 of Indian corn, 282,591 of oats, 23,928 of barley, 88,616 of potatoes, 17,080 lbs. of wool, 407,567 of butter, and 25,854 tons of hay. There were 7,959 horses, 6,073 milch cows, 9,218 other cattle, 4,547 sheep, and 17,846 swine; 11 manufactories of carriages and wagons, 3 of furniture, 3 of lime, 5 of saddlery and harness, 8 flour mills, and 3 saw mills. Capital, Toledo.

TAMANDU. See Ant-Eater.

TAMAU. A borough of Schuylkill co., Pennsylvania, on the Little Schuylkill river and on branches of the Philadelphia and Reading railroad and the Central railroad of New Jersey, 16 m. E. N. E. of Pottsville and 60 m. N. E. of Harrisburg; pop. in 1870, 5,960; in 1875, about 7,000. It is in a rich coal and iron region, and has good water power. It contains three machine shops and foundries (one of them the largest in the state), stove works, a boot and shoe factory, a rolling mill, two saw mills and sash factories, a spike factory, a brick kiln, a powder mill, a tannery, a lime kiln, two breweries, seven or eight bottling establishments, a gun factory, two screen factories, and two saddle and harness factories, besides shops of the Philadelphia and Reading railroad company. It has a fire department, a national bank, a banking and trust company, three brick school houses, a daily and a weekly newspaper, and ten churches.

TAMARACK. See Larix.

TAMARIND, the fruit of a leguminous tree, tamarindus Indica, the common and botanical name being derived from the Arabs, who, having learned of the fruit from the Hindoos, called it tamamo-bindi, the Indian date. The tree is indigenous to various parts of Africa, and probably also to India, and it grows wild in several of the East Indian islands; it was early introduced into the West Indies, and is completely naturalized there, and also in portions of Brazil and Mexico. There is only one species of the genus. It is a large handsome tree, 60 to 80 ft. high; its compound leaves, of 10 to 20 pairs of small oblong leaflets, form a dense foliage; the flowers, white when they first open, but soon turning yellow, have purple and brown stamens, are borne in racemes, and are fragrant; the fruit is an indehiscent legume or pod, 5 to 6 in. long, straight or curved, thick, and with a hard, brittle exterior shell; the seeds, from 4 to 12, are each sur-rounded by a tough papery membrane, outside of which, and between it and the shell, is a firm, juicy, very acid pulp, traversed by strong woody fibres, which start from the fruit stalk and run through, throwing off branches, to the opposite end (apex) of the pod. The ripeness of the pods is known by the brittleness of the outer shell; they are picked, and in the West Indies deprived of the shell and packed in a cask, and boiling sirup is poured over them until the vessel is full; when cool the package is headed up and is ready for market. A better kind, rarely found on sale, is prepared by packing the shelled fruit in stone jars, with alternate layers of sugar. In the East Indies the fruit is usually preserved without sugar; the shell is removed and the pulp and seed are kneaded into a mass, and in this form tamarinds are chiefly used on the continent of Europe. The pulp has a brisk acid taste, modified more or less by the amount of sugar used; it contains Tartaric, citric, and other acids, and some principle not well ascertained which gives it a laxative property. Tamarinds are used, especially in tropical countries, to prepare a refreshing drink, by pouring boiling water over the fruit; this drink is also used as a laxative and refrigerant in fevers. By boiling the preserved fruit with a small quantity of water, and straining, the pulp is obtained pure; it is used as an article of diet, and it enters into the composition of a popular laxative, the compound preparation of senna. The wood is useful for timber, and makes a fine charcoal. The shell of the seeds is astringent and contains tannin; their kernels are used as food in India in times of scarcity.

TAMARISK, the name of ornamental shrubs of the genus tamarix (the ancient name, supposed to be from the river Tamaris), of a small family (tamaricinéæ) closely related to the pink family. The genus belongs to the old world, and the more than 50 described species are reducible to about 20, all shrubs or small trees, with minute scale-like or awl-shaped, alternate leaves, which are appressed, and small purplish flowers in terminal spikes or racemes; the parts of the flower are in fours or fives; it has a one-celled ovary, ripening into a pod.
with many seeds, each of which has a small tuft of hairs. The common tamarisk (*T. Gallica*) is abundant on the Mediterranean and Atlantic coasts of Europe, and, though spontaneous in England, is thought to have been introduced there; from its slender graceful habit, and the abundant though not showy flowers, this is deserving of a place among shrubbery; in the northern states it is often killed to the ground in severe winters. *T. Africana* and others are offered in the catalogues, but there is much confusion as to names. *T. mammifera* of the East (regarded by some botanists as a variety of *T. Gallica*) is supposed by some to be the plant the manna from which fed the Hebrews. (See MANNA.) Tamarisk manna is produced in small drops from the *T. Gallica* in Arabia, the branches having been punctured by an insect. Tamarisk galls are found upon *T. orientalis*, in N. W. India, and are used in India instead of oak galls.

**TAMATAVE**, a town and the principal port of Madagascar, on the E. coast, in lat. 18° 10' S., lon. 49° 28' E.; pop. about 7,500. It is built on a point about 350 yards wide, with low sand hills behind it. Nearly all the buildings, excepting a few belonging to foreign residents, are in the native style, with high roofs thatched with rushes. The town has a large trade with the interior, and is fast increasing in commercial importance. The total value of imports in 1873 was $487,255; of exports, $390,930. The principal imports are sheetings, calico, rum, brandy, shoes, and salt; exports, beef, hides, and India rubber. The duties are 10 per cent. in kind on imports, and 10 per cent. in money on exports.

**TAMALILIPAS** (formerly Nuevo Santander), an E. state of Mexico, bounded N. by Texas, E. by the gulf of Mexico, S. by Vera Cruz, and W. by San Luis Potosí and Nuevo Leon; area, 28,-659 sq. m.; pop. in 1871, 108,778. The coast is low and sandy, and several lagoons extend along the shore, the largest being the laguna Madre, more than 100 m. long, and in some places 30 m. wide. The Rio Grande del Norte forms the northern boundary line; other rivers are the Fernando or Tigre, Borbon, Santander, and Tampico; the mouths of all are so much encumbered with bars that they are almost useless for navigation. In the northern part of the state the flat country extends inland for some distance, and the surface then rises into elevated plains; but in the south it is diversified by numerous mountains and fine valleys. During the hot season the climate on the coast is unhealthful, but in the elevated parts of the interior it is temperate and agreeable. There are rich silver and copper mines, but they are little worked. The forests abound in valuable timber. Much of the soil is very fertile, and the grains, vegetables, and fruits of the temperate and torrid zones are easily grown; but little attention is paid to agriculture. Vast numbers of cattle, and to a less extent horses, mules, goats, and sheep, are reared. The chief towns are Ciudad Victoria, the capital, Matamoros, and Tampico.

**TAMBERLIK, Enrico**, an Italian singer, born in Rome in 1820. He made his début at the Teatro del Fondo in Naples in 1841, and subsequently sang in Spain, South America, England, and St. Petersburg, in which city he appeared for 18 consecutive seasons. He visited the United States in 1875, but without success, his voice being impaired.

**TAMBOURINE**, an instrument of the drum species, consisting of a wooden or metal hoop, over which parchment is distended, and which is hung with a set of bells. It is held in either hand and beaten with the knuckles of the other. Certain peculiar effects of sound are produced by rubbing the parchment briskly with the thumb. The tambourine is one of the most ancient instruments known, and, from the graceful use which can be made of it, has always been a favorite with dancers.

**TAMBOURINE, E.**, a government of European Russia, bordering on Vladimir, Nizhegorod, Penza, Saratov, Voronezh, Orel, Tula, and Riazan; area, 26,688 sq. m.; pop. in 1870, 2,150,971. It is level, and partly traversed by steppes in the south. The chief rivers are the Tzna, Moksha, and Vorona, the banks of which are swampy and covered with forests. Grain, hemp, flax, and poppies are raised, especially in the southern part. The other products include timber, peat, iron, saltpetre, and sulphur; and there are many mineral springs. The government is celebrated for its horse markets and studs. **H. A city, capital of the government, 260 m. S. E. of Moscow; pop. in 1867, 28,617. It is the seat of a bishop, and has many churches, schools, and charitable institutions, and manufactories of tallow, woolens, sail cloth, &c. The annual markets are celebrated. Gardens and fine streets make it one of the pleasantest of provincial cities.

**TAMBRINI, Antonio**, an Italian singer, born in Faenza, March 28, 1800. After several
years' practice in the theatre and churches of his native city, he made his public début at Bologna in 1818, and soon rose into great celebrity in Italy. In 1833 he first appeared in London and Paris, and thenceforth visited them annually until his retirement in 1854, when he settled at Sèvres, France. With Grisi, Rubini, and Lablache, he was one of the original performers in Bellini's Puritani, and for several seasons continued a member of that remarkable quartet. His voice, a baritone of great power and sweetness, was shown to the best effect in the operas of Rossini, Bellini, and Donizetti, and he was also an excellent actor both in serious and buffo opera. His finest parts were Figaro and Don Giovanni.

TAMERINI, Pietro, an Italian theologian, born in Brescia in 1737, died in Pavia in March, 1827. In 1772, while professor in the seminary of Brescia, he was appointed by Pope Clement XIV. prefect of studies in the Irish college of San Isidoro at Rome. In 1778 he was appointed by the empress Maria Theresa professor of theology at Pavia and director of studies in the Germano-Hungarian college in that city. In 1793 he resigned his professorship, but in 1797 the French authorities in Lombardy compelled him to fill the chair of ethics and international law in the university. This chair was suppressed in 1798, but restored in 1801, and filled by him till 1818, when he was appointed dean of the faculty of law. He published Idea della Santa Sede (Pavia, 1784), in which he opposed the doctrine of papal official infallibility, while maintaining the jurisdictional supremacy of the Roman see; Introduzione allo studio della filosofia (Milan, 1797); Lezioni di filosofia morale, e del naturale e sociale diritto (4 vols., Pavia, 1806–12); Elementa Juris Natura (Milan, 1818); and Cenni sulla perfettività dell'umana famiglia (Milan, 1823).

TAMERLANE. See Timour.

TAMPIO, or Santa Ana de Tamaulipas, a seaport town of Mexico, in the state of Tamaulipas, on the river Pánico, 5 m. from the gulf of Mexico, and 235 m. N. N. W. of Vera Cruz; pop. about 5,500. It is on rising ground, with wide streets crossing at right angles. The houses are mostly of stone, and there are two churches, a custom house, two hospitals, a prison, and some monuments. The harbor is not very safe, and has a dangerous bar. The commerce is principally with New York, New Orleans, and Liverpool, and to the latter port there is a regular line of steamers. For summer ending Sept. 30, 1874, the value of imports was $715,821; of exports, $1,886,472, including $1,294,015 specie.

TANAGER, a name given to the tanagra, a very large division of the finch family, peculiar to America, and almost entirely confined to the southern portion of the continent, which contains nearly 200 of the more than 220 species described by Sclater. The bill has the upper mandible notched, and is usually triangular at the base and arched; the toes have strong claws, and the hind toe is long and strong. They are small and brilliant birds, the prevailing colors being orange, scarlet, and black; many have a pleasing song, and a few are remarkable for their musical powers; their flight is rapid, movements active, and habits arboreal; most unite in flocks, often in the neighborhood of human habitations, but a few are solitary; the food consists of insects, fruits, and seeds. Of the 20 genera, only a few of the common ones can be here noticed.—In the genus pyranga (Vieill.) the wings are long and pointed, the second quill nearly as long as the third, which is longest; tail moderate and nearly even. One of the most richly colored of North American birds is the scarlet tanager (P. rubra, Vieill.), about 7 ½ in. long and 11 ½ in. in alar extent; the male in the breeding season is of a general bright carmine color, with the wings and notched tail velvety black; the female is dull yellowish green, which is also the color of the young and the other sex in autumn and winter.

Scarlet Tanager (Pyranga rubra)
color, and the gape, as in others of the genus, well provided with bristles bending downward; the females olive above and reddish yellow below, as are the young males; the color is lighter and more rosy than in the scarlet tanager, and the bill is much larger. It is found in the S. Atlantic and gulf states and Guatemala, is so sensitive to cold that it rarely goes further north, unless it rains, and is not seen in the southern states after the middle of September; it is of solitary habits, preferring growths of stunted hickories and oaks. The song is like the syllables "chicky, chucky, chuck," and is chiefly at night; the food consists of insects, especially large beetles, taken on the wing; the nest is rudely made and insecurely fastened to its supporting branch; the eggs are four or five, light blue, and are incubated for 12 days by both sexes. In the genus tanagra (Linn.) the bill is short, elevated at base, rather triangular; the wings moderate, with the third and fourth quills longest. There are many species of South American, living in troops; the nest is carelessly made. The bishop tanager (T. episcopus, Linn.) is purplish violet, with the small wing coverts bluish white, the middle shaded with violet, the larger ashy, and the wing and tail blackish bordered with blue.—

The genus callisto (Boie) comprises about 30 species of the most beautifully variegated of tropical birds, all inhabitants of the dense South American forests. The best known species is the festive tanager (C. festiva, Boie), which has the throat and crown blue, forehead and upper back black, collar scarlet, rest of plumage parrot green. The celebrated orga-
nista, remarkable for the sweetness and great compass of its voice, belongs to the genus euphonia.

TANAI S. See Don.

TANANARIVO, or Antananarivo, a city of Madagas-
car, capital of the province of Imerne in the territory of Ankova, and the residence of the so-called sovereign (now queen) of Madagascar, near the middle of the island, in lat. 18° 56′ S., lon. 47° 28′ E.; pop. about 75,000. It is on a long irregular hill in the midst of a highly cultivated valley, 18 m. long by 10 m. wide, and 7,000 ft. above the sea. The houses of the better classes are substantially constructed of wood, with high bamboo roofs thatched with rushes; those of the poorer classes are of split bamboo covered with mats. The palace, on the summit of the hill, is rect-
gangular, about 60 ft. high, with a tall roof pierced with three rows of windows, and with double verandas. A smaller palace near by is the residence of the prince royal, and the houses of the chief nobles and military officers are in the immediate vicinity. N. of the pal-
ace is a natural amphitheatre, capable of hold-
ing 100,000 persons, where large public assem-
blys are held. The doves are let in the open air W. of the palace, and a little beyond is a precipice 300 ft. high, down which those con-
 victed of witchcraft and sorcery are thrown.

Through the efforts of the missionaries a marked improvement has taken place of late years in the habits and manner of life of the people, who have adopted many European cus-
toms. Schools and chapels have been estab-
lished, printing offices opened, and many thou-
sand Bibles and other books printed.

TANCRED, an Italian crusader, born in 1078, died in Antioch in 1112. He was a son of the marquis Odo or Ottobunus and of Emma, a daughter of Tancred de Hauteville and sister of Robert Guiscard, duke of Apulia. He took the cross under his cousin Bohemond, son of Robert Guiscard, made over his heritage to his younger brother, and embarked in 1096 from Taranto. In the plains of Châlcedon his troops joined those of Godfrey of Bouillon, with whom he formed an intimate friendship. At the siege of Nicaea in 1097 he distinguished himself, at the battle of Doryleum saved the army of the cross from destruction, and after the taking of Nicaea led the advanced guard through Asia Minor. He took possession of Tarsus and Malmistra, to both of which Baldwin laid claim, giving rise to a bitter quarrel; but they were afterward reconciled. He achieved great distinction during the siege of Antioch; and at the storming of Jerusalem he was one of the first to mount the walls. In the carnage and rapine which followed, he almost alone of the Christian knights manifested compassion, and at the risk of his own life saved thou-
sands of the captured. When the sultan of Egypt marched toward Jerusalem, Tancred de-
feated his advanced guard, and shared in the subsequent victory at Ascalon, Aug. 12, 1099. He afterward took Tiberias, beleaguered Jaffa, and was made prince of Tiberias or Galilee. Bohemond, now prince of Antioch, being taken prisoner by the Saracens, Tancred marched to his relief, and administered his government during his detention; and when Bohemond after his release went to Europe to arm the West against the Byzantine empire, he left the defence of Antioch to Tancred. During his absence his principality was attacked on all sides, but was heroically defended by Tancred, who reduced Artesia, besieged Tripoli in 1109, and subsequently withstood in Antioch a se-
vere siege from the Saracens. Bohemond died at Salerno, and the host he had collected was scattered. Tancred now resumed the offen-
sive, defeated the Saracens, and forced the sultan to evacuate Syria. His exploits have been celebrated, partly in prose, partly in verse, by Raoul de Caen, in Les gestes de Tancrède; and he is one of the principal characters of Taso-
so’s “Jerusalem Delivered.”

TANEY, a S. W. county of Missouri, border-
ing on Arkansas, and drained by White river and its affluent; area, about 700 sq. m.; pop. In 1870, 4,407, of whom 10 were colored. The surface is hilly, and the soil fertile. The chief productions in 1870 were 3,735 bushels of wheat, 135,577 of Indian corn, 11,975 of oats, and 48,250 lbs. of butter. There were 1,163
horses, 1,025 milch cows, 1,594 other cattle, 3,189 sheep, and 9,500 swine. Capital, Forsyth.

TANEY, Roger Brooke, an American jurist, born in Calvert co., Md., March 17, 1777, died in Washington, D. C., Oct. 12, 1864. He belonged to a Roman Catholic family, graduated at Dickinson college, Pa., in 1795, was admitted to the bar in 1799, commenced practice in his native county, and was elected a delegate to the general assembly as a federalist. In 1801 he removed to Frederick, and in 1816 was elected to the state senate. In 1832 he removed to Baltimore, where he continued to reside until his death. In 1824 he identified himself with the supporters of Gen. Jackson, but was nevertheless made attorney general of the state by the federal governor in 1827. In 1831 he was appointed by President Jackson attorney general of the United States. He supported the president in his controversy with the United States bank, and in September, 1833, was appointed secretary of the treasury on the dismissal of Mr. Duane from that office; and he immediately issued orders for the removal of the government deposits from the United States bank to the local banks selected by him as agents of the government. When his nomination was communicated to the senate, that body rejected it by a vote of 28 to 18. In 1835 he was nominated to fill a vacancy on the bench of the supreme court, but was not confirmed by the senate. When Chief Justice Marshall died, and the president nominated Mr. TANEY as his successor, the senate, now having an administration majority, confirmed the nomination, and he took his seat upon the bench in January, 1837. In the decision of the questions which came before him as a judge he displayed great ability; and though his views of constitutional law were less in the direction of centralization than those of his predecessor, he did not fail to sustain to the fullest extent the powers which he believed were justly claimed for the federal government. A striking illustration of this is the case of Ableman v. Booth, 21 Howard, 506 (1859), in which he denied the right of the state courts to inquire into the validity of imprisonment by or under a claim of federal authority, and asserted exclusive jurisdiction for that purpose in the federal courts; a decision opposed to the general practice that had before prevailed, but which has recently been reaffirmed by the court. The most noted of his decisions was that in Dred Scott v. Sandford, 19 Howard, 398. In that case Scott, who was held as a slave in Missouri, brought suit to recover his freedom, suing in the federal court on the ground of being a citizen of a different state from the defendant, and claiming his freedom because of having been taken by his master into territory made free by the act of congress commonly called the Missouri compromise. The case, having been decided in the circuit court, was removed to the supreme court. The decision (1857) declared that Scott was not entitled to bring suit in the federal court, because he was not a citizen; the chief justice in an elaborate opinion declaring that for more than a century previous to the adoption of the declaration of independence negroes, whether slave or free, had been regarded "as beings of an inferior order, and altogether unfit to associate with the white race, either in social or political relations; and so far inferior that they had no rights which the white man was bound to respect." Having reached this conclusion, which of itself put an end to the case, the court went further, and considered the main question involved, namely, whether it was competent for congress to exclude slavery from the territories of the Union; and the majority, Justices McLean and Curtis dissenting, denied the power. The party dissatisfied with this conclusion made it the occasion for a severe arraignment of the court, not only because of the views held as to the right to legislate against slavery, but because those views were expressed in a case not calling for them, inasmuch as the court had already decided that it had no jurisdiction. The decision, in its denial of the right of citizenship to negroes, was disregarded by the executive department after Mr. Lincoln became president, and by the judicial also when Mr. Chase became chief justice and admitted colored persons as practitioners in the federal courts. In May, 1861, Chief Justice TANEY was applied to for a writ of habeas corpus on behalf of John Merryman of Baltimore, who had been arrested under the orders of a federal general, and promptly issued the writ. The officer to whom it was addressed declined to obey, on the ground that Merryman had been arrested on a charge of treason, and that the officer had been duly empowered by the president to suspend the writ of habeas corpus. Upon this the chief justice ordered an attachment to issue, but as it was impossible to serve this, he wrote out his opinion denying to the president the power to suspend the writ of habeas corpus, and insisting that it could only be done by legislative authority. To this opinion no attention was paid at the time, but congress soon passed the necessary law to meet the objection. A memoir of his life, prepared at his request by his friend Prof. Samuel Tyler (Baltimore, 1872), includes his autobiography, which only comes down to 1801. A bronze statue of him by Rinehart, ordered by the state of Maryland, was unveiled in Annapolis, Dec. 10, 1872.

TANZANY. (the meeting place of waters), a lake in central Africa, discovered by Burton and Speke on Feb. 13, 1858. It occupies a long depression in a region of considerable elevation, S. of the Victoria and Albert lakes and N. W. of Lake Nyassa. It is included between lat. 3° and 9° S., and lon. 29° and 32° 30'E., and extends about 400 m. in a N. W. and S. E. direction, its width varying from 10 to 60 m. Its height above the level of the sea,
according to the latest observations (made by Lieut. L. V. Cameron, R. N., 1874), is 2,711 ft. The water is deep and pure, though peculiar in taste. The northern portion of the lake, which was thoroughly explored by Livingstone, lies between the 29th and 30th meridians, and narrows as it trends northward, being largely hemmed in by mountains on or near the coast. Nearest the W. shore, just S. of the 4th parallel, is the large island of Mozima, 40 m. long. At its N. extremity the lake receives the waters of the Rusizi. S. of lat. 6° the lake is wholly E. of the 30th meridian. The E. coast is hilly. The wide bay which forms the S. extremity of Tanganyika is the Lake Lembata of Livingstone. Between lat. 6° and 7° the W. coast rises into mountains 2,500 ft. high, wooded to their summits. On both sides innumerable small streams and many considerable rivers flow into the lake. The river Lukuga, discovered by Lieut. Cameron on the W. coast in May, 1874, which is 300 to 500 yards wide and from three to five fathoms deep, leaves the lake, near lat. 6°, with a current of 1-2 knot an hour. This explorer traced the river four or five miles, until his boats were stopped by the density of the aquatic vegetation.—The hydrographic relations of Lake Tanganyika have been the subject of much controversy. As to its asserted connection with the Nile system, see Nile. According to native information, the Lukuga flows into Livingstone's Lualaba, but Capt. Burton regards this outlet as really such only in the season of floods, when it acts as a surplus drain, becoming in turn a tributary to the lake in the dry season; a view which is evidently founded on Livingstone's observation that from February to November the surface water of the lake, as seen at Ujiji, moves northward at the rate of about a mile an hour, while during the remainder of the year there is a similar gentle movement in the opposite direction.—The shores of the lake are rich in beautiful scenery, and in many portions are thickly inhabited. The principal place upon it is the town of Ujiji, on the E. coast.

TANGER, or Tangiers (Moorish, Tanja), a city and seaport of Morocco, near the W. entrance of the strait of Gibraltar, in lat 35° 47′ N., lon. 5° 48′ W.; pop. about 12,000. It is on high ground overlooking a spacious bay, surrounded by a wall, and defended by several forts. Its streets are narrow and dirty. The harbor was once good, but is now so filled up with sand that vessels of 300 or 400 tons only can enter it. The entrances in 1873 were 525 vessels, tonnage 48,956; clearances 520, tonnage 49,086. The total value of the imports was $1,755,125, of which $600,000 was in specie; of the exports, $1,216,080. Its trade consists principally in supplying Gibraltar, Cadiz, and Lisbon with provisions.—Tanger is the ancient Tingis, supposed to have been founded by the Carthaginians. It was an important city under the Romans, and under Claudius became the capital of Mauritania Tingitana. In 1471 it fell into the hands of the Portuguese, who held it till 1662, when it was ceded to England as a part of the dowry of Catharine of Braganza, queen of Charles II. The British abandoned it in 1684, after destroying the mole which they had built. In 1844 it was bombarbed by the French.

TANGIPAHOA, a S. E. parish of Louisiana, bounded N. by Mississippi and S. by Lakes Pontchartrain and Maurepas, and intersected by the Tangipahoa river; area, about 720 sq. m.; pop. in 1870, 7,928, of whom 2,994 were colored; in 1875, 7,248, of whom 3,196 were colored. The surface is low and level, and the soil in some parts fertile, in others sandy. It is traversed by the New Orleans, Jackson, and Great Northern railroad. The chief productions in 1870 were 64,093 bushels of Indian corn, 35,809 of sweet potatoes, 1,642 bales of cotton, 20,423 lbs. of butter, 9,071 of wool, and 57,030 of rice. There were 772 horses, 1,480 milch cows, 4,877 other cattle, 3,457 sheep, and 6,270 swine. Capital, Amite City.

TANJORE. I. A district of Madras, British India, bounded N. by Trichinopoly and South Arcot, E. and S. E. by the bay of Bengal, S.
country is watered by the Coleroon and Cavery and their numerous branches. There are 64 irrigation tanks in the district, and extensive works connected with the rivers, so that the entire area of irrigation in 1872-3 was 748,673 acres. The surface consists for the most part of an extensive plain of great fertility. Cotton goods are manufactured, and salt is made in the neighborhood of Point Calymere. The inhabitants are nearly all Hindoos, and their industries have been more perfectly preserved than in most other parts of India. The district forms the inland boundary of the French coast settlement of Carilcal.  

II. A city, capital of the district, on a branch of the Cavery, 180 m. S.W. of Madras and 45 m. from the bay of Bengal; pop. about 80,000. It contains two forts, the greater about 4 m. in circumference and the lesser about 1 m., both strong and well constructed. The rajah's palace stands in the centre of the great fort. The pagoda in the small fort is considered the finest building of the kind in India. The manufactures consist of silk, muslin, and cotton goods. Tanjore was founded about A.D. 814, and became the capital of a Hindoo principality of the same name, which was absorbed by the Maharattas in the 17th century. The British assumed the government about the year 1800.

**TANNAHILL, Robert**, a Scottish poet, born in Paisley, June 3, 1774, died May 17, 1810. He worked all his life as a weaver. His volume of "Poems and Songs" (1807) became very popular; but while revising it he fell into a state of despondency, aggravated by the refusal of Constable to print a new edition, burned all his new and revised poems, and drowned himself. An enlarged edition of his remains, with a memoir, was published at Glasgow in 1888, and reprinted at Paisley in 1874.

**TANNCIC ACID, or Tannin.** The astringent principles existing in a great variety of plants, which render them capable of combining with the skins of animals to form leather, of precipitating gelatine, of forming bluish black precipitates with the per-salts of iron (or if a free acid be present a dark green color), were formerly termed tannin. These substances, being found to possess acid properties, are now known as tannic acid, and various distinctive names are given to them as they are found of different chemical compositions, though agreeing in their essential properties. Thus the tannic acid derived from the gall nut is termed gallotannic acid; that of the oak, querutannic acid; of the fustic (morus tinctoria), moritannic acid; of the cinchona, quinotannic acid, &c. The principal sources of tannin have been named in the article LEATHER, and the method of extracting it has been particularly described in the article on GALLS, which are the most abundant source of it. Besides this variety, which is the same as that existing in the bark and leaves of many forest trees, fruit trees, and shrubs, and in some roots, as those of the tormentilla and bistort, there is another less known, as the tannin of the catechu and kino, which precipitates the salts of iron dark green instead of blue. Gallotannic acid when pure is a whitish, uncrystallizable solid substance, without odor, intensely astringent to the taste; it dissolves freely in water, to a less extent in dilute alcohol, and sparingly in ether. The best solvent for medical uses is glycerine. It changes blue litmus paper to red, and expels carbonic acid from its compounds with effervescence. Its formula is C_{5}H_{10}O_{7}. Its aqueous solution exposed to the air absorbs oxygen, and is converted into gallic acid. Besides its use in tanning, gallotannic acid is employed to produce with the salts of iron the gallotannate of iron, which is the basis of most of the writing inks. It is also employed in medicine for its astringent property, chiefly in checking hemorrhages, as a wash for ulcers, ophthalmic affections, &c. If taken internally in large quantities, it is an irritant; but in small doses it is absorbed and makes its appearance in the urine as gallic acid, having undergone a process of oxidation in the organism. The combinations of tannic acid with iron and with leafl have been applied in the form of ointments to the dressing of ringworms, gangrenous sores, &c.

**TANNING.** See LEATHER, vol. x, p. 275.

**TANNSY** (Fr. {athanasie}, contract to tanaisie, from Gr. ἀβατοσία, immortality, in allusion to some supposed preservative quality of the plant, or to its durable flowers), {Tanacetum vulgare}, a plant of the composite family, a native of Europe, which was formerly cultivated, but has escaped from gardens and become a common roadside weed. It is a perennial herb, with large, twice or thrice pinnately divided, deep green leaves, and stems 2 to 4 ft. high, bearing corymbs of heads of golden yellow flowers, which are nearly all tubular and fertile. A variety called double tansy has the
leaves more cut and crisped. The leaves have a strong fragrance, due to a volatile oil and a bitter, aromatic taste, and have long been in use infused in spirits as a domestic aromatic tonic; in former times it was held in much esteem as a remedy in dropsy, and as a worm-destroying medicine. This volatile oil is kept in the shops, and is popularly supposed to produce abortion; it is highly poisonous, and its use for criminal purposes has often killed the mother. The green leaves were formerly used in cookery, but have been superseded by foreign spices, though tansy puddings are still made in England.—A native species, *T. Huronense*, found in Maine and on the great lakes, is only of botanical interest.

**TANTALUM.** See Columhium.

**TANTALUS**, a character of Greek mythology, differently described as king of Argos, Corinth, Lydia, or Paphlagonia. Having given offence to the gods, he was punished in the lower world by confinement in a lake, where he was tormented with thirst, yet could not drink, for the waters always receded from his lips. Branches laden with fruit hung over his head, and when he stretched forth his hand to take the fruit the branches withdrew.

**TAOS**, the N. W. county of New Mexico, bordering on Colorado and Arizona; area, about 7,500 sq. m.; pop. in 1870, 13,079. It is watered by the Rio Grande and the Rio de Chama, one of its tributaries, and by the San Juan, a branch of the Colorado, and is crossed by several spurs of the Rocky mountains. Gold mining is carried on to some extent. The chief productions in 1870 were 153,799 bushels of wheat, 80,224 of Indian corn, 21,542 of oats, 15,040 of peas and beans, 2,323 of potatoes, and 90,503 lbs. of wool. There were 1,045 horses, 999 mules and asses, 924 milch cows, 2,600 working oxen, 4,104 other cattle, 81,108 sheep, and 638 swine; 2 flour mills, and 1 quartz mill. Capital, Fernandez de Taos.

**TAPESTRY** (Gr. τάπης, a carpet), an ornamental figured cloth, used for lining the walls of apartments, or for covering articles of furniture. The Egyptians and Hebrews attained great skill in ornamenting textile fabrics by colored yarns worked in by the hand, and also by the loom. The art was early introduced into France, and about the 9th century tapestry was made with the loom; but the fabrication with the needle continued as an occupation for ladies of the highest rank. Up to the 12th century the use of tapestry was limited to the adornment of churches and monasteries; but after this period it began to be adopted in dwellings. In France the workmen employed in the manufacture were originally called *sarazino* and *sarazinos*, indicating the origin of the art as derived from the Saracens. The finest work in the 14th and 15th centuries was produced by the Flemings, and about this period the principal manufactories in the west of Europe were at Bruges, Antwerp, Arras, Brussels, Lille, Tournay, and Valenciennes. Florence and Venice at that time produced very rich and costly tapestry; but in the 16th century the more ornamental work with threads of gold and silver was introduced in the manufacture of Fontainebleau. One of the most famous pieces is the Bayeux tapestry, commemorating the Norman conquest of England. (See Bayeux Tapestry.) About the end of the reign of Henry VIII. the art of weaving tapestry was introduced into England. In the reign of James I. the manufacture was established at Morthlake in Surrey under royal patronage. For the earlier designs old patterns were employed, but afterward original scenes were furnished by Francis Cleyn. The method of weaving tapestry in what is called the **haute-lisse** or high warp has been described in the article Gobelins.—See Notice historique et descriptive sur la tapisserie dite la reine Mathilde, by the abbé Laffetay (Bayeux, 1874); and “The Bayeux Tapestry, reproduced in Autoype Plates, with Historic Notes by Frank Rede Powke” (Arundel society, London, 1875).

**TAPEWORM.** See Entozoa, vol. vi., p. 683.

**TAPIOCA.** See Cassava.

**TAPIR (tapirus, Cuv.),** a genus of ungulate mammals, characterized by a nose prolonged into a short, movable proboscis; skin very thick and covered with close short hair, the neck furnished with a kind of stiff mane; tail very short; ears small, erect, and pig-like; four toes on the fore and three on the hind feet, separate and ending in nail-like hoofs; skull pyramidal as in the hog, with the nasal bones much arched for the muscles of the proboscis; teeth, 6 incisors and 2 small canines in each jaw, and molars 14 above and 12 below. The tapirs look like hogs, but the legs are longer; they inhabit the moist tropical forests of South America and of the Malay peninsula and archipelago, usually sleeping by day in retired places, and feeding at night on fruits, grasses, and other vegetable substances, though they are as omnivorous as the hog; like their congeners, they are fond of rolling in the mud and water, and are excellent swimmers; they are gentle and easily tamed; when pursued they
TAPPAN, Henry Philip, an American clergyman, born at Rhinebeck, N. Y., April 23, 1805. He graduated at Union college in 1825, studied at the Auburn theological seminary, was for a year assistant pastor of the Reformed Dutch church in Schenectady, and in 1828 was settled as pastor of a Congregational church at Pittsfield, Mass. In 1832 he was appointed professor of moral and intellectual philosophy in the university of the city of New York. In 1838 the faculty resigned, and for some years he conducted a private seminary. In 1852 he was elected president of the university of Michigan, which post he held till 1863, since which time he has resided chiefly in Europe. His principal works are: "Review of Edward's Inquiry into the Freedom of the Will" (12mo, New York, 1839); "The Doctrine of the Will determined by an Appeal to Consciousness" (1840); "The Doctrine of the Will applied to Moral Agency and Responsibility" (1841); "Elements of Logic, together with an introductory Review of Philosophy in general, and a preliminary View of the Reason" (12mo, 1844; revised and enlarged ed., 1856); "Treatise on University Education" (1851); and "A Step from the New World to the Old" (2 vols. 12mo, 1852). His three works on the will were republished in Glasgow (1 vol., 1857).

TAR, a thick, black, viscid, impure turpentine, procured by burning the wood of pinus palustris, P. sylvestris, and other species of pine and coniferous trees; also obtained as a product of the destructive distillation of peat, bituminous coals, and shales. It was known to the ancient Greeks, and Dr. Clarke, who describes the method of manufacturing it in the forests of Bothnia, says there is not the smallest difference between the processes there practised and those of ancient Greece. Along the whole coast of the gulf of Bothnia the inhabitants are very generally engaged in this occupation. They make use of the roots of the fir trees, with logs and billets of the same, which they break in a cleft, and place in a cavity in the ground, generally in the side of a bank. In the bottom of this cavity is placed a cast-iron pan from which a spout leads out through the bank. The heap is covered over with turf, and is then fired, as in making charcoal. Tar collects in the latter part of the process of charring, and runs off through the spout into barrels. Tar is a product where charcoal is the chief object of the process, but is seldom obtained in quantities sufficient to render it an object to collect it, except in charring the resinous woods of the pine family. In Sweden, where the business is also important, some peculiar methods are adopted to increase the yield of tar. Trees of no value for the saw mill are partially peeled of their bark a fathom or two up from the ground, not enough to kill them, but only to check their growth. After five or six years, when cut down, the wood is found to be much richer in resinous matters which produce tar. It is noticed that the condition of the weather during the process of charring may make a difference of 15 or 20 per cent. in the yield of tar. In the United States tar is produced in almost all parts of the country where pitch pine and the pinus australis are found. Along the coast of the southern states, especially of North Carolina, Virginia, and Georgia, the business is carried on upon a large scale in connection with the manufacture of turpentine, rosin, and pitch. Old trees which have ceased to produce turpentine, and dead wood which is rich in resinous matter, are selected for the coal pits. The process does not materially differ from that already described. The product is not only sufficient for home consumption, but large quantities are annually exported.—In the preparation of pyrroligous acid, tar is one of the products of the destructive distillation, settling in the bottom of the tanks in which the liquids are collected. The variety known as coal tar is obtained when bituminous matters are distilled for the production of illuminating gas. (See GAS, and PETROLEUM.) Both wood and coal tars are complex mixtures of a variety of liquids holding solid matters in solution or suspension; thus, wood tar, the internal stack, fitch containing the hydrocarbons included in the term eupion, and the benzole series of hydrocarbons, including toluol, xylene, cymole, also naphthaline, &c., besides oxidized compounds, including creosote, picamum, kapnomor, &c. Rosin and paraffine are among its solid contents. When its volatile products have been driven off by distillation or boiling, the black carbonaceous residue is known as pitch. The composition of coal tar is materially different, it contains all the great variety of products derived from the destructive distillation of bituminous coal as obtained from the gas works. Coal tar, a refuse product of these works, may be considered in

if the fangs could be opened at an angle proper to pierce his skin. The great hairy spiders of the genus *mygale* are called tarantulas in the southwestern states, and are destroyed by the large red-winged wasp, *pompilus formosus.*

**TARARE,** a town of France, in the department of the Rhône, on the Tardine, 21 m. N. W. of Lyons; pop. in 1872, 18,694. It is situated at the foot of Mount Tarare, and is celebrated for its muslin manufactures.

**TARASCON** (anc. Tarascon), a town of France, in the department of Bouches-du-Rhône, on the left bank of the Rhône, 10 m. N. of Arles and 50 m. N. W. of Marseilles; pop. in 1872, 12,454. It is connected with Beaucaire, on the opposite side of the river, by one of the finest suspension bridges in France. It contains a magnificent castle of the counts of Provence, on a rock overhanging the river, built in the 15th century on the site of a temple of Jupiter, and now used as a prison. The church of St. Martha is a Gothic edifice commenced in the 16th century, with a richly sculptured entrance and a crypt with remarkable tombs and a marble statue of Martha. Silk, woollen, and cotton goods are manufactured.

**TARBEs,** a town of France, capital of the department of Hautes-Pyrénées, beautifully situated on the left bank of the Adour, 25 m. E. S. E. of Pau; pop. in 1872, 16,565. It is the seat of a bishopric dating from about A. D. 400, and has a modern cathedral built on the site of the castle of Bigorre. It was injured during the middle ages by successive invaders, and was twice burned by the Huguenots in the 16th century.

**TARE.** See Vetch.

**TARENTUM.** See Taranto.

**TARGUMs** (Chal. *targem,* to translate), the general name given to the Chaldee, or more accurately Aramaic versions and paraphrases of the Hebrew Scriptures. On account of the many vicissitudes of the Jewish people in the course of their history, and more especially on account of their long captivity in the Babylonian empire, the knowledge of the ancient Hebrew language had gradually declined, and Aramaic had become the language of the people. Hence after the time of Ezra, whenever the Scriptures were read in public by the priest, an interpreter (*meturgenmon*) translated them into the Aramaic. This translation it was forbidden to reduce to writing; but the rule was gradually violated, and by the end of the 2d century A. D. the practice of writing translations or "targums" had become fixed. The work of collecting and comparing the versions of individual translators, and reducing them to one, was probably accomplished about the end of the 3d century. The oldest and best of the targums is on the Pentateuch, usually called the "Targum of Onkelos," or "of Onkelos the proselyte." The existence of Onkelos, and his name, have been fruitful themes of discussion among Biblical scholars, but it is now pretty generally agreed that he had nothing whatever to do with the targum attributed to him. Its language is Chaldee, very similar to that of the book of Daniel, and as faithful to the original as its destination as a version for the people would permit. A principal feature is its careful avoidance of all anthropomorphic expressions. Its final redaction probably took place about A. D. 800, and in Babylonia. The targum second in time and importance is that called the "Targum of Jonathan ben Uzziel," or "Targum on the Prophets," embracing Josua, Judges, Samuel, Kings, Isaiah, Jeremiah, Ezekiel, and the twelve minor prophets. It probably originated in Palestine, and was completed in Babylon about the middle of the 4th century. There is no evidence that Jonathan ben Uzziel ever had anything to do with it, and it was undoubtedly the work of many hands. The third and fourth targums are essentially one work. The former, embracing the whole Pentateuch, is the later, and is called like the second the "Targum of Jonathan ben Uzziel," but as he could not possibly have had any connection with it, it is often called the "Targum of Pseudo-Jonathan." The fourth, called "Targum of Jerusalem," a name originally common to both this and the third, embraces portions of each of the books of the Pentateuch. The "Targum of Pseudo-Jonathan" is an emended and completed edition of the "Targum of Jerusalem," the latter being itself a collection of emendations, amplifications, &c., to the Targum of Onkelos. They originated in Syria or Palestine in the latter half of the 7th century. The fifth class of targums are on the Hagiographa, and are usually called "Targums of Joseph the Blind," who had undoubtedly been dead many centuries when they were written. They probably originated in Syria some time between the 9th and 12th centuries. They embrace: 1. Proverbs, Job, and Psalms. The targum of Proverbs is both faithful and complete; those of Job and the Psalms are mere collections of fragments. 2. Targums on the Song of Songs, Ruth, Lamentations, Esther, and Ecclesiastes. They appear to be all by one author, but their differences from the originals are so great that they can hardly be called versions. Their dialect is about equally related to East and West Aramaean. 3. Two targums on Esther. One of these, known as the second targum, is for the most part a collection of tales and legends. The sixth targum is on Chronicles, and appears to have been made in Palestine at a very late period. The seventh targum, according to the enumeration of Deutsch, is on Daniel, has been known only within the last 30 years, and exists so far as known only in a translation of a portion of it into Persian. It is not usually included in the list of targums. The eighth targum is on the apocryphal portions of Esther, and has no particular value. Many fragments of lost targums are scattered in va-
rious works of Semitic literature. There is no edition of any of the targums which deserves to be called critical. Most of them are included in the large polyglot editions of the Bible, and a much improved edition of the "Targum of Onkelos" was published at Wilna in 1852.

—For an extended discussion of the targums, condensing almost all the learning of the subject, see E. Deutsch's "Literary Remains" (New York, 1874).

TARIFA, a town of Spain, in the province of Cadiz, Andalusia, on the southernmost point of the kingdom, in lat. 36° 3' N., lon. 5° 35' W., 52 m. S. E. of Cadiz, and 25 m. S. E. of Cape Trafalgar; pop. about 12,000. It is surrounded by old walls and towers, and has a strong fortress. A Moorish castle within the walls is now used as a prison. Tarifa was named from Tarif ibn Malek, a Saracen chief who landed here from Africa in 710, a year before the great Moorish invasion of Spain. During the Moorish domination all vessels passing through the straits of Gibraltar were here levied on to pay duties; whence the word tariff. In 1292 Sancho the Brave of Castile captured it, and Alonso Perez de Guzman held it against the Moors in 1294. About 1340 the Moors besieged it again, but were driven away by the kings of Castile and Portugal. In 1811 it was garrisoned by 1,200 British troops and 600 Spaniards, who held it from Dec. 19 to Jan. 4, 1812, against 13,000 French troops. The French captured the place in 1823.

TARLETON, Bannastre, an English soldier, born in Liverpool, Aug. 21, 1754, died Jan. 23, 1833. He was a lieutenant colonel in Cornwallis's army, and raised in this country a troop called the British legion, which contributed largely to British successes in the south. He massacred Col. Buford's regiment, stationed on Waxhaw creek, May 29, 1780, and "Tarleton's quarter" became a synonyme for cruelty. In 1781, with 1,100 men, he attacked an inferior American force near the Cowpens under Gen. Morgan, and was defeated. He was with Cornwallis during the rest of the war, and was present at the surrender of Yorktown. After his return to England he was promoted to the rank of colonel, and was so popular that in 1790 he was sent to parliament free of expense from his native town. In 1817 he received the commission of major general. He was created a baronet, Nov. 6, 1818. He published a "History of the Campaigns of 1780 and 1781 in the Southern Provinces of North America" (4to, London, 1878).

TARN, a S. department of France, in Languedoc, bordering on the departments of Aveyron, Haute-Garonne, and Tarn-et-Garonne; area, 2,217 sq. m.; pop. in 1872, 332,718. The S. E. part is mountainous, and the rest of the department is traversed by hills. The principal river is the Tarn, a tributary of the Garonne, which receives the Aveyron, Tescun, and Agout; and near Albi there is a series of falls called Saut-du-Tarn. Coal, iron, lead, copper, gypsum, and porcelain and pottery clay are found. The vine is cultivated, and much brandy is made. Woollen, cotton, and silk goods, iron, leather, and paper are manufactured. It is divided into the arrondissements of Albi, Gaillac, Castres, and Lavaur. Capital, Albi.

TARN-ET-GARONNE, a S. department of France, in Gironde, bordering on the departments of Lot, Aveyron, Tarn, Haute-Garonne, Gers, and Lot-et-Garonne; area, 1,436 sq. m.; pop. in 1873, 221,610. The whole department belongs to the basin of the Garonne, and the surface has a gradual slope to the west. The Garonne, Tarn, and Aveyron are all navigable in this department. Iron, coal, and marble are found. About two thirds of the surface is arable, one tenth is forest, and one tenth is devoted to the vine, the wine being excellent. The mulberry for rearing silkworms is extensively cultivated. Mules and poultry are reared in great numbers and are a principal source of wealth. The products include iron and some coal and marble. Woollen, linen, and silk goods, cutlery, iron, and beet sugar are manufactured. The department is divided into the arrondissements of Montauban, Moissac, and Castelsarrasin. Capital, Montauban.

TARPEIA, a Roman maiden, the daughter of Spurius Tarpeius, who, according to the legendary history of the period, was governor of the citadel on the Capitoline hill when the Sabines invested Rome. Tarpeia saw and admired the bracelets of the Sabines, and offered to betray the citadel to them for "what they wore on their left arms." She opened the gate at night, and as they passed in they threw upon her their shields, which were worn on the left arm, and crushed her. She was buried on that part of the hill called the Tarpeian rock.

TARQUIN, I. Lucas Tarquinius Priscus ("the Elder"), fifth king of Rome, assassinated about 578 B.C. According to the common story, his father was a Corinthian nobleman named Demaratus, of the family of the Bacchiade, who fled on the overthrow of his order by Cypselus and settled at Tarquinii in Etruria. The son, whose original name was Lucumo, inherited great wealth, married a noble Etruscan woman named Tanaquil, who was skilled in augury, and at her instigation removed to Rome to seek a higher career than any within his reach in Etruria. He gained the confidence of King Aeneus Marcus, became guardian to his children, and on the king's death was elected to the vacant throne, about 616. He destroyed the Sabine town of Aipples, and subdued a number of Latin towns. His greatest exploit was the defeat of the Sabines, who advanced to the gates of Rome, but were driven back and at length completely overthrown upon the Anio. He built the vast sewers which drained the lower part of the city, and are still perfect; laid out the Circus Maximi, and instituted the Roman games; assigned the shops in
the forum to private citizens; and began to surround the city with a stone wall, which his successor finished. Under Tarquin 100 new members (the patres minorum gentium) were added to the senate, and the number of the vestal virgins was increased from four to six. The sons of Ancus Marcus, fearing that he would secure the succession to his son-in-law Servius Tullius, planned his death. (See Servius Tullius.)

II. Lucius Tarquinius Superbus (“the Proud”), the seventh and last king of Rome, son of the preceding, died about 495 B.C. About 534 he formed a conspiracy, murdered Servius Tullius, and usurped the throne. He immediately, as the semi-legendary story of his reign has it, abolished all the privileges that Servius had given to the plebeians, decried the death of the senators who had supported them, took the whole administration of justice into his own hands, and put to death or exiled all who were obnoxious to him. The senate was seldom consulted, and its vacancies were not filled. Under him the Latin league was joined by the Hernici and by two Volscian towns, and Rome became the head of the confederacy. With the spoils from the wealthy city of Suessa Pometia he began the erection of the capitol. He subdued Gabii, a Latin city which refused to enter into the league, and about 510 besieged Ardea. While Tarquinius Collatius, son of Aruns, the brother of Tarquinius Priscus, was with the army before this city, his cousin Sextus Tarquinius, the king’s son, went to his house at Collatia, and there violated his wife Lucretia. Lucretia sent to the camp at Ardea, and summoned thence her father and her husband. With them came Lucius Brutus. To these three she told what had happened, enjoined them to avenge her, and stabbed herself with a dagger. Brutus led the way into the market place, whither the corpse was carried, summoned the people, and related the occurrence. So great was the hatred already entertained of the Tarquins and the indignation now excited, that a decree was immediately passed by which the king was deposed, and his family banished from the city. Tarquin hastened to Rome, but found the gates closed against him. Brutus repaired to Ardea, where he was received with joy, and the army renounced its allegiance to the tyrant. Tarquin took refuge at Tarquinii, and thence sent ambassadors to Rome to demand his private property. These ambassadors conspired with some young nobles for the restoration of the king, but were discovered, and with their confederates—among them two sons of Brutus—were executed, and Tarquin’s private property was given up to plunder. He now formed an alliance with the Etruscan cities of Tarquinii and Veii, and endeavored to recover the throne by force, but was defeated near the forest of Arisia. He next obtained the assistance of Lars Porsena of Clusium, who marched against Rome with a great army. (See Poessen.) Finally the whole Latin confederacy espoused the cause of Tarquin against Rome, and the contest was decided by the Roman victory in the battle of Lake Regillus, about 498. Tarquin retired to Cumae, and there died.

TARRAGON. (Lat. dracunculus; Span. taragona), an aromatic herb (artemisia dracunculus) belonging to the composite, and in the same genus with the common wormwood, but differing from this and most other species in having undivided leaves. It is a native of Siberia and the region of the Caspian sea, and is much cultivated in Europe, and sparingly in American gardens. It is a perennial, with stems 2 to 3 ft. high, and bears upon the upper branches small heads of inconspicuous flowers, which in cultivation are infertile; the long, narrow, and smooth leaves have an aromatic odor and a taste somewhat like that of anise. The French, who call it estragon, consider the leaves or young shoots essential to the proper dressing of some salads, and use it also to flavor vinegar, pickles, and mustard, and in other compounds. Tarragon vinegar is made by simply infusing the leaves in strong vinegar. The plant is perfectly hardy in this country.

TARRAGONA. I. A N.E. province of Spain, in Catalonia, bordering on the Mediterranean and the provinces of Lérida, Barcelona, Castellon, Teruel, and Saragossa; area, 2,451 sq. m.; pop. in 1870, 350,898. The province is traversed from N. to S. by the Prades mountain range, which has numerous offsets that extend to the coast, and the intervening valleys are very fertile. The only river of importance is the Ebro. There are mines of lead, copper, silver, and manganese, and the hills are covered with pine, cork, and oak. Good wine is produced, and there are many manufactories of silk, woollen, velvet, and cotton goods, oil, soap, pottery, and brandy. II. A city (anc. Tarraco), capital of the province, on the Mediterranean, at the mouth of the Francoli, 273 m. E. N. E. of Madrid; pop. about 18,000. It is fortified, and consists of two parts, the high and the low. It is the seat of an archbishop. There are schools of navigation and design, and an ecclesiastical seminary. The mole, begun in 1790 and finished in 1874, is 4,242 ft. long. The exports to the United States for the year ending Sept. 30, 1874, chiefly wine, nuts, and liquorice, amounted to $286,312.—The town is supposed to have been originally settled by the Phoenicians. Under the Romans it was the capital of Hispania Tarraconensis, and is said to have contained 1,000,000 inhabitants. There are remains of a Roman amphitheatre and aqueduct. It was captured by the Goths, was destroyed by the Moors under Tarik, and remained uninhabited for four centuries. It was captured by the British in the war of succession. In 1811 the French under Suchet took it by storm. In the middle ages a number of church councils were held in Tarragona.

TARRANT, a N.W. county of Texas, intersected by the West fork of Trinity river; area,
Tarrytown and dextrotartaric itatory, contains natural schools a Sleepy Washington Major distincting as mercere, and Point de la Haud, and where it widens into the Tappan Zee, and on the Hudson River railroad, 26 m. N. of New York city; pop. in 1875, 6,500. It is very picturesque, and contains a large number of elegant country seats. It is celebrated as the scene of the capture of Major André in 1780, and contains a monument commemorative of that event. South of the village is Sunnyside, the residence of Washington Irving, whose grave is in the Sleepy Hollow cemetery, near the old Dutch church. The village contains a silk factory, a boot and shoe factory, a steam pump factory, a tool factory, a sash and blind factory, a national bank, a savings bank, several public schools, two female seminaries, two boarding schools for boys, a weekly newspaper, and 11 churches.

Tarshish, the name of an ancient emporium, or, according to some critics, more than one, as some of the passages of Scripture in which it is mentioned appear to indicate that it was W. and others E. of Palestine. There are 25 or 30 references to it in the Scriptures. Tartessus in Spain, Tarsus in Cilicia, the island of Thasos in the Grecian archipelago, Carthage, some support of the British isles, and Point de Galle in Ceylon have all been urged as fulfilling certain conditions of the Scriptural references. The following facts concerning it are gleaned from various passages of Scripture. It was largely engaged in commerce, and probably in ship building; it is several times spoken of as an island or seacoast; it had large traffic with Tyre and Sidon, especially in gold and silver, tin, iron, and lead; it is usually represented as W. of Palestine and of Tyre, and its ships are spoken of as broken by an E. wind. Yet we are told distinctly in 2 Chron. ix. 21, that Solomon's ships went to Tarshish with the servants of Hiram, returning every three years, and bringing "gold and silver, ivory, and apes, and peacocks;" and that Jehoshaphat joined with Ahaziah in building ships at Ezion-geber, a place on the Elainic gulf of the Red sea, to go to Tarshish (2 Chron. xx. 36), while the corresponding passages in 1 Kings (ix. 26-28, x. 22, xxii. 48) say that Tarshish vessels were built at Ezion-geber and sent to Ophir, whence they brought "gold and silver," &c. This apparent discrepancy has been explained in three ways: (1) (which is most plausible), that the name "ships of Tarshish" does not necessarily imply that the ships were built at Tarshish or intended to ply between that and some other port, but designated a peculiar style of ships, and that hence ships intended for a long coast voyage were called "ships of Tarshish" from their resemblance to the Phenician model; (2), that the ships built at Ezion-geber were really intended for the trade to Tarshish (Tartessus) in Spain, and were to be transported across the isthmus of Suez to the Mediterranean; and (3), that there were two and possibly more places called Tarshish. Tarshish, a city of Asiatic Turkey, in the vilayet and 20 m. W. S. W. of the city of Adana, on the right bank of the Cydus, about 10 m. from the Mediterranean; pop. about 8,000. It stands in a fertile plain, and is well built of stone. It has an ancient church, several mosques, handsome caravansaries, and public baths. Wheat, barley, cotton, copper, and gall nuts are exported.—Tarsus is said by the ancients to have been founded by Sardanapalus. It was taken by Alexander, and under the Romans rivalled Athens, Antioch, and Alexandria. It was the birthplace of the apostle Paul and of several Greek philosophers, poets, and grammarians.

Tartar (named from Tartars, the infernal regions, according to Paracelsus, on account of its fiery heat; also called argol), the crude bitartrate of potash, precipitated from wines as they ferment, being set free as alcohol is produced, in which it is insoluble. When purified it is known as cream of tartar or bitartrate of potassium. Salt of tartar is a name often given to pure carbonate of potash. Soluble tartar is a name given to the normal or neutral tartrate of potassium, used in medicine as a cooling purgative. (See Potassium, vol. xiii., p. 763.)—Tartar is also the name of an incrustation upon the teeth, composed, according to Berzelius, of salivar mucus 13-5, animal matter soluble in muriatic acid 7-8, and phosphate of lime (earthy phosphates) 7-9.

Tartar, Cream of. See Cream of Tartar. Tartar Emetic, a double tartrate of antimony and potassium. (See Antimony.) Tartaric Acid, an organic tetratomic acid, which is now regarded as belonging to a group derived from corresponding tetratomic alcohols by the substitution of oxygen for hydrogen molecules. Only one of the acids, the erythric (C6H10O2), has been actually formed, from erythrite (C6H12O5), but the composition and behavior of tartaric acid favors the theory that it has a similar derivation. The formula of tartaric acid is C4H6O6, and includes four bi- basic acids having different crystalline forms, and different properties in regard to polarized light, viz.: dextrotartaric acid, which turns the plane of polarization to the right; levotartaric acid, which turns it to the left with equal force; paratartaric or racemic acid, which has no rotatory power, but is separable into two equal parts of right-handed and left-handed acids; and an inactive acid not thus separable.
TARTARIC ACID

Dextrotartaric acid is the ordinary tartaric acid found in grapes, tamarinds, pineapples, and several other fruits, usually in combination with potassium, and frequently with a small portion of calcium. The acid of commerce is prepared from tartar or argol, and was first separated from it by Scheele in 1770. The present mode of manufacture is as follows. The crude tartar is dissolved in hot water in which is stirred a little pipe clay and bone black to remove coloring matter. The filtered or decanted liquid deposits on cooling crystals of cream of tartar, from which the acid may be prepared by dissolving them in boiling water, or the original solution may be employed. Powdered chalk is added as long as there is effervescence or the liquid reddens litmus. The product consists of an insoluble tartrate of calcium and a soluble normal tartrate of potassium, which latter, after separation of the calcium salt, is mixed with an excess of chloride of potassium, which throws down the remaining tartaric acid also as tartrate of calcium. Both precipitates are washed and digested with sulphuric acid diluted with eight or ten parts of water, by which means sulphate of lime is precipitated while the tartaric acid is left free in the solution. The filtrate is carefully evaporated to the consistency of a sirup, and placed in a warm situation to crystallize. Liebig found that tartaric acid is produced by the action of nitric acid upon milk sugar. It may also be obtained from succinic acid by submitting the latter to the action of bromine and treating one of the products, dibromosuccinic acid, with oxide of silver and water. Tartaric acid crystallizes in transparent, oblique rhombic prisms of sp. gr. 1.755, which are inodorous, permanent in the air, and easily soluble in hot and cold water and in alcohol, but insoluble in ether. The crystals are colorless, but sometimes bordered with a fungoid growth. Tartaric acid is used in calico printing to liberate chloride from bleaching powder, and in medicine, principally for the preparation of effervescing powders. (See EFFERVESCENCE.)—Other Varieties of Tartaric Acid. The grapes cultivated in certain districts of the upper Rhine and in the Vosges contain, besides ordinary tartaric acid, an isomeric acid, called paratartaric or racemic acid, which resembles it in many particulars, but differs much in others; for instance, it is rather less soluble, and has not the power of rotating the plane of a polarized ray of light. Pasteur has made some interesting researches upon the subject, and finds that if racemic acid is united with single bases, a salt is formed whose crystals are all identical; but if it is united with two bases, after the manner of Rochelle salt, and the solution allowed to crystallize slowly, two varieties of crystals are formed, bounded by the same number of faces, inclined to one another at exactly the same angles. They however have certain hemihedral faces which are developed on opposite sides of the two crystals, so that one crystal is like the reflected image of the other, and may be denominated morphologically right-handed and left-handed crystals. If these crystals are selected and separately recrystallized, each variety will produce its own particular form of crystal, and one will have right-handed and the other left-handed rotary powers on polarized light. The acids obtained from these two varieties of crystals have also corresponding right-handed and left-handed rotary powers, one being in fact ordinary or dextrotartaric, the other levotartaric acid. As these two acids have equal rotary powers in opposite directions, if their solutions are mingled in equal proportions the mixture will have no effect upon polarized light. When concentrated solutions of the two acids, or of single crystals of racemic acid are deposited with sensible evolution of heat. Both acids also exhibit pyro-electricity, but in opposite directions. Pasteur also found that racemic acid may be artificially produced by the action of heat upon certain compounds of tartaric acid which are capable of resisting a high temperature; for instance, when tartrate of cinchonine is exposed to a temperature of about 288° F. and afterward repeatedly boiled in water and treated with chloride of calcium, racemate of calcium is formed. Left-handed tartaric acid may in like manner be converted into racemic acid. The formation of racemic acid in these reactions is accompanied by the production of a fourth modification, which Pasteur calls inactive acid, having, like racemic, no action on polarized light, but which, unlike racemic, cannot be resolved into right-handed and left-handed acids.

TARTARS, a branch of the Mongolian or Turanian division of the human race, principally inhabiting Asia. The name is one of indefinite and indiscriminate application, used with varying comprehensiveness by different writers. In its widest sense it may be regarded as embracing the Altaian group of Mongolians, according to Vichrow; that is, all the various tribes and nations inhabiting the table lands of central and northern Asia who are not of Aryan blood, including the Tartars proper, the Kirghiz, the Calmucks, the Mantchoos (sometimes called the Mantchoo Tartars), the Mongols proper, or the Mongols of Mongolia (who, however, probably constitute a separate branch), and the Tungusians, who are thought by Huxley to share the physical characteristics of the Esquimaux. In a more restricted application of the word, the Tartars comprise the Turanian inhabitants of Turkistan and the adjacent regions. These are the nomad Kirghiz, who dwell in Khokan and Kashgar, on the Pamir steppe, and in the adjacent valleys; the Uzbeks, who have advanced farthest toward settled civilization and constitute the governing class in Turkestan; the Kiptchaks, a semi-nomadic people living in Khokan, who travel with their flocks...

TARTARS 575

777 VOL. XV.—87
during the grazing season; the Buddhist Calmucks of eastern Turkistan, extending into Dzungaria; the Kazaks, in the region of the Sir Darya; and many smaller tribes. The predatory Turkomans inhabiting the country E. of the Caspian, from the Oxus to the Persian frontier, are of Tartaric origin, although the pure Tartar features are preserved in but few of the tribes, owing to the large admixture of Aryan blood. The characteristic Tartar physiognomy appears most distinctly at the present day among the Kirghiz, who have high cheek bones, noses thick but depressed, narrow eyes, and little or no beard. Almost every grade of variance from this type, however, is met with. In central Asia, the word Turk is used as synonymous with Tartar, merely to indicate Mongolians. According to Col. Yule, the two classes of people whom Marco Polo would identify with Gog and Magog represent the two genera of the Tartar race, namely, the White Tartars, or Turks, and the Black Tartars, or Mongols proper, who formed the bulk of the followers of Genghis Khan. Indeed, the name Mongol (bold), which he is said first to have given to the tribes who followed his standard, has been regarded as directly derived from Magog.—The word Tartar or Tatar (also Tur-ta), appears to be of Chinese origin, and was applied to early invaders of China from the upper Amoor region. They were a warlike and savage race; and possessing vast numbers of horses, they often descended upon the peaceable Chinese, and plundered their villages. Their predatory characteristics came to be so closely associated with their name as to lead to its eventual application to numerous other robber hordes. The Altai mountains appear to have been the centre of the great Mongolian migratory movement which began in the 4th century and lasted until the 10th, extending over the neighboring Asiatic countries and under Attila far into Europe, where its results may still be traced in the Tartar population of eastern and southern Russia. The vast military expeditions of Genghis Khan and Timour were subsequent movements of a like character. Shamanism was the original faith of the Mongols. This was succeeded by Buddhism, which was abandoned for Lamism about the end of the 16th century. Sunni Mohammedanism is now professed by the western Tartars generally, both in Asia and Europe.

TARTARUS, in the Grecian mythology, a son of Ether and Gea, and the father of the giants Typhon and Glaucidna. In the Iliad TARTARUS is a place as far below Hades as heaven is above the earth, and there by later writers the spirits of the wicked are said to be punished. By the later poets also the name is often used synonymously with Hades.

TARTARY, a geographical designation now usually limited to Turkistan and the adjoining regions, but formerly of much wider significance, embracing a broad belt stretching across the centre of the Asiatic continent from the

Japan and Okhotsk seas on the east to the Caspian on the west, and according to some geographers extending westward into Europe as far as the river Don. Tartary in its most extended sense therefore includes, in Asia, Mantchooria, Mongolia, Dzungaria, East Turkistan or Iligh Tartary, Turkistan proper, including Khokan, Bokhara, and Khiva (formerly known as Independent Tartary), and all the southern part of the Russian possessions in Asia; and in Europe, the greater part of the Russian governments of Orenburg, Astrakhan, and Yekaterinoslav, the Don Cossack territory, and the Crimea, the last of which was formerly called Little Tartary, and also Crim Tartary, from the name of the hordes which settled there in the 15th century. The name Tartary, however, is now seldom applied to any region outside of that bounded N. by Siberia, E. by Mantchooria, S. by China proper, Thibet, India, Afghanistan, and Persia, and W. by the Caspian sea.

TARTINI, Giuseppe, an Italian violinist, born at Pirano, Istria, in 1692, died in Padua in 1770. He gave up law and theology, acquired unrivalled proficiency as a violinist, eloped with one of his pupils, and lived for two years concealed in the convent of Assisi. There he diligently studied music, and being at length forgiven, came out of the convent the best player in Europe. Among his celebrated pupils were Pagan, La Houssaye, and Pugnani. His most remarkable composition is his Sonate du dible, or "Tartini's Dream."

TARTRATES, salts formed by the union of tartaric acid with bases. Tartaric acid is dibasic, and forms with monatomic metals acid salts, like bitartrate of potassium, KHC\(_2\)H\(_4\)O\(_6\); normal salts, like normal potassic tartrate (solute tartar), K\(_2\)C\(_2\)H\(_4\)O\(_6\); and double salts, like sodio-potassic tartrate (Rochelle salt), NaK\(_2\)C\(_2\)H\(_4\)O\(_6\). With diatomic metals it forms normal salts, like normal tartaric acid tartrate, BaC\(_2\)H\(_4\)O\(_6\); and double salts consisting of a double molecule of the acid in which two atoms of hydrogen are replaced by a diatomic and two atoms by a monatomic metal, like baric-potassic tartrate, BaC\(_2\)H\(_4\)O\(_6\)K\(_2\)C\(_2\)H\(_4\)O\(_6\)+2H\(_2\)O. With triatomic metals it forms a peculiar class of salts, well illustrated in the ease of the antimony salts, as normal antimonious tartrate, (SbO)\(_2\)C\(_2\)H\(_4\)O\(_6\); acid antimonious tartrate, SbO\(_2\)C\(_2\)H\(_4\)O\(_6\); and potassio-antimonious tartrate, tartar emetic, K\(_2\)SbO\(_2\)C\(_2\)H\(_4\)O\(_6\). Many of the tartrates are used in medicine, and several are employed in calico printing and dyeing, as the tartrate of chromium and the tartrate of potassium and tin. The principal medicinal tartrates are the double salts, tartar emetic and Rochelle salt. (See ANTIMONY, and ROCHELLE SALT.) The tartrates of the alkalies are oxidized in the animal system to bicarbonates, so that the administration of tartrate of potassium renders the urine alkaline. The acid alone, on the other hand, is more efficient than the mineral acids in acidifying this excretion.
TARUDANT, the chief city of the province of Sus, Morocco, in the valley of the Sus, about 44 m. from the Atlantic coast, and 140 m. S. W. of Morocco; pop. estimated by Rohlfis at 30,000 to 40,000. It lies near the foot of the S. slope of the Atlas, about 4 m. from the right bank of the river Sus. The country around it is highly cultivated, and it is surrounded by gardens and palm groves. The wall, enclosing a large area, much of which is occupied by gardens, is flanked by towers and entered by five gates. The kasa or citadel occupies an angle on the E. side. The streets are crooked, narrow, and impracticable during rains. There are three principal mosques and many smaller ones, two prisons, and several fountains. The dwelling houses are mostly of one story. Tarudant is noted for its leather and dye works, and for manufactures of copper, mostly pots and kettles, which are exported as far as Timbuctoo, Kuka, and Kano. It was formerly celebrated for sugar culture, but the plantations no longer exist. The inhabitants are rude and intolerant to Christians.

TASCHEREAU, Jules Antoine, a French author, born in Tours, Dec. 19, 1801, died in Paris, Nov. 11, 1874. He was one of the editors of the National, and for a short time after the revolution of July, 1830, he was secretary general of the prefect of Paris and a member of the council of state. Subsequently he became one of the editors of the Revue de Toulouse and of the Revue de Toulouse des Réaux (6 vols., 1833–4), and the founder of the Revue rétrospective (20 vols., 1833–7). From 1838 to 1842 he was a member of the chamber of deputies, and in 1846 he was returned to the constituent and subsequently to the legislative assembly. Early in 1852 he was placed in charge of the catalogue of the national library, of which he published many volumes (1855 et seq.), and he was director general of the library from 1856 to 1874. He edited the works of Molière (8 vols., 1823–4) and Boufflers (2 vols., 1827), and the literary correspondence of Grimm and Diderot (15 vols., 1829–30), and wrote biographies of Molière (1825) and Corneille (1829; new ed., 1837).

TASCHEREAU, Eléazar Alexandre, a Canadian archbishop, born in Quebec in 1816. He studied in the seminary of Quebec, was ordained priest in 1842, and became successively professor of mental philosophy there, director of studies, and superior. In 1856 he received in Rome the degree of doctor in canon law, and was appointed to teach that science in the Laval university. In 1870 he governed the diocese of Quebec as administrator, after the death of Archbishop Baillargeon, and he was consecrated as his successor, March 19, 1871.

TASHKEND (anc. Shasi), a city of Turkistan, formerly included within the boundaries of Khokan, but now under Russian rule, situated in lat. 43° N., lon. 68° 40' E., near the junction of two small affluents of the Sir Darya or Jaxartes, 150 m. N. W. of the city of Khokan; pop. estimated at 80,000, mostly Musulmans. It stands in a fertile plain covered with numerous gardens, amid what is described as literally a forest of fruit trees, is enclosed by a high wall of unburned bricks 15 m. in circuit, and is entered by 12 gates. A great part of the town consists of houses surrounded by gardens and vineyards, the walls of which are so close together that only narrow lanes are left between. The houses are principally built of mud, and are about 11,000 in number. The former residence of the khan consists of a castle defended by walls and ditches; and there are more than 300 mosques, 15 bazaars, and numerous colleges and old temples. The principal manufactures are silk and cotton goods, iron, and gunpowder. Commerci ally, Tashkend is perhaps the most important city in Russian Turkistan. The chief lines of communication from northern Asia concentrate there, and by means of caravans an extensive trade is carried on with all the neighboring countries, including British India. The attempt of the Russian government, however, to establish a great fair at Tashkend, similar to that held at Nishni Novgorod, has proved a failure. Tashkend has been celebrated in central Asia from the earliest times for its wealth and as a commercial emporium. It was assaulted and captured by a Russian force under Gen. Tcherniayeff, in the war with Kho kan, in June, 1865, and now with the surrounding territory constitutes a separate administrative district of Russian Turkistan.

TASMAN, Abel Janssen, a Dutch navigator, born at Hoorn about 1600, died probably on his second voyage to New Guinea and New Holland. In 1642 he was sent by Van Diemen, governor general of the Dutch East India company, to explore the extent of the continent of New Holland. He set sail from Batavia on Aug. 14, and on Nov. 24 discovered the island to which he gave the name of the governor general (now Tasmania). He subsequently discovered New Zealand, the islands of the Three Kings, and the archipelagos of the Friendly and Feejee islands, and returned to Batavia after a voyage of 10 months. On Jan. 29, 1644, he undertook a second voyage along the coasts of New Guinea and New Holland; the details of which are unknown. He published a narrative of his first voyage, which was reprinted with the voyage of Coreal at Amsterdam in 1792.

TASMANIA (formerly Van Diemen's Land), a British colony of Australasia, consisting of the island of the same name and several smaller islands, mostly in Bass strait; area, 26,215 sq. m.; pop. in 1870 (by census), 88,286; estimated, Jan. 1, 1874, 164,217. Capital, Hobart Town. The island of Tasmania is situated 120 m. S. E. of Australia, from which it is separated by Bass strait, between lat. 40° 38' and 43° 38' S., and lon. 144° 40' and 148° 30' E. It is 240 m. long from N. W. to S. E.; its extreme breadth from N. E. to S. W. is 200 m.; area, 24,330 sq. m. The coasts, which present al-
most every variety of scenery, are indented by numerous bays and inlets, and good anchorage is to be found almost everywhere. The principal harbors are: on the W. coast, Port Davey, which is much frequented by whaling vessels, and Macquarie harbor; on the N. coast, Stanley at Circular Head, Emu bay, Port Frederick, Port Dalrymple, and Waterhouse roads, between Anderson and Ringarooma bays; on the E. coast, George, Oyster, Spring, and Fortescue bays; and on the S. E. coast, Port Arthur, Storm bay, Norfolk bay, D'Entrecasteaux channel, Port Esperance, Muscle bay or Southport, and Recherche bay. There are 55 islands off the coast; all of which belong to Tasmania. The Furneaux group, N. E. of the main island, includes Flinders island (801 sq. m.), Cape Barren island (172 sq. m.), Clarke island (80 sq. m.), Chappell, Hummock, and several smaller islands. Their inhabitants, 242 in number in 1870, many of whom are half-breeds, live mostly by seal fishing. Off the N. W. end of Tasmania are King's island (425 sq. m.), Robbins' island (87 sq. m.), Hunter. These Hummock, and smaller islands. Off the S. E. coast are Bruny island (140 sq. m.), divided into North and South Bruny, which are connected by a narrow isthmus, Maria island (37 sq. m.), Schouten island (10 sq. m.), and many smaller.—Tasmania is traversed by high mountain chains, full of glens and ravines, and separated by fertile and well watered plains. There are two principal chains, one running parallel with the E. coast, the highest peak of which is Ben Lomond, 5,010 ft., and the other forming an elevated table land in the middle of the island, reaching an elevation of 5,908 ft. in Cradle mountain; from the latter diverge numerous smaller ranges, north, west, and south. In the middle of the table land are several lakes, the largest of which are the Great lake (28,000 acres), Sorell (17,000), St. Clair (10,000), and Arthur, Crescent, and Echo (8,000 to 12,000). The chief rivers on the S. E. coast are the Huon, which flows into D'Entrecasteaux channel; the Derwent, which rises in Lake St. Clair, receives numerous tributaries, and flows into Storm bay; and the Coal, which flows into Pitt water. On the S. W. and W. coast are the Spring, the Davey, the Gordon and King's falling into Macquarie harbor, the Pieman, and the Arthur, all with large tributaries; and on the north the Montague, Duck, Detention, Inglis, Cam, Emu, Blythe, Leven, Gawler, Fort, Mersey, Rubicon, Tamar, Piper, Forrester, Trent, and Ringarooma. The Tamar is a tidal river formed by the junction of the North and South Esk.—The central mountain chain, which is of volcanic formation, is of trap upheaved through sandstone, clay, limestone, and slate. The rocks of the E. and S. W. coasts are basalt, granite, gneiss, and quartz. It is conjectured that the island was once connected with Australia, and that the smaller islands in Bass Strait are the peaks of a disrupted mountain chain. Tasmania is rich in minerals. Iron abounds near Hobart Town and on the banks of the Tamar river. Large deposits of tin ore were discovered in 1872 at Mt. Bischoff, and small lodes of copper, lead, and bismuth have been found. Coal abounds at Mt. Nicholas and Douglas river in the northeast, on the Mersey river in the north, at Jerusalem N. of Hobart Town, and at Hamilton in the middle of the island. None of these deposits are worked, but mines of bituminous coal are worked near Port Seymour, and of anthracite coal at Port Arthur, New Town, and Port Serrell. The principal gold mines are at Nine Mile Springs, Mathinna, and Hellyer river. Limestone is abundant, and a fine quality of white freestone is largely exported to Melbourne.—The climate is remarkable for mildness, being subject to extremes neither of heat nor cold. The average temperature of the summer months, December, January, and February, is about 62°; of the autumn months, March, April, and May, 54°; of the winter months, June, July, and August, 44°; and of the spring months, September, October, and November, 50°. The mean annual temperature, as ascertained by 30 years' observation, is about 54°. The mean annual rainfall is 22-71 inches. The atmosphere is remarkably pure, and zymotic diseases are rare. Thunder storms are not common and are seldom violent. Many persons, enervated by the hotter climate of Australia, annually visit Hobart Town for health.—Although much of the interior is mountainous and rugged, there are large tracts of pasture land, and extensive forests, chiefly of the eucalyptus and acacia, affording excellent timber for both cabinet work and ship building. The soil is very fertile, and produces abundantly all the cereals, vegetables, and fruits of temperate climates. Among the fruits cultivated are the peach, plum, apricot, cherry, quince, fig, mulberry, gooseberry, strawberry, raspberry, currant, and grape; also the walnut, filbert, and almond. Large quantities of green and preserved fruits are exported. The live stock in 1873 amounted to 22,334 horses, 106,308 horned cattle, 1,490,738 sheep, 59,628 swine, and 2,201 goats. The indigenous animals are mostly marsupials, like those in Australia, and they exist in such numbers that kangaroo leather and opossum furs are articles of export. There is one unique animal, called the thylacine, Tasmanian wolf, or native tiger, the largest carnivorous animal in Australasia, though no larger than a wolf. Whales, both black and spermacti, are numerous off the coasts, particularly in Bass strait, and the fishery is prosecuted with much vigor; and seals frequent the shores and the islands in their vicinity. Excellent fish are found in all the bays and rivers, and oysters are very abundant. Salmon have been introduced from England, and are now caught in the Derwent. The industries of Tasmania are not extensive. There are several breweries in Hobart Town,
TASMANIA

where ale is made for export to the other colonies, the climate being especially adapted to malting and brewing. There are also tanneries, foundries, soap and candle manufactories, jam-bolling and fruit-preserving establishments, and two manufactories of cloth, tweed, blankets, &c. The value of exports in 1873 was £893,656; of imports, £1,107,167.
The exports of wool amounted to 4,243,483 lbs., valued at £314,068; of jams to the value of £98,281; and of hops, £41,015. Other articles of export are bark, butter and cheese, bran and pollard, the cereals, flour, skins and leather, horses, sheep, sperm and black oil, fruits and vegetables, gold (in 1873, £15,909), and ale. The most important ports are Hobart Town and Launceston. Frequent communication by steamships is maintained between them and Sydney and Melbourne. The only completed railway is the Launceston and Western, 45 m. long, connecting Launceston and Deloraine. The line was opened in 1871; in 1873 it was taken by the government. The Mersey and Deloraine railway, to connect Deloraine with the mouth of the Mersey river, had 18 m. completed in 1874. A main line, connecting Launceston with Hobart Town, 120 m. long, will probably be opened in 1876. The principal towns are connected by telegraph, of which 291 m. were open in 1873. A submarine cable, laid in 1869, connects Launceston with Melbourne.
The aborigines of Tasmania resembled physically those of Australia, excepting that their hair was woolly. They were estimated to number 3,000 to 4,000 when the island was Colonized, and were inoffensive; but from the abuse of the convict colonists a war of extermination broke out. At its close the remnant of the tribe was transported first to Flinders and then to Maria island, and finally in 1849, when only 36 remained, to the vicinity of Hobart Town, where they were established in comfortable dwellings. In 1847-8 a subsidy was given to them. In 1848 nearly a third of the inhabitants were or had been convicts; and although since the cessation of transportation the proportion has gradually decreased, the moral effect is still felt. With respect to religion, the principal denominations are represented as follows: church of England, 55,047; Roman Catholic, 22,091; church of Scotland, 6,644; Free church of Scotland, 2,420; Wesleyans, 7,187; Independents, 3,931. The whole number of churches and chapels in the colony is 316. The Anglicans and Roman Catholics have each a bishop. Education is under the management of a council, and a board supervises the distribution of all moneys voted by parliament. In 1875 there were 141 public schools, with 10,803 pupils on the rolls and an average attendance of 7,947; 105 male teachers, 108 female teachers, and 32 pupil teachers. There are four superior schools: Horton college, high school, Hutchins's school, and the church grammar school. The attendance of children at the public schools is compulsory, under a fine of £2, except in cases of private education. In 1870 there were 29,444 persons in the colony who were unable to read. The public press includes two daily newspapers published at Hobart Town, two tri-weekly and a semi-weekly at Launceston, and several weekly and monthly periodicals. The colony is divided into 19 counties, which are subdivided into parishes. For electoral purposes it is divided into districts, 16 for the election of members of the legislative council, and 32 for members of the house of assembly. The government consists of a governor and executive council appointed by the crown. The governor is assisted by a cabinet consisting of four official members, colonial secretary, colonial treasurer, attorney general, and minister of land and works, and sometimes a premier or officer. The legislative power is vested in a parliament of two houses, the legislative council and the house of assembly. The legislative council is composed of 16 members elected for six years, the house of assembly of 32 members elected for five years. The judiciary consists of a chief justice, a puisne judge, and minor justices. The revenue is derived from customs, railway receipts, land sales, and miscellaneous taxes. The general revenue for 1875 was estimated at £295,817, and the expenditure at £311,206. The debt of the colony at the end of 1875 was £2,477,400, incurred mostly for the following purposes: public works, £938,598; immigration, £200,000; commute state aid to religion, £100,000; in payment of an old debt to the imperial government, £80,500; in aid of land fund, £30,000. —Tasmania was discovered in 1642 by the Dutch navigator Abel Janssen Tasman, who believed it to be a part of the mainland of Australia, and who named it Van Diemen's Land after Anthony van Diemen, then governor general of the Dutch East Indies. Its insularity was not established till 1778, when Mr. Bass, a surgeon of the British navy, circumnavigated it. The first settlement was made in 1803 by a detachment of marines and a body of convicts, in charge of Lieut. Bowen, who selected Risdon on the Derwent river as the site for a penal station. In 1804 Col. Collins, who landed with 400 prisoners, changed the site to the opposite side of the river, and named it Hobart Town after Lord Hobart, then secretary of state for the colonies. Van Diemen's Land was erected into an independent colony in 1825. For some years the prosperity of the colony was impaired by the depredations of "bush rangers," or escaped convicts, but they were finally suppressed. In 1853 the transportation of convicts ceased, and on Jan. 4, 1856, on the petition of the legislative council to the home government, the name of the colony was officially changed to Tasmania.

TASSAERT, Nicolas François Octave, a French painter, born in Paris, July 26, 1800, died there by his own hand, April 26, 1854. He left the school of fine arts in 1825, and became known
as a distinguished portrait, historical, and genre painter, but long struggles with adversity drove him to suicide. His principal productions include "The Funeral of Dagobert at St. Denis" (for the museum of Versailles), "Death of Correggio," "The Slave Merchant," "Diana at the Bath," and "The Old Musician."

TASSO, Bernardo, an Italian poet, born in Bergamo, Nov. 11, 1493, died in Ostiglia in September, 1569. He became in 1531 secretary to the prince of Salerno, and accompanied him in several expeditions of Charles V. In 1533 he settled at Sorrento with his bride, the celebrated Porzia de' Rossi. After her death he fled from the inquisition, became connected with the courts of Urbino and Mantua, and ended his life as governor of Ostiglia. He wrote a heroic poem entitled L'Amadigi, founded on the story of Amadis de Gaul, containing 100 cantos. One of the episodes was expanded into a poem called Floridante, published after his death by his son. He also wrote sonnets, odes, and lyrics, a "Discourse on Poetry," and "Three Books of Letters."

TASSO, Torquato, an Italian poet, son of the preceding, born in Sorrento, March 11, 1544, died in Rome, April 25, 1595. He received his early education at Naples, and studied in Rome, Urbino, Venice, Padua, and Bologna. In 1562 he wrote his charming romantic poem Rinaldo, and about the same time began to prepare his epic on the delivery of Jerusalem by Godfrey of Bouillon. In 1565 he went to Ferrara as a gentleman in the suite of Cardinal d'Este, whose brother, the duke Alfonso II., received Tasso with great distinction. His grave and melancholy beauty, eloquence, and varied accomplishments enlisted general admiration, and endeared him to the duke's sisters Lucrezia, the future duchess of Urbino, and Eleonora, who became known as the poetic object of his affection. He spent a year's residence with the cardinal in Paris, where Charles IX., Catharine de' Medici, and the French poets showed him marked attentions, he became estranged from his patron, and, mainly through the influence of the princesses, was in 1572 formally attached to the court of Ferrara, with a salary but without specific duties. His celebrated pastoral drama Aminta was performed in 1573 with great splendor at the court, and afterward at Urbino. In 1575 he completed his great epic poem under the title of Il Goffredo, which was afterward changed to Gerusalemme Liberata. The duke, Eleonora, and Lucrezia (who had separated from her husband) gave him new evidences of their regard, and would hardly permit him to leave them. Yet in November, 1575, he went to Rome to submit his epic to Scipione Gonzaga, and received an invitation to enter the service of the Medici family, which he ultimately declined; but the hostility between the Medici and Estes made him ever afterward believe that the duke had taken umbrage at his negotiation with them, although on his return to Ferrara he was received with the wonted cordiality. He was now living in perpetual fear of his enemies, whose numbers had increased with his fame, and of emissaries of the inquisition, although that tribunal had absolved him from the charge of heresy to which he had long fancied himself liable on account of some passages in the Gerusalemme. At length he found his correspondence intercepted, and had a violent altercation with a deceitful friend who had purloined his private papers, with a view, he suspected, of giving the duke evidence of his relations with Eleonora, and he was charged with referring to his love for her in the episode of Sofronia and Olimo in his epic. But the duke expressed no other feeling about him excepting an anxiety for the restoration of his mind, which he regarded, or feigned to regard, as diseased. Even after a murderous assault said to have been committed by Tasso in one of his frantic fits upon Lucrezia's servant, the duke released him after a brief confinement and permitted him to retire to a convent (June, 1577), where he was to remain till the restoration of his health. Tasso, however, fled in July to Sorrento, and reached his sister Cornelia's house in the disguise of a shepherd and in a wretched condition. Having regained his health, he became anxious to return, and at the instance of his friends the cardinals Albano and Gonzaga, the duke permitted him do so on condition of his putting himself under medical treatment. New indignities awaited him at Ferrara (February, 1578), despite the friendly disposition of Eleonora. He failed to recover his manuscripts, and, shunned by everybody, he fled again from city to city, everywhere regarded as a maniac. At the court of Urbino he had a short interval of rest, but his apprehensions of danger drove him to Turin. Here he was befriended by Eleonora's brother, the marquis d'Este, and might have lived in peace; but he hastened back to Ferrara in the vain hope that the celebration of the duke's third marriage with a princess of Mantua (early in 1579) would prove auspicious for a reconciliation. He was not permitted to see any member of the ducal family, and the courtiers and lackeys insulted him so grossly that he broke out in vehement denunciations, and was committed to the hospital of Santa Anna. Here he was surrounded by maniacs of the worst description, and treated with a harshness which excited the pity of Montaigne and other visitors. A garbled publication of the Gerusalemme in 1580 was followed in 1581 by genuine editions, which had a prodigious circulation, and gave such a prestige to his name that his situation was slightly improved, and many of his admirers availed themselves of the easier access to his cell. The death of Eleonora in 1581, which Lucrezia thought would make the duke relent, had no such effect; and while fortunes were made by the sale of his epic, Tasso lingered in prison. He was not released

TASTE

551

until July, 1886, and only after repeated appeals from the most influential quarters and after his health had reached its lowest ebb, and then solely on condition of remaining in charge of Duke William of Mantua, who showed him much kindness. After William’s death he made in 1887 ineffectual attempts to better his fortunes in Rome, and in 1888 to recover his patrimony at Naples. For the rest of his life he almost continually travelled from Naples to Rome and from Rome to Naples, enjoying in the latter city his residence at the monastery of Mount Olives; but he was finally obliged to live in a charitable asylum at Rome until the grand duke of Tuscany came to his rescue and invited him to visit Florence (1590). Here, as everywhere else, he received distinguished though empty honors. In a subsequent journey to Rome, the famous brigand Sciarra refrained from molesting him and his travelling companions, and showed great deference for his genius. In 1598 appeared his Gerualemme conquistata, a remodelled form of his first epic, to which he alone regarded it as superior. It was dedicated to Cardinal Cinzio Aldobrandini, who thereupon induced Pope Clement VIII. to crown Tasso in the capitol. He reached the Vatican on Nov. 10, 1594, but after a relapse of his fever he was taken at his request to the monastery of St. Onofrio, on the Janiculum, where he died before the time assigned for his coronation. —The tribulations of the poet, the peculiar condition of his mind, his relations with the princes Eleonora, and the duke’s proceedings against him, have given rise to many conflicting statements, and thrown a pathetic halo over his life and genius. Goethe has made him the hero of a celebrated drama; Hallam regarded him as superior to Virgil in grace, though inferior in vigor; Ranke and other modern scholars have written on him extensively; Lamartine has called him “the crusader of poetry;” and Friedrich Schlegel places him above Ariosto on account of his melodious versification and picturesque and impassioned delineations of love. The academy of Crusa, however, bitterly contested at the time Tasso’s superiority over Ariosto. The most complete of the early genuine editions of the epic appeared at Parma (4to, 1581), and the most correctly printed among the latest editions is that of Padua (3 vols. 4to, 1827–28). It has been translated into most Italian dialects and into Latin, repeatedly into English, French, German, Spanish, Portuguese, Polish, and Russian, and in 1875 into modern Greek. The best translation into English is by Edward Fairfax (London, 1600; latest American ed., New York, 1855); and the most recent English version is by Sir J. K. James (2 vols., 1860). The Gerualemme has cast Tasso’s other works into the shade, although his Rime or lyrical poems are unsurpassed in their descriptions of disappointed love, and the choruses in his otherwise unsuccessful tragedy Torriamondo are remarkable for pathetic sweetness. His prose dialogues, moral treatises, and other minor works are also entitled to more attention than they have received. The most complete edition of his works is by Rosini (93 vols., Pisa, 1831–32). A good select edition appeared at Milan (5 vols., 1823–5). His principal biographers in Italian are his friend Manso (Naples, 1619) and Serassi, whose work is the most complete (Rome, 1786; new ed., Florence, 1868); and in English, Black (2 vols. 4to, Edinburgh, 1810) and R. Milman (2 vols., London, 1850). See also “Conjectures and Researches concerning the Love, Madness, and Imprisonment of Torquato Tasso,” by Richard Henry Wilde (2 vols. 12mo, New York, 1842); Sulla causa finora ignota delle venture di Tasso, by Capponi (2 vols., Florence, 1840–46); a complete chronological edition of his correspondence, by C. Guasti (5 vols., 1852–53); and Dei amore e della prigione di Tasso, by L. Chirabrio (Turin, 1862).

TASTE, the sense by which we distinguish the sapid properties of bodies, through the sensory apparatus in the mouth. Though the tongue takes the principal cognizance of gustatory sensations, the soft palate and its arches and the faucæ share in this office. The nerves of taste are the lingual branch of the trifacial or fifth pair of cerebral nerves, distributed to the mucous membrane of the anterior two thirds of the tongue, and the glosso-pharyngeal nerve, which supplies the base of the tongue, the soft palate, pillars of the faucæ, and upper part of the pharynx. The glosso-pharyngeal nerve is also regarded as the channel by which disagreeable impressions producing nausea and vomiting are propagated to the medulla oblongata. The exact seat of the sense of taste has been determined by placing in contact with various parts of the mucous membrane small sponges moistened with some sweet or bitter fluid, like a solution of sugar or quinine. It is thus found that the power of perceiving savors resides in the whole upper surface (dorum) of the tongue, its point and edges, the soft palate, the faucæ, and part of the pharynx. The most acute sensibility to taste is found in the base, tip, and edges of the tongue, while it is less marked in the middle of its upper surface, and almost or entirely wanting in its inferior surface. These parts are also supplied with general sensibility by the same nerves which communicate to them the sense of taste; and in the tip and edges of the tongue the general sensibility is even unusually acute, as compared with the external integument or other mucous membranes. (See TONGUE.)—Owing to the existence of these two kinds of sensibility in the organs of taste, we must distinguish between the different impressions produced upon them by foreign substances. The sapid qualities, properly speaking, which are distinguishable by the sense of taste alone, are such as we designate by the terms sweet, sour, alkaline, salt, bitter, &c., besides
various compound savors, like those of cooked meats, vegetables, and fruit. But other physical qualities are often mingled with these, which are of a different character, and are perceived by the general sensibility of the mucous membrane, here developed to an unusual degree. Thus, what is called a viscid, watery, or oleaginous taste is simply a certain modification in consistency of the substance under examination. An oil may have a well marked taste; but this is in consequence of its partial rancidity, or of its containing other impurities or sapid ingredients. An oil which is perfectly pure and fresh is almost or entirely destitute of taste, and conveys to the mucous membrane of the mouth only the sense of its oleaginous consistency. Other substances have an irritating or pungent quality, like alcohol, red pepper, and mustard; and this pungency is also perceived by the general sensibility of the mucous membrane. Most of the condiments in ordinary use produce their effect principally by means of their pungency, mingled with a small proportion of true sapid qualities. Many articles of food also have their taste modified or heightened by the presence of volatile ingredients perceived by the sense of smell; and this mixture of sapid and odoriferous qualities gives to the substances in question the properties which we know as their flavors. In this way are produced the flavors of wines, of tea and coffee, of cooked meats, &c. How much of the effect produced by these substances upon the senses is due to their odoriferous qualities, may be ascertained by holding the nose while swallowing them, so as to prevent the passage of air through the nasal passages.—An essential condition of the sense of taste is, that the sapid substance should be in a state of solution. In the solid form a substance even of well marked sapid quality, like crystallized sugar, produces no effect upon the taste, and is perceived only when applied to the tongue, only to the physical contact of a foreign body. It is only when it is presented in the liquid form, or is gradually dissolved in the fluids of the mouth, that it impresses the nerves of taste, and its sapid qualities are accordingly perceived. This is probably because sapid substances excite the sense of taste only by being actually absorbed by the mucous membrane, and thus coming in contact with the extremities of the gustatory nerves. This absorption requires time for its accomplishment, and especially requires that the substance, to be taken up by the mucous membrane, should be in a proper condition of fluidity. It is also on this account that a free secretion of saliva is so essential an aid to the sense of taste. When the internal surface of the mouth is in a dry condition, the savor of the food is imperfectly perceived. The salivary fluids, being themselves partly composed of organic materials, are especially adapted for rapid absorption, and, as they penetrate the mass of the food undergoing mastication, they become impregnated with its sapid ingredients, and cause them to penetrate readily the substance of the mucous membrane. The sense of taste is also materially aided by the movements in mastication, and particularly by those of the tongue; since a combination of movement and pressure is always favorable to the absorption of fluids by the animal membranes. The full effect of sapid substances is not obtained until the moment of actual deglutition. It is only after mastication is complete, and the food is actually in the involuntary grasp of the fauces and pharynx, to be swallowed into the stomach, that all parts of the gustatory mucous membrane are brought in contact with it at once, and their sensibility heightened by the simultaneous contraction of the muscles of deglutition.

TATE, a N. W. county of Mississippi, formed in 1873 from De Soto and Marshall counties; area, 406 sq. m.; pop. about 12,000. It is drained by Coldwater river, and traversed by the Mississippi and Tennessee railroads. The surface is undulating, and the soil fertile. The chief crops are wheat, Indian corn, sweet potatoes, and cotton. Capital, Sanatobia.

TATE, Nahum, an English poet, born in Dublin in 1602, died in Southwark, Aug. 12, 1715. He went to London, succeeded Shadwell in 1692 as poet laureate, and died in the precincts of the mint, a privileged place for debtors. He was associated with Dryden in the authorship of "Absalom and Achitophel," the second part of which is mostly his composition. He wrote "Memorials for the Learned, collected out of eminent Authors in History" (1666); "Miscellanea Sacra, or Poems on Divine and Moral Subjects" (1698); and "Panacea, a Poem on Tea" (1700). He also produced an alteration of "King Lear" from Shakespeare, which long held the stage to the exclusion of the original. But he is chiefly remembered by his version of the Psalms, made in conjunction with Major Denis, which is still retained in the "Book of Common Prayer." It was first published under the title of an "Essay of a New Version of the Psalms of David, consisting of the first Twenty, by N. Brady and N. Tate" (8vo, 1695). This was succeeded by "The Book of Psalms, a New Version in Metre, fitted to the Tunes used in the Churches, by N. Tate and N. Brady" (1696), and a "Supplement of Church Hymns" (1700).

TATIAN (Tatians), an ecclesiastical writer of the 2d century, the time and place of whose birth and death are uncertain, though he calls himself an Assyrian. He had received the education of a Greek, and been a teacher in the pagan schools before he went to Rome, where he practised as a teacher of eloquence, became the associate of Justin Martyr, and was converted to Christianity. After the death of Justin (about 165), he seems to have returned to the East, and adopted views resembling those of the Gnostic Marcion on the dual principle of good and evil, and on the essential depravity of matter. He became the founder
of a sect known as Tatianists, forbade marriage and the use of animal food and wine, substituted water for wine in the service of the eucharist, and required the giving up of worldly goods as the evidence of Christian sanctity. His "Discourse to the Greeks." (Προς Ἑλληνας), written while he still held orthodox opinions, has passed through many editions, the earliest being that of Zürich in 1546, and the best that of Oxford (8vo, 1700). The account of Tatian and his opinions is best given by Le Nourry in Worth's edition of his works; by the Benedictine Cellier, in vol. ii. of his *Auteurs sacrés et ecclésiastiques*; and by Daniel in *Tatian der Apologist* (Halle, 1837).

**TATIUS, Achilles.** See *Achilles Tatius.*

**TATINALL, a S. E. county of Georgia, bounded by the Altamaha and N. E. by the Can-nouchee, and intersected by the Great Ohooppee river; area, about 1,200 sq. m.; pop. in 1870, 4,860, of whom 1,280 were colored. The surface is level, and the soil sandy and mostly poor. The chief productions in 1870 were 14,684 bushels of Indian corn, 28,117 of oats, 25,326 of sweet potatoes, 314 bales of cotton, 29,854 lbs. of wool, and 120,013 of rice. There were 5000 horses, 100 mules and asses, 6,567 milch cows, 15,138 other cattle, 12,090 sheep, and 13,420 swine. Capital, Reedsville.

**TATTA,** a town of British India, in Sinde, on the W. bank of the Indus a few miles above the head of the delta, 48 m. S. W. of Hyderabad; pop. about 10,000. It stands on ground slightly elevated by ruins, which are exceedingly abundant in the vicinity, and include an old cemetery said to contain 1,000,000 tombs. The town is much decayed. During the season when the river overflows its banks it is almost completely surrounded by water. There are some manufactures of cotton and silk goods, but the trade is not very extensive. Tatta is supposed to be the ancient Pattala. The Portuguese plundered it in 1555, and the British established a factory there in 1758.

**TATTLER,** the proper name of the wading birds of the snipe family, of the division *towanae,* as distinguished from the *tringaen* or sandpipers; they are often called sandpipers, in English gamgabets, and in France chevaliers or *totanes.* The bill is slender, nearly straight, about as long as the tarsus, pointed, not grooved for the terminal four, gape extending beyond the culmen, terminal half hard and horny, and base covered with a soft skin; wings long; legs and neck elongated; toes connected anteriorly by membrane; tail almost always strongly barred. They are genuine waders, frequenting the water's edge, picking up insects, mollusks, &c.; they are swift fliers and runners, and some species take readily to the water; they perform migrations of considerable extent, going north to breed in spring, and returning through the temperate regions in early autumn at which time the flesh is fat, juicy, and much esteemed. The French name is derived from the body being mounted on long legs, and appearing as if on horseback. The nest is on the ground, usually near water, and the young quit it as soon as hatched; in the breeding season they keep in pairs, and the families remain together until spring. — The tell-tale tattler or greater yellow-legs (*gambetta melanoleuca*, Bonap.) is about 14 in. long, 25 in. inalar extent, with the bill 2½ in.; wings long, first quill the longest; tail short; legs yellow and long; hind toe small. Above it is cinnamon of various shades, with lines, spots, and edgings of dull white; lower back brownish black; rump and upper tail coverts white with more or less perfect brownish bands; white below, with brownish stripes on neck and bars of spots on breast; quills brownish black; tail white, with brownish black bands. This bird, sometimes called stone snipe, is found throughout temperate North America and Mexico, preferring large soft marshes and the vicinity of fresh water; it lives with other waders and the smaller ducks; the common name is derived from the habit of uttering its shrill whistle of four loud and rapidly repeated notes at the least sign of danger, giving the alarm to all the ducks and other game birds in the neighborhood; its notes are easily imitated, calling the bird within gun-shot; the flesh in autumn is excellent eating; the eggs are four, 2½ by 1½ in., pale greenish yellow, with brown and purplish gray blotsches. The common yellow-legs and the willet will be noticed under those titles. — The spotted tattler or pect-weet (*tringoides macularius*, Gray) is 7½ to 8 in. long, 13 in. inalar extent, with the bill 1 in., and the tarsus rather less; the bill has both mandibles grooved and is tapering; lower third of tibiae naked; tail much rounded; outer toe webbed to first joint. It is brownish olive-green above, with bronzed lustre and lines and spots of brownish black; line over eyes and

![Tell-Tale Tattler (*Gambetta melanoleuca*)](image-url)
under parts white, the latter with circular brownish black spots; primaries, secondaries, and outer tail feathers tipped with white, the last with irregular brownish black bars. It is found over temperate North America, in Central America in winter, and also in Europe; it is one of the most common marsh birds of New England, arriving from the south about the beginning of May; it is often called  

TAUNCHNITZ. I. Karl Christoph Trangott, a German publisher, born at Grosspardon, near Grimma, Oct. 29, 1761, died in Leipsic, Jan. 14, 1836. He learned the printer's trade at Leipsic, and worked in the celebrated printing house of Unger in Berlin. In 1792 he entered the house of Sommer in Leipsic, and in 1796 established in that city the house long known by his name. He began with a small printing house, but in 1798 opened a bookstore in connection with it, and in 1800 a type foundery. In 1810 he published the first volumes of a series of Greek and Latin classics, which, from their accuracy, cheapness, and convenient size, became very popular. He also published some very perfect editions of classical authors in folio. In 1816 he established the first stereotype foundry in Germany; and he was the first to stereotype music. His edition of Mozart's Don Giovanni had a wide popularity. He also printed stereotype editions of oriental works, including two of the Hebrew Bible, and an edition of the Koran. II. Karl Christian Philipp, son of the preceding, born in Leipsic, March 4, 1798. He enlarged his father's business and carried it on with success until he retired in 1825. Besides many celebrated and important philological publications, he completed in 1840 Furst's edition of the Hebrew concordance. III. Christian Bernhard, a German publisher, cousin of the preceding, born Aug. 25, 1816. He founded in Leipsic in 1837 a publishing house, which has become celebrated by the issue of a collection of English works, well known as the "Tauchnitz editions," of which more than 1,000 volumes had been published in 1868, of more than 120 English authors; a copyright for the continent being secured for the more recent works. In 1866 he began the publication of a series of German authors for the use of English-speaking people. In 1860 the title of baron was conferred upon him by the duke of Saxe-Coburg-Gotha, and his title was recognized by the king of Saxony in 1861. TAUER, Johann, a German mystic, born probably in Strasburg in 1290, died there, June 16, 1361. At the age of 18 he renounced a fortune to enter the Dominican cloister. After studying the scholastic theology in Paris he returned to Strasburg, and came under the influence of Master Eckhart. He became one of the so-called "friends of God," an unorganized brotherhood, including priests, nobles, and burghers in all the large cities, who represented the height of mysticism, denied the special prerogative of the clergy except in the celebration of the sacraments, and dwelt upon worship in the heart and life. He preached in Strasburg, Cologne, and Basel, where Henry of Nordlingen had resumed his forbidden functions. Amid the ravages of the black death (1848-50), he bestowed the consolations of religion on the people, preaching in German mingled with Latin. He wrote in German a treatise on "Following the Lowly Life of Christ" (Frankfort, 1821), addressed a remonstrance to the clergy against leaving the dying unattended and unabsolved, and denounced ecclesiastical abuses. Having been summoned by the emperor Charles IV., when at Strasburg in 1848, to render an account of his faith, he disappeared from the city, but returned there shortly before his death. The best of the early editions of his sermons are those of Leipsic (1498), Basel (1521-2), Halberstadt (1529), and Cologno (1543). There is a modern German translation of Schorer of his sermons (3 vols., Frankfort, 1826; 2d ed., 1864), and of his Nachfolzung des armen Lebens Christi (1833). The hymns attributed to him are of doubtful authenticity.—See Schmidt, Johannes Taufer von Strasburg (Hamburg, 1841), and Miss Winkworth. "Life and Times of Tauler," with 25 of his sermons translated from the German (1857).

TAUNTON, a city and one of the shire towns of Bristol co., Massachusetts, at the head of navigation on Taunton river, 24 m. from Narragansett bay, 17 m. E. of Providence, R. I., and 32 m. S. of Boston; pop. in 1850, 10,441; in 1860, 15,376; in 1870, 18,629, of whom 4,606 were foreign-born or 20,429. In shape it is an irregular polygon, having an extreme length N. and S. of 11 m. and an average width of 6 m. The surface is generally level; half of the land is wooded with forests of pine, oak, beech, and cedar, and there are five ponds of considerable size. It is traversed by the Taunton river and two principal branches, the Canoe and Rumford, which furnish power for many mills and factories. Navigation is impeded by ice but a small part of the winter. The city communicates by rail with Boston, Providence, Fall River, Newport, New Bedford, Cape Cod, and various other points, and has a line of street cars. There are several villages within the city limits. The streets of the central village are well laid out, lighted by gas, and adorned by shade trees of various kinds. The "green" is a well shaded public ground. There are many elegant residences, some of great cost, to which are attached gardens and conservatories. The principal public buildings are the court house, city hall, hotels, school houses, and churches. The
TAUNTON

state hospital for the insane occupies a conspicuous site, with grounds of more than 140 acres, and accommodates over 400 patients. Taunton has from the beginning been noted for its manufacture of brick and iron, the latter being at present the leading business, and employing a capital of about $2,900,000. There are two locomotive works, two tallow and nail factories, several founderies and machine shops, &c. In copper manufacture a capital of about $900,000 is invested. The Taunton copper company, the oldest and largest in the United States, has been incorporated nearly 60 years. Its products are copper, sheet zinc, and yellow metal sheeting. Among other establishments are two manufacturies of silver-plated and Britannia ware, four of stove linings and fire brick, two of crucibles, five cotton factories, a flannel factory, a carriage factory, &c. There are three national banks, with an aggregate capital of $1,300,000, and two savings banks, with deposits to the amount of $4,500,000. The coasting trade is important. Taunton and Taunton river are also proverbial for their herring fisheries, the privileges of which are still annually sold, though few of the inhabitants now pursue this branch of industry. Large quantities of shad and alewives are taken from the river in April and May.—The city is governed by a mayor, aldermen (one from each ward), and 24 common councilmen. The taxable value of property in 1874 was $18,826,-228; city debt, $275,600. The public schools comprise the following grades: high, 1; grammar, 12; intermediate and primary, 31; ungraded schools, 15. The number of pupils enrolled in 1874 was 3,654; average attendance, 2,522; total expenditure for support of schools, $42,739 58. There are two private schools, an incorporated academy, a public library of 15,000 volumes, and a daily and two weekly newspapers. The principal charitable institutions are the mayor, alms house, the city almshouse, and a home for aged and infirm women. There are 19 churches, viz.: 2 Baptist, 3 Congregational, 2 Episcopal, 1 Free-Will Baptist, 4 Methodist, 2 Roman Catholic, 3 Unitarian, 1 Universalist, and 1 Union.—Taunton, of which the Indian name was Cohannet, was settled in 1638 by a company from Taunton in England, from whom a large proportion of the present natives of the town are descended. It became a city in 1864. One of the chief promoters of its settlement was Miss Elizabeth Pool, to whom a monument has been erected in the cemetery. In King Philip's war the town was protected from harm by the king's friendship for Thomas Leonard. Here was Philip's favorite hunting ground.

TAUNTON, a town of Somersetshire, England, on the Tone, 138 m. W. S. W. of London; pop. in 1871, 15,466. It has an old castle, several places of worship, including the church of St. Mary Magdalen with a fine renovated tower, and various charitable and educational institutions. Among the latter is a college established in 1868 by the Congregationalists at Fairwater, outside of the town. The wool manufactories established in the 14th century have long since declined, and gloves are now the staple industry. In 1645 it was held by Blake for the parliament, and sustained a protracted siege by 10,000 royalists.

TAURIDA, a S. government of European Russia, bordering on the governments of Kherson and Yekaterinoslav, the sea of Azov, and the Black sea; area, 24,537 sq. m.; pop. in 1870, 704,997, a large part Tartars. The government includes the Crimea (the Tauris of the ancients, whence the name Taurida), which comprises nearly one third of the area and population, and contains the capital Simferopol, and the principal port and naval station Sebastopol. (See Crimea.) The N. part is a dry elevated country, with a sandy soil impregnated with salt, and without trees, but with some rich valleys that produce luxuriant herbage. Agriculture is little attended to, and the country is chiefly devoted to rearing cattle. A few small streams flow into the sea of Azov, but the only river of importance is the Dnieper on the N. W. frontier. Numerous tongues of land formed by alluvial deposits project from the S. coast, the most extensive of which lies S. of the estuary of the Dnieper, and was anciently called Achilles Dromos, or Race Course of Achilles. Salt, saltpetre, and naphtha are abundant, and marble is quarried.

TAURENENIUM, an ancient Greek city on the E. coast of Sicily, about half way between Messana and Catana, founded on the hill of Taurus, overlooking the sea, after the destruction of Naxos, 3 m. to the south, by Dionysius the Elder of Syracuse, in 408 B. C. In 394 Dionysius besieged it unsuccessfully for a long time, but it fell into his hands in 392. In 258 Andromachus, the father of the historian Timæus, is said to have collected all the exiled Naxians, and established them at Taurenien. In 344 Timoleon landed here, but left Andromachus in possession. Subsequently it fell into the hands of Hiero, king of Syracuse. During the servile war in Sicily (184-132) it was desperately defended by the insurgent slaves. It was one of the last places taken from the Greek emperors by the Saracens (906), who destroyed it. The modern village of Taormina occupies its site.

TAURIS, a range of mountains in Asia Minor, forming in the main the watershed between the waters flowing into the Mediterranean and those flowing into the Black sea. It consists of two principal chains, the Taurus proper, in the south of the peninsula, and its northeastern continuation, the Anti-Taurus. With its ramifications in the north, which by former geographers were generally designated as the Anti-Taurus, the range forms three sides of the broad plateau of central and eastern Asia Minor. The commencement of the Taurus proper on the west is a disputed point. Its principal divisions are the Lycean and the Ge-
lician Taurus. It follows closely the sinuosi-
ties of the coast, leaving but a narrow margin
between; the northern slopes are less abrupt
than the southern, monum.-clapped plains are nu-
merous, and fine forests cover the sides of the
chain. In the ancient province of Lycia the
summits Takhtali Dagh and Ak Dagh are re-
spectively 7,800 and 9,800 ft. high. Gok Dagh,
on the confines of ancient Pisidia, Isauria, and
Cilicia, is of about equal height with Ak Dagh,
while the highest summit of Bulghar Dagh,
further east, reaches an elevation of about 11,-
400 ft. The Ala Dagh connects Bulghar Dagh
with the Anti-Taurus, which extends from the
W. branch of the Sihun (anc. Saurus), through
Cappadocia, to the vicinity of the upper Eu-
phrates and the Armenian mountains. The
Arjish Dagh (anc. Aryaz in Cappadocia),
the highest peak of Asia Minor (18,100 ft.),
though isolated, is generally reckoned as be-
longing to the Anti-Taurus. On the whole,
however, this chain is less high than the Taurus
proper. The Amanus range, E. of the river
Sihun (anc. Pyranus), connects the Anti-
Taurus with the mountain system of Syria.
The main pass between the latter country and
Asia Minor, called by the ancients the Clician
Gates, is formed by the valley of the upper
Cydnus (now Tersus), 'in the Cilician Taurus,
N. W. of Adana.

W. A. TAUTZ. A German pianist, born near
Waraw, Nov. 4, 1841, died in Leipzig, July 17,
1871. He studied under his father and Liszt,
after whom he ranked as the first pianist in
Europe. In 1861-2 he brought out at Vienna
works of Liszt, Wagner, and Berloz in such a
manner as to gain for himself a great reputa-
tion as an orchestral director. In 1865 he
went to Berlin and was made court pianist,
and became the head of the institution for
piano virtuosos. He played without notes
nearly every great composition from the time
of Bach to Liszt.

TAUTWIN. See Blackfeet.

TAUVERIE or TAUVERSE. A. S. W. län or govern-
ment of Finland, Russia; area, 8,394 sq. m.;
pop. in 1872, 193,477, all Lutherans. It is
mountainous, and has many lakes. Corn,
hemp, flax, and cattle are produced. B. A
town, capital of the län, 85 m. N. E. of Abo;
pop. in 1876, 3,150. The first Finnish railroad
was opened in 1863 hence to Helsingfors.

TAVERNIER, Jean Baptiste, a French travel-
ler, born in Paris in 1605, died in Copenhagen
in 1659. He early explored many countries,
served occasionally as a soldier, and made six
journeys to western Asia and to India, mostly
on foot. His father-in-law, a jeweller, having
taught him the art of valuing precious stones,
he acquired a fortune, was ennobled by Louis
XIV. for promoting French trade in India, and
bought the barony of Aswan near the lake of
Geneva; but he was ruined by his nephew,
and in 1687 fled to Berlin to escape persecu-
tions as a Protestant. There he became direc-
tor of an East Indian company, and soon un-

dertook a seventh journey, which was inter-
rupted by his fatal illness in Denmark. Louis
XIV. bought of him millions of francs worth
of diamonds. Under his direction Chappuzin-
edited Les six voyages de J. B. Tavernier (2 vols.,
1676-7), and La Chapelpe a 3d volume in 1679.
The latter also reedited in 1675 Nouvelle rela-
tion de l'intérieur du sérail du grand seigneur,
Une histoire du Japon, and Mémoire sur la con-
duite des Hollandais. The first named work
has been frequently reprinted and translated
(English, 2 vols. folio, 1678-84).

TAXES, the contributions levied by a govern-
ment upon persons and property, for the use of
the government. As a revenue for the use
of the state is absolutely essential to the exis-
tence of any orderly government, it is reason-
able to infer that taxes were levied preceding
the earliest of which historical records remain.
But in the early ages rulers had other means
of supplying their wants without resort to
regular levies. One of these might be prop-
erty of which the state or its ruler had the
ownership, the rents or other returns from
which rendered taxes unnecessary. In early
periods, also, fines and confiscations or com-
pensations for crime constituted an important
source of revenue. The early taxes were most
severe where the religious worship was sup-
ported by this means. Among the Hebrews,
in the time of theocracy, there was a capita-
tion tax of a half shekel (about 30 cts.) pay-
able by every male in the nation (according
to some the regular payment of this was of
later origin); a tribute of the first fruits, and of
the first born of their domestic animals, which
might be commuted for money at a fixed rate;
a redemption tax for the first born male of the
family; and a first and second tithe for the
support of the Levites and of the service of
the tabernacle, and every third year a third
tithe (according to some an application of the
second tithe) for the benefit of the poor, and
so in some sense a poor rate. After they
adopted the regal form of government, the
taxes were greatly increased. Solomon col-
lected a large revenue; and the stoning to
death of Adoram, "who was over the tribute,"
and the secession of the ten tribes at the com-
 mencement of the reign of his son and suc-
cessor, indicate how oppressive had been the
taxation.—In the Athenian republic there were
no direct taxes, either on personal or real
estate; the sources of revenue were the lands
of the republic, fines and confiscations, the
royalty of ¼ of the products of the mines, a
capitation tax on freedmen and foreigners resi-
dent in the republic, customs duties on foreign
commodities and merchandise, on which a
tariff of 2 per cent. was levied, some excise
duties, licenses of markets and houses of pros-
titution, and tribute paid by other cities and
islands. The imposts, licenses, &c., were gen-
erally farmed to companies, which gave secur-
ity for their prompt payment. In times of
war, extraordinary contributions were levied
on wealthy citizens, or an appeal was made to their patriotism. The common people, so far from paying any tax except the duty on the goods they purchased, received from the state large appropriations for public games and spectacles. In Rome, under the republic, the spoils of conquered nations and the annual tribute exacted from them defrayed the greater part of the expenses of the state; but under the empire it was found necessary to resort to numerous devices of taxation, portions of the territorial revenues were sequestered, capitation taxes levied, tolls, taxes on corn, and legacy and hereditary duties collected, heavy sums exacted for the privilege of Roman citizenship, &c. During a large part of the middle ages, under the feudal institutions, there was no system of taxation. The kings were maintained by the products of their land, and in case of war their vassals, the barons and knights, were under obligation to furnish their quota of men-at-arms equipped and provisioned without expense to the monarch; and this military service was performed by their tenants by way of rental for the lands they cultivated. The first approach to modern systems was made during the middle ages by the republic of Venice, which levied taxes on the lands of the republic, and also in the form of duties on manufactures and imports; these duties, which brought in a large revenue, were imposed on the necessaries as well as the luxuries of life. In France, prior to the revolution, there was a serious obstacle to any equitable system of taxation in the fact that the nobility and clergy, the privileged classes as they were termed, were exempted from its burdens. In England the finances for centuries were badly managed; there was little encouragement to industry, and the taxes, whether direct or indirect, were insufficient for the expenses of the government. The privileged classes were exempted as in France. Revenue was often raised to the sale of monopolies, and to forced loans, contributions, and confiscations. In most of the other countries of Europe no taxes were levied on the clergy or the nobles. In the countries of western Asia, the government of provinces with the right of taxation was bestowed on favorites, or sold to the man who would pay highest for it; and as the duration of the government of these rulers was short, they practised the most cruel extortion, completely annihilating industry, and often transforming countries once prosperous and populous into desert wastes. — Taxes are either direct or indirect. The former are those which are levied upon the persons, property, business, income, &c., of those who are to pay them; the latter are levied on commodities in the hands of manufacturers and dealers, and will be paid ultimately by consumers as a part of the price of the commodity. Presumptively the former are paid by the persons taxed, while as to the latter the persons who make payment to the government only advance to it the taxes, expecting to reimburse the amount in their sales and thus transfer the tax to the purchasers. They constitute therefore as to these taxes the collectors for the government, collecting with ease and convenience from the whole body of consumers a tax which it would be difficult and expensive, perhaps impossible, for the government to collect from the several consumers after the articles taxed have passed into their hands. But though direct taxes presumptively fall upon the persons taxed, a portion of the burden is usually transferred to others, and is diffused through the community in a manner that renders it impossible to indicate the precise extent. A direct tax on lands is paid by the land owner; but if the revenues of the state were principally collected from this source, the necessary result would be such an increase in the price of everything which the land produces as would transfer to consumers a large proportion of the tax, and thus have the effect of an indirect tax upon them. A like result must follow the taxation of professional incomes, unless the incomes of other callings are taxed proportionally, so as to equalize the burden by the tax law itself, instead of leaving it to be equalized by the increase in price of whatever those who pay the tax have to sell, as compared with the price of what is sold by those who are not taxed. A process of equalization of this nature must always be going on when one class of property or occupation is taxed and another exempted. — The true principles of taxation were little understood until the time of Adam Smith, and even now are in many particulars the subject of earnest controversy. That writer laid down maxims of taxation as follows: ''1. The subjects of every state ought to contribute toward the support of the government, as nearly as possible, in proportion to their respective abilities; that is, in proportion to the revenue which they respectively enjoy under the protection of the state. 2. The tax which each individual is bound to pay ought to be certain, and not arbitrary; the time of payment, the manner of payment, and the quantity to be paid, ought all to be clear and plain to the contributor and to every other person. 3. Every tax ought to be levied at the time and in the manner in which it is most likely to be convenient for the contributor to pay it. 4. Every tax ought to be so contrived as both to take out and keep out of the pockets of the people as little as possible over and above what it brings into the public treasury of the state.'" Prof. Amasa Walker, in his "Science of Wealth," adds to these the following, which he justly says has been adopted in every country having any considerable taxation: "5. The heaviest taxes should be imposed on those commodities the consumption of which is especially prejudicial to the interests of the people." The first of these maxims has met with little or no recognition except in recent times. It has already been said that until recently,
even in the most civilized countries, precisely those classes who enjoyed the largest revenue, and presumptively were most able to contribute to the support of government, were exempted altogether. The modern idea not only accepts this first maxim, but it goes somewhat further in a direction opposite to the practice of former times, and holds that revenue which is obtained incidentally the support of the person and his family should be regarded as not subject to taxation at all, but the whole burden should be levied upon the large revenues. Full effect is seldom given to this idea, but its recognition is seen in the exemption of small incomes when an income tax is laid, and in the exemption of household furniture, tools of trade, &c., when property is taxed by value. While this first maxim is true in a general sense, there are many exceptions to be made to it, and no tax system ever professes to be framed in strict accordance with it. The land owner who voluntarily allows his lands to lie idle is profiting from others, who by contributing to the common benefit of society, has no claim to exemption; and as his property is meanwhile protected by the government, it is only reasonable that he should make due return for this protection. A man possessed of large means may have them invested in a large establishment, fine grounds, elegant collections of art, &c., which a moderate income enables him to support; while another whose whole capital is kept in productive employment may realize no greater income from his comparatively small means, supplemented by his own labor. Obviously in such cases income could not be a proper standard of taxation as between the two. To render the maxim just in all cases, other than pecuniary returns must be had in view, and the standard of taxation must embrace something besides income. In modern times complicated systems have generally been established in which taxes have been laid on expenditure as well as on income, and to these have been added taxes on the value of property, the purpose being to levy a diversity of taxes which, as they work together, will be likely to result in distributing the burdens of government more equally and justly than any single tax could possibly do. The second maxim is one that should admit of no exception when direct taxes are laid; but when taxes are indirect, one of their chief advantages is supposed to be that they are paid by the people without their being aware at the time that they are paying taxes at all, or at least without reflection on their part that what they pay as price includes a tax. The third maxim is sometimes had in view in the imposition of taxes in kind, but it must be very rare indeed that this method of obtaining a revenue can be either convenient to the people or servicial to the government. Only when extraordinary circumstances render a ready exchange of the products of the country for money, such as for a time existed while the southern states of the Union were in insurrection against the government, could taxes in kind be preferable either to the tax payers or to the government. The exchange of property for money is always better done by individuals than by the government, and the government consults the interests of the people by making taxes payable at the season of the year when the harvests have generally been gathered, and when it is presumed the tax payers can most conveniently meet the demand. The fourth maxim is often violated by large and needless accumulations in the public treasury, which are impolitic for the further reason that they tend to extravagance and corruption and invite peculation. One important measure which governments adopt has express reference to this maxim, viz., the warehousing system, under which the importer, instead of being compelled to pay the customs duties on the arrival of the goods, and to charge his customers with the consequent loss of interest until sales are made, is permitted to leave them in store, and to pay the duties when the goods are withdrawn for sale. Mr. Walker's supplementary maxim is had in view in all well regulated governments. Spirituous and fermented liquors and tobacco are usually made to pay heavy taxes, while breadstuffs are exempt, or only taxed as a part of the general property of the country by value; and at the same time perhaps license taxes will be imposed upon dealers in spirits and tobacco, and also upon the keepers of billiard tables and places of amusement.—The taxes which have been laid at different times have been almost infinite in variety, depending sometimes mainly on considerations of policy, while at others the necessities of government have compelled it to make use of every available means of extracting money from the people. One of the earliest taxes was perhaps a capititation tax, but this can seldom be reasonably fair or equal, because it can take no account of the differences in condition, resources, or income of the persons taxed. The land tax was also an early device, and the feudal services easily slid into a burden of this character. A land tax as a part of a system of taxes may be a just tax, and by itself may not be so unequal or unjust as would at first be supposed. Land is the most available resource for direct taxation, and in this country land is found in the hands of so large a portion of the people that the states are enabled to raise the greater part of their revenues from this source without exciting any general feeling of discontent. Land taxes may be measured by area, which, except in the case of assessments for some local purposes, must always be unequal, or they may be measured by rents or by value. A house tax is common in other countries, and was formerly measured by windows or hearths; but as the adoption of one form or another is merely a matter of the convenience which was the measure of the tax, the rent or rental value is generally
TAXES

589

substituted. The income tax, however just in
theory, has always proved unequal from the
impossibility of obtaining accurate returns, and
unpopular from the necessity it involved of
paying into the business and private concerns
of the people. Great use has however been
made of it in England, where one has been
imposed ever since 1542, undergoing in the
mean time 15 alterations, the rate ranging from
16d. in the pound to 2d. In some tax laws
incomes are graded, and those are taxed least
which are derived from property otherwise
taxed, or which for any reason it is thought
should not be taxed as high as others. In
America an income tax has always been excep-
tional. Excise taxes are laid in great variety,
and in some countries produce the larger por-
tion of the revenue. The heaviest are usually
those on the manufacture of liquors; these have
sometimes been made so heavy as to furnish
strong inducements to evasion, and by various
ingenious contrivances, combined usually with
corruption of the revenue officers, the heavy
tax is made less productive than a light one.
Excise taxes are also laid on employments in
various forms, on the profits of business and of
corporations, &c. A succession tax, or a tax
on the privilege of succeeding to an inheritance
or to a testamentary gift, has been customary.
When the succession is collateral, or out of the
immediate family of the deceased, it comes in
diminution of a new capital and will not be
burdensome; but when paid by the immediate
family of the deceased, the burden is more felt,
because that from which the tax is taken was,
for all purposes of comfort and enjoyment, the
property of the family before. Customs taxes
are in some countries next in productiveness to
excise taxes, while in others they are much
more productive. They are favorite taxes
with governments because they are easy of
collection, and because the people submit to
them more willingly than to either the direct
or the indirect internal taxes. They are ob-
jectionable because of the strong invitation
they hold out to smuggling, which is greater
in proportion as the tax is heavy, and also be-
cause of the temptation they offer for discrimi-
nating legislation for the benefit of particular
occupations or to build up monopolies. Pro-
ective taxation is usually laid in this form.
Either an excise or a customs tax will be pro-
ductive in proportion as the article taxed is
one in general use, and as the government suc-
ceeds in collecting the tax and preventing eva-
sions. An export tax is not often laid, it be-
ing thought impolitic as tending to diminish
exportation and production, and also because,
the extent that it seems to transfer to pur-
chasers in other countries the burdens of the
government imposing it, the tendency is to
invite retaliatory legislation. A property tax
by value has very generally been regarded in
America as the most equal and just of all taxes.
Practically it falls mainly on real property,
from the difficulty of discovering and listing
personality except in its most tangible forms.
Stamp taxes are laid in various forms: on
manufactured articles, bills of exchange, checks,
deeds, contracts, and other instruments of busi-
ness or traffic, on the process of courts, letters
of administration, &c., and sometimes on news-
papers. No taxes are so easily, cheaply, or
conveniently collected as these, and when levied
on articles selected with a view to a fair dis-
tribution of the burden, none could be more
just. In the United States they are generally
abandoned except for the purposes of the excise
on manufactures. The enjoyments and amuse-
ments of the wealthier classes are sometimes
taxed specially, the taxes being imposed in re-
spect to their servants, horses, carriages, dogs,
plate, &c. The interest of money is sometimes
taxed specially; so are dividends of corpora-
tions and joint stock companies; so sometimes
are indentures of apprenticeship, and even mar-
riages. Many light taxes are laid for regula-
tion merely, usually in the form of license fees.
A principle generally accepted is, that arti-
cles of luxury should be selected for taxation
to the relief of articles of prime necessity.
This tends to cast the burden upon those best
able to bear it, and at the same time leaves
every man to tax himself, since his purchases
are made of choice and not from necessity.
But this by no means has the effect at all times
to make the weight of taxes fall upon the
wealthier classes. Mr. R. D. Baxter estimates
the taxes paid by the manual labor classes of
Great Britain on alcoholic drinks and to-
acco at 6½ per cent. of their income, and
those paid by the upper and middle classes on
the same articles at 2½ per cent.—The offi-
cial figures of European budgets convey no
adequate idea of the relative taxation in the
respective countries, because in one country
they may embrace the taxes levied for many
purposes which in another will be provided
for by taxes not brought into the correspond-
ning budget. Furthermore, no adequate returns
are anywhere made of the items of local taxa-
tion, which constitute a large proportion of the
aggregate taxes. These local taxes in Great
Britain are estimated to exceed £30,000,000.
Any comparison between the taxation of the
United States and that of the European coun-
tries would also be likely to mislead, unless it
brought into view the taxation of the several
states as well as that of the nation. Taxation
in the United States ranges itself under the
three heads of federal, state, and municipal.
The first is almost wholly in the form of
customs and excise duties. The figures for the
fiscal year 1875 were:

| Customs duties | $157,167,712 60 |
| Taxes on distilled liquors | $25,681,201 12 |
| on fermented liquors | 9,144,391 66 |
| on tobacco | 87,300,676 06 |
| Stamp taxes | 6,083,596 13 |
| Taxes on banks | 4,066,560 87 |
| Penalties and other items | 1,385,700 90 |
| Total internal taxes | 106,549,865 11 |

* Total of taxes | $297,016,927 11 |
State taxation is usually laid for general state purposes only. The bulk of all state taxation is laid upon property by a general valuation. In some states these are supplemented by taxes on occupations or "privileges," on the franchises of corporations, &c. Taxes on those occupations which are transient and those which are thought to require peculiar supervision and regulation are usual in all the states. Municipal or local taxation is commonly very much heavier than state taxation. It embraces: 1, all taxes laid for the general purposes of counties, cities, boroughs, towns, and villages; and 2, those local taxes which are usually called assessments, and which are laid in special districts supposed to be peculiarly benefited by the construction of some public work, and by some rule of apportionment which proposes to charge each item of property within the district in proportion to the benefit it will receive. Taxes on this principle are often, though not always, laid for the opening and improvement of streets, for sewerage and lighting in cities, for country drains, for levees and embankments, &c. The legislature directs these to be provided for by general taxation of the municipality, or by local assessments, as it deems most just, or it confers upon the municipality within which the work is to be done a discretion in the premises.—The methods of collecting taxes are various. Formerly in some countries the collection of the revenue was farmed out to contractors, but this led to enormous abuses and oppressions, and is no longer thought of. Customs duties are usually collected by requiring everything imported to pass through the hands of government officers, and the tax to be paid before the goods pass beyond their control. Excise taxes may be imposed in the form of stamps, and collected in a sale of the stamps, to be affixed either by the person taxed or by some official. Assessed taxes are mainly collected by a collector who holds a tax list and warrant is issued, and who is authorized to distrain goods, and perhaps to take the body of the person taxed. In the United States taxes on lands are generally permitted to be enforced by a sale of the lands after other means of collection are exhausted. Much use is made of penalties under revenue laws, not only for the punishment of frauds and evasions, but also to compel the furnishing of lists, returns, &c.—Many things are usually exempt from taxation. Indeed, any taxation is only a selection of subjects to be taxed, leaving everything else exempt; but where special classes of persons, occupations, property, &c., are taxed, many exemptions are made. Public property is usually exempt, and this includes court houses, public school buildings, asylums, &c. Houses of worship are also generally exempted, and sometimes the property of clergymen; the idea being that this indirect encouragement to religious worship is for the good of the state, and also, perhaps, that as the community in general contribute in some form to the maintenance of churches, this exemption produces no condition of inequality. Special propositions of individuals in any class taxed are usually unjust, and in the United States, except when made for a consideration, must be regarded as forbidden by constitutional principles.—Taxation and protection are regarded as reciprocal rights and duties. But protection is the consideration rather for the liability to taxation than for actual taxation; as, if the government should see fit to collect all its taxes from lands, persons owning no lands and therefore not taxed, but liable to be taxed, would be equally entitled to protection with the land owner himself. In Great Britain and the United States it is a constitutional maxim that taxation and representation go together, and the people's representatives vote the taxes which the people are to pay. A violation of this maxim led to the American revolution. The exact force of the maxim is not well determined. It is not usually in doubt so far as the general taxes for the use of the state are concerned: these must be granted by the legislature; but in the case of local taxes some questions remain to be determined. There can be no doubt that local powers to tax are not inherent in the municipalities, but must be conferred by the state. Usually they are conferred with proper restrictions, and the municipalities are then left to exercise them at discretion. And it must be conceded that when the powers are to be employed for purely local purposes in which the commonwealth at large has no concern, this maxim would be disregarded if liberty in the premises were not left to the people directly interested; and this in the United States is customary.—See Leone Levi, "On Taxation, how it is Raised and how Expended," (London, 1860); Parrien, Traité des impôts considérés sous le rapport historique, économique et politique en France et à l'étranger (5 vols., Paris, 1862-74); Sir Morton Peto, "Taxation, its Levy and Expenditure, past and future," (New York, 1866); R. Dulley Baxter, "The Taxation of the United Kingdom," (London, 1869), and "Taxation and Local Government," (1874); George J. Goschen, M. P., "Local Taxation," (London, 1872); Sarjeant, "Taxation, Past, Present, and Future," (London, 1874); R. S. Blackwell, "Tax Titles," (3d ed., Boston, 1874); "Local Government and Taxation," edited by J. W. Probyn ("Cobden Club Essays," 1875); Francis Hilliard, "The Law of Taxation," (Boston, 1873); and Thomas M. Cooley, "The Law of Taxation," (Chicago, 1876).

TAXIDERMY (Gr. ταξιδήμος, arrangement, and ἄποια, a skin), the art of preparing the skins of animals so that they retain their natural appearances, and also of arranging them in the forms and natural positions of the animals from which they are taken. This often includes the preservation of the skeleton or parts of the skeleton, which is replaced as being the
most convenient model or frame on which the skin can be placed. The art also includes the preservation of the whole of the bodies of small animals, which in such cases is synonymous with embalming. The principal operations in taxidermy are the removal of the skin, which requires much care and dexterity, and its treatment with some preserving preparation, as arsical soap, composed of arsenic 1 oz., white soap 1 oz., carbonate of potash 1 dr., distilled water 6 drs., camphor 2 drs. This soup prevents the attacks of insects and keeps the skin soft. The larger skins are often treated with the following preparation, called "preservation powder:" arsenic and burnt alum each 1 lb, ground oak bark 2 lbs., camphor ½ lb. Gloves should be used in applying the preparation. Corrosive sublimate, carbolic acid, and more recently salicylic acid, have been used in different ways with success. There are so many details that directions cannot be given in this place. — See directions by Prof. S. F. Baird in the "Report of the Smithsonian Institution" for 1856; Swainson's "Taxidermy," forming a volume of Lardner's "Cabinet Cyclopaedia," and the "Taxidermist's Manual," by Capt. Thomas Brown, F. Z. S. (New York, 1875).
California, and returned home by the way of Mexico. In 1851 he set out on a protracted tour in the East, in the course of which he ascended the Nile to lat. 12° 30' N., and afterward traversed large portions of Asia Minor, Syria, and Europe; and in the latter part of 1852 he made a new departure from England, crossing Asia to Calcutta, and thence proceeding to China, where he joined the expedition of Commodore Perry to Japan; and he afterward made several other journeys. In 1862-3 he was secretary of legation at St. Petersburgh, and part of the time charged d' affaires. In 1874 he revisited Egypt, and attended the millennial celebration in Iceland, at which a poem by him was read, translated into Icelandic. At intervals he has appeared as a public lecturer, and has resided for several years in Germany. Besides his "Views Afoot," he has published "El Dorado, or Adventures in the Path of Empire" (2 vols. 12mo, 1850); "A Journey to Central Africa" (1854); "The Lands of the Saracen" (1854); "A Visit to India, China, and Japan" (1855); "Northern Travel: Summer and Winter Pictures of Sweden, Denmark, and Lapland" (London, 1857; New York, 1858); "Travels in Greece and Russia" (1859); "At Home and Abroad: Sketch Book of Life, Scenery, and Men" (1859; 2d series, 1862); "Colorado, a Summer Trip" (1867); "By-Ways of Europe" (1869); and "Egypt and Iceland" (1874). His volumes of poems are: "Ximenia, or the Battle of the Sierra Morena, and other Poems" (Philadelphia, 1844); "Rhymes of Travel, Ballads, and other Poems" (1848); "The American Legend," a poem delivered before the Phi Beta Kappa society of Harvard university (1850); "Book of Romances, Lyrics, and Songs" (1851); "Poems and Ballads" (1854); "Poems of the Orient" (1855); "History and Travel: a selection from his early lyrics (Boston, 1855); "The Poet's Journal" (1862); "The Picture of St. John" (1866); "The Ballad of Abraham Lincoln" (1869); "The Masque of the Gods" (1872); "Lars, a Pastoral of Norway" (1873); "The Prophet, a Tragedy" (1874); and "Home Pastoral, Ballads, and Lyrics" (1875). He has also published the novels "Hannah Thurston, a Story of American Life" (1863), "John Godfrey's Fortunes" (1864), "The Story of Kennett" (1866), and "Joseph and his Friend" (1870). He has translated in the original metres both parts of Goethe's "Faust" (1870-71), and has edited a "Cyclopedia of Modern Travel" (Cincinnati, 1856), "Fraithoof's Saga," translated by W. L. Blackley from the Swedish of Tegnér (1867), Anerbach's "Vienna and the Rhine" (2 vols., 1869), and "Illustrated Library of Travel, Exploration, and Adventure" (vols. i.-iv., 1872-74). Several of his works have been translated into German, French, and Russian. Since 1873 he has been engaged upon a combined biography of Goethe and Schiller.

TAYLOR, Brook, an English mathematician, born at Edmonton, Aug. 18, 1835, died in or near London, Dec. 29, 1731. In 1701 he entered St. John's college, Cambridge, and in 1708 wrote his treatise on the "Centre of Oscillation," which was published in 1713 in the "Philosophical Transactions." In 1712 he was chosen a fellow of the royal society, and from 1714 to 1718 was its secretary; and he contributed papers on magnetism and mathematical subjects. His Methodus Incrementorum (1715) is the first treatise in which the calculus of finite differences is proposed for consideration, and contains the first enunciation of the celebrated theorem which bears his name. In 1715 he conducted a controversial correspondence with Count Raymond de Montmort on the tenets of Malebranche, and in 1719 he published his "New Principles of Linear Perspective." His Contemplatio Philosophica was published posthumously, with a memoir by his grandson, Sir William Young (1798). He left a number of works which are still unpublished.

TAYLOR, Edward T., an American clergyman, born in Richmond, Va., Dec. 25, 1793, died in Boston, April 6, 1871. From 7 to 17 years of age he was a sailor boy. Captured on a privateer in the war of 1812, he was imprisoned at Dartmoor, England, and acted as chaplain to the prisoners. In connection with the New England Methodist conference he began stated labors and continued nine years, till about 1828, when he became chaplain of the Boston seamen's bethel, which post he retained till his death, acquiring a world-wide fame as the eloquent sailors' preacher. For many years he was known as Father Taylor. He visited Europe in 1832, and Palestine in 1842; and he was chaplain of the Macedonian, sent in 1846 to the relief of the starving poor of Ireland.

TAYLOR, George, a signer of the Declaration of Independence, born in Ireland in 1716, died in Easton, Pa., Feb. 29, 1781. After receiving a good education at Amedy as a "redemptioner," and bound himself for a term of years to an iron manufacturer at Durham, Pa. His employer subsequently made him his clerk, and after his death Taylor married his widow and became master of the establishment. He was a member of the provincial assembly from 1764 till 1770, when he was made a judge of the county court and colonel of militia. In October, 1773, he was again elected to the provincial assembly. He was elected to the continental congress on July 20, 1776, signed the Declaration on Aug. 2, and in March, 1777, returned to Congress.

TAYLOR, Sir Henry, an English poet, born in 1800. In 1824 he entered the colonial office, where he has long been one of the five senior clerks. His earliest publication was "Isaac Commenus, a Play" (1827), and he is best known by two dramas in blank verse, "Philip van Artevelde" (1834) and "Edwin the Fair" (1842). His other works include "The Eve of the Conquest, and other Poems" (1847); "Notes from Life, in Six Essays" (1847); "Notes from Books, in Four Essays" (1849);
"The Virgin Widow, a Play" (1850); and "St. Clement's Eve, a Play" (1852). A collective edition of his plays and poems was published in 1863 (3 vols. 8vo).

TAYLOR, Isaac, an English author, born at Lavenham, Suffolk, Aug. 17, 1787, died at Stanford Rivers, Essex, June 28, 1865. His father, Isaac Taylor, originally a line engraver, became a dissenting minister, and wrote several popular books for children. His mother, Ann Taylor, wrote "Maternal Solicitude" and other educational works. The son was trained as an artist, but devoted himself to literature, and also displayed much mechanical ingenuity in his invention of an engraving machine which was employed in producing the plates for Trail's Josephus, and a machine for engraving patterns on rollers for calico printing, now in use in Manchester. Some of the designs from his pencil were engraved for Boydell's Bible. Though brought up as a dissenter, he became a member of the established church. In 1862 he received a civil service pension of £100 for his services to literature in the departments of history and philosophy. He published "Elements of Thought" (1825); "History of the Transmission of Ancient Books to Modern Times" (1827); "The Process of Historical Proof Exemplified and Explained" (1829); "Balance of Criminality, or Mental Error compared with Immoral Conduct" (1828); and a translation of Herodotus with notes (1829). In 1829 appeared anonymously his "Natural History of Enthusiasm," which was received with extraordinary favor, and was followed by "A New Model of Christian Missions" (1829); "Saturday Evening" (1829); "Fanaticism" (1829); "Spiritual Despotism" (1829); and Physical Theory of Ancestry, in which the last remnant of the surrender of the author's "incongruit." His other works are: "Home Education" (1828); "Ancient Christianity, and the Doctrines of the Oxford Tracts for the Times" (8 parts, 1829-40; 4th ed., with supplement and indexes, 2 vols. 8vo, 1844); "Man Responsible for his Dispositions, Opinions, and Conduct" (1840); "Lectures on Spiritual Christianity" (1841); "Loyola, and Jesuitism in its Rudiments" (1849); "Wesley and Methodism" (1851); "The Restorations of Belief" (1855); "The World of Mind" (1857); "Logic in Theology, and other Essays" (1839); "The Liturgy and the Dissenters," and "Ultimate Civilization, and other Essays" (1860); "The Spirit of Hebrew Poetry" (1861); and "Considerations on the Pentateuch" (1863).—His brother Jefferies published a number of popular books for young people. His sisters Ann (died 1800) and Jane (1783-1824) published "Original Poems" and "Hymns" for children, and "Hymns" for Sunday schools. (See Auto-biography and other Memorials of Mrs. Gilbert, formerly Ann Taylor," edited by Sarah Gilbert, 2 vols., London, 1874). Jane also published "Display," a tale (1815), and "Contributions of Q. Q." (1824); and her "Memoirs, Correspondence, and Poetical Remains," appeared in 1825 (2 vols.).—His son ISAAC, a clergyman of the established church, has published "Words and Places" (1864; enlarged ed., 1880), which attempts to give a complete explanation of the local names of Great Britain; "The Family Pen: Memorials Biographical and Literary of the Taylor Family of On-gar" (2 vols., 1867); and "Etruscan Researches" (1874).

TAYLOR, Isidore Sévérin Justin, baron, a French author of English origin, born in Brussels, Aug. 15, 1789. After studying art he served several years in the French army, reaching the rank of major, and afterward travelled in Italy, Greece, and the East, bringing back rich collections, which he placed in the galleries and museums of Versailles and Paris. He exerted himself to procure from the French chambers the restoration of the principal monuments of the middle ages in France; in 1824 was made royal comissary of the Comédie Française; and at the direction of the government twice visited Egypt, and negotiated the transfer to France of the obelisks of Luxor and other Egyptian antiquities. He was made a senator in 1859. In connection with G. Dodier and De Caillien, he edited the illustrated "Voyages pittoresques et romantiques dans l'ancienne France" (fol., 1829-54); "Voyage pittoresque en Espagne, en Portugal et sur la côte d'Afrique de Tanger à Tétouan" (4to, 1826 and seq.); "La Syrie, l'Egypte, la Palestine et la Judée" (4to, 1837 and seq.); "Pélerinage à Jérusale-m" (1841); and "Voyage en Suisse, en Italie, en Suisse, en Angleterre, en Écosse, en Alle-magne, en Grèce, &c." (1849).

TAYLOR, Jeremy, an English theologian, born in Cambridge in 1613, died at Lisburn, Ireland, Aug. 13, 1667. His father was a barber and surgeon, and he was educated as a sizar at Cambridge, but obtained a fellowship at Oxford in 1636, and in 1658 the rectory of Uppingham in Rutland. In the civil wars he adhered to Charles I., who made him his chaplain, and for a defence of episcopal written at the king's request commanded his admission to the degree of D. D. in 1642. The same year his rectory was sequestered by the parliament, but he continued to write for the royal cause till 1648, when he was obliged to retire into Wales, where he maintained himself by teaching school, and wrote some of his most important works. His "Liberty of Prophesi- ing" (1647), in behalf of toleration, was published at the very crisis of the civil struggle. This was followed by his "Holy Living and Dying" (1650-51), now perhaps the best known of his works, and "The Great Exemplar, or the Life and Death of the Holy Jesus" (1650). He subsequently preached occasionally in Lon-don, and suffered several short imprisonments on account of his royalist sympathies. He was also censured by his own party for some expressions thought to indicate Romanist views,
TAYLOR and in 1658 was imprisoned in the tower in consequence of his publisher having prefixed to his collection of offices a print of Christ in the attitude of prayer. He was released through the efforts of Evelyn, and on the invitation of the earl of Conway removed to the north of Ireland. In 1660 he went to London to publish his “Ductor Dubitantum,” the most extensive work on casuistry in the English language. While there he signed the royalist declaration of April 24, and Charles II. on his restoration nominated him bishop of Down and Connor, to which the bishopric of Dromore was soon added. He was shortly afterward made a member of the Irish privy council, and elected vice chancellor of the university of Dublin. His second wife was a natural daughter of Charles I. As a writer of sermons Bishop Taylor stands preeminent. His complete works were published by Bishop Heber with a memoir (15 vols., London, 1829–32), and his life by R. A. Wilmott (London, 1847).

TAYLOR, John, an English author, called “the water poet,” born in Gloucester in 1580, died in London in 1654. He was educated at the free school of Gloucester, and was apprenticed to a London waterman, an occupation which he followed during the greater part of his life. In 1596 he served in the fleet under the earl of Essex, and was present at the attack upon Cadiz. After his return he plied on the Thames, and collected the lieutenant of the tower’s demand on imported wines. Subsequently he kept a public house in Phoenix lane, Long Acre. His publications, in prose and in verse, amounting to upward of 80, are of value as illustrations of opinions and manners during the first half of the 17th century. They were published in folio in 1650. Two of the most curious of his prose works are devoted to descriptions of a journey on foot to Scotland in 1618, and of another, made principally in a boat, from London to Hereford in 1641.

TAYLOR, John, an English minister, born near Lancaster in 1694, died at Warrington, March 5, 1761. He was educated at Whitchaven, and settled for 18 years as teacher and minister at Kirkstead in Lincolnshire. In 1733 he was chosen pastor of a Presbyterian congregation at Norwich, where he preached for 24 years, and avowed anti-Trinitarian sentiments. In 1757 he became principal of the dissenting academy at Warrington. His principal published works are: “The Scripture Doctrine of Original Sin” (1748); “A paraphrase on the Epistle to the Romans” (1748); “The Scripture Doctrine of the Atonement” (1750); “An Hebrew English Concordance” (2 vols. fol., 1754–7); and “A Scheme of Scripture Divinity” (1762), edited by his son.

TAYLOR, Nathaniel William, an American clergyman, born in New Milford, Conn., June 23, 1786, died in New Haven, March 10, 1858. He graduated at Yale college in 1807, studied theology, and in 1812 was ordained pastor of the first church (Congregational) in New Haven, and became eminent as a preacher. In 1822 he was called to the Dwight professorship of didactic theology in Yale college, in which office he continued till his death. In 1828 he preached at New Haven the “concio ad clerus,” in which he set forth views upon human depravity and other related doctrines which caused him to be widely denounced for heresy; and for several years he maintained a vigorous discussion of these and similar topics, through the quarterly “Christian Spectator.” Since his death four volumes of his works have been published, viz.: “Practical Sermons” (2 vols., New York, 1858); “Lectures on the Moral Government of God” (2 vols., 1859); and “Essays, Lectures, &c., upon Select Topics in Revealed Theology” (1859).

TAYLOR, Richard, an English printer, born in Norwich, May 18, 1781, died in Richmond, Dec. 1, 1858. He studied the classical and other languages and literature while learning the printer’s trade in London, and in 1808 established himself in business with his father; and his press soon became the medium through which nearly all the more important works in scientific natural history were published. In 1807 he became a fellow of the Linnean society, and in 1810 was elected its under-secretary, an office which he held nearly half a century. He also attached himself from the commencement to the “British Association for the Advancement of Science.” In 1822 he became a joint editor of the “Philosophical Magazine,” and in 1838 he established the “Annals of Natural History.” His own literary labors, which were principally in the field of Biblical and philological research, comprise an edition of Tooke’s “Diversions of Purley” (1829 and 1840), enriched with notes; Warton’s “History of English Poetry” (1840), in the reprinting of which he took the chief part; “Taylor’s Historical Memoirs,” &c.

TAYLOR, Stephen William, an American educator, born in Adams, Mass., Oct. 23, 1791, died at Hamilton, N. Y., Jan. 7, 1856. He graduated at Hamilton college, N. Y., in 1817, and became a teacher. From 1838 to 1845 he was professor of mathematics and natural philosophy in Hamilton college (now Madison university), from 1846 to 1851 president of the university of Lewisburg, Pa., and from 1851 till his death president of Madison university, of which he published a historical sketch. He was professor of mathematics and natural philosophy in Hamilton college (now Madison university), from 1846 to 1851 president of the university of Lewisburg, Pa., and from 1851 till his death president of Madison university, of which he published a historical sketch. He was literary editor of the Chicago “Evening Journal,” and during the civil war he was its principal correspondent with the armies of the west. After the war he settled at La Porte, Ind. He has published “The Attractions of Language” (1845); “January and June,” essays and poems (1853); “Pictures in Camp and Field” (1867); “The World on Wheels,” railroad sketches (1875); “Old Time Pictures and
Sheaves of Rhyme" (1874); and "Songs of Yesterday" (1875).

TAYLOR, Thomas, an English scholar, sur-
named the "Platonist," born in London, May 15, 1758, died at Walworth, Nov. 1, 1835. He studied the classics, mathematics, and chem-
istry, and became clerk in a banking house.
He issued, in the course of 40 years, transla-
tions of part or the whole of the hymns of Orpheus, the works of Plato (5 vols. 4to), Proclus, Julian, Pausanias, Plotinus, Apuleius, Aristotle, Maximus Tyrius, Demophilus, Iamblichus, Herocles, Porphyry, Celsus, Ocellus
Lucanus, and Olympiodorus, and the Chal-
dean Oracles." He also published works on
geometry and arithmetic, on the Eleusinian
and Bacchic mysteries (new ed., with intro-
duction and notes by Alexander Wilder, M. D.,
1875), on "The Rights of Brutes" (in ridicule of
Paine's "Rights of Man"), a new edition of
Heredicus's "Greek Lexicon" with addi-
tions, "History of the Restoration of the Pla-
tonic Theology," "Miscellaneous in Prose and

TAYLOR, Tom, an English author, born in
Sunderland in 1817. He graduated at Trinity
college, Cambridge, and became a fellow. He
was for two years professor of English litera-
ture in University college, London, was
called to the bar in 1845, and in 1850 became assis-
tant secretary to the board of health, and in
1854 secretary. Since 1858 he has been secre-
tary to the local government act office. He is
the author of more than 100 dramatic pieces,
among the most successful of which are "Still
Waters Run Deep," "The Unequal Match," "The
Overland Route," "The Contested Election,
"Our American Cousin," "The Ticket-of-Leave
Man," and "Twixt Axe and Crown." In
conjunction with Charles Reade he has
written " Masks and Faece," and other plays. He
has also published a "Life of Benjamin
Robert Haydon" (3 vols. 8vo, 1853); an edi-
torial preface and continuation of the "Auto-
biographical Recollections of C. R. Leslie" (3
vols. 8vo, 1860); a "Handbook to the Pictures
of the International Exhibition of 1851" (8vo,
1862); "Birket Foster's Pictures of English
Landscape, engraved by the Brothers Dalziel,
with Pictures in Words by Mr. Tom Taylor"
(4to, 1862); "Ballads and Songs of Brittany,
translated from the French of Villemarque
(4to, 1865); on conjunction with C. W.
Franks, a "Catalogue of the Works of Sir
Joshua Reynolds" (8vo, 1869).

TAYLOR, William Cooke, an Irish author, born
in Youghal, April 16, 1800, died in Dublin,
Sept. 13, 1849. He was educated at the uni-
versity of Dublin, and went to London, where
he resided till two years before his death. His
chief works are: "Historical Miscellany"
(12mo, 1829); "History of France and Nor-
mandy" (1830); "History of the Civil Wars
in Ireland" (3 vols., 1831); "History of Mo-
hammedanism and its Sects" (1843); "History
of Popery" (1837); "The Bible Illustrated
from Egyptian Monuments" (1838); "Manual
of Modern History" (8vo, 1838); "Manual
of Ancient History" (1840); "Natural History
of Society" (2 vols., 1840); "Romantic Bio-
graphy of the Age of Elizabeth" (3 vols.,
1849); "History of British India" (1849); "Revolution,
Insurrections, and Conspiracies of Eu-
rope" (2 vols., 1849); and "Memoirs of the
House of Orleans" (3 vols., 1849). He also
edited Bacon's essays and Chapman's transla-
tion of Homer. In 1846 he was employed by
the British government to inquire into the
system of education on the continent.

TAYLOR, William Mackergo, an American cler-
gymen, born at Kilmarnock, Ayrshire, Scot-
land, Oct. 23, 1829. He graduated at the uni-
versity of Glasgow in 1849, studied theology
in Edinburgh, was licensed to preach in 1852,
and in 1853 was ordained pastor of the Uni-
ted Presbyterian church at Kilmarnocks. In 1855
he accepted a call to the United Presbyterian
church at Derby road (Bootle), near Liver-
pool, and remained there for 16 years. In
1871 he visited the United States as a dele-
gate of the United Presbyterian church to the
general assembly of the Presbyterian church
in the United States at Chicago. In 1872
he became pastor of the Broadway Taberna-
icle church in New York. He has published
"Life Truths" (London, 1862); "The Mir-
acles: Helps to Faith, not Hindrances" (Edin-
burgh, 1865), written as a reply to Renan's
"Life of Jesus;" "The Lost Found and Wander-
er Welcome" (1870); "David, King of
Israel" (New York, 1874); and "Elijah the
Prophet" (1876).

TAYLOR, Zachary, twelfth president of the
United States, born in Orange co., Va., Sept.
12, 1784, died in Washington, D. C., July 9,
1850. His father, Col. Richard Taylor, served
throughout the revolutionary war, and was
removed in 1785 from Virginia to Kentucky,
where he had an extensive plantation in the
neighborhood of Louisville. Zachary was en-
gaged till his 24th year on the plantation. His
brother Hancock, a lieutenant in the United
States army, died in 1808, and the vacant
commission was assigned to Zachary. He was
made a captain in November, 1810, and after
the declaration of war against Great Britain
was placed in command of Fort Harrison, a
blockhouse and stockade on the Wabash river,
about 50 m. above Vincennes. This was the
first object of attack by the Indians, a large
force of whom invested it in September, 1812,
and after professions of peace made a furious
night assault and set fire to the lower build-
ings of the fort. Taylor had but 50 men, of whom
two thirds were ill; but after a sharp conflict
of several hours he extinguished the flames and
repulsed the assailants with severe loss. For
his conduct on this occasion he received from
President Madison the rank of major by brevet,
the first instance in the service of this species of
promotion. A few months later he took part in
a successful expedition led by Gen. Hopkins.
against the Indian villages, and in 1814, with the full rank of major, commanded an expedition against the British and Indians on Rock river. On the restoration of peace in 1815, congress reduced the army and annulled many of the promotions made during the war. Taylor was reduced to the rank of captain, and in consequence resigned his commission and retired to his plantation near Louisville. Being soon reinstated as major, he was employed for several years alternately on the N. W. frontier and in the south, where in 1822 he built Fort Jeanp. In 1819 he became lieutenant colonel, and in 1832 colonel. In the latter year he was engaged in the Black Hawk war, and was then ordered to Prairie du Chien, where he took command of Fort Crawford, which had been erected under his superintendence. In 1836—49 he served in Florida. On Dec. 25, 1837, he defeated the Indians in the desperate and decisive battle of Okceehobee, and was promoted to the rank of brigadier general by brevet; and in April, 1838, he was made commander-in-chief in Florida. In 1840 he was appointed to the command of the first department of the army in the southwest. He purchased at this time an estate at Baton Rouge, to which he removed his family. Congress having in March, 1845, passed the joint resolution annexing Texas, Gen. Taylor was directed to defend it against invasion from Mexico. In July he embarked at New Orleans with 1,500 troops, and in the beginning of August encamped with them at Corpus Christi, Texas, where he was reinforced, so that in November his forces amounted to about 4,000 men. The administration desired to bring the Mexican question to a crisis, without, if possible, incurring the responsibility of beginning a war. Indirectly, therefore, it endeavored to induce Gen. Taylor to advance his forces into the disputed territory; but he disregarded all hints to that effect, and would not move till explicitly ordered by the president. Positive instructions were at length sent, and on March 8, 1846, the army began its advance toward the Rio Grande, and on the 28th reached the banks of that river opposite Matamoros. Here it encamped and erected Fort Brown, which commanded Matamoros, where the Mexicans were also throwing up batteries and redoubts. On April 12 Gen. Ampudia, the Mexican commander, addressed a note to Gen. Taylor requiring him within 24 hours to break up his camp and retire beyond the Nueces, "while our governments are regulating the pending question in relation to Texas," and informing him that his non-compliance would be regarded by the Mexicans as equivalent to a declaration of war. Gen. Taylor replied that he was acting under instructions which did not permit him to return to the Nueces, and that if the Mexicans saw fit to begin hostilities he should not avoid the conflict. Ampudia was soon after superseded by Arista, who early in May crossed the Rio Grande with 6,000 men, and on the 8th of that month attacked and was defeated by Gen. Taylor with 2,900 men at Palo Alto, a few miles from Matamoros. (See Palo Alto.) The Mexicans retreated to the Flumen de la Palma, and on the following day again gave battle to the Americans, who after a severe contest routed them and drove them across the Rio Grande. The total loss of the Mexicans in these battles amounted to about 1,000 men. Taylor was promoted to the rank of major general, took possession of Matamoros on May 18 without opposition, and remained there till September, when he marched against Monterrey, which he reached on Sept. 9 with a force of 6,025 men, mostly volunteers. The place was defended by Ampudia with about 10,000 regular troops. On the 19th Taylor ordered an assault, and after several days' desperate fighting Ampudia capitulated on the 24th. (See Monterrey.) Taylor made Monterrey his headquarters, but occupied with a strong detachment the city of Saltillo, the capital of the state of Coahuila. He was making preparations for an advance upon San Luis Potosi, when the best part of his force was transferred to the expedition against Vera Cruz, under Gen. Scott. He was left with only 5,000 men, of whom but 500 were regulars, the rest being volunteers who had never seen a battle. He received intelligence that Santa Anna had concentrated at San Luis Potosi the flower of the Mexican army to the number of 21,000 veteran troops, and was moving rapidly to attack him in the valley of the Rio Grande. Gen. Taylor on Feb. 21, 1847, took a position at Buena Vista, a mountain pass 7 m. from Saltillo, and awaited the approach of the Mexicans, who made their appearance on the following day, and were signally defeated. (See Buena Vista.) Santa Anna retreated to San Luis Potosi, and during the rest of the war the valley of the Rio Grande remained in quiet possession of the Americans. On his return home in November, 1847, "Old Rough and Ready," as his soldiers familiarly called him, was greeted everywhere by the warmest demonstrations of popular applause; and as the time for the presidential election was approaching, his name was at once brought forward for the presidency. He avowed himself "a whig, but not an ultra whig," and in several letters intimated his willingness to accept the nomination provided he could be left untrammeled by partisan pledges, at the same time expressing his distrust of his fitness for the office. In June, 1848, he was nominated by the whig national convention at Philadelphia, the other candidates for the nomination being Mr. Clay, Mr. Webster, and Gen. Cass. Mr. Benton, who had created such a commotion in New York was nominated for the vice-presidency. Henry Wilson of Massachusetts and a few other delegates, on this result being announced, withdrew from the convention, and subsequently formed the freesoil party on the basis of opposition to the extension of slavery. The democratic national convention had al-
TCHAD

ready nominated Lewis Cass for the presidency; but a powerful section of the New York democracy, familiarly known as barnburners, refused their support to Mr. Cass, partly because of his pro-slavery position. On Aug. 9, 1848, these free soil democrats assembled in convention at Buffalo, N. Y., together with the free soil whigs who had rejected the nomination of Gen. Taylor, and the liberty party men who had previously supported James G. Birney. A fusion of these parties was effected on the basis of a platform of which opposition to the extension of slavery was the leading principle, and Martin Van Buren was nominated for president and Charles Francis Adams of Massachusetts for vice president. At the election in November 168 electors were chosen for Taylor and Fillmore to 127 for Cass and Butler. The Van Buren and Adams party did not carry a single elector, their popular vote being about 200,000, while that for Gen. Taylor was about 1,360,000, and that for Cass 1,220,000. Gen. Taylor was inaugurated president on Monday, March 5, 1849, and on the following day appointed as his cabinet John M. Clayton of Delaware, secretary of state; William M. Meredith of Pennsylvania, secretary of the treasury; George W. Crawford of Georgia, secretary of war; William B. Preston of Virginia, secretary of the navy; Thomas Ewing of Ohio, secretary of the interior; Jacob Collamer of Vermont, postmaster general; and Reverdy Johnson of Maryland, attorney general. The democratic party had elected a plurality of the members of congress, and a few free soil members held the balance of power between the whigs and democrats. A vehemence struggle began with regard to the organization of the new territories, the admission of California as a state, and the question of the boundary between Texas and New Mexico, all of these being connected with the question of the extension of slavery. California had applied for admission into the Union with a constitution excluding slavery. There being at this time an equal number of free and slave states in the Union, the proposition to admit California and thus give the free states a preponderance in the senate excited throughout the south the most violent opposition. At the same time New Mexico and Utah, or Dese- ret, as it was called by the Mormons who occupied it, were without governments. President Taylor in his messages to congress recommend that California should be admitted, and that the other territories should form state constitutions to suit themselves, and should be admitted into the Union with or without slavery as their constitutions might prescribe. These recommendations were not acceptable to the slaveholding leaders, many of whom made open threats of secession. Henry Clay in the senate introduced the compromise measures known by his name, including the recommendations of the president's message. (See Clay, Hen-

TCHAD, or Tasd, a lake of central Africa, on the borders of Bornoo, Kanem, and Baghirmi, between lat. 12° 30' and 14° 30' N., and lon. 18° and 35° 30' E. It is an irregular triangle, the base of which lies W. S. W. and E. N. E.; length from N. W. to S. E. about 150 m., greatest width about 120 m., area 10,500 sq. m.; but it varies greatly in size in the dry and the rainy season. Its elevation above the level of the sea is about 1,000 ft. It rarely exceeds 15 ft. in depth, and many parts of it are in the dry season a reedy swamp. About two thirds of its area is occupied by islands. Its shores are generally low and flat and covered with rushes and reeds, back of which is fertile ground and rich pasturage; but on the north they rise gently and are wooded. The S. and W. shores are frequently inundated, and the streets of Kuka, the capital of Bornoo,
which stands about 10 m. from the S. W. shore, are sometimes overflowed. Lake Tchad has two large tributaries, the Komadugu on the west and the Shary on the south, but no known outlet. Dr. Nachtigal says that at some former period the surplus waters were discharged through the Bahr el-Ghazal into an extensive lake 300 m. N. E. The course of this ancient river can still be traced by a fringe of trees, and according to the Arabs water flowed through it for 100 m. during the inundation of 1870. The water of the lake is fresh and sweet; the shallow parts are covered with aquatic plants, and hippopotami, crocodiles, turtles, fish, and water fowl abound. Large herds of antelope feed on its shores, and there are many elephants in the forests on the north. Villages abound on its banks, and the islands in it are densely populated, the central ones by the Buddumas, the eastern by the Kuti, and the northeastern by the Kanembali. The Buddumas are a pagan tribe, distinct from the surrounding Mohammedans. They are well made, active, regular in features, and dark brown or black in complexion. Both sexes are clothed in cotton, and they wear sandals and many ornaments. Cattle and goats are raised by them, and they cultivate maize and cotton.—Lake Tchad was known to Leo Africanus in the 16th century, but the first Europeans who visited it in later times were Denham and Clapperton in 1823. Barth, Overweg, and Vogel explored its vicinity in 1851-'5, Rohls in 1866, and Nachtigal in 1870.

**TCHERNIGOV.** I. A S. W. government of Russia, bordering on Mohilev, Smolensk, Orel, Kursk, Poltava, Kiev, and Minsk; area, 20,231 sq. m.; pop. in 1870, 1,659,600. The surface, with the exception of the western portion, is flat, and the soil is particularly fertile. It is well watered, the most important rivers being the Dnieper, which flows on the W. boundary, and its affluent the Desna, which intersects the government. Horses, horned cattle, and sheep are abundant, and the breeds of the first two are particularly good. The manufactures are chiefly articles for domestic use. Much honey, wax, and brandy are produced. II. A city, capital of the government, on the Desna, 350 m. S. W. of Moscow; pop. in 1867, 17,096. It is an old town, and has a castle, a beautiful cathedral, several schools, and a large trade.

**TEA.** (Chinese, *tehia, cha, or tha*), a substance used in making a beverage by infusion, consisting of the dried leaves of one or more species of plants of the old genus *thea*. Bentham and Hooker, who have thoroughly revised the genera, say (*Genera Plantarum*, vol. i., p. 187) that they can find no good characters by which to separate *thea* as a genus distinct from *camellia*; as botanists were mostly agreed that there was but one species of *thea*, the botanical name of the tea plant under this arrangement will be *camellia thea*. The genus is well known from the very general cultivation of *C. japonica* and other species, especially their double forms, in greenhouses in the northern states, and in the open air in the southern. The tea species differs from any of these in having longer, narrower, thinner, more serrate, and less shiny leaves; its flowers are axillary and nodding, and, though only about an inch across, closely resemble those of a single *camellia*.
India has encouraged the introduction of the Chinese plant, and also the cultivation of that found wild in Assam, and large supplies are sent from India to England. In Java and Penang the culture has been established with favorable results. About 1850 the plant was introduced into Brazil, and by the aid of Chinese laborers some tea was produced; but little mention has been made of the results in later years. The experiments in cultivating tea in the United States have been numerous; the most noted was that of Dr. Junius Smith of Greenville, S. C., who gave in the reports of the United States patent office from 1848 to 1859 full accounts of his results; his labors and those of others show that there are localities in the southern states well adapted to the production of excellent tea, and that its success in this country is only a question of the price of labor. In California, where the plant flourishes admirably, an experiment in tea culture has recently been undertaken by a colony of Japanese.—While the many varieties of tea are no doubt produced by the same species, the quality of the product being largely determined by the preparation given to the leaves, it is also much influenced by the soils and situations in which the plants grow. The tea of the hills is different from that of the low lands, and that which receives but little care gives a product inferior to the highly cultivated. The slopes of the hills are preferred, at an elevation depending upon the climate; almost any good arable soil, free from stagnant moisture, will serve for the culture. In China the plant blooms in November, and the seeds are ripe by the next autumn; these, kept in sand till the following spring, are sown in a seed bed, or in rows where the plants are to grow; the plants stand 4 or 5 ft. apart each way, and when about 18 in. high the leading shoots are pinched to induce them to become bushy. The plants yield a small picking in their third year, and attain their maximum yield in the eighth or tenth, after which they deteriorate and give way to young plants; in some localities the land is enriched with litter, sewage, or other fertilizers; the plant, which would naturally form a tree, is, for the convenience of picking, kept pruned down to 5 ft. The quality of the tea depends largely upon the age of the leaves at the time of picking; the younger the leaves the more delicate their flavor, and of course the smaller the yield. The earliest picking, the first of April, consists of the buds and the very youngest leaves; a second gathering, at the end of April or early in May, consists of more developed leaves, and is the most important crop; an inferior quality of leaf is gathered in July, and in some localities another picking of old and poor leaves is made still later. The picker has a basket slung by a cord around his neck, to leave both hands at liberty; he holds the shoot with one hand, and breaks off the blade of the leaf with the other, for, except in the earliest picking of the very
young leaves, no portion of the petiole or leaf stalk must be gathered with the finer kinds of tea. If left in large masses, so that heating or natural fermentation takes place, the leaves are deteriorately injured. The manipulations to which they are subjected vary greatly, and are often prolonged and repeated in various ways. As each locality has its traditional treatment, supposed to be necessary, the accounts of the process vary greatly; in all, however, the first step is to prevent the fermentation of the leaves, by exposing them in shallow baskets to the sun and air, which withers and slightly dries them. They are then placed in small quantities in a shallow copper or iron pan heated by charcoal or other fuel, and rapidly stirred; at the proper moment they are swept out into other vessels or upon a table, where other workmen rub the leaves between their hands in order to roll them into the form which they finally retain; exposure to the air and a final heating complete the process with some teas, while with others there are several heatings, alternated with airings; the choicer teas are spread out upon a table to be assorted before packing, all imperfectly rolled leaves being removed and the dust and fine fragments sifted out. The chest with its leaden lining being ready, one bare-footed laborer gets into it, and another gradually pours in the leaves, which the first treads down firmly, and as soon as the case is full the leaden cover is soldered down. If the process of drying is completed as rapidly as possible after picking, the tea remains green; but for black tea the process is prolonged, and repeated with long intervals of exposure, sometimes for a whole night, in order that a kind of fermentation may take place. Sometimes two qualities are made from the same picking by sifting the finer leaves from the coarser after they are dried. Apart from the tedious labor of picking the crop leaf by leaf, the necessity for these many small operations before the tea is ready for use will prevent its successful culture in this country, where the cost of labor is already a serious problem in the cultivation of the ordinary farm crops. It requires about 4 lbs. of fresh leaves to make 1 lb. of dried tea, and the yield per acre is from 300 to 400 lbs. Certain districts in China produce either-green or black tea exclusively. A third sort, the scented teas, is recognized in commerce. The scenting is generally due to the admixture of certain flowers, and while it is sometimes practised upon choice kinds, it is more frequently employed to give inferior kinds a better flavor; the principal flowers used are those of tea-olive, olea (or somanthus) fragrans (see Ozark), and the chubake (platanus indica spicuca); but those of the cape jasmine (Gardenia) are sometimes employed. The flowers are laid with the leaves under pressure, or are dried with them and afterward sifted out. The classes of tea are subdivided, and names, not always permanent, are given to subvarieties founded upon the size and age at which the leaf is picked. Of the Chinese teas, the principal black sorts are boahea, congou, souchong, cape, oolong, pekoe, and others. Bohea is the finest of these, and its importation has greatly fallen off of late years. The highest quality of black tea is pekoe, which consists of the very youngest leaves of the first picking; these, when so young that they are still clothed with down, constitute the flowery pekoe. Among the green teas are twankay, hyson skin, young hyson, hyson, imperial, and gunpowder. The gunpowder in green tea corresponds with the pekoe in black, and like that is from the first gatherings; imperial, hyson, and young hyson are grades made from the second and third pickings, while the inferior light leaves, winnowed from the hysons, make the hyson skin, the chief market for which is found in this country. The brick tea of Thibet is probably the poorest of all; it gets its name from the shape of the blocks into which refuse tea and tea sweepings are made by mixing them with bullock's blood and drying by fire heat; the bricks are wrapped in paper or sewed up in sheep skins, and are rarely exported except as a curiosity. The teas from India have a separate nomenclature. The finer teas, both black and green, are rarely seen in this country; if packed in large parcels, or conveyed in the hold of a ship, a fermentation or change takes place which destroys their quality; a large share of the crop is consumed by the wealthy Chinese, and a portion of it finds its way by overland conveyance to Russia. —Teas are subject to various adulterations in China, and in the countries where they are sold, including the mixing of different qualities, and the coloring and other treatment to improve the looks of inferior kinds. The manipulation of poor teas to give them a finer appearance is carried on in China, and there are establishments in both England and America engaged in the business. The glazing or facing of teas is done with plumbago or black lead, added in fine powder to the teas in a revolving cylinder where the mutual attrition imparts to the leaves a peculiarly smooth and glossy appearance. Green teas, being in this country especially popular (their higher price conveying the idea that they are of better quality), are produced to meet the demand by coloring cheaper black kinds. The principal materials used in coloring are "China clay," or terra alba (largely found in this country and exported), Prussian blue, and turmeric; sometimes gypsum and indigo are used; the coloring matters, mixed in proportions to produce the desired shade, are added to the slightly moistened tea and moistened until the color becomes evenly distributed and the leaves by rubbing together become glazed. This treatment, with variations in the manipulation, is so general that but very little uncolored green tea is offered for sale. The coloring and facing are readily detected by examining the leaves under the microscope as an opaque
object, when the particles of coloring matter are easily seen; if it is desired to make a further examination as to the materials used, the leaves must be treated with water, and the washings subjected to chemical tests, or be burned, and an analysis made of the ash. The adulteration by mixing a finer tea with a portion of an inferior grade is common; besides this the Chinese prepare what is called "lie tea" for this express use, consisting of the dust which accumulates in the manufacture of tea, and the dust of other leaves, rice husks, &c., made up by the aid of gum into little pellets and colored to resemble tea. Some years ago the annual importation of this stuff into England was half a million pounds annually, all of which was used to mix with teas. The adulteration is readily detected by soaking a portion of tea and examining it with a lens; the true leaf may be unrolled and spread out, while the fictitious article will separate into its component fragments. Another adulteration is with exhausted tea leaves; at the Chinese tea houses, which are open day and night, the tea is usually made in a cup, covered with a saucer, and then poured into another cup; large jars stand about the saloons into which the dregs are emptied; these are carefully made over and find their way into commerce. The detection of these when colored is not difficult, but when they are rerolled without coloring, a chemical analysis must be made; it is generally only necessary to test for the amount of tannic acid, which in genuine teas ranges from 20 to 40 per cent., while in exhausted teas it is from 7 to less than 1 per cent., and sometimes completely extracted. The adulteration with other leaves is practised in China, and was formerly to a large extent in England; willow leaves and those of canella sacanga are much used in China, while in England those of the sloe or wild plum, the hawthorn, elder, plane tree, poplar, and others have been employed. These adulterations and others with false leaves may be readily detected by soaking out and unrolling them; those of the true tea being well known as to their shape, the character of the margin, and especially the serration (the looping together of the principal veins just within the margin being very characteristic), they may be readily picked out from any foreign admixture by the aid of a hand glass.—Tea has been analyzed by different chemists, whose results show much discrepancy, doubtless due to the variable character of the product. The average composition is, in 100 parts: carbohydrates (gum and sugar), 21; fatty matters, 4; albuminoids, 16; tannin, 20-23; vegetable fibre, 20; theine, 2 or 3; mineral substances, 5; water, 5; and an aromatic oil, less than 1. The most important constituent is theine, or, as it is identical with the active principle in coffee, caffeine, a crystallizable substance, soluble in water and having a bitter taste (see Caffeine); acting as a feeble base, it is classed among the alkaloids, with the formula C_{n}H_{3}N_{4}O_{7}+H_{2}O. Some give the proportion as high as 6 per cent, in the finer green teas, but the average is 2 to 3 per cent. The constituent next in importance is the aromatic oil, as upon this depends the aroma and a large share of the flavor of the tea. The tannin gives the tea its astringency; in the proper making or infusing of tea the object is to extract as much of the theine and aromatic oil and as little of the tannin as possible; when tea is infused too long, or is boiled, the amount of tannin in the infusion is perceived by its marked astringency; more or less of the other constituents are taken up by the water, and give what is called "body" to the tea. The wealthy Chinese make their tea in the cup. The proper quantity of leaves is placed in the cup, boiling water poured over them, and the cup covered for a time with the saucer; to prevent the leaves from rising to the surface, a perforated bit of silver, or silver filigree work, is placed over them. The poorer Chinese make their tea in a tea pot. In Japan some teas are reduced to a fine powder, which is infused in the cup and stirred before taking; that both the infusion and powder may be swallowed; it is also the custom in Tertiary to take the leaves with the liquid. In other countries it is customary to make some addition to the tea: in England and America, sugar and milk or cream; in Russia, lemon juice; and on the continent of Europe it is very common to add a little brandy or other spirit. The quality of the tea (the infusion) is greatly affected by the manner of making it. Those who think that color indicates strength boil the tea, either putting the leaves directly into boiling water, or placing them in cold water and setting the pot upon the fire until the water boils; some practise prolonged infusion, with the same result, a dark-colored liquid, in which the proper flavor is concealed by the amount of tannin extracted; and some add a fragment of soda to increase the color. Connoisseurs in tea usually make it on the table, a caddy containing several kinds of tea and an urn of boiling water being at hand; a portion of boiling water is poured into the tea pot, and when that is thoroughly warmed the water is distributed among the tea cups; then the leaves of one sort (or a
mixture of two or three sorts) are placed in the pot, boiling water poured on, and in a few minutes, the cups being emptied of the water put in to warm them, it is served. The character of the water greatly influences the quality of the tea, it being impossible to make really good tea with hard water. Excess of lime in the water may be corrected by the judicious use of carbonate of soda.—The effects of the habitual use of tea have been much discussed, some regarding them as highly deleterious, while others, on account of the large proportion of nitrogen in theeine, have maintained that tea is nutritious, and serves as a substitute for food. The elaborate experiments of Dr. Edward Smith ("Foods," in the "International Scientific Series," New York, 1878) are worthy of study; his results in brief are: that while the amount of nutrient contained in the quantity of tea one consumes is not sufficient to be of use in building up the system or in supplying heat, it has a marked effect upon the vital functions, and particularly stimulates respiration, as shown by the increased amount of carbonic acid thrown off by the lungs after taking it; and that it powerfully promotes the assimilation and transformation of other foods. Excessive use of tea produces wakefulness and increased mental and bodily activity, which is followed by a reaction that brings exhaustion and a corresponding depression. Most of the unpleasant effects of tea are ascribed to the volatile oil; the long continued breathing of air impregnated with this produces illness in the packers of tea, and the tea tasters at the tea marts in China, who are even careful not to swallow the infusion, are obliged in a few years to give up their lucrative positions with shattered constitutions. The Chinese, who drink tea at all times, are careful to use none less than a year old, as in time the oil either evaporates or is so modified that it ceases to be injurious.—There are numerous substitutes for tea in different countries, and widely separated peoples have in use some plant the active principle of which is closely analogous to, if not identical with, that in tea. Besides coffee and chocolate, one of the most important of these beverages is the Paraguay tea. (See Mate.) The khat of Arabia and Abyssinia, introduced into the Mohammedan parts of Africa, is catha edulis, the leaves and small twigs of which possess the properties of tea in an eminent degree. The coca of Peru and Bolivia, though generally chewed, has similar properties, and is sometimes used like tea. (See Coca.) Other plants might be cited. (See also New Jersey Tea.)—The official records of importation into England begin in 1723, in which year the importation was 370,823 lbs.; in the first year of the present century the quantity entered for home consumption was 23,730,150 lbs. Until 1834 the East India company had a monopoly of tea, which paid a heavy duty; but in that year the duty was reduced, and the trade thrown open to all. The imports of tea into Great Britain and Ireland for five years, ending Dec. 31, entered for home consumption only, were: 1869, 906,993 cwt.; 1870, 1,056,202 cwt.; 1871, 1,184,540 cwt.; 1872, 1,141,005 cwt.; 1873, 1,178,759 cwt. The value of the total import for the same years, of which one fourth was reexported, was £10,311,465, £10,097,619, £11,035,644, £12,933,143, and £11,373,595. The imports into the United States for five years, ending June 30, for home consumption, were: 1869–70, 429,293 cwt.; 1870–71, 458,615; 1871–2, 569,741; 1872–3, 678,707; 1873–4, 498,318. The total values (in gold) for the respective years were $18,871,546, $17,254,617, $22,943,575, $24,466,170, and $21,212,384.

**TEACHERS’ INSTITUTE** in the United States, an assembly of the teachers of the public schools of a county or part of a county for the purpose of receiving instruction in the art and methods of teaching, by lectures, conferences, class drills, &c., from experienced teachers. An institute is usually held in each county under the supervision of the county superintendent of schools once a year, sometimes oftener, the sessions lasting from one to two weeks. The instruction is free. This plan was first adopted by Henry Barnard, state superintendent of schools in Connecticut, in 1839. Institutes have been held in New York since 1843, and have been maintained by state appropriations since 1847. They were begun in Massachusetts and Rhode Island in 1845, and soon afterward in many other states. In most of the states they are required by law to be held, and in several the attendance of teachers is obligatory. In some states provision is made for their maintenance by public funds. The instruction in these temporary training schools is necessarily almost wholly oral, and is confined to an explanation and illustration of the best methods of teaching and governing schools. Conferences are held, in which the teachers relate their own experience of particular methods of instruction and discipline.

**TEAK,** an East Indian tree, *tectona grandis* (called in Malabar *teka*), valuable for its timber. It belongs to the *cortichen* family which, while its most familiar representatives with us are ornamental herbs and shrubs, includes some important tropical trees. The teak is remarkable for its size and beauty; it grows over 200 ft. high; the elliptical leaves are 12 to 24 in. long, and so rough as to be useful for polishing wood; the small white flowers are fragrant, in terminal panicles, and have the structure common to the family. The tree is found in various parts of India and the adjacent islands, and has been introduced into other British possessions. It is probable that other and closely related species contribute to the supply of commerce. The wood of the teak is one of the most remarkable known on account of its great weight, hardness, and durability, qualities which have caused it to be long used in...
the East, not only for temples, but for dwellings. It is most employed in ship building, being practically indestructible by wear or decay, and vessels built of it have lasted 100 years, to be then only broken up on account of their poor sailing qualities from faulty models. The wood works easily, but on account of the large amount of silex contained in it, the tools employed are quickly worn away; it is brownish, and contains an oil which prevents spikes and other iron work with which it is in contact from rusting, even when the wood is used green. Its weight varies in different localities, from 42 to 52 lbs. to the cubic foot; the teak from Malabar is the heaviest, while that from Burmah and Siam is much lighter; in ship building its great weight largely offsets its durability, and it is therefore now customary to use it only for planking.—Various similar woods are called teak; the African teak was long used in ship building before its origin was known; it is the genus *Oldfieldia*, of the euphorbia family.

**TEAL**, the common name of the small river ducks of the genera *Nettion* (Kaup) and *Querquedula* (Stephens), called *sorcilles* by the French. In the genus *Nettion* the bill is as long as the head, straight, unusually narrow, with sides parallel, as high as broad at the base, the depressed tip with a very narrow nail; wings moderate and pointed, second quill the longest, and the secondaries lengthened and pointed; tail moderate and wedge-shaped; toes united by a full web, the hind one short and slightly lobed. There are about 20 species, distributed all over the globe, though most numerous in the northern hemisphere; they are migratory, commencing their rapid flights in small flocks soon after sunset, resting by day on the surface of fresh water or the reedy shores of rivers and lakes, and feeding principally at night on aquatic insects and worms, seeds, and grains; the nest is made of a large mass of decayed vegetable matter lined with down, and the eggs are eight to ten; they are highly esteemed as game. The European teal was domesticated by the Romans. The green-winged teal (*N. Carolinensis*, Baird) is 14 in. long, 22 to 24 in. in alar extent, and the bill 1½ in.; the head and neck are chestnut, the chin black, and the forehead dusky; around the eyes and on the sides of the head is a broad rich green stripe, passing into a bluish black patch on the nape; below white, with rounded black spots on throat; lower neck, sides, and scapulars finely banded with black and grayish white; speculum on wings broad and rich green; a white crescent in front of bend of wings; under tail coverts black, with a patch of buff white on each side; wing coverts plain olive-gray; in the female the under parts are white, and the upper dark brown with gray edgings. It occurs over the whole of North America, and accidentally in Europe; it migrates principally over the land, breeding from the great lakes to the fur countries; it runs well, is a good swimmer and diver, and a very rapid and graceful flier; having a comparatively long neck, it feeds while swimming, and, being choice in its selection of food, affords a delicious flesh; it is not very shy; the eggs are 1¾ by 1½ in., much rounded, dull yellowish with indistinct deeper tints.—In the genus *Querquedula* the bill widens a little to the end, which is obtusely rounded, is higher than broad at base, has a wider nail and the lamellae visible on the sides. There are about half a dozen species in North America, Europe, and Asia, with habits similar to those of the other genus. The blue-winged teal (*Q. discors*, Steph.) is 16 in. long, 24 or 25 in. in alar extent, with a bill of 1½ in.; the head and neck above are plumbeous gray; top of head black; white crescent in front of eyes; under parts purplish gray, each feather spotted with black; fore part of back brownish with two narrow bands of purplish gray; back behind and tail greenish brown; under tail coverts black; outer webs of some of the scapulars and the wing coverts bright blue; greater coverts tipped with white, with grass-green speculum below them; bill black; in the female the top of the head is brown, chin and throat yellowish white, back brown with paler edgings, under parts whitish.
with obscure brown spots, and the same blue and white in the wings as in the male. It is found throughout southern North America to the Rocky mountains, is abundant about the mouths of the Mississippi in winter, and is less hardly than the green-winged species.

**TEARS**, the limpid, colorless, slightly saline secretion of the lachrymal glands, continually poured out in quantity sufficient to bathe the surface of the eyes, to secure the easy and free motion of the lids, and to wash off any irritating particles from their sensitive membrane. The lachrymal belong to the aggregated glands, or those in which the vesicles or acini are arranged in lobules; there is one at the upper, external, and anterior part of each orbit, in a depression of the frontal bone, in relation with the external rectus muscle, resting behind on a fatty areolar tissue; each gland is of the size of a small almond, reddish white, flattened, and enveloped in a fibro-cellular capsule; the secretion is poured out by six or seven trunks opening within the upper lid. At the inner angle of the eyes, in both lids, are two very narrow, always open apertures, the lachrymal puncta, in the middle of a slightly prominent tubercle, about ½ line from the inner junction of the lids; they are opposite each other, the lower turned up and the upper down, and both outward and backward. Through these openings the tears are conveyed by the lachrymal ducts in each lid to the lachrymal sac, at the inner angle of each eye, in the bony groove between the lachrymal bone and the ascending process of the superior maxillary; it is a small membranous sac, opening below into the nasal duct, which conveys the tears into the nose beneath the inferior turbinated bone. At the inner angle of the lids, in front of the globe and behind the lachrymal puncta, is a small reddish tubercle, pyramidal, with the summit turned forward and outward; this is the lachrymal caruncle, and consists of a mass of small mucous covered by the conjunctiva, which forms in front and to the outside a semi-lunar fold, called the nictitating membrane; this is rudimentary in man, but remarkably developed in birds. The act of crying, generally accompanying an increased secretion of tears, as far as the movements of respiration are concerned, is very nearly the same as that of laughing, though occasioned by a contrary emotion; the expiratory muscles are in more or less violent convulsive movement, sending out the breath in a series of jerks, accompanied by well known sounds; in children the act is sometimes continued almost to the complete emptying of the chest of air, to the great dismay of parents, but the necessity of breathing when is always stronger than the convulsive muscular movements. Moderate excitement, whether of joy, tenderness, or grief, increases greatly the quantity of the tears, though the secretion is checked by violent emotions; in intense grief the tears do not flow, the restoration of the secretion being a sign of moderated sorrow, and itself affording relief by the resumption of nervous action. The sensory, emotional, or instinctive ganglia, situated at the base of the brain, to a certain extent independent of the will, in intense grief become congested, and the flow of tears is the natural method for their relief; hence the danger of cerebral disturbance from long continued tearless grief. Considering their size, there are no other glands which ordinarily can so increase the amount of their secretion as the lachrymal; the quantity is sometimes very great, and very easily stimulated; the shedding of tears is alsocontagious.—The lachrymal puncta may be closed, causing the tears to flow over the cheeks, for which the remedy is dilatation by fine probes. When the nasal duct is obstructed, the eye is watery and the corresponding nostril dry, the sac forming a small tumor at the side of the nose; the sac also may be inflamed, with pain, tenderness, swelling, and feverish symptoms; this may end in suppuration, and an external opening, constituting lachrymal fistula, requiring the restoration of the obliterated duct by styles of different materials.

**TEASEL** (A. S. tæssel, from teasan, to tease), the ripened flower heads of *dipsacus fullonum*, used for raising a nap upon woolen cloths. The genus *dipsacus* (Gr. ἄφις, to thirst, supposed to refer to the cups formed by the united leaves in some species, which hold water) is the representative of a small family, the *dipsacées*, which is so closely related to the *compositae* that in a systematic arrangement it is placed next to that family. Like the composites, the teasel family have their flowers in dense heads, but their anthers are not united and the seeds have albumen. In the teasel itself, of which there are about a dozen old-world species, the plants are biennial or perennial, with coarse, deeply toothed, opposite, rough leaves; the branches are terminated by an oblong head, consisting of small flowers, each in the axil of a bract, which appears as a strong scale when the seeds are ripe. The wild teasel (*D. sylvestris*) is sparingly introduced, and is found in the older states as a roadside weed; it is from 2 to 6 ft. high, and its numerous heads of pale purple flowers, with a large involucre at their base, make it a conspicuous and not inopportune plant; the bracts to the heads terminate in a long straight point; it should be treated as an intruder. The teasel of commerce, or fullers' teasel, though bearing the specific name given above, is generally supposed to have originated from the wild teasel, from which it differs in having a longer head with a shorter involucre; the bracts are much stiffer, and have hooked points. These heads, about 2½ in. long and 1½ in. in diameter, and clothed with regular, strong, sharp, recurved hooks; they are an important article of commerce, and in some countries of cultivation; considerable quantities are produced in England, but the chief supply is from Holland and France. The teasel has now and then been cultivated in
is thrown against the plants to keep them upright; when the flowers wither, the heads are cut, leaving 8 or 9 in. of stalk attached, and dried in the sun. Their use is to tease or raise a nap upon cloth, and this is done by the hooks, which catch and pull out one end of the wool fibres, near the surface, leaving the other end of the fibre still twisted in the thread. Formerly teasing, or teasling, was done by hand, the heads being fastened in a frame, and drawn over the surface of the cloth by the operator with a frame in each hand; now the work is done by machinery; the teasels, cut lengthwise into halves or quarters, are attached to a wooden cylindrical frame, which revolves, while at the same time the cloth passes beneath it. Much inventive talent has been expended in providing substitutes for teasels, but all have been discarded; for the natural teasel, unlike any artificial substitute, while sufficiently strong to perform the required work, will yield or break in contact with a knot or other obstacle, without injury to the cloth.

TECHNOLOGY (Gr. technē, an art, and λόγος, discourse), the systematic knowledge of the theory and practice of the industrial arts. It is divisible into several branches, but chiefly into chemical technology and mechanical technology. Chemical technology embraces those industries which chiefly demand a knowledge of chemistry, such as the manufacture of chemicals, including the various acids and the compounds of soda and potash; the manufacture of soap and candles, glass, and the various kinds of pottery and porcelain; the manufacture of illuminating gas, and the distillation and refining of the waste products of gas works and of crude petroleum; and the distillation and rectification of spirits and the fermentation of wine and beer. Mechanical technology embraces textile manufactures and the mechanical arts in general. In many of the arts a combination of both mechanical and chemical knowledge is required, as in glass making and calico printing. Schools of technology are established independently and also in connection with colleges and universities, not only for the advantage of the general student, but for those who intend to become experts in one or at most a few branches, in which the fundamental principles of the arts are taught, including mathematics, mechanical engineering, natural philosophy, chemistry, and usually mineralogy and geology. In independent institutions other branches are added.

TECUMSEH, or Tecumthia, a chief of the Shawnee Indians, born near the present town of Springfield, Ohio, about 1768, killed at the battle of the Thames, Oct. 5, 1813. His first prominent appearance was in the attack on Fort Recovery in 1794. About 1805 his brother Elskwatawa set up as a prophet, denouncing the use of liquors, and of all food and manners introduced by the whites. Tecumseh and the prophet then attempted to unite all the western tribes into one nation to resist the whites. They visited the Indians from the lakes to the gulf of Mexico, and soon had a village of 400 Indians gathered at Greenville. Gen. Harrison required them to remove, as it was beyond the Indian limit fixed by treaty. Tecumseh went to Vincennes with 400 warriors to overawe Harrison, and the conference was broken up by his violence. Finding that he had gone too far, he attempted to explain. In 1811, while he was in the south exciting the Creeks and Seminoles to rise by promises of English aid, Harrison marched on the prophet's town to demand that the Indians should return to their various tribes, murderers of whites be surrendered, and plunder given up. The prophet attacked him, and was defeated at Tippecanoe, on the Wabash (Nov. 7). This disconcerted Tecumseh's plans and broke the spell of the prophet's power. When war was declared with England, Tecumseh appeared in Canada with a number of warriors, and refused to meet the American commanders in council. He was in the action against Van Horn on the Raisin, and after being wounded at Maguaga was made a brigadier general in the British forces. He was in command with Proctor at the siege of Fort Meigs, and saved American prisoners from massacre. After the battle of Lake Erie he urged Proctor to engage Harrison when he landed, but accompanied him in his retreat. In the first engagement he was wounded while holding the passage of a stream. With Proctor he selected the battle ground at the Thames, in the S. Western part of Canada, and he commanded the right wing. Laying aside his sword and uniform in the conviction that he must fall, he put on his hunting dress and
fought desperately till he was killed. Col. R. M. Johnson was said to have shot him; but in reality his death was not for some days known to the Americans.—The life of Tecumseh and of his brother the prophet has been written by Benjamin Drake (12mo, Cincinnati, 1841).

The teeth in vertebrates for the seizure and mastication of food, placed at or near the entrance to the alimentary canal. In adult man there are 32, 16 in each jaw, implanted in sockets, and of an irregular conoid form; in the child, previous to the second dentition, there are only 20. For their development see Dentition. The number of the teeth increases in the lower animals, being greatest in the cetaceans and marsupials among mammals, and also considerable in many reptiles and fishes. The portion of a tooth above the socket is called the crown, the concealed part the root or stam; between these there is a middle, or less marked constriction or neck. In vertebrate animals the teeth, like the bones, have for their earthly basis phosphate of lime, mingled with some carbonate of lime and a certain proportion of fluorid of calcium. The latter substance is more abundant in the enamel of the teeth than elsewhere, but everywhere phosphate of lime is the main ingredient upon which the teeth depend for their solidity and firmness.—A tooth is composed of three different tissues, dentine, crista petrosa, and enamel. The dentine, forming the greater part of the body of the tooth, consists of a firm, transparent, nearly homogeneous substratum, composed of about 72 per cent. of calcareous matter and 28 per cent. of organic substance. It is permeated throughout by minute cylindrical channels, called canaliculi, about $\frac{1}{300}$ of an inch in diameter, which radiate from a central cavity contained in the tooth, called the pulp cavity, toward the external surface of the dentine. During their course the canaliculi branch and divide, often several times in succession, becoming thus very much reduced in size and at the same time increased in number. In the central cavity of the dentine is contained the pulp of the tooth, a soft, vascular, and sensitive papilla, the only portion of the tooth which is supplied with blood vessels and nerves. Undoubtedly the canaliculi of the dentine are either channels for the absorption of nutritious fluids from the pulp, or are filled with soft filaments composed of organic material, by which this absorption is accomplished. The crista petrosa is a thin layer of bony tissue attached to the outside of the dentine in the fang of the tooth, and serving to connect it, by means of its periostium, more firmly to the socket. It differs but little from compact bony tissue elsewhere, except that it contains no blood vessels, and is distinguished only by the presence of the irregularly shaped bone corpuscles, which are connected by their radiating filaments with the extremities of the canaliculi of the dentine. The enamel, which covers the surface of the crown of the tooth, is much the hardest of its tissues, containing often over 95 per cent. of calcareous matter. It appears to consist of superimposed layers of calcified epithelium, and is well adapted, by its extreme solidity and almost crystalline texture, to endure the attrition of foreign substances without disintegration.—Three kinds of teeth are distinguishable in mammals, viz., incisors, canines, and molars. The incisors are in the front and median portion of the jaws, and have a simple flattened root and a thin cutting edge, suitable for dividing and collecting food, as in the jaws of the beaver and squirrel and in the lower jaw of the ox. The canines, four in number, are next to the incisors; cut by a root through a line, except in man; the crown is conical, and the root long and simple. They are the so-called eye and stomach teeth in man, and form a striking characteristic and formidable weapons in the carnivora; they are best adapted for securing and tearing living prey. The molar teeth are the most posterior, and have flattened and tuberculous crowns suited for grinding down vegetable food; they are most developed in herbivorous animals; the roots in man are often much bifurcated, rendering extraction difficult.—Teeth are so intimately related to the food and habits of animals, so easily examined, and of such indestructible materials, that they are of the first importance in the classification of animals, both living and fossil. When fully formed they are subject to decay, but have no inherent power of repair; they may increase by abnormal growth of the crista petrosa, their most highly organized constituent. For the diseases and the mode of treatment of the teeth, see Dentistry.—In fishes the teeth vary from none in the sturgeon and lopho-branchis to countless numbers in the pike and the siluroids. They are usually conical, but sometimes flattened or pavement-like, villiform, serrated, and cutting; they may be situated on any of the bones of the oral cavity, on the tongue, and in the pharynx; in most cases they are firmly united to the jaws by continuous ossification, but in some are movable; they are composed of dentine and its modifications, enamel occurring in only a few cases, like the parrot fish (scarus); and they are frequently shed and renewed, the germs being developed from the free surface of the buccal membrane. Among reptiles, the whole order of chelonians (tortoises and turtles), and also the toad family among batrachians, are without teeth. In the others these organs are usually simple, and adapted for seizing and holding but not chewing their food; the number is never so small nor so large as in fishes, and is rarely characteristic of species. They are generally conical, sharp, and smooth, and may be placed on any of the bones entering into the structure of the mouth; the base never branches into diverging fangs, and in most is anchylosed in various ways to the bone which bears them, as noticed.
under the different families; dentine and cement are always present, and sometimes enamel, as in the saurian crown. Among mammals, some of the edentates, as ant-eaters and pangolins, have no teeth; in the others they are implanted in sockets, and the molars have two or more roots when they have a limited growth; they are confined to the superior, inferior, and intermaxillary bones, a single row in each. Mammals have been divided by Owen into monophyodonts, or those which generate a single set of teeth, and diphyodonts, or those which generate two sets of teeth; the former include the monotremes, edentates, and carnivorous ceteceans, and the latter all the other orders.—For full details on this subject the reader is referred to the following writings of Prof. Richard Owen: "Odontography" (London, 1840–45); article "Teeth" in vol. iv. of the "Cyclopedia of Anatomy and Physiology" (1852); and "The Principal Forms of the Skeleton and Teeth," in vol. i. of Orr's "Circle of Sciences" (London; reprinted in Philadelphia, 1854).

TEGEA, an ancient city of Greece, in the S. E. part of Arcadia. Its territory was called Tegeatis. It is mentioned in the Iliad. Its early history was marked by a constant war with the Spartans, and about 560 B. C. it fell into their hands. About 500 Tegeans fought at Thermopylae, and 3,000 at Platea. Tegea became a member of the Arcadian confederacy after the battle of Leuctra (371), and subsequently of the E teolian league. After the Roman conquest of Greece it continued to be a place of considerable importance, but about A. D. 400 was totally destroyed by Alaric. Its remains, found near the village of Peali, about 4 m. from Tripolis, consist of broken columns, friezes, and architraves, and a church in ruins.

TEGNER, Esaias, a Swedish poet, born at Kärrkerud, Wermland, Nov. 13, 1782, died in Wexio, Nov. 2, 1846. He was the son of a clergyman who had assumed the name of Tegnér after his native village of Tegnaby. He graduated at the university of Lund in 1802, and became teacher of aesthetics and librarian there, and in 1813 professor of Greek. In 1818 he was elected to the academy of sciences and took his degree in divinity, and in 1824 he became bishop of Wexio. His works include "Searc (111); Nattvarvs Barnen ("The Children of the Lord's Supper," 1820), Longfellow's version of which (1841) was regarded by Tegnér as the best of all the translations; "Azel (1821); and Frithjof's Saga (1825), based upon Icelan-
dle sagas. The last has been repeatedly set to music, and translated into many languages. Among the latest versions are Count Leibnitz's in German (Frankfort, 1873); Leopold Hamel's in English (London, 1875); and Victor Wilder's in French, set to music by Max Bruch (Paris, 1875). A complete collection of Tegnér's published works was edited and his biography written by his son-in-law Bottiger (7 vols., Stockholm, 1847–51; new ed., 1871 et seq.); and a collection of his posthumous writings has been made by Elof Tegnér (3 vols., 1874). His correspondence has also been recently published. A colossal statue of Tegnér was erected at Lund in 1853.

TEHAMA, a N. county of California, lying between the Sierra Nevada and the Coast range, and intersected by the Sacramento river; area, 2,800 sq. m.; pop. in 1870, 3,587, of whom 294 were Chinese. Lassen's peak, in the N. E. corner, is 10,577 ft. high. The E. portion is partly rocky and barren and partly covered with forests of pine. In the west are several well watered and fertile valleys. Some gold is found in the Sierra Nevada, and salt and medicinal springs of great value in the Coast range. The Oregon division of the Central Pacific railroad traverses it. The chief productions in 1870 were 404,722 bushels of wheat, 108,328 of barley, 445,456 lbs. of wool, 68,185 of butter, 83,000 gallons of wine, and 6,549 tons of hay. There were 3,068 horses, 2,157 milk cows, 9,408 other cattle, 130,806 sheep, and 19,459 swine; 3 flour mills, 6 saw mills, and 2 manufactories of gloves and mittens. Capital, Red Bluff.

TEHERAN, or Tehran, the capital of the kingdom of Persia, and of the province of Irak-Ajemi, 70 m. S. of the Caspian sea and about 210 m. N. of Ispahan, in lat. 35° 41′ N., lon. 51° 23′
dry ditch and a thick mud wall, flanked at intervals with semicircular projections, and pierced by gates which are always guarded, and are closed after sunset. Inside there are many vacant spaces, gardens, and extensive ruins; but the streets are narrow, irregular, unpaved, and filthy. The houses are badly built and mean in appearance. Outside the walls are suburbs of considerable extent, several large caravansaries, and many enclosed gardens. The principal building of the town is the Ark or royal palace, which occupies a large space adjoining the northern wall, and is fortified. The bazaars are wretchedly kept and dirty. One of the mosques is roofed with plates of gold. In summer the climate is unhealthy, and the monarch and about two thirds of the inhabitants encamp on the plains of Sul tanpah and on a hill in the neighborhood the shah has a palace and beautiful gardens. Telegraph wires connect Teheran with the Caucasian and Turkish frontiers. Not far from it are the ruins of the ancient Rhages, the capital of Parthia. Teheran was unimportant until made the capital of Persia by Aga Mohammed Khan about 1796. A treaty of commerce with England was signed here, Oct. 28, 1841.

TEHUANTEPEC. 1. An isthmus of Mexico, lying between the bay of Campeachy on the gulf and the bay of Tehuantepec on the Pacific, and comprising the states of Tabasco and Chiapas and part of the state of Oaxaca. Its breadth from bay to bay at the narrowest place is 130 m. It is drained by the Coatzacoalcos river, which flows northward, discharging into the bay of Campeachy, and extending three fourths of the width of the isthmus; and by the Tehuantepec river, flowing into the bay of the same name. There are several lakes and lagoons. At one time it was proposed to construct a ship canal across the isthmus, improving the navigation of the Coatzacoalcos for a part of the distance, and surveys were made. (See CANAL, vol. iii., p. 690.)

II. A town of the state of Oaxaca, on Tehuantepec river, about 15 m. above its mouth, and 110 m. E. S. E. of Oaxaca; pop. about 14,000. The houses are generally of stone. Part of the town is occupied by Indians, who are civilized and industrious. It has salt works and cotton factories, and a considerable pearl fishery in which many of the inhabitants are engaged. Indigo is raised in the vicinity, a purple dye is procured from a shell fish abundant there, and some cochineal is exported. The harbor is shallow, with a dangerous bar at the mouth of the river, and is little frequented.

TEJADA, or LERDO DE TEJADA, SEBASTIAN, president of Mexico, born in Jalapa, April 23, 1825. He was educated in the seminary of Puebla and in the college of San Ildefonso, in the city of Mexico, became rector of the college in 1852, and received the diploma of advocate in 1853. He was a judge of the supreme court from December, 1855, to June 1, 1857, when he became minister of foreign affairs and premier, but resigned in September on account of his support of the new liberal constitution, in opposition to President Comonfort. He was a member and the last president of the assembly of representatives during the sessions of 1861-'2. He opposed the treaty for arranging the English debt, and its failure led to the downfall of the Zamacona cabinet. His influence led to the ratification in December, 1861, of treaties of commerce and of extradition with the United States. He was member of congress in 1862-'3, and followed the government on its removal from Mexico, during the French invasion. On Sept. 2, 1863, he became minister of justice, and on Sept. 11 of foreign affairs. He shared with Juarez the honor of the eventual recovery of the national independence. The presidential term of Juarez expiring on Nov. 30, 1865, Lerdo de Tejada, to avert the excitement of a new election, caused the presidential term to be extended until the termination of the war. After the capture of Maximilian, he was voluntarily spared his life. After the return of Juarez to the capital, in July, 1867, Lerdo de Tejada suspended all treaties with those foreign powers which had failed in neutrality toward Mexico, or had joined in the intervention; but he accorded to aliens the same security as to Mexicans. In 1868 he became chief justice of the supreme court. In that capacity, under the name of Juarez, he became president on the death of Juarez in July, 1872; and on Nov. 1 he was almost unanimously elected to that office for the term ending Nov. 30, 1876.

TELEGRAPH (Gr. τῆλε, afar, and γράφων, to write), an apparatus by which intelligence is communicated to a distance. It properly includes the various methods of signalling. The Roman generals, as described by Julius Africanus, spelled words by means of fires of different substances. The North American aborigines made use of regular stations over the western country for such signals; and the Indians of the northwest territory in this way made known the approach of Fremont, as he passed through their regions. Polytius describes two modes of telegraphing by means of torches; and Bishop Wilkins, after giving an account of this in his book entitled "Mercury, or the Secret and Swift Messenger," describes a method of conversing at a distance with three lights or torches at night, which may be so used as to indicate the 24 necessary letters of the alphabet, these being divided into three classes of eight letters each, which are severally designated by one, two, or three torches, and the number of the letter by the number of times the torches are elevated or disposed. Another mode of telegraphing, proposed by Bishop Wilkins, in which intelligible signals were conveyed by means of two lights attached to long poles; and for long distances he suggested the use of the then newly invented telescope. A variety of systems of telegraphic signals were brought into notice by different inventors in the 17th and 18th centuries, one
TELEGRAPH

of the earliest of which is that of Dr. Robert Hooke described in the "Philosophical Transactions" for 1684. It consisted of 24 symbols formed of blocks of wood, representing alphabetical characters, and six more formed of curved lines to be used as arbitrary signals. These were to be exposed in succession in an elevated frame at some conspicuous point, and, being observed at another station, were to be there repeated and sent forward to the next, and so on. At night torches or other lights were to be substituted for the wooden figures. The first working telegraph of much importance was that known as Chappe's, invented in 1792, which was brought into use during the wars of the French Revolution. At the top of a tall post was attached a cross bar upon a pivot, so that it could be easily turned from a horizontal to an inclined position. Each end of this cross bar carried a short arm, which could also be turned upon its pivot so as to stand in any position in relation to the bar. The movements were made by means of ropes which passed through the bar and down the post. This apparatus admitted of 256 distinct signals; but M. Chappe limited its use in great part to 16 signals, each one of which represented a letter of the abbreviated alphabet he had constructed. Chappe's method has been generally adopted, all the alleged improvements in it being of minor importance. Mr. R. Lovell Edgeworth about the same time brought before the public his plan of a telegraph, or as he called it telegraph or telegraph, by which the signals represented numbers, the meaning of which would be found in the dictionary prepared for this system. The signals were made by means of four pieces of wood, each one in the form of a long isosceles triangle, placed near together, each supported upon a pivot round which it could be turned in any direction. The movements of each were limited to eight, and indicated the first seven numerals and zero. The first triangle or pointer represented units, the second tens, the third hundreds, and the fourth thousands, so that any number might be expressed that did not contain the figure 8 or 9. The admiralty telegraph proposed by Lord G. Murray was used in England from 1795 to 1816, when it gave place to that known as the semaphore (Gr. σήμα, a sign, and φερεω, to carry), which the French had adopted in 1808. This consisted of six conspicuous boards or shutters set in a frame, each of which could be turned upon its axis so as to present either its edge or its broad surface to the next station. The movements represented figures, and a series of numbers was indicated by their combinations. Some of these stood for the letters of the alphabet, and the others for arbitrary signals. The French semaphore (also known as signal posts) consisted of three or more arms attached by pivots to an upright post, admitting of motion in any direction, and indicating by their various positions either figures or letters. Many modifications of this apparatus were used. For telegraphic communication at sea, flags of various colors have long been used. (See Signals, Naval.) In 1835 Gauss proposed to employ a small heliograph or mirror for reflecting rays of light from the sun or an artificial source as a means of communicating signals. With a mirror so small that it may be carried in the waistcoat pocket, flashes of light may be clearly perceived for 12 m. or more, and, the mirror being gently moved on some established system, the appearance and disappearance of the flashes may indicate letters or words. By this device time can be saved, telescopes dispensed with, and the signals seen only by those for whom they are intended. Francis Galton, the African traveller, proposed a plan similar to this at a meeting of the royal geographical society, and described an optical arrangement he had devised by which the operator may know if the mirror is directed aright. Among the later publications upon the telegraph, and adopted previous to the electric telegraph, are papers in the "Journal of the Society of Arts," xxxvi., xxxvii., xxxviii., and xxxix.; "A Treatise explanatory of a New System of Naval, Military, and Political Telegraphic Communications," &c., by John Macdonald (London, 1817); "Description of the Universal Telegraph for Day and Night Signals," by C. W. Pasley (London, 1823); and Edgeworth's "Essay on the Art of conveying Secret and Swift Intelligence," in the "Transactions of the Royal Irish Academy," vol. vi. The advantage of all these methods of telegraphing, which may be described in general as the optical method, is, that they employ nature's great highways, which cost nothing; the disadvantages are, that the signals cannot record themselves, but require the constant attention of an observer, and can be used only for moderate distances and in favorable weather. Moreover, the expense is great compared with the meagre intelligence which is communicated. The semaphore between London and Portsmouth, 72 m., which could be used less than one fifth of the time, required an annual expenditure of £3,408.—ELECTRO TELEGRAPH. The various kinds of electric telegraphs may be classified in two ways. In the first place, they differ in regard to the source from which the electricity is derived. In the present state of science, five independent sources of electricity are recognized: 1. friction; 2. chemical action; 3. magnetic induction; 4. heat; 5. physiological actions. The difficulty of regulation unites frictional electricity for this work, except at short distances and in dry air. The fourth and fifth sources must be rejected as insufficient for practical use. Successful telegraphs must rely on electricity produced by chemical action or magnetic induction. In the second place, electric telegraphs may be classified according to that one of the five special effects of electricity which is selected as the means of delivering the message when
it arrives: 1. The statical attractions and repulsions would be impracticable except with frictional electricity. 2. The chemical effect of electricity is capable of making a visible sign and also a permanent record. 3. The magnetic effect is able to make a visible sign, as in the needle telegraph; it can also prick out its message in an artificial alphabet, or even print it in ordinary type. 4. The physiological effect can furnish a signal which may be felt. 5. The luminous and the calorific effects can be used for visible signals, but they cannot write or print. Of the manifold attempts at electric telegraphs, the best are now known to be those which employ the chemical or the magnetic effects. As the chemical telegraph works silently, an electro-magnet is required even in this case to attract the attention of the person who is to receive the message. The electro-magnetic telegraph can address the eye or the ear, and can also write or print.—Attempts have been made to prove that the electric telegraph was foreshadowed more than two centuries ago. Prof. Mannoir puts in a claim for Dr. Odier on account of a letter which he wrote in 1773. But Addison, in No. 241 of the “Spectator,” written in 1711, quotes from the Proelusiones Academicæ of Strada a description of essentially the same arrangement as that proposed by Dr. Odier. Moreover, Schwenter in 1636 had the same idea, but borrowed it from a still earlier writer. How chimerical the scheme was in all these cases, and how unworthy of being regarded as an anticipation of the real discovery, will appear from the following brief description of the project: A magnetized needle is free to move over a graduated dial, the marks being the letters of the alphabet. One of these instruments stands in one place, and another in a remote city. If the needle of one is placed upon a particular letter, the needle of the other will move to the same letter by virtue of the magnetic forces. Du Fay, Winckler, Lemonnier, Gray, and Desaguliers made experiments, which showed that the effect of electricity could be transmitted to a distance. The discovery made by Dr. Watson in 1747, that electricity would force its way through considerable lengths of wire, and that earth and water could take the place of wire in completing the circuit, furnishes the first facts of any significance in the history of the electric telegraph. He transmitted shocks across the Thames and the New river, in one instance at Shooter’s Hill the circuit being composed of about 2 m. of wire and 2 m. of the earth; and he supported his wires upon posts. Franklin made similar experiments across the Schuykill river in 1748, and De Luc afterward on the lake of Geneva. Signals were communicated by means of the electric shock from one apartment to another by Lesage at Geneva in 1774, and by Lomond in France in 1787 by the divergence of pith balls on some concerted plan; and in 1794 Reizen of Ger-}

many employed the electric spark for telegraphing, making use of interrupted strips of tin foil, so arranged that the form of the letter or figure was exhibited by the sparks. He employed 36 wires from one station to another, each one of them communicating with one of the letters or figures, and each one connecting with a return wire, thus making 72 in all. This plan is described in vol. ix. of Voigt’s Magazin. Cavallio in his “Treatise on Electricity” (1795) suggests the explosion of gunpowder to call attention, and then the transmission of signals by a succession of sparks at intervals and in numbers according to the system agreed upon. Don Francisco Salvá of Madrid and Sr. Betancourt constructed similar telegraphs at Madrid in 1797 and 1798, one of them extending between Madrid and Aranjuez, about 26 m. (Voigt’s Magazin, vol. xi.) Salvá communicated his plans to the royal academy of sciences at Barcelona, and according to the journals of 1798 they were highly commended by the minister of state. Salvá appears to have had a clear idea of the practicability of electric communication even beneath the sea, and in the last of his memoirs he proposed to substitute the voltaic pile for the electrical machine. Other attempts to employ frictional electricity were made by Francis Ronalds at Hammersmith, England, in 1816, on a line of 8 m.; and in 1827 by Harrison G. Dyar at the race course on Long Island, N. Y., on a line of 2 m. The latter made use of iron wire, glass insulators, and wooden posts, and employed for signalling the chemical power of the electric current to change the color of litmus paper. Ronalds introduced the plan of employing a clock at each of the two stations, both of them running together exactly, and each bringing into view one after the other the letters of the alphabet arranged upon a disk which revolved behind a small window, to which each station was connected by a wire. Each clock was provided with two pith balls connected with an electrical machine at the other station; and their divergence called the attention of the other operator to the letter then in view. The voltaic pile, discovered in 1800, furnished in its continuous current a more promising agent for transmitting intelligence than the sudden and transient discharge of the friction machine. Sömmerring began his experiments in 1809, and devised a plan of telegraphing which was as perfect as was practicable at that time. He used 35 wires, terminating in gold points, set up vertically on a horizontal line at the bottom of a glass reservoir of water. In the other direction these wires, brought together in a tube, extended to the other station, where they again diverged, terminating in brass plates attached to a horizontal wooden bar. The plates at one end and the points at the other were marked with corresponding letters, and whenever a momentary current was sent through any two of the plates, hydrogen was evolved at one of the gold points and oxygen at
another, and thus two letters were indicated. Sömmerring found that the addition of 2,000 ft. of wire produced little or no sensible additional resistance, and that voltaic action was instantaneously developed at least for the distance of 3,000 ft. In 1810 Prof. Coxe of Pennsylvania suggested a method of telegraphing by means of the chemical effect of electricity. Schweigger described an improvement upon Sömmerring’s arrangement, by which all the wires could be dispensed with except two. The batteries then known were insufficient for the transmission of currents through great distances, and besides were deficient in sustaining power; therefore no further progress was made in perfecting the electric telegraph until the principles of electro-magnetism had been developed. (See Electro-Magnetism.) In 1819 Oersted discovered the power which the current possesses of deflecting a magnetized needle out of the magnetic meridian. In 1820 Schweigger added the multiplier. This was followed by Arago’s discovery in the same year that a steel rod was magnetized when placed across a wire which was carrying a current. Ampère immediately substituted a helix for a straight wire. In 1829 Sturgeon used soft iron in place of steel, and the electromagnet was born. Between 1828 and 1830 Prof. Henry of Princeton, N. J., made great improvements in the construction of electro-magnets by covering the wire and winding the coil compactly. In 1831 he devised an instrument which is essentially the same as the Morse register. Moreover, Ohm in 1827, and Fechner in 1831, published the results of their theoretical investigations into the laws of the voltaic current, which shed a flood of light on the subject of telegraphing at long distances. If these investigations had but little practical effect, it was because they were not generally known until the same results had been at a later day worked out empirically. Equally important was the invention of the constant battery by Daniell in 1835, and of various other constant batteries which have been contrived since that time. The discovery of magneto-electricity by Faraday in 1831, and the introduction at a much later date of the inducting coil, supplied constant sources of intense electricity adapted to the telegraph. Within a year after Oersted’s discovery Ampère pointed out its applicability to telegraphic signals. His plan contemplated at least 30 needles and 60 independent wires. In 1828 Ritchie gave an experimental illustration of such a device before the royal institution of London. In 1839 Fechner had a similar project for uniting Leipsic and Dresden by means of 24 sets of underground wires. In 1832 Schilling exhibited to the emperor Nicholas of Russia a needle telegraph in operation on a small scale. He used a needle provided with a multiplier of insulated wire for each letter or number to be indicated. The several wires were brought together beyond the multipliers into one cord, and thence passed to the first station. Eventually he succeeded in reducing the number of needles to one. He also introduced an alarum at the commencement of the passage of the current by causing a solid body to fall, on the same principle as had been already recommended by Prof. Henry in his lectures. These experiments were interrupted by his death, and the steps made were lost, without even a very accurate account of the results being preserved. The next experiments of importance were those of Gauss and Weber of Göttingen in 1833 and 1834. They employed first voltaic electricity excited by numerous small elements, and afterward a magneto-electric machine to transmit signals from 9,000 to 15,000 ft. They caused a magnetic bar to be deflected to one side or the other, and interpreted its repeated movements into the letters of the alphabet. The vibrations of the magnet were checked by a damper, or by the use of currents alternating in direction. This telegraph was of practical value in comparing clocks and for other purposes. Gauss stimulated his pupil Steinheil to a bolder undertaking, in which he was assisted by the Bavarian government. Steinheil’s telegraph, completed in 1837, extended 12 m., employed but a single wire, and made use of the earth to complete the circuit. The signals were sounds produced upon a series of bells of different tones, which soon became intelligible to a cultivated ear; and the same deflections of the needle that caused the sounds were also made to trace with ink lines and dots upon a ribbon of paper moved at a uniform rate, the alphabet having a remote resemblance to that invented by Swain in 1829. Steinheil used a magneto-electric machine, but with the magnets stationary and the multiplying coils revolving close to them.—Morse’s telegraph, which is generally recognized in all parts of the world as the most efficient and simple, was first publicly exhibited in the university of New York in 1837. It had been gradually brought to a working condition by experiments and contrivances devised by the inventor since 1832, with the assistance of L. D. Gale and George and Alfred Vail. In October, 1837, Prof. Morse filed a caveat in the patent office to secure his invention; and he obtained the patent in 1840, covering the improvements he had in the mean time made in the apparatus. The telegraph was first brought into practical use, May 27, 1844, between Washington and Baltimore. An insulated wire buried in a lead pipe underground was first tried, and failing was replaced with one on posts. The power was derived from a voltaic battery, and an electromagnet was employed at the receiving station for developing its effects. When the current flowed, this magnet attracted an armature, by which, according to the duration of the current, dots or dashes were marked upon a moving slip of paper with a pen or pencil. The apparatus furnished a simple and effective means of recording signals, which by the needle tele-
The apparatus was improved by the substitution of a sharp point for the pen or pencil, which is attached to one end of a lever, at the other end of which is the movable armature. The following illustrations exhibit the several parts of the Morse instrument as now in use. The key, fig. 1, consists of a brass lever L, swung on pivots, and having on one end a button. When this button is pressed down, two platinum wires, a and b, are brought into contact, thus closing the circuit; when the pressure is removed, a spring lifts the lever, separates the wires, and breaks the circuit. When the message is sent the operator permanently closes the circuit by springing to the left the lever S, which brings into contact the duplicate platinum wires a' b'. The relay magnet, fig. 2, is an electro-magnet wound with a long fine wire, which is introduced into the main line and becomes a part of the great conductor from city to city. When the key-breaks and closes the circuit, the relay receives the voltagc current and becomes magnetized and demagnetized. The delicately poised lever L, having the armature of the magnet attached to it, vibrates forward and backward, bringing together the two platinum wires a b, and thus breaking and closing a secondary or local circuit, embracing a local battery and a strong electro-magnet. This magnet performs various work, such as embossing or printing paper, or the liberation of machinery for the production of sounds. A screw B is used to move the magnet coils backward and forward so as to adjust the general magnetic power, and a spring S retracts the armature after magnetic attraction has drawn it forward. The sounder, fig. 3, is an electro-magnet used in the local circuit.

The armature, A, is attracted by the electro-magnet M, causing the lever L to vibrate between the screws S S, which are so adjusted as to limit the vibrations. The backward and forward blows thus given, some of which are short and some long, correspond to the dots and dashes of the Morse alphabet. This is now more generally used than the Morse register or recording instrument, as experience has proved that fewer errors are made by the ear than by the eye. The Morse register, fig. 4, has also the electro-magnet M, the armature A, the lever L, and the adjusting screws S S; but instead of producing sounds merely, the lever L embosses on a fillet of paper P dots and dashes in precise accordance with the movements of the key and relay. The paper is carried between two rollers, moved by clockwork, in one of which is a groove, into which the steel point presses the paper. When successive blows are struck on the key, closing and opening the circuit quickly, corresponding dots appear on the paper; but if the key be pressed down for a longer or shorter time, keeping the circuit closed, a continuous line of any desired length may be produced on the paper. The signs for the letters of the English alphabet (which are variously modified to adapt them to other alphabets), and for the numerals and punctuation marks, are as follows, those most used being the simplest:
TELEGRAPH

The slightness of the difference, which cannot be avoided, between some of the signs, as in the O and S, I and O, L and T, &c., exposes to mistakes, which in case of writing in cipher cannot be corrected, and not always when the message is perfectly understood by the operator who sends it. Thus a merchant telegraphed from New Orleans to his correspondent in New York to protect a certain bill of exchange; the word “protect” was read as “protest,” and involved serious consequences.—What is known as the English telegraph is the result of the investigations and inventions of William F. Cooke, whose attention was directed to this subject in March, 1836, when a student at Hidelberg, by witnessing an experiment performed by Prof. Möneke of causing the deflection of a magnetic needle by the electric current. In July of that year Cooke produced an experimental instrument, which he not long afterward took to England and sought to introduce on the Liverpool and Manchester railway. He there became associated with Prof. Wheatstone, and the two united their labors to perfect the instrument. The first patent for an electric telegraph was issued to them on June 12, 1837. They employed five magnetic needles and coils, and either five or six wires, with a peculiar keyboard invented by Wheatstone, upon which were arranged the letters, and these were designated in turn as any two of the needles arranged across the centre of the board pointed to one and another of them. The apparatus underwent various modifications in the hands of its inventors, and was much simplified by the use of only two needles, and finally of only one, different letters being designated by the deflection of the needle to the right or to the left one or more times in either or both directions. The swinging of the needle is checked by small pins fixed on the dial, so that the motions are rendered precise and clear. In this single-needle telegraph, each instrument has its own battery and wire. In case of accident to the wire of one instrument, that of the other serves to keep up the communication. With each apparatus was formerly connected an alarum bell, the clapper of which was moved by a weight or spring connected with clockwork, which was released by means of an electro-magnet. This is now generally abandoned, the sound made by the click of the needle against the pins being found sufficient. Wheatstone introduced one very important feature in his electric telegraph, which is a local battery for working the alarum. It is brought into action by the deflection of a magnetic needle, the ends of which are thus placed in contact with the two wires of the second battery, and so close its circuit. The double-needle telegraph is often used upon the railways of Great Britain, each needle having its own wire. The different signs are made by the movements of one or both of the needles. The needles upon the dial are moved by the messages sent as well as by those received, so that each operator may see the signals he makes. In these needle telegraphs no record is made of the message by the instrument itself; the operator observes the signs, and notes them upon paper as they succeed each other. With the English double-needle telegraph, employing two wires and two batteries and other apparatus at each station, an expert operator can send as many as 150 letters a minute; but this is more than can be correctly read, the limit of which is about 100 letters a minute, and in actual practice the number is somewhat less than this, or from 17 to 24 words a minute. Operators accustomed to the work do not require the lettered dial for reading the movements of the needle.—Of the numerous telegraphic inventions that soon succeeded those already named, Alexander Bain’s are particularly worthy of notice. He was engaged in England as early as 1840 in producing a printing telegraph, and in 1846 patented what is known as an electro-chemical and registering telegraph, the principle of which had been first applied to the purpose by Dyar in this country in 1827, and by Edward Davy in England in 1838. Mr. Bain brought his new telegraph to the United States in 1849, and it was brought into use on several important lines; but after a lawsuit involving chiefly the use of the local circuit, the Morse interests forced a consolidation, and the Bain system had afterward but a limited use. The local circuit gave to the Morse system its great importance and value. On long lines of telegraph the wire offers such resistance to the passage of the current that its presence is detected only by delicate instruments, which however are capable of vibrating levers whose object is to open and close secondary or local circuits; and these circuits being short, unlimited magnetic power may be obtained for recording or producing sounds. The Bain telegraph was essentially the same as that now called the “automatic.” The revival of the system is due to recent discoveries in the arrangement of circuits, by which the rapidity of recorded electrical impulses through very long conductors has been made almost infinite. For recording, dots and lines are produced on chemically prepared paper, which is moved while damp at a uniform rate over a metallic roller; a fine wire, through which the line current passes, rests on the surface of the
paper and blackens it by decomposing the chemical. The current was formerly sent over the line by the key, as in the Morse system; but to call attention a bell was used, and this usually required a local circuit. Mr. Bain had at this time fully developed a plan for transmitting signals with a rapidity far greater than could be effected with the key, and this plan is the same as that now used in the revived system. In place of the key a fillet of paper was punched with lines and dots representing a message. This was passed over a metallic roller with great speed, and a fine wire which rested on the paper entered each hole as it moved and completed the circuit through the roller. The receiving machine was made to run at a speed corresponding with that of the transmitting machine, and the perforated dots and dashes were reproduced in blackened dots and dashes. The advantage of this system lies in the transmission of long messages, which are received and prepared by several operators, at great speed. Until recently this speed could be obtained only on short circuits, the marks on long circuits running into each other and becoming illegible. Later improvements have enabled messages to be sent from Brussels to Ostend and back at the rate of 450 words a minute; and the American instruments have sent between Washington and New York 5,250 letters a minute, requiring 10 copiers to feed it, 10 copyists, and two operators.—Facsimile Telegraphs. Electric copying or facsimile telegraphs are modifications of the automatic chemical. They originated with F. C. Bakewell of England in 1850, and have been improved by Caselli, Bonelli, and others. In them the message is written with a pen dipped in varnish upon a sheet of tin foil, which is then laid around a metallic cylinder, corresponding precisely in its size, rate of revolution, and longitudinal movement, with another cylinder at the receiving station, which is covered with chemically prepared paper and provided with a pointer like that of the Bain chemical telegraph. Those cylinders being set in motion at the same instant, the point of the registering apparatus makes a continuous colored line, running round the cylinder in a close spiral so long as the metal style at the other station presses upon the tin foil; but as this passes over the lines of varnish a break in the circuit occurs, causing an interruption of the colored line at the other station. The blank spaces thus produced will be found when the lines have been drawn over the whole paper to be a facsimile of those written in varnish upon the tin foil. The lines, though drawn as spirals upon the cylinder, appear as parallels when the paper is taken off. About 10 revolutions of the cylinder, making as many parallel lines, are sufficient to complete one line of writing; a cylinder 6 in. in diameter affords sufficient length for about 100 letters of the alphabet in one line; and as the rate of revolution is not less than 30 in a minute, 300 letters or more may be transmitted in this period. A message in cipher can be sent by this method without risk of error, and even invisible messages written in colorless varnish may be received and impressed in invisible characters upon a sheet of paper, to be afterward brought out by chemical means; thus, if the paper be moistened with diluted acid alone, no visible mark is left upon it until it is brushed over with a solution of prussiate of potash, when the lines appear in their blue color. Great improvements in the autographic telegraph have been made by Caselli, who has succeeded in making dark letters upon a white ground. His instruments have been used on some of the French lines since 1862.—Printing Telegraphs. Royal E. House, of Vermont, received a patent in 1849 for an admirable long-line printing apparatus, which was first used in 1847, sending messages in Roman capitals between Cincinnati and Jeffersonville, Ind., 150 m. The necessity of avoiding the peculiar features upon which other telegraphic systems were established, in order to give to it a distinctive and patentable character, added greatly to the difficulties of the undertaking, which after nearly six years of labor were overcome by the ingenuity and perseverance of Mr. House. The apparatus is very complicated, and little more can be attempted than to state its great powers of execution and its perfect accuracy. The mechanical movements of this machine are set in action by hand labor applied to a crank, which works an air pump for supplying a current of condensed air, which under the control of the electric current carries forward the movements of the composing and printing apparatus, so that each letter may be printed at the exact instant that it is struck upon the keyboard of the instrument. This keyboard, which resembles that of a piano, is connected with the electric current, and as the keys are struck the circuit is opened and closed with the movements of a circuit wheel which controls the movements of the type wheel. A complete revolution of the circuit wheel, coming round again to the same letter, breaks and closes the circuit 28 times, and other letters a less number according to their arrangement on the type wheel. The printing apparatus is quite distinct from the circuit, but the composing apparatus forms a part of it. The impression of the letter is produced by a blackened ribbon being pressed against the paper by the type. From the voltaic battery of one station, the current passes along the wire to the next station, then through the coil of an axial magnet to the insulated iron frame of the composing machine, and thence to a circuit wheel revolving in this frame. Through a slot in the frame that rubs the edge of this wheel it passes into the return wire, and through another battery back to the first station to pursue the same course through the composing machine and magnet there, and all others upon the line. In sending a message, the operator sets his machine in motion and
TELEGRAPH

gives a signal by breaks of the circuit, repeated a different number of times for different offices on the same wire. As this is heard by the operator at the receiving station, he sets his machine in motion, and the type wheel at its starting point, and signals back that he is ready. No further attention is required on his part, while the machine goes on, printing the communication in Roman capitals upon the long strip of paper regularly supplied to the type wheel. From 250 to 260 letters as a maximum can be accurately printed every minute, and over 3,000 words an hour of press news, partly abbreviated, have been sent over the wires with a single instrument. The House printer was the parent of many others working on the same principle, the "step by step" movement, in which each break or close of circuit allows a tooth of an escape wheel to pass; a type wheel being on the same shaft, a new letter appears for each tooth that escapes.

On May 29, 1858, Mr. Hughes patented a telegraph, in which the feat of printing a letter with every impulse or wave of the electric current was accomplished. In the other telegraphs, as already described, several impulses produced by successive makes or breaks of the circuit are required to form a single letter; this in House's telegraph varies up to 14 breaks, the maximum required for repeating the same letter, and averages about 7 impulses; and in the Morse system the average is about 2½ impulses, those which make lines being of longer duration than those which make dots. The saving of time thus effected by the Hughes instrument is of great importance, especially on long lines in which an appreciable amount of time is expended in the passage of the current. In long lines of submarine telegraphs, as will be noticed below, a greatly increased resistance is experienced in charging the wires with the electric current, and the impulses necessarily succeed each other with extreme slowness and diminution of force. The type wheel in the Hughes system is provided with 28 types; it is kept in rapid revolution during the whole time of operating, and is so perfect in its movement that, though the revolutions may be from 100 to 140 a minute, the variations of two machines at different stations do not exceed ½ of a second in several hours. At the instant one of the 28 keys is depressed, the current entering the magnet at the distant station causes the strip of paper to be brought against the type opposite to it at the time, and receive the impression in ink while this is rapidly carried round with the wheel. The operator can send an average of two impulses with each revolution of the type wheel, thus making the capacity of the instrument 200 letters or 40 words a minute, and the maximum is much above this. The regulators or governors of the clockwork which carries the type wheels at the different stations are springs of the same musical tone, which consequently vibrate the same number of times a second, and which control by their vibrations the escapement of the apparatus. The power of the electric current required is reduced in a wonderful degree by the combination of the natural magnet and the electro-magnet, making only so much electricity necessary as will neutralize the magnetism in the natural magnet by causing magnetism of an opposite polarity to be created in the poles of the electro-magnet. This extreme delicacy, however, renders the telegraph liable to be interrupted by atmospheric electricity, such as is developed previous to and during the continuation of the aurora borealis. It is asserted that this instrument can work upon a longer line without the aid of repeaters than any other, and this with an extraordinarily low battery power. In the winter of 1858 a new instrument was perfected by G. M. Phelps of Troy, combining the most valuable portions of both the House and Hughes patents, which has been introduced with great success on nearly all the lines formerly using those inventions. This has been termed the "combination" instrument, and has the advantage of being able to work through a much longer circuit than the House machine, with a smaller battery, as well as of being much simpler. The keyboard and transmitting machinery of this instrument are precisely like those of Hughes, as is also the printing apparatus, with the exception of the electro-magnet, which is of the ordinary form, and operates upon the type wheel through the medium of compressed air as in the House machine. The vibrating spring used by Hughes as a governor is superseded in the combination instrument by a most ingenious electro-magnetic governor, the invention of Mr. Phelps. It consists of a hollow iron drum, geared to the transmitting cylinder and type wheel of the instrument and moving with them, but much faster. If the machinery has a tendency to revolve too rapidly, the increased centrifugal force, acting upon a detached section of the drum, actuates a series of levers inside, by which a spring is raised, closing the circuit of a local battery through an electro-magnet. A friction brake, which is applied to the revolving drum by the attraction of this magnet, instantly reduces the speed to the required limits, when the local circuit is again broken. The combination instrument is considered the most perfect printing telegraph for long lines yet produced. The Anders printing telegraph, patented in 1871, and worked by magneto-electricity, is designed for private lines, though capable of operating over distances of 45 m. —Dial Telegraphs. In these instruments the step by step movement is generally employed, but the escape wheel does not carry a type wheel, nor do the printing accessories enter into their construction. A light needle is carried around with the escape wheel and points at the successive letters. They are thus visual and not recording telegraphs. In England, the "Magnetic Telegraph Company" employed
magneto-electricity, thus dispensing with voltaic batteries, the use of which involves much care and expense. The apparatus is remarkably compact, without clockwork or complicated movements such as are common in other telegraphs. Though used double, with two sets of magnets, with a wire from each connecting with two needles upon the dial at the opposite station, the whole apparatus, including the tablet or dial, occupies but a few inches of space, and is always ready for instant use, however long it may have remained inactive.

The magnets, of horse-shoe form, about 13 in number for each set, are 15 in. long and 14 in. broad. They are laid one upon another in two piles near together, and fastened down to the table by screws. Opposite the ends of each pile, placed upon a rotating axis, is the soft iron armature, consisting of two cylinders wound around with long coils of fine copper wire covered with cotton. The wire of the two coils is connected together, and one end of each passes in a spiral through the axle to the platform upon which the apparatus rests. One end is thence carried into the earth, and the other, going to the electromagnet of its own dial, thence to the distant station, and through the instrument there into the earth. The same arrangement is repeated with the other set. The axis of each armature extends toward the operator, and is provided with a crank handle by which each is turned to generate the electric current. The effect is seen in the movement of the two needles placed upon the dial over the magnets. It is asserted that this telegraph is worked with the greatest economy, that it cannot be disturbed by electric storms in the atmosphere, and that its average celerity has been found to be 27½ words a minute, with a maximum of 37½. In the United States the dial telegraph is largely used where operators are supposed to have but moderate skill, as in police and private telegraphy. The instruments are worked with a small battery. Primary signals are given by bells, and the letters are pointed out by the revolving needle. The transmitting part is the usual circuit wheel, which breaks and closes the circuit and produces the rotating movement of the needle of the distant instrument. This circuit wheel is arrested, in the process of telegraphing, by a series of pins, one of which is placed opposite each letter. When the A pin of the transmitter is pressed down, the circuit wheel is arrested just as it has caused the needle of the other instrument to rotate to A.—Con

struction of Telegraph Lines. Telegraph wires are usually carried over the surface of the country upon poles standing from 25 to 30 ft. above the ground, and placed from 80 to 100 yards apart. As poles are objectionable in cities, many plans have been devised for carrying the wires under ground. In London they are covered with gutta percha and tape and put into lead or iron pipes, which are laid under the sidewalk, or into creosoted wooden troughs filled with bitumen, which are buried in trenches beside the roadway. In Paris the wires are carried in lead pipes through the sewers and catacombs. The "American Compound Wire Company" have introduced a wire, consisting of a core of steel and envelope of copper, with a tinned surface, which, with equal conductivity and greater strength, weighs less and requires fewer supports. Another insulated wire, called "kerite wire," the invention of Mr. A. G. Day of New York, has a covering of rubber and hydrous lime which is said to offer great resistance to oxidation, and that it may be exposed in the air or buried in the earth for years without serious injury. As, with batteries of the same intensity, the conductivity increases with the cross section of the wire, large wires are to be preferred to small ones upon long circuits. In working direct, a distance of over 400 or 500 m., the line is usually divided at some intermediate point into two distinct circuits, which are connected by means of a "repeater." If the circuit be broken on either side of the repeater, it will break the circuit on the other side also. The combined circuits can thus be operated from either end as if they were one continuous wire, while the current of each battery has to pass only half the distance between the terminal stations. A line can thus be extended indefinitely. Copper wire is a much better conductor than one of iron of the same size, and will carry the current from five to six times as far; but want of strength, and frequent breakage from its greater expansion and contraction by the changes of temperature, prevent its use except on important submarine lines. The insulation of the wires upon the posts is a matter of much importance, and is not easily effected, for any non-conductor interposed between the wire and the post becomes a conductor when its surface is wet with rain. Glass knobs with grooves around them for securing the wire have been made in a great variety of forms, and secured to the posts, or to the cross bars where there are several wires, by pins of wood or iron. A great improvement upon this is a glass cap exactly fitting over a wooden pin ½ in. in diameter, and having an outer covering of wood, saturated like the pin with coal tar and pitch, to which the wire is fastened, and which, projecting below and entirely covering the pin, keeps it dry and makes the insulation complete. Batchelder's vulcanite insulators have been very extensively applied in the United States. In Europe, insulators of earthenware and porcelain are used. In forests the wires should be allowed to pass loosely through the supports, so that in case of a tree falling upon them they need not be broken; but in an open country they are usually fastened to each post. On some telegraph lines in Europe and in Asia, the wires, instead of being supported upon poles, are buried beneath the ground. Their first cost is always heavy,
and many of them have soon proved failures through imperfection in the insulation. The wires are best insulated by coating them with gutta percha, and they are protected from injury by laying them in pipes of lead or of earthenware, or in wooden boxes preserved by saturating the wood with a solution of sulphate of copper or chlorides of zinc. Some of these lines have worked perfectly for many years, but when they fail it is a matter of great expense and difficulty to discover their defective points.—In the extent of its telegraphic lines the United States has exceeded every other country. In 1860 it was estimated that there were over 50,000 m. in operation, and at present there is not less than 150,000 m. of wire. In the aggregate, 700,000 m. of wire spread their network over the earth for telegraphic purposes, including lines in Australia, India, China, and Siberia. Russia is engaged in extending an important line from Moscow to the Pacific so as to connect eastern Asia with Europe, and possibly hereafter with America by the way of Behring strait. This line was completed to Perm, on the borders of Siberia, and from that place across the Ural mountains to Omsk on the Irtsch, in 1861. Hence it is continued to Tomsk, and S. E. to Irkutsk; next it passes the Altai mountains to Kiakhta on the Chinese frontier, thence to Cheta on the Amoor, and thence to Nertchinsk. From Orum, or some other point on the Amoor, one branch will go down the river and another southward to a Russian port on the Japan sea. The project of extending these lines to Behring's strait, and across to Alaska, Oregon, and California, which had been partially carried into effect on the American side, was abandoned after the Atlantic cables had been brought into working condition.—Submarine Telegraph.—A submarine telegraph appears to have been conceived by several of the earlier electricians. Salva is said to have proposed one as early as 1797 between Barcelona and Palma in the island of Majorca. Experiments were made in India by Dr. O'Shanghemsey in 1839 with this object, and he insulated his wires by covering them with tarred yarn, enclosing them in split rattan, and covering this again with tarred yarn. Wheatstone in 1840 gave it as his opinion before a committee of the house of commons that a submarine communication between England and France was practicable. Morse, on Oct. 18, 1842, laid a copper wire, insulated by means of a hempen strands coated with tar, pitch, and India rubber, from Governor's island to the Battery in New York, and the next morning was beginning to receive communications through it, when the wire was caught in the anchor of a vessel getting under way, and being hauled on board was stolen by the sailors. Samuel Colt laid a submarine cable in 1849 from Coney island and Fire island, at the mouth of New York harbor, up to the city, and operated it successfully. The first submarine rine telegraph wire laid in Europe was across the Rhine from Deutz to Cologne, about half a mile; it was insulated with gutta percha, and laid by Lieut. Siemens of the royal Prussian artillery. This appears to have been the first application of gutta percha to this purpose, the substance about the time first beginning to attract attention. In 1850 a copper wire covered with gutta percha was laid between Dover and Calais by Brett, but its success was short-lived. The next year it was replaced by a cable of four wires, which has given complete satisfaction. In 1858 six cables (the longest of which, between England and Scotland, was about 100 m.) were successfully laid. In 1854 five other cables went into operation, the longest being only about 64 m. In 1856-60 two more were added, that from Paisley to Constantinople being about 160 m. Besides these, two cables had been laid in deeper waters: one from Newfoundland to Cape Breton, and another from Spezia to Corsica. The grand attempts to connect the European and American continents by a cable across the Atlantic, commenced in 1857 and perfected Aug. 5, 1858, have been noticed in the article FIELD, CYRUS WEST. Before these were undertaken great encouragement was given to the enterprise by the successful experiments made on Oct. 2, 1856, in transmitting distinct signals at the rate of 210, 241, and even 270 a minute through a number of connected coils of wires, insulated with gutta percha, and making a total length of about 2,000 m., increased to a virtual circuit of 2,300 m. by the interposition of fine wires at the joinings of the coils. The wires were excited by the magneto-electric coils of Whitehouse, and the signals were received upon the ordinary recording apparatus of Morse. But a great difference was afterward experienced in the working of the wires when submerged. Before the cable was laid it was ascertained that insulated wires acquire a new character when submerged, and that instead of transmitting the current as simple conductors, they are of the nature of the Leyden jar, the gutta percha corresponding to the glass, the inner wire to the interior coating, and the iron covering or the water itself to the exterior coating; and that consequently the cable must be charged throughout the entire length before any current is produced. Among other interesting phenomena, it was observed that the voltaic current is not transmitted so rapidly through such a conductor as the magneto-electric current; and that alternating positive and negative signals are transmitted more rapidly than successive signals of the same character. After being laid, the wires were first worked by the Kulm-korf induction coils and a Smee battery, and afterward by a Daniell battery; but the current was for the most part so weak as scarcely to operate the most delicate relay, though susceptible to a current that can hardly be perceived on the tongue. The effect was indicated
at the Newfoundland station by the deflection of a delicate galvanometer, and at Valentia in Ireland by that of the reflecting galvanometer of which a delicate mirror carries a small mirror from which a beam of light is reflected. This ray being thrown upon a surface at some distance, a movement of the magnet that is not directly perceptible may be even measured upon a graduated scale. The transmitted current was, much of the time that the cable continued in action, so weak that every expedition of this kind was necessary to render the signals perceptible. From the first there was a defect in the part of the cable laid toward the Irish shore, which caused a temporary interruption of communications between the ships. Between Aug. 13 and Sept. 1 there were 129 messages of 1,474 words sent from Valentia to Newfoundland, and 271 of 2,885 words in the other direction. The message from Queen Victoria to the president of the United States, 99 words, occupied in its transmission 67 minutes. The rate of reception was very variable, the signals being often unintelligible and requiring several repetitions. Electricians were sent to Valentia, and the most powerful batteries, as well as the great magneto-electric machine of W. T. Henley, were applied to test the condition of the cable. The power thus employed was more than 1,000 times what would be required in an ordinary well insulated conductor to give perfect signals to the mirror galvanometer. To the end of the cable a volatil battery was connected by one of its poles, a galvanometer was placed in the circuit, the other pole was connected with the earth, and by these means the location of the defect in the cable was ascertained; but all attempts to recover it were unsuccessful. The cost of the cable was as follows: for 2,500 m. at $485 per mile, $1,212,500; for 10 m. at $1,250 per mile, $12,500; and for 25 m. shore ends at the same price, $51,250; making altogether $1,286,250. The expenditures of the company up to Dec. 1, 1858, had amounted to $1,834,500.—After the failure of this great enterprise attention was directed to the practicability of extending a cable across the Atlantic from Labrador to Scotland, by way of Greenland, Iceland, and the Faroe islands. The route is about 1,800 m. long, and presents no continuous length of submarine cable for a greater distance than that between Labrador and Greenland, which is about 600 m. Mr. T. P. Shaffner, of the United States, had obtained in 1854 from the king of Denmark a concession of exclusive rights in Greenland, Iceland, and the Faroes, for the purpose of extending the Atlantic cable. He sailed from Boston, Aug. 29, 1859, and made the preliminary surveys at his own expense, and he induced the British government to send a steam vessel to take the deep-sea soundings; but the project was not consummated. The failure of other deep-sea cables, as that between Sardinia, Malta, and Corfu, and the long cable from the Red Sea to India, increased the distrust occasioned by the failure of the Atlantic cable of 1858. The result was that a committee, consisting of the most eminent electrical engineers, was appointed by the English chamber of commerce and the "Transatlantic Telegraph Company," to whom the duty was assigned of inquiring into the causes of these disastrous failures, and providing instructions for the future in regard to the manufacture, tests, and placing of cables. It appeared that the mechanical department of the subject was in a more advanced state than the electrical. The committee, after 18 months of hard work, published an elaborate report in 1863. Moreover, the theoretical researches of Thomson, Jenkins, and others, had thrown much light on the electrical requirements of submarine lines. Meanwhile, a cable was laid successfully between Malta and Alexandria in 1861, and the Persian gulf cable (about 1,150 m. long) in 1864. When Mr. Field visited England in 1862, to urge on a second attempt to establish telegraphic communications across the Atlantic, he found that the manufacturers, Messrs. Glass, Elliott, and co., were confident of their ability to make and place a good and durable cable between Great Britain and America, and were willing to incur a part of the risk. The second Atlantic cable, made by the "Telegraph Construction and Maintenance Company," was tested with every precaution, and found to be unexceptionable in its electrical conditions, and was shipped on board the Great Eastern in 1865. This cable (2,186 m. long) consists of seven copper wires (No. 18) twisted into a spiral, covered with four coats of gutta percha, between which are thin layers of Chatterton's compound. The external protection is made of ten iron wires, each surrounded by manila yarn. After about half of the cable had been paid out it broke, and the expedition was abandoned for the season. The total expenditure of money had been about $5,000,000. In 1866 a third cable, of similar construction to the second, but stronger in construction and more flexible, was placed on board the Great Eastern and successfully laid. The length between Trinity bay and Valentia is 2,134 m. Its first duty was to transmit a message of peace, viz., that a treaty had been signed by Prussia and Austria. Capt. Anderson returned with the Great Eastern to the place where the cable of 1865 had parted, and succeeded in splicing it and completing the line. In 1869 the French Atlantic line went into operation between Brest and St. Pierre, and between St. Pierre and Duxbury, Mass., the total length being 3,857 m. In 1870 more than 15,000 m. of cable were laid, including the Indian line (from Suez to Aden, from Aden to Bombay, and from Penang to Singapore), the China cable, and the North China from Hong Kong to Shanghai and from Shanghai to Posiet in the Littoral province of Siberia. In 1874 the work was begun by the "Direct Cable Company," of laying the new Atlantic line between Ballinskelligs bay,
in Ireland, and Rye, New Hampshire, by the way of Nova Scotia. In spite of many obstacles and delays, the cable was put in position between Rye Beach and Torbay, N. S., and between Torbay and Newfoundland, also between Cape Breton and a point 200 m. E. of Newfoundland, before rough weather put an end to the work. The final splice of 200 m. was made early in the summer of 1875. In 1873 a cable was laid between Lisbon and Madeira; in 1874 Madeira was connected by cable with St. Vincent, one of the Cape Verde islands (1,200 m.), and St. Vincent with Pernambuco (1,845 m.). In 1876 cables were laid between Jamaica and Porto Rico, Constanti- nople and Odessa, Zante and Otranto, and Barcel- ona and Marseilles. In all, more than 200 cables now exist, with a length of about 50,000 m. The interval of time which must elapse between the sending of successive signals through similar cables increases as the square of their lengths; and in different cables of equal length, this time is the least when the thickness of the insulating coating is one third of the diameter of the compound conductor. With the improved transmitting apparatus of Thomson and Varley, eight words can be sent in the time otherwise required for one. Seventeen words a minute have been sent through the French Atlantic cable. Thomson's syphon recorder quadrupled the speed of cable telegraphy. The current from the cable passes into a coil of wire suspend- ed between the poles of magnets. The coil turns round in a direction depending upon the direction of the current. The motion of the coil is communicated by means of a thread and lever to a glass syphon which feeds itself with ink from a basin. The ink is electro- static and spurs out against a moving strip of paper, and draws an undulating curve which indicates the letters of the message. The speed of working with this recorder is about the same as with the reflecting galvanometer; and in either case it is much greater than could be attained by the moving armature, which requires that the current should rise and fall by large differences; and this would take more time.—Telegraphic Disturbance. The offices and operators of air lines of telegraph are exposed to accidents from lightning, either from the direct stroke or the induced electricity when a discharge occurs between two clouds. A great many lightning guards have been devised. Sabine mentions eleven. In lines which follow the undulations of mountainous regions (as between Vienna and Milan), there is so great disturbance from atmospheric currents, even under a blue sky, that it is impossible to send messages at certain hours. The aurora sometimes acts powerfully upon the wires, interfering with the battery currents. On such occasions, if the battery be taken off, the messages may be sent by means of the current induced by the aurora. The action of cable lines is disturbed by earth currents. Generally, the difference of electric potential between different parts of the earth is small; but it is subject to sudden and capricious changes, and amounts sometimes to that of a battery of 140 of the Daniell elements. The direction of these earth currents is such as to derange particularly the Atlantic lines. The instruments are protected by the use of the condensers of Varley and others. These earth currents must not be confounded with those excited when plates of zinc and copper are buried in the earth, which Kemp, Fox, and Reich made the subject of numerous experiments, and which Balm, Palagi, and others put into the harness to work the telegraph.—Various Uses of the Telegraph. The electric telegraph has been applied to uses never contemplated by its originators. In 1832 Channing and Farmer of Boston devised a system of telegraphic fire alarms, which was largely adopted in the city of Boston. Five so-called signal circuits were extended from the city hall to different parts of the city, and in connection with these were stationed 50 signal boxes attached to buildings at convenient points. The door of a box being opened, a crank is seen with directions for the number of times it is to be turned to convey to the central office the number of the station and district. From the central station five wires called alarm circuits connect with the different fire bells throughout the city, the hammers of which, run by weights, are set in action by the telegraph itself and strike the number of the district and station of the alarm. The electric current is excited by a magneto-electric machine which is set in motion by the pressure of the water with which the city is supplied, and the same power is employed to wind up the weights that move the bell hammers. The bells have been rung, as an experiment, from Portland through the telegraph wires extending to that place. The fire alarm also affords an incident for protection to the city from lightning. Large metallic surfaces being placed near the wires at all the stations and connected with the ground, a stroke of lightning upon the wires will leap across to these conductors, and pass harmlessly to the ground, while the artificial current possesses too little intensity ever to overcome the intervening space, and continues in the circuit. Similar arrangements are provided upon many telegraph lines. The telegraphic fire alarm has now been introduced into all the larger cities. The fire alarm telegraph of Boston is employed to designate the exact noon by a single stroke upon the bell of the Old South church, an ex- act chronometer being placed in the circuit and arranged so as to pass the current at 12 o'clock precisely. By a similar arrangement in London a large ball is made to drop exactly at 12 o'clock from a pole erected in the Strand by the action of a current from the royal ob- servatory. The same thing is also done at Nelson's monument, Edinburgh. In Paris a cannon is fired upon a similar plan. Chro-
nometers in observatories are also made to run synchronously with a standard instrument by means of the electric current. Recently, the Harvard college observatory has established a telegraphic connection with Boston, and thence with the lines which diverge from that city, so that a uniform time can be distributed to all the railroad stations in New England. In a similar way Greenwich time is given to the whole of Great Britain. The application of the telegraph to the determination of longitudes has been described in the article Coasr Sur-
voy, vol. iv., p. 759. Upon some railroads the telegraph is used with great advantage for regulating the running of trains. In numerous places telegraphs have been constructed for private purposes, and in London from the house of commons to the committee rooms. The transactions of the stock exchange in New York are telegraphed to the brokers' offices and the hotels, and are instantly and simultaneous made known in a thousand different places, where they are sometimes recorded by automatic printing instruments. For this purpose a very rapid printer has been devised. The usual type and escape wheels are made very light, and are rotated, not by electricity, but by a spring. The current is reversed at every vibration, and the printing is effected by a magnetic magnet, which is included in the same circuit with those that liberate the escape wheel; but it is made more sluggish in action so that it does not perform its work until the arrest of the circuit wheel at a letter gives time for it to be charged. This instrument, which occupies only one sixth of a cubic foot of space, will print 800 letters a minute.—A system of telegraphs for the use of large cities was devised by Wheatstone, by which a company leases the use of a small wire by the year to individuals. For distances not exceeding 20 m. a copper wire no larger than a cotton thread is sufficient. Now, if each wire be wound with thread, may be brought together into one cord, and suspended from strong iron wires passed in different directions upon the houses. The latter, communicating with the ground at numerous points, will convey away all atmospheric discharges that might otherwise be troublesome. The "Law Telegraph Compa-
y" in the city of New York has established a complete system of communication by means of dial instruments between the leading law firms and the courts. A rapid system of sig-
nalling is used, by which any member of the company can be put, through the agency of a central office, into direct private communica-
tion with any other member, or with the courts of New York or Brooklyn. The Chester dial is employed by this company. In the automatic fire alarm, a circuit is closed by the expansion of metal under a rising temperature. The circuit closer, which is called a thermostat, is attached to the ceilings of stores or dwellings, and is adjusted to work at a fixed tempera-
ture. In the city of New York houses and stores furnished with these instruments are connected telegraphically with the fire patrol, the usual apparatus for indicating the locality of the fire being included in the system. The district telegraph system, which has been in-
troduced in New York, Boston, and elsewhere, by which a messenger, policeman, or fireman can be summoned to any house that adopts it, is a still wider extension of Wheatstone's scheme. On a smaller scale, telegraphic communications may be kept up between the remote quarters of a ship or yacht; the electro-magnetic bell-ringer may be used for domes-
tic purposes, and the burglar alarm for the protection of private dwellings. By means of Batchelder's electro-magnetic tell-tale clock, the times are recorded when a watchman visits the different points of his beat. The most difficult piece of music may be punched out upon a moving strip of paper, and then played automatically by means of electro-magnetism. On the field of battle, telegraphic lines may be quickly extemporized, and an interchange of reports and orders may be maintained between the outposts of an army and headquarters. During the American civil war, telegraphic field trains were in use. A machine has been invented, operated by keys, which enables a reporter to secure a printed copy of the very words which come from the mouth of the ora-
tor. In some countries, as in England, where the lines have been purchased by the govern-
ment, the telegraphs are associated with the postal service. For short distances the pneu-
matic telegraph is used, the written messages being driven through underground pipes by condenséd air. For this purpose three engines of 50 horse power each are in constant service at the central post office in London.—
Multiple Telegraphy. During the last quar-
ter of a century various attempts have been made to contrive ways by which two mess-
engers should be sent at the same time, in the same or in opposite directions, over a single wire. Gintl, Edlunng, Wartmann, Frischen, Sie-
mens, Halske, Dunecker, Starke, Rouvier, Zan-
tedeschi, Farmer, and Stearns have all experi-
mented with this object, and some of them have invented ingenious instruments. In 1849 Sie-
mens and Halske took out a patent in England for a method of transmitting simultaneously a plurality of messages. In 1855 Starke devised a method of sending two messages at the same time upon the same wire. By means of two keys, and two batteries of different intensi-
ties, two independent receiving magnets were worked at the other end of the line, either separately or together. In 1854 Siemens and Halske independently invented the differential method of sending two messages at the same time in opposite directions. About the same time Farmer devised a way of doing the same thing, using two auxiliary batteries in combi-
nation with two principal batteries. The es-
sential conditions for successful duplex tele-
graphy are: 1, that neither key should put in action the receiving magnet at its own end of the line; 2, that in all positions of the key signals should be sent through a line of constant length and capacity. This is done by dividing the current from the battery at each end of the line equally between the line itself and an equivalent resistance coil and condenser, and winding the wire round the receiving magnets in such a way that the two parts of the current produce equal and opposite magnetism in the core of soft iron. The modifications made by Stearns in the arrangement of Siemens and Ginti have obviated all the practical difficulties, and made duplex and even quadruplex telegraphy a success in the United States. By means of Stearns's invention, known as the Franklin, the duplex system has gone into effect, not only between Boston and Washington, but also between Cape Breton and San Francisco, and has been introduced into England. The quadruplex system works well between Boston and New York. The phonetic system of Gray and Bell (which is still in its infancy) aims to increase indefinitely the number of messages which can be sent simultaneously over a single wire, by using tuning forks, moved by electro-magnets, for sending and receiving the signals. Only one fork at the receiving station is in unison with a particular fork at the sending station, and responds to it. Experiments upon a similar system were made by Paul la Cour in Copenhagen on a line of 242 m. in 1874, an account of which was presented to the royal Danish academy of sciences. It was thought that by this arrangement not only many messages could be sent at the same time on a single wire, but also a message could be received only by the station for which it was intended.

TELEY, László, count, a Hungarian statesman, born in Pesth, Feb. 11, 1811, died there, May 8, 1861. He studied at Pesth and Patack, wrote a drama, Kegyence ("Favorite"), and became a leading opposition member of the diets of Transylvania and Hungary. In September, 1848, he went as envoy of the Hungarian government to Paris, where he published Le bon droit de la Hongrie (1849). After the close of the Hungarian war he resided mainly in Paris. During the war of 1859 he was a member of the Hungarian national committee in Italy, and in 1860 went to Dresden, where he was arrested and surrendered to the Austrian government. Francis Joseph restored him to liberty on the promise of severing his connection with the Hungarian refugees and abstaining from political agitation. After a few months, however, Teleky accepted an election by his former constituents to the house of representatives. The diet was opened April 8, 1861. The debate on the address to the monarch, prepared by Francis Deák, was to open on May 8, and Teleky, the leader of the radicals, who opposed any measure looking like a recognition of Francis Joseph as king of Hungary, prepared an elaborate discourse on the situation. This was found on his desk on the morning of the 8th, and near it on the floor the dead body of the writer, whom, as various indications showed, dissatisfaction with his own course had led to end his life by a pistol shot.

TELEMACHUS, a legendary Greek prince, son of Ulysses and Penelope. When Ulysses went to Troy, Telemachus was an infant. About the time for the father's return the son made an unsuccessful endeavor to eject the suitors for his mother's hand, and then set out to seek information of his father. Accompanied by Minerva, in the guise of Mentor, a faithful friend of Ulysses, he visited Fylos and Sparta, and was kindly received by Nestor and Mene- laus. Returning home, he found his father with the swineherd Eumeus, disguised as a beggar, and aided him in slaying the suitors. The TEOLEOSAURUS, a genus of fossil crocodiles of the secondary epoch established by Geoffroy, differing from the living crocodiles in having biconcave vertebrae. The general form of the cranial was that of the gavials; the nostrils opened anteriorly at the end of the muzzle and posteriorly on a level with the jugal arch; the lower jaw was spoon-shaped at the end, with teeth on the sides like canines, the other teeth being small, equal, conical, and adapted for seizing a fish prey; the body was protected by larger and more solid plates, the anterior limbs were smaller, and the posterior more fin-like than in the present crocodilians. The strata which enclose their remains indicate a marine habitat. The genus has been divided by modern palaeontologists into several subgenera, as given by Pictet. In the liras is found mystriosaurus (Kaup), having a very long muzzle, flattened head, and eyes directed upward. The T. (M.) Chapman- ni (König), from the upper liras of Yorkshire, England, is described in the "Philosophical
Transactions" of 1758; the vertebrae were 64, 16 being dorsal, and the teeth about 70 in each jaw; some of the dermal plates were 34 in. in their transverse diameter; it attained a length of about 13 ft. The name has been generally restricted to the species found in the oolite, especially the T. Cadomensis (Et. Geoffr.), or crocodile of Caen, from the limestone of Normandy. This is characterized by large orbits near together, a flattened muzzle five times as long as wide, very long transverse processes of the dorsal vertebrae, and thick rectangular scales forming 10 regular series, each containing 15 or 16; it must have attained a length of 20 ft.

TELEPHONE (Gr. τῆλε, afar, and φωνή, to speak), an apparatus for transmitting sounds to a distance, through the agency of electricity. The principle of the magnetic telephone depends upon two things: 1, that a thin soft-iron plate, placed in a confined position, as in an artificial ear, will be thrown into vibrations by sound waves, just as the tympanum of the natural ear is affected by similar waves; and 2, that if these vibrations are produced near one end of a steel magnet around which an insulated wire is coiled, a magneto-electric current will run through the wire each time that the iron plate approaches and recedes from it. If this wire be carried to a distance and coiled around a second magnet, the electric current thus induced will simultaneously affect the magnetism in it; and if a thin iron plate, similar to the first, be placed near its end, in the same relative position as the one in front of the first magnet, the vibrations of the first plate will be reproduced in the second. To recapitulate: In the human ear sound waves induce vibrations in the tympanum, and these vibrations are conveyed to the auricular nerves through a series of small articulated bones. In the telephone similar waves cause vibrations in a soft-iron disk, called the diaphragm; these vibrations induce electric currents, which, passing through wires, cause tremors in a second magnet, and these reproduce in a second diaphragm the original vibrations, which carry to the tympanum of the listener the exact sounds which produced the vibrations. As the instrument at each end of the wire are precisely alike, the action is reciprocal, and sounds may be conveyed in either direction. The construction of the telephone will be best understood by a reference to the diagram,fig. 1. In this, b b represents the section of a thin tube, made with a flange which bends outward. Next to this flange is a thin iron plate, ce, which constitutes the diaphragm of the instrument, and which is thrown into vibrations by the sound waves. A wooden ring or washer, dd, is placed next to this, and upon it a spiral-shaped tube, ee, just large enough in the barrel to admit the magnetized steel rod g. The parts may be screwed up tightly together, by means of the screws h h. The mouthpiece, aa, is shaped like a funnel, so that the voice may be concentrated on a small part of the diaphragm. Around the spool is wound about 50 yards of fine silk-covered copper wire, the ends of which are joined to the line wires, j j. These connect with another precisely similar instrument at a distance from the first. To operate the telephone, the magnet is pushed in until it nearly touches the diaphragm, ce. Any sound now made in the mouthpiece, aa, causes a vibration in the diaphragm, ce, which is communicated to the magnet, and through it to the wires. The latter convey the thrill to the magnet of the second instrument, which in turn causes vibrations in its diaphragm, and this reproduces the sound waves which caused the vibrations in the first instrument. Thus the sounds made in the mouthpiece of the first instrument are conveyed over miles of wire, and reproduced so accurately by the second instrument that the words of a speaker may be distinctly heard, and even the tones recognized. Conversation has been carried on through the telephone by persons 300 miles apart. Sounds have been conveyed much further; but beyond that distance the articulation is so indistinct that words are unrecognizable. In using the telephone, the instrument is held close to the lips, and the speaker talks loudly and distinctly into the mouthpiece. The words are repeated at the other end of the circuit with the same pitch.

![Fig. 1.](attachment://image.png)
and cadence, even the character of the speaker's tones being so faithfully reproduced that voices are easily distinguished; but the tones are in a measure ventriloquial, and seem to come from a great distance. No previous training is required to enable any one to use the telephone. The instrument has merely to be held to the ear to enable the operator to hear distinctly any message sent from the other end. The same instrument is then placed to the mouth and the answer returned. To facilitate the transmission and reception of messages, two instruments are generally used by each operator, one of which may be held to the ear and the other used for speaking. If several telephones are connected with one wire, the sounds sent over the circuit are reproduced by each, so that any number of persons may listen to the same message; many sounds may also be transmitted at the same time, like the singing of the different parts of a song, in which case each performer sings into a separate instrument. The tones of a musical instrument, or of a collection of instruments, may be conveyed and reproduced in the same manner. A telephonic concert was given in Steinway hall, New York, April 2, 1877, in which all the music, instrumental and vocal, was executed by performers in Philadelphia, and transmitted over the ordinary telegraph wires. The principle of the telephone has long been known; all that is new about it is its adaptation to practical uses. Electric telephones, devised not long after the introduction of the telegraph, were capable of conveying to a distance musical tones; but the other characteristics of sound, intensity and quality or timbre, were entirely wanting. In 1837 Prof. Charles G. Page, of Washington, discovered that the rapid magnetization and demagnetization of iron bars produced a molecular change of sufficient intensity to cause a sensible sound. De la Rive, of Geneva, increased these musical effects in 1843, by operating on long stretched wires. In 1854 Charles Bourseul, under-inspector of the telegraphic lines at Auch, France, suggested the practicability of transmitting speech by electricity in almost precisely the way in which it has been accomplished by the telephone of to-day; but, although his plan was published in the Count du Moncel's Exposé des applications de l'électricité, it does not appear to have been tested practically. The first to utilize Page's discovery was Philip Reis, of Friedrichdorf, Germany, who in 1861 constructed a telephone in which a vibrating diaphragm was caused to make and break a galvanic circuit. Reis's apparatus reproduced the tone or pitch of sounds, so that the successive notes of a melody could be distinctly recognized; but they were all of the same intensity, because the currents which formed them were all of the same strength. It was therefore only a philosophical toy, and of no practical value. In 1873 Elisha Gray, of Chicago, produced what he called his "resonator." By attaching organ pipes to this, the sounds were magnified, and he was able to fill a large hall with music played 100 to 200 miles away. Gray also proved the practicability of transmitting composite sounds, such as chords, to a distance. By his apparatus the intensity as well as the pitch of sounds was reproduced; but it was reserved for Alexander Graham Bell, of Boston, to discover a method by which all the characteristics of sound, pitch, intensity, and quality, could be transmitted. This rendered possible the reproduction at a distance of human speech with all its modulations. The telephone exhibited by him in Philadelphia in 1876 was worked with an electro-magnet, but he subsequently adopted a permanent magnet. An external and a sectional view of the Bell telephone are given in figs. 2 and 3. The instrument is about 6 in. long, 2 1/2 in. in diameter in its widest part, and 1 in. in diameter in the tube. The tube F, fig. 3, which is made of hard rubber, contains the magnet A, whose distance from the diaphragm, E E, is about 3/8 of an inch. The magnet used in the latest form of the instrument is a square compound magnet, 4 1/4 in. long and 1 1/2 in. in diameter, formed of three pieces riveted together. On this end next to the diaphragm is fitted a wooden spoon, about 1 in. long, wound with fine silk-covered copper wire to 60 ohms. A
its rusting from the dampness caused by the breath. Mr. Bell has received two patents in the United States for the telephone, one bearing date March 7, 1876, and the other Jan. 30, 1877; and his instrument is now in practical use in many cities in this country and in Europe. Among others who have made extensive experiments in the transmission of sounds to a distance are Prof. A. E. Dolbear, of Tufts college, Massachusetts; G. M. Phelps, of New York; and Thomas A. Edison, of New Jersey, the inventor of the phonograph (see Phonograph). The Dolbear telephone is essentially the same as the present form of the Bell instrument, and was devised by its inventor in the autumn of 1876 without any knowledge of the mechanism used by Bell. Prof. Dolbear claims that he was the first to utilize magneto-electric currents for the transmission of speech. The Phelps instrument is also the same in principle, but differs in exterior form. In the Edison telephone the diaphragm is made to vibrate against a disk of carbon, which forms a part of an electric circuit, the current of which is generated by a two-cell battery. The resistance of this disk varies in accordance with the pressure on the diaphragm, and occasions a proportionate variation in the strength of the current, which is thus made to reproduce all the characteristics of vocal waves.

TELESCOPE (Gr. τῆλε, far, and ἀστόρθευν, to view), an instrument for aiding the eye in viewing distant objects. The general construction of the telescope is based upon the property possessed by a convex lens or concave mirror of converging to a focus the rays of light falling upon it from any object, and of forming at that focus an image of the object itself. This image may be rendered visible, as in the camera obscura, by interposing at the focus a white screen, a plate of ground glass, or a cloud of light smoke within which the image will appear suspended. But if the rays be allowed to proceed without interruption, and the eye be placed in the axis of the lens or mirror and at the proper distance from the focus, the image will be seen more distinctly than before; and if the focus be nearer to the eye than to the lens, the apparent dimensions of the image will be greater than the apparent dimensions of the object itself. This is the simplest, though not the common form of the telescope. Usually a second lens of shorter focus than the first, is introduced near the image, the effect of which is to increase still further the apparent magnitude of the object; and thus is constituted the ordinary telescope, which in its elementary construction consists of an "object glass" or "object mirror," of as large dimensions as practicable, and an "eye glass," which enables the eye to receive the image under the greatest practicable angle. In fig. 1, M is the object glass and N the eye lens. The inverted image $a$ of a distant object $A$ is formed between the eye lens and its principal focus, and the eye lens then gives a magnified image of it, $b' a'$. The object glass is always necessarily convex, and the mirror concave, but the eye glass may be either; if convex, it is placed at the proper distance beyond the focus, and, the rays having crossed, the image then appears inverted; if concave, as in the common opera glass, it is placed within the focus, and objects appear in their natural position. The magnifying power of the instrument is measured by dividing the focal distance of the object glass by that of the eye piece; the illuminating power depends mainly on the size of the object glass. In the terrestrial telescope, commonly called spy glass, the image is produced in its natural position. To effect this two additional lenses, $O$ and $P$, fig. 2, called condensing glasses, are introduced between the real image and the eye lens. The object $A$ produces an inverted and smaller image at $b$. The lens $O$ being at the distance of its principal focal length from $b$, the rays which fall on $P$ will be parallel, and the image $a' b'$ in the principal focus of $P$ will be erect, as will also be the magnified image $a'' b''$. It is believed by many authorities that the theory of both the telescope and the microscope was known to Roger Bacon, and the telescope is said to have been used by Digges before the 17th century; but the first really definite accounts of the invention date from the latter part of the year 1608. Magnifying lenses had long been known, and even the compound microscope had been invented by the Jansens nearly 20 years before this date; a discovery which has somewhat embarrassed the study of the question before us from confusion of the by no means explicit terms in which both instruments are described. But it is now generally conceded that the honor of making the first telescope belongs to one of two individuals, Hans Lipperheim, a spectacle maker in Mid- delburg, and Jacob Adrianus, called also Metius, a native of Alkmaar. Lipperheim, on Oct. 22, 1608, presented to his government three instruments with which "one could see things at a distance," applying at the same
made drawings of the moon, discovered the satellites of Jupiter, and observed the spots upon the sun. The new "cylinders," as they were called, were soon in general use, and were exposed for sale in Paris in the early part of the same year. These first telescopes are sup-

![Fig. 8—Galileo's Telescope.](image)

posed to have been all made with a concave eye lens. Kepler in 1611 suggested the use of a convex eye lens; but the first actual application of one was made by the capuchin Schyrle de Rheita, who describes it in his work *Oculus Enoch et Elia* (1640). This eye lens gives a much larger field of view, but shows objects inverted. On the other hand, the Galilean telescope had the advantage of greater distinctness and brightness than was found in the "astronomical" form. The true cause of this advantage is now known to lie in the partial compensation by the negative eye piece of the aberrations caused by the object glass, the result being in this case the difference, while in the astronomical telescope it is the sum, of the aberrations of the two lenses. Rheita invented also the binocular or double telescope, a construction which frequently recurs afterward, but always as a thing of curiosity rather than of practical utility until in modern days, as the double opera glass or lorgnette, it has become serviceable in reconnaissances, terrestrial and celestial.—The very first attempts to gain magnifying power and light by enlarging the object glasses of telescopes, revealed a most unexpected and formidable obstacle. It was found that all objects appeared strongly tinged with prismatic colors. This obstacle remained unexplained until the time of Newton, and unconquered more than half a century longer. But if at the time insurmountable, it did not prove unavoidable, for it was ascertained that by making the focal distance of the object glass very great in proportion to the diameter, the colored fringes could be rendered practically imperceptible. Enormously long telescopes were therefore constructed, and it was with them that the brilliant discoveries of that time were made. Huygens used telescopes of his own manufacture, and one of his object glasses, 125 ft. in focal length, is still to be seen in the library of the royal society of London. English makers also produced telescopes of nearly equal dimensions, and Auzout in Paris spoke of surpassing all others, but it does not appear whether he succeeded. The elder Campani, at Rome, made lenses of from 70 to 156 ft. focus, and with these Cassini discovered two of the satellites of Saturn. Cassini also used
other lenses made by Borelli of 40 and 70 ft., and by Hartsoeker of not less than 250 ft. focus. These object glasses were used without any tube, the lens being placed upon a mast, or, as Cassini recommended, at the angle of the table and controlled, not without considerable difficulty, by cords leading to the observer at the eye-lens. The source of the inconveniences attending the use of shorter lenses was generally supposed to lie wholly where it did really lie in part, in the imperfect collection of the rays of light, which were at that time believed to be homogeneous, into a simple focus. It was distinctly understood that the rays which passed through a lens near its centre would not be refracted to precisely the same point with those which pass through it near its circumference; that is, there would be what is technically called spherical aberration. This is a true cause, but by no means the whole cause of the indistinctness of images in the telescope. Accordingly, with that belief, it was thought the evil might be remedied by grinding lenses with other surfaces than spherical, and machines were devised by Descartes, by Hevelius of Dantzic, by Du Son of London (who ground deep parabolical concave lenses, with which he asserted that telescopes might be used "with full aperture," and yet show no colors), by Sir Christopher Wren, and others. But the main reliance of the astronomer until near the close of the century was in the aerial telescope, with which, unwieldy as it was, many brilliant discoveries were made.—An improvement, of more importance than that of the figuring of lenses, consisted in the modification of the eye-piece. By the introduction of more than one convex lens, Rheita had re-invented the image; but this was all the gain that either he or Kepler, who also proposed the same thing, seems to have expected. In fact, there was an increase of aberrations which caused distaste for the plan, and it was not until about 1658, when Huygens invented the combination which still bears his name, that much advantage was gained by multiplying lenses. This eye-piece is composed of two convex lenses whose focal lengths are as 3 to 1, which are separated from each other by an interval equal to half the sum of these focal lengths, the place of the telescopic image being between the lenses. This arrangement was found to have a remarkable advantage in point of distinctness over the single eye glass, by reason of the apportionment of spherical aberrations between the lenses, and the consequent less amount of injurious effect in the result, while no addition whatever was made to the color of the images formed by the object glass. To this day the "Huygensian eye-piece" remains one of the best combinations for ordinary viewing purposes. Another eye piece, less successful, was constructed by Campani with three lenses so arranged as to show objects "without any iris or rainbow colors."—The refracting telescope remained full three quarters of a century without further material improvement. Morin, professor of mathematics in the collège de France, first in 1654 attached a telescope to the microscope; but the index of a graduated are, in order, as he says, "to measure the fixed stars quickly and accurately." He was also the first to gain sight of stars in the daytime. But it was only after the introduction of fixed threads into the field of the telescope that it became a really useful auxiliary to instruments of measurement. At the present day it seems at first strange that astronomers should have preferred the simple "sights" or "pinwheels," with which they had always been accustomed to observe, to the far more accurate perception furnished us by the telescope; and yet they, without any means of designating the centre of the field of view, and with only the feeble optical power at their command, were right in their preference. Even as late as 1673, Hevelius argued earnestly in favor of the pinwheels for observing, from a want of confidence in the new method. As early as 1641 Gascoigne, an accomplished young English astronomer, had applied fixed threads to the telescope, and had also invented the wire or filar micrometer. He perished at the battle of Marston Moor, and his invention, of which no account had been published, remained forgotten until nearly 90 years after, when an opportunity for reclamation occurred upon the reinvention of the micrometer by Auzout. About the same period Roemer gave to the telescope one of its most important applications, by attaching to it an axis at right angles to its length, and placing it so as to revolve in the plane of the meridian; and shortly afterward Picard in Paris and Flamsteed at Greenwich, following up this idea, commenced a new era in observation. (See Transit Circle.)—Mersenne, in his correspondence with Descartes, had before 1639 suggested the practicability of using a concave mirror instead of the principal lens in the telescope. In 1660 James Gregory of Edinburgh published, in his Optica Promota, the plan of a reflecting telescope, consisting of a concave mirror, perforated in the centre, by which the rays were to be converted to a focus before it, and after crossing would be received upon a second small concave mirror, be reflected back by the latter, and, crossing again near the opening in the first reflector, would be there received by a lens and transmitted to the eye. The rays having crossed twice, objects would appear in their natural position. An unsatisfactory attempt was made to construct such a telescope. Newton now took up the study. He soon found the true cause of the prismatic colors, and concluded "that the perfection of telescopes was hitherto limited, not so much for want of glasses truly figured according to the prescriptions of optic authors, . . . as because that light itself is a heterogeneous mixture of differently refrangible rays. So that, were a glass so exactly
figured as to collect any one sort of rays into one point, it could not collect those also into the same point which, having the same incidence upon the same medium, are apt to suffer a different refraction." Thus he was led "to take reflectors into consideration," since here there would be no separation of colors; but inasmuch as any irregularity of figure in a concave mirror would produce greater distortion in the image than would be the case with a lens, "a much greater curiosity [nicety] would be requisite than in figuring glasses for refraction."

The Gregorian construction, mentioned above, appeared to him to have such disadvantages, that he "saw it necessary to alter the design, and place the eye glass at the side of the tube." Having then found an alloy of copper and tin which appeared to possess the requisite qualities for mirrors, and having also devised a "tender way of polishing proper for metal," he attempted the construction of a reflecting telescope upon the plan which has ever since borne the name of Newtonian, and soon produced an instrument with which he could discern the "concomitants" of Jupiter and the phases of Venus. Another one made soon after (1671),

![Newton's Telescope](image)

having a speculum of 1½ in. diameter and 6½ in. focus, was presented by him to the royal society of London, by whom it is still preserved. In these telescopes the mirror M, fig. 4, is at the lower end of the tube, the mouth of which is directed toward the object to be observed. The rays 1 and 2 from one end of the object being reflected toward a, and the rays 3 and 4 from the other end toward b, an inverted image of the object would be formed at b a; but a small plane mirror M', interposed at an angle of 45°, diverts the image to a' b', and the eye lens O magnifies this into A B. In the same year that Newton's new telescopes were made, Cassegrain, a Frenchman, proposed still another construction. The large mirror was perforated, but the rays proceeding from it were, before reaching their focus, received upon a small convex mirror which sent them back with less convergence to form the image near the eye piece. It was asserted that this form, which like Gregory's was not immediately brought into use, would possess several advantages over the Newtonian; but the English philosopher showed that these advantages were rather objections, and that the difficulty of properly working the mirrors would always be a serious obstacle to their general acceptance. In fact, we hear little more of them until 70 or 80 years later, when Short, a celebrated artist of Edinburgh, revived their manufacture, and, by his peculiar skill in figuring and mutually adapting the mirrors ("marrying them," as he termed it), brought them into favor for a time. But practical difficulties, especially in the manipulations of the large speculum, interposed for many years to prevent even the Newtonian construction from coming into general use. It was known indeed that in order to reflect all the rays accurately to the same focus, the figure of the mirror should be not spherical but parabolic; but no method was known whereby this figure could be attained with certainty. At length, in 1718, Huygens made a mirror 6 in. in diameter and with a focal length of 62 in., which bore a magnifying power of 230. This instrument may be considered to have established the reputation of reflectors; for on being compared by Bradley and Pound with the 123-foot aerial telescope of Huygens, it proved fully a match for the refractor, except that the latter showed objects somewhat brighter. After this period reflectors came rapidly into general use, and have ever since been the favorite kind of telescope in England. Their construction was greatly facilitated to practical men by the appearance in 1777 of an elaborate memoir by Mudge, giving a detailed account of his process of making and finishing specula. Another important memoir upon the same subject, by the Rev. John Edwards, was published in the appendix to the "British Nautical Almanac" for 1787. (See Speculum.—About 1766 a small telescope, only 2 ft. long, fell into the hands of a German organist residing in Bath, England. He sent to London for a larger instrument, and, finding its cost too great, undertook to make one for himself. That organist was the elder Herschel. He devoted all the time at his command to the manufacture of reflectors. Improving continually upon his successive results, and with increasing means at his disposal, he made many Newtonian reflectors, some even as large as 20 ft., as well as several of the Gregorian form of 10 ft. focus. His discovery of the planet Uranus, in 1781, brought him to the notice of George III., by whose liberality he was enabled in 1785 to undertake the construction of the celebrated 40-foot reflector, which was pronounced fini-

![Herschel's Telescope](image)
so that the image of the object was formed at \( b \ a \), near the eye lens \( O \), which magnified it into \( b' a' \). It is commonly said that the sixth satellite of Saturn was discovered with it; but this is a mistake, the satellite having been in reality detected with one of Herschel's 18-inch reflectors. After the lapse of 50 years, during the latter portion of which the telescope had lain unused, it was dismounted by Sir John Herschel at the end of 1839, and on New Year's eve his family assembled within the tube and sang its requiem. It now rests horizontally upon three stone pillars, a monument to the memory of its constructor. — Newton evidently conceived that the prismatic rays of light, once separated, could not be recomposed into white light except by the same refraction that had separated them, and that therefore the removal of these colors from a telescopic image was impossible. The weight of Newton's authority was sufficient for a time to repress further investigations in this direction; and it was not till 1729 that an Englishman named Hall, guided, it is said, by a study of the mechanism of the eye, was led to a plan of combining lenses so as to produce an image free from colors. Telescopes were made according to his directions, and were said to perform well; but the secret of their construction died with him, and no public account of the facts was given until called forth by later occurrences. In 1747 Euler, referring to the construction of the human eye, declared that a combination of lenses of different media was possible which should give a colorless image, and investigated analytically the curvatures for a lens compounded of glass and water. His result was questioned by the man from whom opposition might have been least expected, John Dollond, who, relying too implicitly upon Newton's dictum, was contending against his own future fame. But he was soon led to consider more attentively the remark of a Swedish mathematician, that there were certainly some cases to which Newton's rules did not apply. He undertook experiments, at first with prisms of glass and water, and soon found that when the prisms were so combined that the rays passed through without refraction, they were tinged with the colors; next, arranging the prisms so that the rays appeared without colors, he found them displaced by refraction. He arrived at the same results by using prisms of crown and flint glass. From prisms to lenses the transition was easy, and his triumph was finally completed, when, having combined a convex lens of crown glass with a suitable concave of flint, he was able to correct the colors and leave sufficient refraction outstanding to produce a telescopic image. Euler still believed all kinds of glass alike in their optical properties, and that it was only some happy combination of curvatures at which Dollond had arrived; but his doubts soon gave way before experience, and the masterly powers of his analysis were brought to bear successfully upon the problem of the compound object glasses. The subject attracted universal attention, and mathematicians everywhere contributed toward perfecting by theory the requisite conditions of curvature of the lenses. The new telescopes were called achromatic, or free from color, and henceforth the "dispersive power" of any medium, by virtue of which the differently colored rays are differently refracted (that is, are dispersed from each other), was recognized as independent of the "refractive power," by virtue of which the whole pencil is diverted from its original source. Attempting, in 1768, to make double object glasses of short focal distance to be used with a concave eye lens, Dollond found difficulties in the management of the spherical aberration, and thereupon the idea occurred to him of dividing this aberration by having two lenses of crown glass and including the flint lens between them; an arrangement which accomplished the purpose in view, but did not succeed with convex eye pieces also. His son Peter resumed these experiments, and presented to the royal society of London a triple object glass of 35 ft. focal length and 35 in. aperture, with which the telescopic image was pronounced by Short, an excellent judge, to be "distinct, bright, and free from colors." A beautiful suggestion was made by Wollaston of a means of testing and correcting the concentric adjustment of lenses. By removing the eye glass of a telescope and viewing any bright object, as a lighted candle, through the object glass, there may be observed at the same time with the refracted image a series of fainter images formed by the second refractions from the different surfaces. It is evident, then, that if the glasses be truly centred, these images will all be in the same straight line; or if there be any error of position of either lens, it will be decidedly manifested, and by proper adjusting screws may be corrected accordingly. Among the many mathematical solutions of the new problem of the object glasses were the precepts given by Klügel, in his "Dioptrics," viz.: 1, that the radii of curvature of the first, or crown lens, should be such that the angles of the incident ray with the normal would be equal at both surfaces, which would give for crown glass a ratio of nearly 1 to 8; 2, the radius of the third surface, the first of the flint lens, should be such that the rays of mean refrangibility passing through both the centre and edge of the lens would unite as nearly as possible in the same part of the axis, so that the spherical aberration would be sensibly destroyed; and 3, having determined the outstanding dispersion for the red and violet rays, the fourth surface should be made such as to unite these rays as nearly as possible in the same point with the rest. Early in 1816 Bohnenberger, commenting upon these precepts, showed that, by changing the ratio of the first two surfaces from \( \frac{1}{2} \) to \( \frac{3}{2} \), the proportion of aperture to focal length could be materially increased without prejudice to
the performance of the instrument. Not long afterward Gauss remarked that it was possible, theoretically, to construct an object glass which would unite all the rays of any two colors as well as the mean rays at the centre and at a given distance therefrom into one and the same point. Both lenses should be concavo-convex. With a proportion of aperture to focal length of $1/4$ he obtained an almost perfect union of rays. The unusually deep curvatures of the lenses seem to have occasioned some scruples on the part of opticians, and this construction remained almost forgotten for 40 years, until Steinheil found and conquered the practical difficulty, and in 1890 arrived at complete success in the manufacture of the Gaussian object glasses.—The proper construction of eye pieces was also a matter of some consideration. Besides the Huygensian form, which is only applicable for viewing objects, Ramsden in 1783 introduced another, which is still used in micrometer observations. It consists of two plano-convex lenses, of equal focus, with their convex surfaces toward each other, and separated by a distance of two thirds of the common focal length. By this arrangement, to which he was guided by a remark of Newton, the essential condition of a "flat field" is gained, and the aberrations, chromatic and spherical, are so much reduced as to be practically insensible. For terrestrial observations, the elder Dollond sought to reduce aberrations and enlarge the field of view by increasing the number of lenses, and, after improving the four-glass eye pieces already in use, obtained by adding a fifth lens a combination which very satisfactorily effected both the desired objects.—Joseph Fraunhofer studied the theory of light and the laws to which it is subject, and was able, through various media, and solved the difficulty of procuring disks of homogeneous flint glass. The process by which his glass was manufactured is kept a secret, but it is generally understood that the disks themselves are obtained by selecting and melting together the most faultless specimens from larger masses of the best glass, whose constituent parts however are not known. Having now the glass, he well knew how to combine curvatures to suit its peculiar properties, and the results are to be found all over Europe. He completed in 1824 the splendid telescope for the observatory at Dorpat. The object glass of this instrument, double and not triple as sometimes stated, has a clear aperture of 9½ in., and a focal length of 170½ in. Its optical performance is of the highest character. It gave to the stellar images a perfect sharpness of definition, which enabled it not only to resolve the closest known double stars, but also to discover as double or multiple others that had passed unchallenged before the exquisite 50-foot reflectors and the practised eye of the younger Herschel. Fraunhofer's style of "mounting," the telescope remains to this day essentially unimproved.—

The manufacture of optical glass has received much attention in England. In 1824 a committee was appointed by the royal society to take into consideration the theory and to experiment upon the manufacture of such glass. The chief labor devolved upon three members, G. Dollond, Faraday, and Herschel. The first results were reported to the society in 1829. The efforts of this committee were directed to the manufacture of very heavy glass, and they obtained disks of 7 in., which seemed, so far as tried, to answer all the requirements of the telescope. Dr. Ritchie also devoted much attention for several years to the same subject, and with considerable success, but was prevented by premature death from publication of any of his processes. Judging by the appearance of Ritchie's glass, Mr. Simms inferred that it had been fused in moulds and there subjected to pressure. The largest disk had 7½ in. diameter, and was ground for use by Simms himself. It was found to be "an excellent glass, but not altogether faultless." The idea occurred to some that the desired achromatricity might be obtained by separating the lenses and placing the flint at some distance down the tube in the narrowing cone of rays. In 1828 Alexander Rogers proposed to introduce in combination with the crown lens a smaller compound lens of plate and flint glass, in which the refraction is entirely destroyed, and the outstanding dispersion left available for the desired correction of that of the outer lens. The investigation of the requisite curvatures of this compound lens was found to present no peculiar difficulty; and moreover the final perfection of the compensating action could be accomplished by proper adjustment of the relative positions of the lenses, so that less rigorous accuracy is requisite in their mechanical formation. Rogers found it probable that a telescope of 18 ft. focal length, with a crown lens of 12 in. aperture, could be made achromatric with a flint lens only 4 in. in diameter; and four years later this construction was introduced into use by Plossl at Vienna with much success. It received the name of "dialytic" or separated telescope. One of these telescopes, in the possession of Schumacher, having an aperture of 2¼ in. and focal length of 2 ft., was described by him as of extraordinary excellence in defining power. Struve compared a dialytic telescope of 3½ in. aperture, bearing a magnifying power of 135, with a Fraunhofer telescope of half an inch greater aperture and a power of 210, and was scarcely able to perceive any superiority in the latter. Telescopes with lenses of rock crystal and glass were advertised to be made in Paris by Cauchoir in 1881, and some few came into favorable notice; but the difficulty of obtaining the materials in suitable shape and size will be a permanent obstacle to their general manufacture. It had long been observed that, even in the best telescopes, there were residual colors hav-
ing their origin in the want of a perfect cor-
relation of the colored spaces in the spectra
formed by the crown and flint lens; so that
if any two colors be made to unite at the same
focus, as in ordinary object glasses, there would
not be at the same time a complete union of
the rest. This want of correlation is called the "irrationality" of the colored spaces, and
its effect is called the "secondary spectrum."
Dr. Blair, to overcome this effect, first made
each of the lenses of his object glass indepen-
dently achromatic, and in such a way that their
secondary spectra corrected each other. This
he accomplished by using fluid media, two
lenses of which were enclosed in combination
with three of glass. Moreover, in the course
of his experiments, he discovered that muri-
atic acid combined in proper proportions with
metallic antimony gave a spectrum in which
the colors had exactly the same proportions as
in crown glass; and therefore by enclosing this
fluid between two crown lenses, one a
plano-convex and the other a meniscus, he ob-
tained a telescope absolutely free from colors.
The name "aplanatic," or without error, was
given to this combination. Another fluid-lens
telescope, of the dialytic form, was constructed
by Barlow, who made use of the high disper-
sive power of sulphuret of carbon, a beauti-
fully transparent and colorless fluid. He was
able to render achromatic a combination of a
crown lens 8 in. in diameter with a fluid lens
of half the size. There is however a practi-
cal objection to the use of sulphuret of carbon
arising from the variability of its density by
variations of temperature.—Reverting to what
may be called the regular construction of acha-
romatics, we find that the successors of Fraun-
hofer at Munich, and Guinand and Cameschoix
at Paris, have produced object glasses of di-
mensions far superior to those of the Dorp-
lens. Disks of 10, 12, and even more inches
in diameter have become familiar to these master opticians, whose skill in working them
keeps even pace with their manufacture; and
in three Munich telescopes, two with more
than 15 in. of clear aperture, one at Pulkova,
another at the observatory of Harvard col-
lege, and the third at Greenwich (aperture 13
in.), have been in use for years. The two for-
mer have been the means of adding largely to
the stores of astronomical knowledge; the
Greenwich telescope has not been much used.
—The few attempts made in the United States
to manufacture optical flint glass have hither-
to been but partially successful, and that with
only small disks; but the American-wrought
object glasses have earned for themselves a
high place. Many have been made in New
York by Henry Fitz, whose largest glass, 13
in. in diameter, was made for the Dudley ob-
servatory at Albany. Spencer, famous for
the excellence of his microscopic objectives, made
for Hamilton college a 134-inch telescope,
which is highly commended. But in exqui-
siteness of workmanship and performance, the
object glasses made by Alvan Clark of Cam-
bridge, Mass., have fairly distanced all competi-
tors, native or foreign. Whoever will glance
over the list of close double stars discovered
with his 7- and 8-inch lenses (see "American
Journal of Science," vols. xxv. and xxix.) will
remark several that must have passed
unnoticed under the review of Struve with his
superior optical power. (See Clark, Alvan.)
Mr. Dawes, one of the most skilful astronomi-
cal observers of his day, took in succession
five or six large refractors from Clark (dispensing
of each in favor of a successor including some
improvement of construction which had sug-
gested itself), and these, scattered throughout
England, attested the skill of the American
optician in the special work of figuring object
glasses, in which at present he and his sons
are unrivalled. In 1859 Clark began the con-
struction of a magnificent object glass of 18
in. clear aperture and with a focal distance of
23 ft., at that time the largest in the world.
It was made from disks of Birmingham glass,
which have a uniform density and freedom
from veins, and, though only rudely mounted
at first, quickly revealed the duplicity of the
minute companion of α Capricorni. In Janu-
ary, 1869, it detected a companion to Sirius,
perhaps the hitherto invisible one whose work-
ings have been indirectly manifested in the
variable movement of the larger star. This
masterpiece, prevented from reaching its or-
iginal destination, was secured for the Chieago
observatory. In 1870 Clark was authorized
by congress to begin the construction of a
telescope 24 in. in aperture for the Washington
observatory; but before the work was entered
upon, the proposed aperture was changed to 26
in., Mr. Newall of Gateshead, England, having
had a glass constructed for him by Cooke and
son s, York, of the hitherto unequalled aperture
of 25 in. The disks of glass, obtained by
Clark from Chance and co. of Birmingham,
reached Cambridge, Mass., in December, 1871,
and the grinding was begun in January, 1872.
"Owing to the great size of the glasses," says
Prof. Newcomb, "the first rough grinding was
done by machinery, the 'grindstone' being a
rapidly revolving iron wheel, over which a
stream of water and sand was kept running.
The glasses were thus roughly brought to the
desired shape in a few days. The forms chosen
were much more simple than those usually
employed in large glasses, the crown glass be-
ing double convex, with an equal curvature
on each face; the flint nearly plane on one
side, while the other was concave, with the
same curvature as the crown glass. . . . In
the month of June, 1873, the glass was in
such good shape that only an expert could see
any defect whatever. Looking through it we
could read, at the distance of some 400 ft., a
microscopic photograph illegible to the naked
eye. . . . Artificial double stars, one third of
a second apart, were clearly separated. In
hands less severely critical than those of the
TELESCOPE

629

makers it would have passed as optically perfect. Nevertheless four months more were spent on it, and it was not till October that it was reported finished. . . . The influence of temperature on its figure was now quite perceptible. In the evening, while temperature was falling, the defect of the spherical aberration was one way, but after it became stationary, it was quite imperceptible. The telescope was mounted at Washington in 1874, and though as yet it has achieved no noteworthy discovery, the ease with which it has gone through the work which had been usually regarded as closely testing the powers of the largest telescopes shows what it is capable of.—In England, the attention of the mechanical astronomers, if we may so call them, has been of late years more especially occupied with the construction of large reflecting telescopes, and preeminently in this department was Lord Rosse, who about 1844 completed a telescope which has a clear aperture of 6 ft. and a focal length of 53 ft. This enormous instrument has two specula, one about 83 and the other about 4 tons in weight. At first each rested upon a system of 27 platforms most ingenuously arranged to distribute their support of this enormous weight in such a manner as to produce equal pressure in every position of the instrument. A strong pressure of the hand at the back of a speculum 4 tons in weight and nearly 6 in. thick produces flexure sufficient to distort the image of a star. At a later period 27 triangles, each with a ball at each angle, were substituted for the platforms, so that now the speculum rolls freely on 81 balls. The tube of the telescope is supported upon a massive universal joint of cast iron resting upon a pier of stonework, and it is so counterpoised by a chain suspension applied at the centre of gravity that it can be moved with great facility, a quick motion being given by a windlass below, and a controlling slow motion in either direction by the hand of the observer above. Various micrometers have been tried with this instrument, but the common filar micrometer with coarse threads answers best; and such is the quantity of light collected by the immense reflecting surface below, that the threads in the micrometer are always distinctly visible without artificial illumination even in the darkest night. The general processes of casting, grinding, and figuring these large specula are described in the article SPECULUM. Several other large reflectors have been constructed by Lassell, De la Rue, and Nasmyth; and the first of these transported to Malta a Newtonian telescope 4 ft. in diameter. De la Rue successfully applied his large telescopes to celestial photography, in which he has made many important improvements.—The manufacture of reflecting telescopes with glass specula received a new impulse from the discovery by Liebig of a process of coating glass with an infinitesimal film of pure metallic silver. From the first days of reflectors, as early as Newton, we find a proposition to substitute a silvered lens for the metallic mirror of his telescope, on account of the greater perfection with which glass could be wrought, and the greater durability of the polished surface. In 1740 Caleb Smith showed how, with glass mirrors silvered upon the posterior surface, the rays of different refrangibility, after twice passing through the glass, and thus becoming separated, might be united again by the action of a small concave lens placed not far from the focus of the mirror. The elder Herschel sometimes used glass reflectors for his smaller telescopes. In 1822 Airy proposed a combination of two silvered lenses in the Gregorian or Cassegrainian form, and showed how, by proper mutual adjustment of the two, a perfect achromatism might be obtained. In 1858, and again in 1841, Barfuss of Weimar found that, of the various forms of reflectors, the Cassegrainian was best adapted for glass mirrors. He demonstrated that in this form both chromatic and spherical aberration may be sensibly corrected in a telescope of 20 in. focus with full 5 in. aperture, and that such a telescope would bear even a power of 600. But by Liebig's discovery a still better field has been opened. His process consists in precipitating the silver upon the glass surface from an alkaline solution prepared by addition of caustic soda to the ammonio-nitrate. After immersing the glass for about three quarters of an hour, an extremely thin and regular film is obtained, which has a slight bronze hue by reflected light, and will transmit a deep blue light when interposed between the sun and the eye. This film is said to be harder than ordinary silver, and, by friction with soft leather and perhaps a little dry rouge, is susceptible of receiving the most brilliant polish externally, while it answers perfectly in figure to that of the glass beneath. Foucault has also made use of a similar process (see Speculum), and succeeded in constructing telescopes of considerable dimensions. One was made by him of 13 in. aperture and only 88 in. focus, with which, under a magnifying power of 600, he could separate the components of the small companion of y Andromedae. Steinhil, investigating the relative reflecting power of a speculum coated by this new process, as compared with others and with the transmitting power of some object glasses, found that, under an angle of reflection of 45°, the amount of brightness obtained was as follows:

We are now able to substitute for the heavy and intractable speculum metal a disk of glass which is far easier to cast and anneal, and being much firmer can be made of less than half the weight of the metallic mirrors.—The heliostat, in reflecting the sun back to the telescope with the aperture diminished as much as possible, and usually provided with shades of stained glass to protect the eye. Still, great inconvenience is felt from the intense heating power of the concentrated solar rays. Sir John Herschel proposed to use only the very small portion of light reflected from the first surface of glass, by constructing the large mirror of a Newtonian telescope of a double-concave, well polished lens, whose first surface only is truly figured to serve as reflector for the 2-0 per cent. of rays untransmitted and unabsorbed. The lower end of the telescope tube being left open, all the remainder of the light passes out and is dispersed. But even the small amount of reflected rays is still further reduced by the second reflection, which is made to take place at the first surface of a prism whose refracting angle should not be less than 30° or 40°, so that now the portion of light finally reaching the observer is but \(\frac{1}{1000}\) of the direct illumination, in consequence of which immense reduction a very light shade only is needed. Porro of Paris, in constructing a telescope upon this principle, improved it by placing the prism for the second reflection at the polarizing angle for glass, whereby, upon introducing a Nicol's prism, the light may be enchained as much as desired without using any shade at all.—The great requisites of a telescope stand are firmness and stability, combined with a facility of motion which will allow the instrument to be pointed with ease and certainty to any part of the heavens. Fraunhofer, whose plan is now generally followed, adopted the equatorial form, as it is called, which consists essentially of a polar axis upon which the whole instrument is moved parallel with the celestial equator, and which carries in a socket another axis at right angles to itself, upon which latter the telescope moves from or toward the pole. By the combined motions command of the whole visible hemisphere is given, and with the advantage that, the instrument being once directed to a star, the observer can follow it in its diurnal path by motion upon the polar axis alone; moreover, by application of a simple train of wheelwork this motion can be effected by machinery, and the observer is thus enabled at his leisure to contemplate or to measure the objects which appear fixed as though in an immovable sky. In the immense English reflectors, the lower end of the tube rests upon the ground or some solid support, and even then for the needful motions of the instrument powerful appliances of machinery have been required; but in latter days mechanical engineers have been able so to combine and counterpoise great masses of cast-iron machinery as to effect with wonderful ease every delicate movement desired by the astronomer, and now the idea of mounting even these large telescopes equatorially is growing familiar. The application of clockwork movement to such large reflectors renders it practicable to use the telescope for celestial photography, as well as for some extremely delicate astronomical measurements.—The application of the telescope to meridian instruments will be exemplified in the article TRANSIT CIRCLE; but the telescope is also universally used for differential measurements. For such observations various modifications or appliances have been from time to time suggested or practised. The filar micrometer is the most common auxiliary of the telescope, and in skilful hands is capable of astonishing accuracy. (See Micrometer.) Great use has also been made of the power of producing and comparing together double images of the objects to be measured. These double images are produced in various ways. Savery in England in 1743, and Bouguer in France four years later, proposed, independently of each other, to measure the diameter of the sun by using two object glasses in the same telescope and with the same eye piece. In Savery's plan the glasses were all fixed so as to give two images of the sun whose outer edges were nearly in contact; and by measuring the variable distance of these edges, he obtained the corresponding variations of the semi-diameter from perigee to apogee. Bouguer made one of his object glasses movable, and thus could measure any angle from zero to his maximum limit, which was probably somewhat greater than the sun's diameter. In 1758 John Dollond invented the divided-object-glass micrometer, which has in later years, under the technical name of heliometer, achieved such wonders in the hands of Bessel and his followers. In this instrument the object glass itself when finished is divided into two equal segments, each of which forms its image independently of the other. When the semi-lenses are brought to their normal position of coincidence, the two images coincide also; but when separated, the images diverge, and the angle of divergence is measured by the amount of separation of the lenses. Thus the apparent diameter of a planet, for instance, is obtained by separating the images until their outer edges are in exact contact, and this may be more accurately perceived than the coincidence of the edge with a fine thread placed tangent to it as in the filar micrometer. Dollond proposed moreover to gain both accuracy and convenience of use by placing a divided object glass of very long focus before the speculum of a reflecting telescope, which would give a larger scale for the measurement of the instrument angle than would belong to a simple telescope of the same length. Fraunhofer was at the time of his death engaged in devising a heliometer which, when afterward completed, was placed at Königsberg. Bessel, whose "Theory of the Helion-
TELESCOPE

eter” is one of the most elaborate and beautiful monographs of astronomy, was able with this instrument to grapple successfully with that even now most difficult practical problem, the measurement of the parallax of a fixed star. Several attempts have also been made, as by Roehren, Maskelyne, and Bosovich, to produce the double images by refraction through prisms or pairs of prisms, either beyond the object glass or sliding within the tube, as well as by dividing the small mirror of reflecting telescopes, as Ramsden suggested for the Cassegrainian form, and Brewster for the Newtonian. Divided-eye-lens micrometers have also been made, the best form of which is that given by Airy, who found the four-glass eye piece best adapted for this purpose, and divided the second lens, counting from the object glass. But in all the arrangements of divided lenses an essential imperfection arises from the exhibition of color and of some distortion in the direction at right angles to that of the line of separation, and this practical inconvenience may be seriously felt in some classes of observations. On this account, it will probably yet be found most advantageous to make use of the double-refracting property of certain crystals for the separation of images.—This account would be imperfect without a sketch of the particular form of telescope employed by the American observing parties in photographing the recent transit of Venus. What was required was a large image of the sun at the focus of the object glass, or the principal focus as it is called. The size of this image is directly proportional to the focal length, and a focal length of about 40 ft. was required to give the image the desired dimensions. It would clearly have been impossible to provide telescopes of this length for distant stations, even if at Washington, Greenwich, or Paris instruments of such dimensions could be so driven by clockwork that the tube should remain constantly directed toward the sun. It became necessary, therefore, to make use of a heliostat, or plain mirror, so worked by a driving apparatus as to deflect the sun’s rays constantly in the same horizontal direction. The construction of a plane mirror sufficiently true for this purpose was a task which fully taxed the skill even of Alvan Clark and his sons. “The slightest deviation from exactness,” as Newcomb points out, “would be fatal; for instance, if a straight-edge laid upon the glass should touch at the edges, but be the 100,000th of an inch above it at the centre, the reflector would be useless.” The mirrors were tested by observing objects through a telescope, first directly and then by reflection from the mirror. If they were seen with equally good definition in the two cases, it would show that there were no irregularities in the surface of the mirror; while if it were concave or convex, the focus of the telescope would seem shortened or lengthened. The first test was sustained perfectly, while the circles of convexity or concavity indicated by the changes of focus of the photographic telescope were many miles in diameter. During the total eclipse of April, 1876, the heliostat again came into play for photographic purposes, but unsuccessfully because of unwise arrangements.

TELFAIR, a S. county of Georgia, bounded E. and W. by the Ocmulgee and N. E. by the Little Ocmulgee river; area, 925 sq. m.; pop. in 1870, 3,245, of whom 1,146 were colored. The surface is level and the soil sandy, with extensive pine forests. The Macon and Brunswick railroad intersects the N. part. The chief productions in 1870 were 62,429 bushels of Indian corn, 15,623 of oats, 20,569 of sweet potatoes, 19,829 lbs. of wool, and 704 bales of cotton. There were 497 horses, 2,663 milch cows, 6,946 other cattle, 8,475 sheep, and 7,477 swine. Capital: Jacksonville.

TELFORD, Thomas, a British engineer, born at Wester Kirk, Eckdale, Dumfriesshire, Aug. 9, 1757, died in Westminster, Sept. 2, 1834. While working in Edinburgh as a stone mason he studied architecture and drawing. In 1788 he removed to London, was employed on the quadrangle of Somerset house, afterward for three years as architect in the Portsmouth dockyard, then upon the alterations of Shrewsbury castle, and in the construction of numerous bridges, one of which over the Severn had a flat arch of 190 ft. span. He superintended the construction of the Ellesmere canal, 108 m. in length, and requiring extensive aqueducts, which he built of iron; the Caledonian ship canal, whose locks surpassed any previously built in size; and six other canals in England and Scotland, the Götha canal in Sweden, an immense tunnel at Harcastle on the Grand Trunk canal, besides 1,000 miles of new road and 1,200 bridges. The St. Katharine docks of London, the improvement of the Aberdeen and Dundee harbors, the construction of iron bridges with flat arches of 170 ft. span, and above all the Menai suspension bridge, were his work.—See “Life of Thomas Telford, Civil Engineer, written by Himself” (4to, with a folio volume of plates, 1888).

TELIOSTS, a name given by J. Müller to the common bony fishes from their well ossified skeleton; the term has been taken by Huxley for one of his orders. They comprise the stenoids and cycloid of Agassiz.

TELL, William, a legendary hero of Switzerland. According to tradition, he was a hunter, living at Bürglen in the canton of Uri. His wife was a daughter of Walter Fürst, who with Stauffacher of Schwytz and Melchthal of Unterwalden organized the conspiracy of the Grüti in 1307, and founded Swiss independence. Tell’s part in the revolt against Austria is related as follows: Gessler, Austrian bailiff in Käsnacht, placed his cap upon a pole in the market place of Altorf, and gave orders that passers by should do it reverence. Tell neglected or refused to do this, and was arrested
and sentenced to death. But Gessler, hearing that he was a skilful marksman, told him his life would be spared on condition of his shooting an apple from his child's head. Tell ventured the shot, and succeeded without injuring the apple. Confident that he had preserved a second arrow in his quiver just before shooting, and asked the object. Tell replied: "To kill you if I had harmed my son." For this he was again put in chains. Gessler then embarked for Küsnacht, taking Tell with him. On the way the boat was overtaken by a storm. The crew, fearing for their lives, begged Gessler to release Tell, that he might steer the boat. He complied, and as they neared the point now known as "Tell's Rock" or "Leasp," Tell sprang ashore; but the most dangerous part of the coast had been passed, and the crew brought the boat safely to Brunnen. Meanwhile Tell went around by land, and, lying in ambush between Brunnen and Küsnacht, wounded Gessler mortally with an arrow. Gessler's death was the signal for a general uprising; the Austrian bailiffs were driven from the several cantons, and their castles destroyed. In 1315 Tell took part in the battle of Morgarten, and in 1354 was drowned in the Schéchen while trying to save a boy's life.—Such is the story in its main features, as Schiller has embodied it in his drama. But recent historical investigations put it in a very different light. Schwytz, Uri, and Unterwalden struggled for autonomy against the Hapsburgs from 1290 to 1315, and later. The conflict seldom took the shape of armed hostilities; it was rather the gradual growth of local independence. We do not know the names of the leaders of the Swiss movement, but we do know that there was no conspiracy of the Grütli, that no such bailiffs as Gessler, Wolfenschliessen, and Landberg existed by those names, and no such men as Tell, Stadtacker, or Melchthal. A league was formed by Schwytz, Uri, and Unterwalden, but it was not a secret conspiracy, and it was formed in 1291 and not in 1307; and there was no uprising in 1308. Kopp (Urkunden der Geschichte der eidgenössischen Bünde, 1855), Huber (Die Waldstätte bis zur Begründung ihrer Eidgenossenschaft, 1861), W. Vischer (Die Sage von der Befreiung der Waldstätte, 1867), Rüillet (Les origines de la confédération suisse, 1869), and others, have shown how patriotic imagination in Switzerland, having lost the remembrance of the precise steps by which independence was obtained, has actually created the tradition in its present shape. The beginning was made by Das weisse Buch, a chronicle composed about 1470, in which first occur most of the names with which we are familiar. Then comes the Tellenlied, composed about the same time; then, in 1540, the Hochacht Spyl of Uri. But these and similar productions were all outdone by Aegidius Tschudi (1505—72), in his Chronicon Helveticum. Tschudi seems to have gathered scraps of tradition wherever he could find them, to have expanded them and put them into the most plausible shape, and to have invented names, surnames, and even dates. Johannes von Müller and Schiller followed Tschudi. The popular version of the Swiss uprising, then, is to be regarded as a distortion of the facts, and its prominent persons and striking incidents are imaginative decorations added by generation after generation from the 15th to the 17th century. But Tell is the embodiment of a wide-spread Aryan myth. The Persian poet Fedir ed-Din Attar (about 1175) sings of a king who shoots an apple from the head of his favorite. Saxo Grammaticus, in his "Danish Chronicle" (about 1170), tells how Toko shoots an apple from the head of his son, by order of King Harold Bluetooth; here the incident with the second arrow is mentioned. In the Edda, Eigil the marksman is made by King Nidung to shot an apple from the head of his son, and the incident with the second arrow again occurs. The name "Tell" has been variously explained. Grimm connects it with the Latin telum, an arrow; others with the German word tell, meaning half-witted. In Das weisse Buch Tell seeks to excuse his disrespect to the hat on the ground that he is dull of wit, saying, "Otherwise I should not be called the tall." According to Carrière, the Tell saga is neither history nor pure invention, but the reminiscence of ancient mythological poetry, recast and coupled with historical events. For a brief account of the Tell saga, see Carrière's edition of Schiller's Tell (Leipsic, 1871), and Buchheim's edition (London, 1871).

TELL-TALE, a bird. See TATTERS.

TELLURIUM (Lat. tellus, the earth), an elementary substance, discovered by Müller von Reichenstein in 1782, but first investigated and named by Klaproth in 1798; symbol, Te; chemical equivalent, 129; specific gravity, 6.65; hardness, 2 to 2.5. Though commonly classed among the metals, it has much analogy in its properties to sulphur and selenium. It fuses between 800° and 900° F., and can be distilled in a current of hydrogen. It is a bad conductor of heat and electricity. It occurs in a native state associated with iron pyrites and various metals, as gold, silver, bismuth, copper, or lead. The native metal is of a brilliant metallic lustre, of a tin-gray or lead-gray color, passing to steel-gray. It is very fusible before the blowpipe, and burns with a bluish flame, green on the edges; it volatilizes in white fumes, leaving no residue; and it is wholly soluble in nitric acid. The substance occurs in small masses, irregularly lamellar, and crystallized in six-sided prisms, at the mine of Maria Loretto near Zalatna in Transylvania. Its most common ore is the black, foliated mineral of Nagyag, which contains about 18 per cent. of tellurium in the form of tellurides of gold, lead, and silver, mixed with sulphides of antimony and lead. Tellurium is almost always combined with small portions of iron or gold.
in a metallic state, silver, or lead, so that some have supposed that the substance ought to be considered as telluride of iron or of gold. Many natural alloys have been met with at the mines of Hungary and Transylvania, and from the collection of those presented by the emperor of Austria to the museum of natural history at Paris, Dufrenoy has arranged the varieties among the following five species: native tellurium, auro-argentiferous tellurium (graphic gold), auro-plumbiferous tellurium (millerite), plumbum-auroferous tellurium (nagagite), and telluric bismuth (tetradymite). Auro-argentiferous tellurium was recognized at the Gold Hill mines, North Carolina, and native tellurium at Red Cloud mine, Gold Hill, Boulder co., Colorado, by Dr. Genth; and telluric bismuth is found in many of the gold mines of Virginia and North Carolina, in fossilized scales and lamellar masses. Gold and silver tellurides occur in masses on the Calaveras range in California. Tellurium forms two oxides, TeO$_2$, TeO$_3$, which correspond in composition to sulphurous and sulphuric anhydrides. Telluric acid, H$_2$TeO$_4$, and telluric acid, H$_4$TeO$_6$, are analogous to sulphurous and sulphuric acids. With hydrogen it forms the gaseous compound H$_4$Te, analogous to sulphuric hydrogen.

**TELLUS.** See Terra.

**TEMES.** A S. E. county of Hungary, in the Trans-Tiszaean circle, watered by the Temes and Béga; area, 2,289 sq. m.; pop. in 1870, 365,174, mostly Roumans and Serbs, and about two thirds belonging to the orthodox Greek church. The soil is very fertile, but the climate is unhealthy. The chief products are wheat, maize, hemp, flax, fruit, wine, and cotton. Cattle, sheep, pigs, and bees are raised.

**TEMESVÁR.** A city of Hungary, capital of the county of Temes, on the Béga canal, connecting it with the Danube at Belgrade, 75 m. S. S. W., and 153 m. S. E. of Pesth; pop. in 1870, 734,748, mostly Germans. It consists of the town proper, which is strongly fortified, and four suburbs, including the village of Mehala. It has been much improved by the draining of marshes. It has fine Catholic and Greek cathedrals, a magnificent synagogue, an arsenal, a theological seminary, a Catholic gymnasium, and a normal school. Leather, cloth, and other articles are manufactured.—The origin of the city is traced to the Romans. The Turks held it, despite a number of sieges, from 1552 to 1718, when it was rescued by the Austrians, under whom it became the capital of the Banat. In 1849 it was besieged for several months by the Hungarians, who were signally defeated here on Aug. 9 by Haynau. A monument was erected in commemoration of this siege, during which the city suffered severely.

**TEMISCAMINGUE, Lake.** See OTTAWA, vol. xii., p. 734.

**TEMISCOUATA,** an E. county of Quebec, Canada, bounded N. W. by the St. Lawrence river and S. E. by New Brunswick; area, 1,771 sq. m.; pop. in 1871, 22,491, of whom 21,809 were of French origin or descent. It is watered by the Trois Pistoles and Madawaska rivers and other streams, and contains Lake Temiscouata, 30 m. long and from $\frac{1}{4}$ to $\frac{1}{2}$ m. wide, the source of the Madawaska. It is traversed by the Grand Trunk and Inter-colonial railways. Capital, Isle Verte.

**TEMPLE,** a valley of Greece, in the northeast of Thessaly, between Mts. Olympus and Ossa, celebrated in antiquity for its beauty. Poets and rhetoricians often mentioned it as a type of sylvan loveliness, and it was also famed as a haunt of Apollo. It was with laurel from Tempé that the victors in the Pythian games were crowned. The most accurate description of the famous pass is that of Livy. The lofty cliffs rise almost perpendicularly on either side, and the Penecus rushes through the middle of the valley. The defile is about 1,400 ft. in length, and is so narrow in parts as to afford space only for the river and the road. Right and left are the ruins of ancient f Basses, and numerous tumuli are seen.

**TEMPERAMENT, a term used to express the differences in the physical and mental constitutions of individuals, referred from remote antiquity to peculiarities in the quality of the solids and fluids of the body. The ancients believed that the fluids of the body consisted of four humors (corresponding to the four then so-called elements, earth, air, fire, and water), which they named bile, blood, black bile (supposed to come from the spleen), and phlegm or watery fluid (believed to come from the brain); and, if either of these elements was in excess, that it gave rise in the above order to the bilious or choleric, sanguine, melancholic, and phlegmatic temperaments. This view was maintained by physicians to the time of Cullen, who admitted only two temperaments, the sanguine and the melancholic. The sanguine temperament is marked by a predominance of the circulatory system, with a strong and frequent pulse, firm flesh, plump figure, smooth and fair skin, ruddy complexion, soft and light hair, and light eyes; there is great nervous susceptibility, ready memory, lively imagination, cheerfulness, and a love for sensual pleasures; its diseases are generally violent and inflammatory. In Cullen's melancholic temperament the solids predominate, the figure being less plump and more firm, the hair and eyes black, the skin coarse and dark, the countenance sallow and sad; the disposition is gloomy and the temper suspicious; the manner is slow, grave, cautious, and impassive. Other temperaments as well characterized as the above are the bilious, lymphatic, and nervous. The bilious or choleric temperament is marked by a supposed predominance of the biliary system, with strong hard pulse, yellowish brown skin and dark hair, and moderately fleshy body; by violent and easily excited passions, firmness and indecency of
character, boldness, and perseverance. In the phlegmatic or lymphatic temperament the flesh is soft, the skin pale and flabby, hair light, pulse weak, and the figure rounded, with little expression of countenance or activity of mind and body. The prominent character of the nervous temperament is a great excitability of the nervous system, and the preponderance of the emotions and impulses over the reason and will; the muscles are small and soft, and the form generally slender.

**TEMPERANCE SOCIETIES.** See Total Abstinence.

**TEMPERED GLASS,** a peculiar condition of glass which has recently been produced by M. de la Bastie of France, by subjecting it while hot to the action of a bath of prepared oil, in which it is enclosed to prevent ignition. This treatment appears to confer a certain degree of toughness to the exterior, which enables it to bear much harder blows than common glass. When broken, however, it crumbles into dust or small fragments, like Prince Rupert’s drops, and it cannot like ordinary glass be cut with a diamond into regular forms, but crumbles under the instrument. An attempt to grind it, or to cut it with the sand blast to any depth, produces disintegration. This indicates that the molecules are held together under a condition of strain, and an optical examination supports the same conclusion.

**TEMPLARS,** or Knights of the Temple (Lat. milites templi), the most celebrated and powerful of the mediæval military orders of Christendom. Its origin dates from 1117, when two French knights, Hugues des Paëns and Geoffroi de Saint-Adémard or Saint-Omer, took on themselves the obligation of escorting the pilgrims who continually journeyed between Jerusalem and the river Jordan. They were soon joined by seven other knights, and were permitted by the patriarch of Jerusalem to add to the three usual monastic vows a fourth one, by which they promised to defend the holy sepulchre and to protect pilgrims travelling through Palestine. They were generously befriended and encouraged in the beginning by the knights hospitalers of St. John. They were very poor, being called “the poor soldiers of the holy city;” and the two founders in their first excursions rode on one horse, a fact perpetuated on the great seal of the order. Baldwin II., king of Jerusalem, gave them a lodging in his palace near the traditional site of the temple, and the canons of the adjoining church granted them a house for an armoury. Their number was soon increased beyond nine till the council of Troyes, 1137–8, which Hugues des Paëns and five of his brethren attended, and which commissioned St. Bernard of Clairvaux to draw up a rule for them, and devise a habit suitable to their mode of life. This rule, approved by Pope Honorius II. in 1138, is divided into 72 articles, several additions having been made. It bound the knights to be present at the public canonical office, and when absent on military service to recite certain vocal prayers at the stated hours; they were to abstain from flesh meat four days in the week, and to refrain from hunting and hawking; each knight was to have three horses and a squire. Their oath, on making their religious profession, bound them to defend at the peril of their lives the mysteries of the Christian faith, the seven sacraments, the 14 articles of belief, the Apostles’ and Athanasian creeds, the Old and New Testaments with the interpretations of the fathers as approved by the church, the unity of the divine nature and the trinity of persons, and the virginity of the mother of Christ both before and after his birth; to perform military service beyond the seas whenever called upon to do so; and never to fly before three infidels, even when alone. The knights were given a white tunie and mantle to distinguish them from the hospitalers, the squires and servitors wearing black or the colors common to the country; and in 1146 they were permitted to wear a red cross on the left breast, the hospitalers wearing a white cross on their black mantles. Their banner was of white linen striped with black, and was thence called baudéant, the name given at the time to a horse marked with black and white, and baudéant became also the battle cry of the order; the red cross was added in 1166. Their helmet, in token of humility, had no crest, and their beards were unct. The members were classed into knights, squires, servitors, and later chaplains, who were priests of noble birth. On assuming the habit of the order all were girt with a cineture of linen thread, as a badge of their service. The order was divided into provinces, the provinces into priories or bailiwicks, and these into preceptories, composed of a single house or several houses in close proximity. Over the whole order presided the master or grand master, having as his lieutenant the grand seneschal, both of whom were appointed by the grand master; treasurer, &c., were elected by the knights in general chapter. The provinces were governed by provincial masters, grand priors, or grand preceptors; and the inferior officers were designated respectively as priors or bailiffs and preceptors. The head province and residence of the grand master was Jerusalem, and its chapter in ordinary times was invested with all the powers belonging to the whole order assembled in general chapter. Pope Alexander III. allowed the order to receive priests as chaplains, without binding them by a military vow. They were ex officio secretaries to the local chapters, and were often appointed preceptors, but were not eligible to the higher offices. The order came in course of time to be designated as sovereign, the grand master owing no allegiance to any prince, and being solely dependent on the pope in spirituals. Their houses were privileged, the ordinaries having no jurisdiction over them; their churches and cemeteries were not liable to in-
TEMPLARS

Terdriots; their properties and revenues were exempted from tithes and taxation; and no person who had made profession as a templar could leave the order, unless he entered another of stricter observance. Many persons sought to be affiliated with the templars without being bound by vows, in order to share these manifold exemptions. There were also oblati, who in return for these privileges pledged themselves to maintain the rights of the order, and donati, or children given from infancy to be reared and incorporated therein.—The warm interest taken by St. Bernard in the soldiers of the temple, his enthusiastic advocacy of their cause, the solemn approbation given to it by the council of Troyes and Honorius II., and the heroic services already rendered by its first members to the Christians of Palestine, made them at once favorites with the princes and peoples of Christendom. The little band of nine soon grew into as many thousands. St. Bernard, whom the templars always designated as their “father,” addressed them in 1146, at the prayer of Hugues des Païans, a series of exhortations, in which he defines their duties and the virtues peculiar to their profession. But while they rejoiced in their recent services and their extraordinary increase, he mentions a circumstance pointing to an early cause of degeneracy: “that the greater number of the nobles who have joined the soldiers of the temple had been men stained by every species of crime, whose conversion, while riding Europe of oppressors and scourges, gave defenders to Palestine.” In the East, besides the province of Jerusalem, the order possessed those of Tripoli and Antioch; in the West were the provinces of France, Auvergne, Normandy, Aquitaine, Poitou, Provence, England (including Ireland and Scotland), Germany, Upper and Central Italy, Apulia, Sicily, Portugal, Castile, Leon, and Aragon. The French provinces were by far the most important, and gave to the order the great majority of its members, as well as its wealthiest possessions. So rapidly had these accumulated throughout Christendom, that Matthew Paris affirms that in the middle of the 13th century they held 9,000 manors. They became more interested in extending and guarding their possessions than in affording protection to pilgrims; and notwithstanding their unquestioned prowess and daring, their frequent feuds with the rival order of the hospitalers, and their open licentiousness and lust of gain, often injured the cause to which they had devoted themselves. They aided or thwarted the plans of campaigns at their pleasure, and frequently stained their knightly name and fame by open treachery, as in the sixth crusade under the emperor Frederick II., the partial failure of which was attributed to the machinations of the templars. During the gradual decline of the Christian kingdom in Palestine they endeavored by separate treaties with the Saracens to secure their own possessions in that country. After having their chief seat successively in Jerusalem (1118–87), Antioch (1187–91), Acre (1191–1217), and the Pilgrim’s Castle near Cressona (1217–91), they were nevertheless compelled at the final extinction of the Latin power in Palestine in 1291 to remove to the island of Cyprus, which they had purchased from Richard I. of England for 35,000 silver marks. Though driven out of the Holy Land, the organization evinced no signs of decay, and its extensive ramifications throughout Europe drew upon it the suspicion and jealousy of princes, whose cupidity was also excited by its immense wealth. Under the influence of these motives, and irritated by his inability to tax the order, Philip the Fair of France determined upon its destruction, and induced Pope Clement V. to have a judicial inquiry instituted into the orthodoxy and morality of the order. Accordingly, in 1306 Jacques de Molay, the grand master of the templars, was enticed to Paris, and on Oct. 13, 1307, all the members of the order in France, including De Molay himself, were taken into custody, and their houses and goods were everywhere seized. The formal charges imputed to them grave heresies and idolatry connected with their secret rites of initiation and internal discipline, and graver violations of morality; but there was no evidence of these beyond their own confessions, wrung from them by torture. The pope hesitated to promulgate the decree for the extinction of the order; but Philip procured one of his creatures, the archbishop of Sens, whose jurisdiction extended over Paris, to convocate his provincial council in that city on May 10, 1310; and on the 18th of the month, by command of that body, 54 members of the order were burned at the stake in a field behind the abbey of St. Antoine. The example was imitated elsewhere, and on May 2, 1312, Clement on his own responsibility, the general council of Vienne then in session being averse to precipitate measures, issued a bull for the abolition of the templars. In it he expressly declares that he does not pronounce “a definitive judgment” on the guilt of the templars, the charges against them not being proven; but that to prevent the further growth of a monstrous scandal, and for the greater good of Christendom, he suppresses the order, reserving to the holy see a final judgment as well as the disposition of the persons and property of the members. Their movable property was for the most part appropriated by the sovereigns of the countries in which it was deposited; and although their landed possessions were nominally transferred to the hospitalers, the crown as a general thing secured the disposition of them. The order ceased at once throughout Christendom except in Portugal, where it assumed the name of the knights of Christ, which order still subsists. Finally De Molay, Guy of Auvergne, and other high dignitaries of the order were burned at the stake, March 18, 1314.
TEMPLE, Frederick, an English bishop, born Nov. 30, 1821. He graduated at Oxford in 1842, and was elected fellow and mathematical tutor of his college. In 1846 he took orders, in 1848 was appointed principal of the training college at Kneeler Hall, near Twickenham, in 1855—7 was an inspector of schools, and in 1855 was appointed head master of Rugby school and chaplain in ordinary to the queen. In 1860 he contributed the first of the essays ("Creation of the World") in the volume known as "Essays and Reviews." In 1868 he supported Mr. Gladstone's measures for the disestablishment of the Irish church, and was nominated bishop of Exeter, and consecrated on Dec. 21, 1869. He has published "Sermons preached at Rugby School, 1858-69" (3 vols., 1861-71).

TEMPLE, Richard Grenville, earl, an English statesman, born Sept. 26, 1711, died at Stowe, Buckinghamshire, Sept. 11, 1777. He was the eldest son of Richard Grenville and Hester Temple, and in 1732 succeeded his mother, who had been created in 1749 Countess Temple, as Earl Temple. The marriage of his sister Hester Grenville with William Pitt, afterward earl of Chatham, was the means of introducing him to public life, and during the first Pitt administration he was a prominent member of the cabinet. In 1852-3 appeared "The Grenville Papers" (4 vols. 8vo), comprising the correspondence of Earl Temple and his brother George Grenville between 1742 and 1777, edited by W. J. Smith. The present representative of the Grenvilles is the duke of Buckingham and Chandos.

TEMPLE, Sir William, an English statesman, born in London in 1628, died at Moor Park, Surrey, Jan. 27, 1699. He was the son of Sir John Temple, master of the rolls in Ireland. After passing two years at Emmanuel college, Cambridge, he went abroad without taking a degree, and made the continental tour. He was married in 1654, and for several years resided with his father in Ireland. He represented the county of Carlow in the Irish convention in 1660, and also in the first Irish parliament after the restoration. In 1663 he removed to England, and in 1665 was sent on a secret mission to the bishop of Münster. In reward for his services, he was created a baronet and appointed resident at Brussels. In 1667 he visited Holland, and urged upon his government the necessity of a league with that country against the projects of Louis XIV. Receiving, in January, 1668, the necessary powers to negotiate such a treaty, he concluded the triple alliance between England, Holland, and Sweden, by which the contracting parties bound themselves to endeavor to bring about a peace between France and Spain, and to keep the former power out of the Low Countries. After perfecting at Aix-la-Chapelle negotiations for peace in pursuance of this alliance, he went in August, 1668, as ambassador to the Hague. Recalled to England in September, 1670, he discovered that the ministry had formed a secret treaty with France, by which the triple alliance was rendered of no effect, and in June, 1671, received his dismissal. For two or three years he resided at his estate of Sheen: but in 1674 he was summoned to negotiate a peace with Holland, which he accomplished in London. He returned soon afterward to his former post at the Hague, and was also one of the mediators deputed to attend the congress of Nimwegen in which participated (1678) in an unsatisfactory treaty of peace between France and Holland, which Temple refused to sign. Returning to England, he declined to accept the office of secretary of state; but Charles II., harassed by the violence of parliament, gladly availed himself of Temple's advice, and his plan for a new privy council of 30 members, 15 to be great officers of state and 15 independent noblemen and gentlemen of great weight and landed possessions, was carried into effect in April, 1679. But in consequence of several perversions of its fundamental principles, and the admission of Lord Shaftesbury as a member contrary to his advice, Temple ceased to attend the regular meetings. A single session of parliament, to which he had been elected from the university of Cambridge, satisfied him with legislative life; and his name being stricken from the list of privy councillors in 1680, he thenceforth lived in retirement, either at Sheen or at Moor Park, a seat in Surrey. During the last ten years of his life Jonathan Swift was his secretary. His works comprise "Observations upon the United Provinces of the Netherlands," essays on the "Origin and Nature of Government," "Ancient and Modern Learning," "Gardening," &c., and a variety of political and miscellaneous tracts. His collected works were first published in 1720, edited by Swift; the last and best edition is in 4 vols. 8vo (London, 1814).

TENANT. See Lease, and Tenure.

TENASSERIM, a commissionship of British Burmah, on the E. side of the bay of Bengal, extending 500 m. from N. to S., with a breadth of from 30 to 80 m., between lat. 10° and 19° 30' N., and lon. 95° 30' and 99° 30' E., bounded N. by Burmah, E. by Siam, S. by the Malay peninsula, and W. by the bay of Bengal, gulf of Martaban, and the administrative division of Pegu, from which last it is partly separated by the river Salwen; area, 46,730 sq. m.; pop. in 1872, 576,765. The country is divided into the districts of Amherst, Tayov, Mergui, Sawgyen, Salwen, and Toungoo (which till recently was a division of Pegu); and the chief towns are Amherst, the capital, Maulmain, Martaban, Tayov, Mergui, and Tenasserim. The sea coast of Tenasserim is about 500 m. in length. S. of lat. 11° 40' it is bold and rocky, while further N. it is flat and much indented with bays, creeks, and estuaries. Along its whole extent are situated islands which appear from seaward to form part of the shore. Those lying S. of lat. 14° 40' N. are known collec-
TENASSERIM

TENASSERIM, or Tenasserim, is a long unsettled state of the country, the entire population at that time amounted only to about 30,000; and its subsequent rapid increase is attributable to the security for life and property afforded by British rule. The town of Tenasserim, on the river of the same name, in lat. 12° 2′ N., lon. 96° 55′ E., was formerly the capital, but is now largely in ruins.

TENANCY, a soft-rayed, fresh-water fish of the carp family, and genus *Tinca* (Cuv.), peculiar to the old world. The best known species is the *T. vulgaris* (Cuv.), rarely more than 14 in. long, of a deep yellowish brown, and sometimes golden and greenish; the dorsal and anal fins have no osseous rays, and the former is inserted behind the commence ment of the ventrals; the teeth on the pharynx are compressed and club-shaped; scales very minute, covered with mucus; a very small labial barbel at each side of mouth; the body thick and broad, and the ventrals in the male much larger than in the female. It is spread over Europe and N. Asia, and is more or less abundant in the ornamental waters and ponds of Great Britain, but is not found much above lat. 60° N.; it prefers stagnant waters with a muddy bottom, con-
of D'Alembert. (See ALEMBERT.) In 1726 she was arrested on a charge preferred against her in the will of La Fresnay, one of her many lovers, who had killed himself in her house, of having sought to destroy him; but the charge fell to the ground. After her speedy release she spent her greater leisure in association with Fontenelle, Montesquieu, and other scholars who attended her receptions, which were among the first of the kind in France. She published Les mémoires du comte de Comminges (1735); Le siège de Calais, a historical novel (2 vols., 1739-40); and Les malheurs de Pamon (1747). Her correspondence with her brother, the cardinal, was published in 1790, and Lettres au duc de Richelieu in 1806. Her works have frequently been published together with those of Mme. de Lafayette. One of the best editions is by Jay and Edennée (5 vols., Paris, 1825).—See Mémoires secrets de Mme. de Tancia, by the abbé Barthélemy (Grenoble, 1790).

**TENDER,** in law, an offer to perform an act, for the performance whereof one person is bound to another. The obligation, and so the offer, may be to pay money or to deliver specific articles. If the tender be of money, it is effectual only when the demand is one of money, and is definite in amount, or is capable of being made so. Thus, a tender cannot be pleaded as a defence to an action upon a contract, unless the contract be one for the payment of money, as for rent; nor to an action for a tort, as for assault and battery. In short, wherever the claim is for unliquidated damages, the general rule is that no tender is admissible. In some of the United States, however, cases of involuntary trespass form an exception, founded partly on usage and partly on express statutory provisions. A tender may be by the defendant in person, or by a third person at his request; and it should be made to the creditor personally, or to some one authorized by him to receive the money. At common law, a tender must be made on the very day the money is due, if that day be made certain by the contract. But the statutes and usages of the states generally permit the tender to be made after that day, if before the action is brought; and in some it may be made after the action is brought. Tender is generally not good if made before the debt is due, but may in some cases be so if it includes interest up to the day of maturity.—A tender of money is not complete without production and offer of the money, unless the creditor expressly or impliedly waives the production. Thus it is said not to be enough in a plea of tender, if the plaintiff did not object to receive the money, for the defendant to prove that he had the money in his pocket, and said to the creditor that he had it ready for him, and asked him to take it. He ought to have produced and offered the money specifically. What amounts to a waiver on the part of the creditor is a nice if not difficult question. It seems from the cases that the creditor may not only waive the actual production of the money, but the actual possession of it in hand by the debtor. The debtor is not bound to count out the money if he has it and offers it.—The tender must be made without any condition that the creditor may not waive, as for instance, that an acceptance is given by the creditor. A demand of a receipt in full of all demands has often been held to invalidate a tender; not so much because a receipt was asked for, as because part was offered in full payment. And it seems that a debtor would lose the benefit of a tender if he should accompany it with a demand of a receipt for the sum that he pays, and because it was refused should retain the money. Tender of a larger sum than is due, with a request of the change or the balance, is not good; but a refusal of the money offered, for reasons distinct from the manner in which the offer is made, as for the insufficiency of the sum or the like, is a waiver of all objection to the form of the tender. The tender should be made in money made lawful by statute. A tender of good and current bank notes is good if no objection is made on the ground that they are not money. The effect of a tender will be destroyed if the creditor can show a subsequent demand by him of the proper fulfilment of the contract at the proper time, and a refusal by the debtor. Tender does not bar a debt as payment would, but rather establishes the liability of the defendant; for, in general, he is liable to pay the sum which he tenders whenever he is required to do so. But the tender stops the recovery of damages or interest for delay in payment, and gives the defendant subsequent costs, provided the plaintiff recovers nothing beyond the sum tendered.—As in sales the property in chattels does not pass while any necessary act remains to be done, so if there be an obligation to deliver those articles, it may be said as a general rule that the obligation is not discharged by tender so long as anything is left undone which would prevent the property from passing under a sale. Chattels tendered, therefore, should be separated and distinguished from any others, and not be so mingled with others that are not to be delivered that they cannot be separately identified. The tender of goods may be made to an agent or by an agent, and must be equally unconditional as if of money; and if the agent of the deliverer has orders to deliver the chattels to the receiver only if he will cancel and deliver up the contract, this is not a tender, although the agent had the chattels at the proper time and place. Generally, if no time or place be specified, chattels are to be delivered where they were at the time of the contract, unless collateral circumstances designate a different place. If the time be fixed, but not the place, it will be presumed that the deliverer was to bring the articles to the receiver at that time; and for that purpose he must go with the chattels to the residence or place of business of the receiver, unless
something in their very nature or use, or some other circumstance of equivalent force, distinctly implies that they are to be left at some other place. And it may happen from the cumbrousness of the articles, or other circumstances, that it is obviously reasonable and just for the deliverer to ascertain from the receiver, long enough beforehand, where they shall be delivered; and then he will be held to this as a legal obligation. If the receiver refuses or neglects to appoint a place, or purposely avoids receiving notice of a place, the deliverer may appoint any place with a reasonable regard to the convenience of the other party, and there deliver the articles. If no expressions used by the parties and nothing in the nature of the goods or the circumstances of the case control the presumption, then the place where the promise is made is the place where it should be performed; and no action can be maintained upon such a promise unless the plaintiff can show a demand at the proper place and time, or a readiness to receive, and notice equivalent to a demand, or else that the demand would have been nugatory because the defendant could not have complied with it. If by the terms of the contract specific articles are to be delivered at a certain time and place in payment of an existing debt, this contract is fully discharged and the debt is paid by a complete and legal tender of the articles at the time and place, although the promisee was not there to receive them; and no action can be thereafter maintained on the contract. But the property in the goods has passed to the creditor, and he may retain them as his own, or take them elsewhere; or he may demand them, and if they are refused bring an action for them as his own.

**TENDON**. The fibrous cord or expansion by which a muscle is united with the surface of bone. Tendons are composed of parallel bundles of white, inelastic, inextensible, fibrous tissue, the spaces between which are occupied by thin layers of loose areolar tissue, with a small proportion of elastic fibres, sufficient to allow a slight gliding motion of the different tendinous bundles upon each other. As a whole, however, the tendon is both inextensible and inelastic, and thus conveys at once the movement imparted by the muscular contraction to the bone into which it is inserted. The typical form of a tendon is that of a long, flexible, cylindrical cord, like those at the lower part of the forearm, for the flexion of the wrist and fingers. Others are more or less spread out into a ribbon-like form, like that of the sterno-mastoid muscle at the upper extremity of the sternum; while others are expanded into a broad and thin sheet or aponerous, like the tendinous expansions of the latissimus dorsi, or of the muscles on the anterior part of the abdomen. The long and cord-like tendons often run in narrow grooves of bone, in which they are confined by fibrous sheets passing over them from edge to edge. Their movement is sometimes facilitated by the existence

of closed sacs or bursæ, situated between them and the bony surfaces over which they pass, and filled with a glairy lubricating fluid. Sometimes, as in the case of the tendon of the superior oblique muscle of the eyeball, they pass through a pulley-like loop or fibrous ring, and then return in an oblique direction to be inserted somewhere between the loop and their point of origin. Sometimes they have developed within them at certain points, where crossing articulations, small bones termed "sesamoid bones," the inner surface of which takes part in the formation of the joint. The patella, or knee pan, is regarded as an unusually large sesamoid bone, developed in the tendon of the great extensor muscle on the front part of the thigh.—Owing to their strong fibrous texture and inextensible quality, the tendons, when contracted or bound down by unnatural adhesions, are liable to produce or perpetuate deformities, particularly in the neck and the extremities. They require, under these circumstances, to be divided by a subcutaneous incision, releasing the contracted parts without bringing the air into contact with the wounded surface. This practice, known as "tenotomy," is largely resorted to in cases of very neck, club foot, and many similar deformities.

**TENEDOS** (in earliest antiquity Cylindra, Leucophrya, Phenice, and Lynneusus), a small island, about 10 m. in circumference, in the Grecian archipelago, now belonging to Turkey, 13 m. from the mouth of the Hellespont, and 4 m. W. of the coast of the Troad; pop. about 7,000, two thirds Greeks. The interior is fertile and well cultivated, producing corn, cotton, fruits, and excellent wine. The small town of Tenedos, on the E. coast, has a good port and is defended by two forts; the Greek quarter was almost entirely destroyed by fire in July, 1874.—In the legend of the Trojan war the island is mentioned as the place to which the Greeks withdrew their fleet, in order to make the Trojans think that they had departed, after leaving the wooden horse before Troy; and it was employed in the Persian war by Xerxes as a naval station. Subsequently, on several occasions, as in the Peloponnesian, Macedonian, and Mithridatic wars, it figured conspicuously as a stronghold; and in the middle ages the Turks and Venetians long contested its possession.

**TENERANI, Pietro**, an Italian sculptor, born at Torano, near Carrara, Nov. 11, 1789, died in Rome, Dec. 14, 1869. He studied after 1814 in Rome under Canova and Thorwaldsen, and became professor and finally president of the academy of St. Luke, and in 1860 chief director of museums. He excelled in religious and classical works, some of which are regarded as superior to the later productions of Canova, and became the head of a school distinguished for a careful collaboration of details and for graceful execution. His best known works include “Christ on the Cross,” in silver, in St. Stephen’s at Pisa; “The Descent from the
TENERIFFE

Cross," in the Torlonia chapel of St. John Lateran; the "Angel of the Last Judgment," in St. Mary's, Rome; "Flora," in possession of Queen Victoria; portrait busts of Thorwaldsen and Pius IX.; and many statues, including one of Bolivar. His last important work is the sarcophagus of Pius VIII. for St. Peter's.

TENERIFFE (Sp. Tenerife), one of the largest islands of the Canary group, about 150 m. N. W. of Cape Bojador, Africa. It is of triangular form, the N. and S. E. sides about 60 m. long, and the W. side 24 m.; area, about 800 sq. m.; pop. about 55,000. The coasts are steep, high, and broken by steep fissures; there are very few sand beaches, and no port accessible to large vessels which is secure in all weathers; but Santa Cruz, the capital of the island and of the Canaries (pop. about 11,000), has a good harbor. The island is volcanic. A lofty ridge traverses it centrally, and culminates near the W. side in the celebrated peak of Teneriffe or Teyde, 15,192 ft. above the sea. This consists of an enormous dome of trachyte covered with layers of basalt, rising from a plateau 7,500 ft. high. The peak itself rises about 2,350 ft. above the last narrow plain; its sides are very steep and difficult of ascent, and the summit is a narrow wall enclosing a crater about a mile in diameter with an average depth of 106 ft. The eruptions from this crater ceased long before the island was discovered by Europeans; but there have been recent eruptions from other craters, notably in 1704, '5, and '6, and 1798, the most recent. Hot vapors arise from the craters, and their surfaces are always warm. The next highest elevations are Chahorn, 9,885 ft., 2½ m. S. W., and Azulejos, 9,400 ft., 3½ m. S. of Teyde. About one seventh of the island is fit for cultivation; the most fertile districts are at the E. end, the best being the plain of Laguna, about 13 sq. m. in extent, from which large crops of grain are obtained. The principal productions are cochineal, nuts, wine, and fruit; the first named is the only one of importance in commerce. In 1873 there was exported 2,476,433 lbs. of cochineal, valued at $1,225,289 in gold. The total value of all other exports during the same year was $295,060; of all imports, $1,988,045, including 3,390 tons of coal. The value of exports to the United States for the year ending Sept. 30, 1874, was $30,000. The commerce of the island is nearly all conducted through Santa Cruz. The one other town worth mentioning is Laguna, in the plain of that name, with a fixed population of about 10,000, largely increased in the hot season. Orotava, on the N. coast, gives its name to a beautiful valley, formerly famous for its gigantic dragon tree, which was blown down by a hurricane at the beginning of 1868.

TENIERS. 1. David, called the elder, a Flemish painter, born in Antwerp in 1582, died there in 1649. He was educated in the school of Rubens, subsequently studied in Italy, and after his return to Antwerp devoted himself exclusively to cabinet pictures. His favorite subjects were rural sports and merrymakings, alehouse interiors, chemists' laboratories, and grotesque subjects, such as the temptation of St. Anthony. He was greatly distinguished as a colorist, and his pictures commanded during his lifetime large prices. H. David, the younger, born in Antwerp in 1610, died in Brussels, Feb. 11, 1685. He early displayed a genius far superior to that of his father in the same specialty of painting, and found a patron in the Austrian archduke Leopold at Brussels, governor of the Spanish Netherlands, who appointed him gentleman of his bed-chamber and his principal painter. The king of Spain appropriated a special gallery to his works, and he had hardly time to meet the fast increasing demand for them. He became director of the academy of Antwerp in 1644, but spent most of his life in the country near Mechlin, in order to familiarize himself with the life of the peasantry. His extraordinary facility in imitating the paintings in the archduke's gallery caused him to be called the Proteus of his art, and he was not less remarkable for his rapid, faithful, and elaborate execution. His charming delineations of the hams and appendages of the toiling classes made him the most popular of all Flemish painters. He produced more than 1,000 pictures, including some of stupendous size. Among those best known are "The Village Wedding," "The Prodigal Son," "Heron Shooting," "The Bagpipe Player," and others in the Louvre, and "A Music Party," "Boors Regaling," "The Misers," and "Players at Trictrac," in the national gallery of London.

TENNANT, William, a Scottish poet, born at Easter Anstruther, Fife-shire, in 1755, died near Dollar, Feb. 15, 1848. He was educated at the university of St. Andrews. At an early age he lost the use of his feet, and in 1801 became clerk to his brother, a corn factor of Glasgow. Returning to Anstruther, he published in 1812 "Anster Fair," in the ottava rima, which passed through many editions. In 1813 he became parish schoolmaster of Dunino, and there mastered the Arabic, Syriac, and Persian languages. He afterward taught at Lasswade and at Dollar academy, and in 1835 was made professor of oriental languages in St. Mary's college, St. Andrews, and compiled Syriac and Chaldaic grammars. He published "The Thane of Fife" (1822); "Cardinal Beaton," a tragedy (1823); "John Galloch," a drama (1825); "The Dinging Down of the Cathedral" (of St. Andrews); "Hebrew Dramas founded on Bible History" (1845); and a "Life of Allan Ramsay" (New York, 1852).

TENNMANN, Wilhelm Gottlieb, a German historian of philosophy, born at Brembach, near Erfurt, Dec. 7, 1761, died in Marburg, Sept. 30, 1819. Abandoning theology for philosophy, he completed his studies at Jena, and was professor there from 1798 to 1804, and subsequently at Marburg. After opposing the
Kantian system he became one of its first adherents. His most important work is the Geschicht der Philosophie (11 vols., Leipsic, 1788-1819), in which all systems are regarded from the standpoint of the critical school. An abridgment, Grundriss der Geschichte der Philosophie (Leipsic, 1812; 5th ed., 1838), has been translated into English by Arthur Johnson (Oxford, 1832; revised by J. D. Morell, London, 1832). His other works include System der Platonischen Philosophie (4 vols., Leipsic, 1792-24), and translations into German from Locke, Hume, and De Gérande.

Tennent, Sir James Emerson, was a British author, born in Belfast, April 7, 1804, died in London, March 6, 1860. His name was originally Emerson, Tennent being added on the succession of his wife to the estate of his father, William Tennent. He graduated at Trinity college, Dublin, and was called to the bar at Lincolns Inn in 1831, but never practised. Under the name of Emerson he published "Travels in Greece" (1825); "Letters from the Aegean" (2 vols., 1829); and "History of Modern Greece" (2 vols., 1830-35). In 1832 he was elected to parliament for Belfast, and represented that city most of the time till 1845. From 1841 to 1845 he was secretary to the India board; in 1845 he was appointed civil secretary to the colonial government of Ceylon, and knighted. He returned in 1850, and in 1852 was member of parliament for Lisburn, and for a few months of that year secretary of the poor-law board. In November, 1852, he became one of the joint secretaries of the board of trade, and on his retirement in February, 1867, he was created a baronet. His works include "Belgium" (2 vols., 1841); "A Treatise on the Copyright of Designs for Printed Fabrics, &c." (1841); "Christianity in Ceylon, with an Historical Sketch of the Brahminical and Buddhist Superstitions" (1850); "Wine, its Use and Taxation" (1855); "Account of Ceylon" (2 vols., 1859; 5th ed., enlarged, 1860); "Sketches of the Natural History of Ceylon" (1861); "The Story of the Guns" (1864); and "The Wild Elephant, and the Mode of capturing and taming him in Ceylon" (1867).

Tennessee, one of the southern states of the American Union, the third admitted under the federal constitution, situated between lat. 35° and 38° 35' N., and lon. 81° 27' and 90° 15' W.; greatest length from E. to W. 492 m.; breadth 109 m.; area, 45,600 sq. m. according to the federal census, or 42,000 as reported by the state authorities. Its shape is rhomboidal, its E. and W. sides sloping at considerable, though not equal angles. It is bounded N. by Kentucky and Virginia, S. E. by North Carolina, S. by Georgia, Alabama, and Mississippi, and W. by Arkansas and Missouri, from which it is separated by the Mississippi river. The state is divided into 94 counties. viz.: Anderson, Bedford, Benton, Bledsoe, Blount, Bradley, Campbell, Cannon, Carroll, Carter, Cheatham, Claiborne, Clay, Cocke, Coffee, Crockett, Cumberland, Davidson, Decatur, DeKalb, Dickson, Dyer, Fayette, Fentress, Franklin, Gibson, Giles, Grainger, Greene, Grundy, Hamblen, Hamilton, Hancock, Hardin, Hawkins, Hardeman, Haywood, Henderson, Henry, Hickman, Houston, Humphreys, Jackson, James, Jefferson, Johnson, Knox, Lake, Lauderdale, Lawrence, Lewis, Lincoln, London, McMinn, McNairy, Macon, Madison, Marion, Marshall, Maury, Meigs, Monroe, Montgomery, Moore, Morgan, Obion, Overton, Perry, Polk, Putnam, Rhea, Roane, Robertson, Rutherford, Scott, Sequatchie, Sevier, Shelby, Smith, Stewart, Sullivan, Sumner, Tipton, Trousdale, Union, Van Buren, Warren, Washington, Wayne, Weakley, White, Williamson, and Wilson. The chief cities and towns are: Nashville, the capital, which in 1870 had 25,865 inhabitants; Brownsville, 2,457; Chattanooga, 6,093; Clarksville, 3,200; Columbia, 2,550; Gallatin, 2,123; Jackson, 4,119; Knoxville, 8,682; Lebanon, 2,073; Memphis, 40,226; Murfreesboro, 3,502; and Pulaski, 2,070. The population of the state and its rank in the Union at decennial periods, according to the federal census, have been as follows:

</table>

Included in the aggregate of 1860 are 60 Indians, and 70 in that of 1870. Of the total population in 1870, 623,947 were males and 635,179 females; 1,339,204 were of native and 19,316 of foreign birth. Of the natives, 1,027,653 were born in the state, 20,217 in Alabama, 18,021 in Georgia, 19,867 in Kentucky, 15,451 in Mississippi, 51,110 in North Carolina, 4,420 in Ohio, 4,074 in Pennsylvania,
TENNESSEE

13,854 in South Carolina, and 43,887 in Virginia and West Virginia. Of the foreigners, 4,593 were born in Germany, 2,055 in England, and 8,048 in Ireland. The density of population according to the federal census was 27.6 persons to a square mile. There were 291,935 families, with an average of 5.44 persons to each, and 324,816 dwellings, with an average of 5.6 to each. The increase of population from 1850 to 1870 was 13.4 per cent. There were 429,592 persons from 5 to 18 years of age, 222,908 males from 18 to 45, and 259,016 male citizens 21 years old and upward. There were 290,549 persons 10 years of age and upward who could not read, and 864,597 unable to write; of the latter, 178,725 were white and 183,952 colored, 163,206 males and 201,473 females; 225,724 were 21 years old and over. The number of paupers supported during the year ending June 1, 1870, was 1,349, at a cost of $39,611. Of the 1,882 readers supplying support, only 414 were colored. The number of persons convicted of crime during the year was 722. Of the 981 in prison June 1, 1870, 560 were colored. The state contained 876 blind, 570 deaf and dumb, 925 insane, and 1,091 idiotic. Of the total population 10 years old and over (890,872), there were engaged in all occupations, 367,987; in agriculture, 267,020, of whom 156,925 were laborers and 129,550 farmers and planters; in professional and personal services, 54,096, including 1,256 clergymen, 24,563 domestic servants, 16,780 laborers not specified, 1,126 lawyers, 2,320 physicians and surgeons, and 2,250 teachers not specified; in trade and transportation, 17,510; in manufactures and mechanical and mining industries, 29,061. The total number of deaths from all causes was 14,289, being 1.18 per cent. of the entire population; from consumption, 2,377, leaving 0 deaths from all causes to 1 from this disease; from pneumonia, 1,298, or 11 deaths from all causes to 1 from this disease. There were 652 deaths from croup, 571 from intermittent and remittent fevers, 729 from cerebro-spinal, enteric, and typhus fevers, and 750 from diarrhoea, dysentery, and enteritis.—The state presents eight great topographical divisions. On its E. border the Unaka, Smoky, Bald, and other mountains, belonging to the Appalachian chain, have an average elevation of 5,000 ft. above the sea, and an area (according to state measurements) of 2,000 sq. m. Between these mountains and the Cumberland table land on the west the valley of East Tennessee comprises a succession of ridges and minor valleys running in almost unbroken lines from N. E. to S. W. The average elevation of this valley is 1,000 ft., and its area 9,200 sq. m. The Cumberland table land rises about 1,000 ft. above the valley of East Tennessee, and has an area of 5,100 sq. m. Its E. side forms an almost continuous N. E. line, and presents an abrupt, rocky rampart. The W. edge is irregular and jagged, with deep coves and valleys. Next on the west, with an average elevation of 1,000 ft. above the sea, and an area of 9,300 sq. m., are the highlands, rim lands, or terrace lands, which extend to the Tennessee river. This division is for the most part a plain, traversed by numerous ravines and streams. In the centre of these highlands is the great central basin, elliptical and resembling the bed of a drained lake; its average depression is about 300 ft. below the highlands, and it has an area of 5,450 sq. m. This whole basin, with the surrounding highlands, is slightly inclined toward the northwest. The next natural division, on the west, is the western valley, or valley of the Tennessee, 10 or 12 m. wide, with an elevation of 350 ft. above the sea and an area of 1,200 sq. m. The surface is broken and irregular, various subordinate valleys extending from 20 to 25 m. into the highlands. The plateau or slope of West Tennessee, which constitutes the seventh grand division, is a gently undulating plain, which slopes toward the Mississippi. It has few rocks, is furrowed with river valleys, and extends westward for an average distance of about 84 m., when it abruptly terminates in a long and steep bluff or escarpment that overlooks the great alluvial bottoms of the Mississippi. It has an area of about 8,850 sq. m., with an average elevation of 500 ft. The extreme western natural division comprises the bottoms of the Mississippi, a low, flat, alluvial plain, having an area of 900 sq. m. and an average elevation of about 300 ft. It is covered with forests, and has numerous lakes and morasses. The state is also popularly divided into East, Middle, and West Tennessee; the first extending from the North Carolina border to about the middle of the Cumberland table land, the second from this line to the Tennessee river, and the third from the Tennessee to the Mississippi.—The rivers of Tennessee afford extensive commercial facilities and abundant water power. The most important are the Mississippi, which forms the W. border, and the Tennessee and the Cumberland, which with their tributaries drain more than three fourths of the state. The chief tributaries of the Mississippi are the Forked Deer and its branches (Obion river and South Forked Deer), the Big Hatchie, and Wolf river. The Forked Deer is navigable for steamboats to Dyersburg, and the Big Hatchie for several miles. (See Cumberland River, and Tennessee River.)—Geologically the state is divided into five districts or cross belts running from N. E. to S. W. The first, comprising the interval between the Mississippi and Tennessee rivers, is occupied (in an order from W. to E.) by the alluvial, tertiary, and cretaceous formations of the gulf of Mexico and the Atlantic seaboard. The second, from the Tennessee river to the W. foot of the Cumberland mountains, is a rolling country of nearly horizontal palaeozoic rocks, with a great basin-like district of lower Silurian ground in the centre, watered by the Cumberland, Stone's, Duck, and
Elk rivers, and surrounded on all sides by sub-carboniferous hills. The third is the moun-
tain division of the coal; a plateau 2,000 ft. above the sea, 40 m. wide by 140 m. long,
bounded E. by the valleys of the upper Ten-
nessee and Holston rivers, and covered with a
plate of carboniferous rocks, which is thinned
and broken up into patches and mounds as
it approaches the Alabama state line. The
fourth district is the great valley of Knox-
vilie or East Tennessee. It is a prolongation of
the great valley of Virginia, the valley of the
Shenandoah, and that of Harrisburg and Reading,
Pa. Its rocks are mainly of Silurian age, up-
turned and broken by enormous faults, which
bring them against the coal. On its E. side
rise the Unaka mountains and their continu-
tions, forming a fifth district, the true prol-
ongation of the Blue Ridge and South mountain
range, extending laterally into North Carolina,
and composed of rocks of the lower periods of
the Silurian age, the equivalents of the slate rock,
gneiss, and marble of western Mas-
sachusetts and Vermont, and partly of "cal-
fiferous sand rock" age. The most abundant
and valuable minerals of Tennessee are coal,
iron, and copper. The state is crossed by the
great Alleghany coal field which extends from
Pennsylvania to Alabama. In Tennessee it is
nearly coextensive with the Cumberland table
land, and forms an irregular quadrilateral 71
m. wide at the N. end and 50 m. at the S. It
covers about 5,100 sq. m. The amount of coal
has been estimated at 42,127,360,000 tons. The
production of the state in 1870, according to
the federal census, was 3,335,450 bushels,
valued at $330,498. In 1874 there were 12
mines in operation, producing about 10,000,-
000 bushels annually. Iron exists in four dis-
inct belts or areas. The principal ones are
across the E. part of the state, at the base of
the border range of mountains, extending
into Virginia on the northeast and Georgia on
the southeast. The most abundant ore in this
belt is the limonite, which occurs in Johnson,
Sevier, Carter, and Blount co. There are also
veins of magnetite and hematite ore, which
will yield from 60 to 70 per cent. of metallic
ores. There are five furnaces in this region,
capable of producing about 15,000 tons an-
ually; but owing to the lack of railroad facili-
ties the amount produced does not exceed 10,-
000 tons. Iron ore containing oxide of man-
genese is abundant in Greene co., from which
spiegeleisen is made. The dyestone belt skirts
the E. base of the Cumberland table land,
extending beyond the limits of the state on the
northeast and southeast. In Tennessee it
reaches from Chattanooga to Cumberland gap,
about 150 m.; it spreads out laterally from 10
to 20 m. into the valley of East Tennessee, and
includes the Sequatchie and Elk valleys. The
chief ore of this belt is a stratified red iron
rock, highly fossiliferous, occurring in layers,
and called at many points dyestone, being
sometimes used for dying. The ore is a va-
riety of hematite, and yields from 50 to 60 per
cent. of iron. There are four furnaces in this
region. The Cumberland table-land belt of
iron ore is coextensive with the coal field.
The ore lies interstratified with shale, sand-
stone, and coal. It is called clay ironstone,
and is an argillaceous carbonate of iron. It
is inferior in quality, producing rarely more than
30 per cent., and usually not more than 20
per cent. of iron, and has not been worked.
The western iron belt crosses the state N. and
S., and lies mainly between the central basin
and the Tennessee river, though extending in
some counties a few miles W. of the river.
It is about 50 m. wide, and embraces an area
of about 5,400 sq. m. But the ore is found
in available quantities only at certain points
called "banks," some of which are miles in
extent, while others occupy only a few acres.
Some of these banks have been worked for
80 years with no signs of exhaustion. The ore
is a limonite or brown hematite, some of it
being inferior in quality; in other places the
yield of iron is from 40 to 55 per cent. There
are 11 furnaces in this region, with a monthly
capacity of about 4,250 tons. Tennessee has
decided advantages for making iron, in the
abundance, cheapness, and contiguity of ore
and of fuel; the disadvantages are distance
from market and want of transportation fa-
cilities. Valuable deposits of copper are found
in Polk co. in the S. E. corner of the state,
covering an area of 40 sq. m. The ore is
smelted by two extensive companies at Duck-
town, having 25 furnaces and employing about
900 hands. From 1865 to 1874 the larger of
these companies produced 8,476,875 lbs. of
ingot copper. Tennessee is rich in marble, which
is found in every part of the state, the va-
rieties including black, gray, magnesien, fawn-
, colored, white, red, variegated, conglomerate,
and breccia. Many quarries are worked. Lime-
stone and other building stone abound in vari-
ous parts of the state. Slate is common, but
little of it is valuable. Several beds of mill-
stone have been found, the most note-
worthy being in Claiborne co. Hydraulic rocks
abound in many counties, especially in Hardin,
Wayne, Perry, Decatur, Warren, and Mont-
gomery, and in Knox and McMinn areas in East
Tennessee. Lithographic stone of an excellent
quality occurs in McMinn co. Granite of vari-
ous shades of color, some of it rivaling the
Scotch granite, is found in Carter co.; and
unakite, a greenish compact granite, in the
Unaka mountains, being peculiar to that lo-
cality. Deposits of potter's clay are found in
East Tennessee, on the Knoxville and Ohio rail-
road, and in the vicinity of the lower Tennessee
river, in the counties of Hickman, Henry, Perry,
and Wayne; also in Montgomery and Blount
co. Some of this clay has been worked up
into stone ware. There are numerous potter-
ies, the largest being in Memphis, Nashville,
and Knoxville. Kaolin is found in Carter co. Fire
clay is found in Stewart and Houston co.
and on the Cumberland river. It also exists in the coal measures immediately underlying a seam of coal. Lead occurs in various places in East and Middle Tennessee. Mines have been worked in Washington, Monroe, and Bradley cos.; one of the most promising is the Caldwell mine on Powell's river in Union co. This vein, which fills a nearly vertical fissure, about 20 in. wide, in nearly horizontal rocks, can be traced about a mile. The two ores of zinc, smithsonite and calamina, occur in considerable deposits in various localities, especially in Clayborne, Union, and Jefferson cos.; they are in greatest abundance in Union co. The Stiner belt, near Powell's river, is 50 or 60 ft. wide, and is marked by the absence of trees. The lead and zinc ores are often associated. Black oxide of manganese is found in small masses, associated with iron, all over the state. Iron pyrites also exists everywhere in the state; a large quantity is found associated with the copper at Ducktown. Large beds also occur near Greeneville in Greene co., and in Moore, Carter, and Perry cos. Heavy spar or baryta, used for cheap paints, is found in Middle and East Tennessee; it is mined in Greene, Washington, Jefferson, and some other counties. It is usually associated with lead, constituting the gangue of that mineral. Asbestos exists in large quantities in Cocke co. Copperas is abundant, and specimens of gypsum have been found. Salt was formerly made in the state, but its manufacture has been discontinued. Saltpetre abounds in numerous caves throughout Middle and East Tennessee. Petroleum has been found at various points, and 10,000 barrels of it has been obtained from the wells near Spring creek in Overton co.; but the production has not been found profitable. Extensive beds of lignite are found in many of the counties of West Tennessee. Alum occurs in the same situations as copperas in Middle Tennessee. Epsom salts in many of the saltpetre caves, and large quantities of bluestone (sulphate of copper) at Ducktown. The state collection of minerals in the capitol comprises, besides a great variety of specimens, 200 kinds of marble, of all colors from Parian white to jet black, all found in the state. Tennessee has marked advantages in the number, variety, excellence, and medicinal value of its mineral waters. Mineral springs occur upon the lofty peaks of the Unakas and along the bases of the long ridges of the eastern valley. The Cumberland table land abounds with sparkling chalybeate springs. There are also valuable sulphur and chalybeate springs in West Tennessee.—Tennessee has numerous caves, many of which were explored in 1811-'13 for the saltpetre earth in them, and a large amount of nitre was then manufactured from the earthy material thus obtained. In the Cumberland mountains are several caves which are 100 ft. or more below the surface and several miles in extent. One has been descended to a depth of 400 ft., where a stream of water was found having sufficient force and fall to drive a mill. Another, on the summit of Cumberland mountain, is perpendicular in its descent, and its depth has never yet been fathomed. Some of these caves contain fossils and bones of extinct species of animals; others, large deposits of the excrement of bats, valuable as a fertilizer. Big Bone cave when first explored contained bones of the mastodon. There are throughout the cavernous limestone region occasional "sink holes," as they are termed. These are hopper-shaped cavities on the surface which communicate with the caves and underground streams. Near Manchester, Coffee co., is an ancient work called the Stone Fort, enclosed by a rude stone embankment by tourists called a wall, upon which trees are growing, whose age is estimated at over 500 years. This mysterious enclosure lies in a peninsula formed by the near approach of two forks of Duck river, and occupies an area of 87 acres.—The climate is generally mild and remarkably salubrious, excepting in the swampy districts of West Tennessee. The eastern division is noted for its pure mountain air. The mean annual temperature along a line running E. and W. through the middle of the state is about 57° in the valley of East Tennessee, 58° in Middle, and 59° in West Tennessee. The temperature is about one degree higher along the southern, and about one degree lower along the northern boundary. Going from W. to E. there is a difference of elevation of more than 6,000 ft., which gives a wide range of climate and great variety in vegetable productions.—East Tennessee, excluding its great valley, has a limited surface adapted to cultivation. The soil of Middle Tennessee is generally good, producing large crops of wheat, rye, oats, Indian corn, buckwheat, barley, potatoes, honeysuckle, hay, sweet potatoes, flax, cotton, and tobacco. The western division is almost level, and cotton, tobacco, and all kinds of grain are grown in extraordinary abundance. The soil of this part is a rich black mould. Along the banks of the Mississippi and Tennessee are extensive cane brakes, covered with reeds. The country is well watered. The N. W. part contains an extensive tract of swampy land. Nearly half of the state is wooded land, and presents almost every variety of timber found in the United States. West Tennessee is specially noted for the magnificence of its forests. The high mountains in the east are covered with forests of pine, which yield tar, pitch, turpentine, and lumber for export; white pine, chestnut, hemlock, and black walnut grow to immense size in the caves of the mountains. On the mountain slopes the sugar maple, ash, cedar, juniper, and savin are also abundant; and in the lower lands as well as in Middle Tennessee the poplar, hickory, black walnut, oak, beech, locust, and cherry are found. The most extensive red cedar forests in the United States are found in the central basin of Middle Tennessee. In the swamps and low lands of
TENNESSEE

West Tennessee the cypress, hackmatack, cottonwood, and swamp cedar occur in large quantities. Several wild or indigenous grasses grow spontaneously. The pawpaw, a low bushy tree or shrub, bearing a fruit somewhat resembling the banana, though inferior to it, is found in the river bottoms. The persimmon, which is common, yields a fruit which in sweetness and pleasantness of flavor equals the date. The black haw, red haw, wild blackberry, wood grape, muscadine, strawberry, whortleberry, gooseberry, and service berry all grow wild and yield luxuriantly. Nuts of various kinds abound, as the walnut, hickory nut, hickory, chestnut, pecan, and chinquapin, all forming articles of export. Ginseng is found on all the elevated lands. The wild animals are the bear, found only in the mountainous districts, deer, raccoons, foxes, opossums, and squirrels. Horses, cattle, sheep, and swine are raised on a large scale, and many thousands are annually exported. The hills and mountain slopes afford an abundance of fine pasturage. Much attention is given to wool growing.—According to the federal census of 1870, the state contained in farms 6,843,278 acres of improved land, 10,771,396 of woodland, and 1,966,540 of other unimproved land. The total number of farms was 118,141, containing an average of 166 acres each; 18,806 contained from 100 to 500 acres, 412 from 500 to 1,000, and 50 over 1,000. The cash value of farms was $218,749,747, of farming implements and machinery $8,194,487. The staple crops of 1873 were reported as follows by the United States department of agriculture:

<table>

Peanuts, constituting an important crop, are raised in the counties of Perry, Hickman, and Humphreys, and parts of Dickson and Lewis, all of which are on the W. side of the Highland rim. The production amounted to 680,000 bushels in 1872, 110,000 in 1873, 200,000 in 1874, and 250,000 in 1875. The average yield is about 40 bushels an acre. The shipment of cotton from Tennessee amounted to 378,813 bales in 1872-3, 489,584 in 1873-4, and 446,674 in 1874-5, most of which was the product of the state. In 1873 there were 613,267 acres planted with cotton. The best grows in the S. half of West Tennessee; it is grown in the whole of the central basin S. of Nashville. As a tobacco-growing state Tennessee ranks third, Kentucky being first and Virginia second. The annual product of the state varies from 20,000,000 to 25,000,000 lbs., or from 13,000 to 22,000 hogsheads. The average yield per acre is between 700 and 800 lbs., though as much as 1,800 lbs. can be produced upon the best soils in good seasons. The soil and climate are well adapted to the cultivation of grapes; much attention has recently been given to this industry, and also to the production of honey. The total number of manufacturing establishments, according to the census of 1870, was 5,317, using 738 steam engines of 18,467 horse power and 1,340 water wheels of 19,514 horse power, and employing 19,412 hands, of whom 17,663 were males above 16 years of age, 1,089 females above 15, and 660 youth. The amount of capital invested was $15,565,205; wages, $5,390,680; materials, $10,657,117; products, $34,302,656. The statistics of the most important industries were reported as follows:

</table>
There has been a marked progress in many industries since 1870, especially in the manufacture of cotton, iron, liquors, and carriages and wagons. In 1875 there were 40 cotton mills with 55,384 spindles; cotton consumed during the year, 6,701,718 lbs., or 14,443 bales. There are no United States customs districts in Tennessee, but Memphis and Nashville are ports of delivery in the district of Louisiana. At the close of 1875 there were 27 national banks in operation, with a capital stock of $3,455,300 and a circulation of $2,474,325.—Tennessee had 466 m. of railroad in 1855, 1,253 in 1860, 1,926 in 1865, 1,492 in 1870, and 1,641 in 1875. The lines lying wholly or partly in the state in 1875 were as follows:

—The governor is elected for two years, and receives an annual salary of $4,000. He must be 30 years of age and a citizen of the state for seven years next preceding his election. He is not eligible for more than six years in any period of eight. In case of the removal of the governor from office, or of his death or resignation, the executive functions devolve upon the speaker elected by the senate. The secretary of state is elected for four years by joint vote of the general assembly, and receives a salary of $1,500 a year and perquisites. A bill may be passed over the executive veto by a majority vote of each house. The state treasurer and comptroller are appointed by the general assembly for two years. The constitution provides that the number of representatives in the legislature shall not exceed 75 until the population of the state shall be 1,500,000, and shall never exceed 99. The number of senators is limited to one third of the number of representatives. There are now (1876) 25 senators and 75 representatives. The sessions of the legislature are biennial, beginning on the first Monday of January in odd years. Senators and representatives receive $4 a day and $4 for every 25 miles travel to and from the capital. No member will be paid for more than 75 days of a regular session, or for more than 20 days on an extraordinary session, for any day when absent from his seat. The judicial power is vested in a supreme court and chancery, circuit, county, and justices' courts. The supreme court consists of a chief justice and five associates, who are elected by the people for eight years, and receive a salary of $4,000 each. Its jurisdiction is appellate only. Terms are held annually in Knoxville, Nashville, and Jackson. The attorney general and reporter for the state is appointed by the judges of the supreme court. Judges of the circuit and chancery courts are elected by the people for eight years. Two terms of the chancery court are held in each county annually. They have all the powers and jurisdiction incident to a court of equity, and exclusive jurisdiction of all equity cases where the amount in controversy exceeds $50. They have jurisdiction with the county courts over the person and property of persons of unsound mind, and of infants. Three terms of the circuit court are annually held in each county. Concurrently with justices of the peace they have jurisdiction of all debts and demands on contract over $50, and exclusive jurisdiction of matters relating to the validity of wills; also appellate jurisdiction of all suits brought before inferior tribunals. Each county has a court consisting of the justices of the county, which has jurisdiction of probate matters. Justices of the peace are elected by the people for six years, and constables for two years. Judges may be removed from office by a two-thirds vote of the legislature. They are prohibited from charging juries with respect to matters of fact, but may state the testimony and declare the law. Fines exceeding $50 on any citizen must be assessed by a jury. The right
of suffrage is given to every male person of the age of 21 years who is a citizen of the United States and a resident of Tennessee for one year, and of the county where he offers to vote for six months. There is no other qualification except the payment of a poll tax of not less than $50 nor more than $1 a year. In 1867 the state gave to negroes the right to vote. Elections for governor and members of the general assembly are held biennially in even years, on the first Tuesday after the first Monday in November; for judicial and other civil officers, on the first Thursday in August. Ministers of the gospel and priests are ineligible as members of the legislature. No person who denies the being of God or a future state of rewards and punishments can hold any civil office. Any person who has engaged in a duel or preparations for a duel, either as principal or second, is disqualified from holding any office of honor or profit, besides being subject to punishment by law. Amendments to the constitution may be proposed in either branch of the general assembly; before taking effect they must be approved by a majority of the members elected to each house of the general assembly when first proposed, by two thirds of the next legislature, and subsequently by a popular vote. The grounds of divorce are: impotency, adultery, desertion for two years, conviction of an infamous crime or of felony, malicious attempt upon the life of the wife, pregnancy by another man at the time of marriage without the husband's knowledge, cruelty, indignities by the husband forcing the wife to separation, abandonment of the wife or turning her out of doors, and refusal to provide for her. The legal rate of interest is 6 per cent, but any rate not exceeding 10 per cent. may be contracted for in writing; if more than 10 per cent. is agreed upon, only 6 per cent. can be collected. Usury is punishable by a fine of not less than $100. Tennessee is represented in congress by 10 representatives and 2 senators, and has therefore 12 votes in the electoral college.—On Dec. 19, 1874, the bonded debt of the state was $29,908,400, which was largely contracted by the indorsement of railroad bonds. The assets of the state on bond account amounted to $5,817,896. The state revenue during 1873 and 1874, not including bonds or coupons paid by railroad companies, amounted to $3,618,703, and the disbursements to $3,290,158. According to the federal census, the true value of property was $201,246,686 in 1850, $483,908,892 in 1860, and $498,297,724 in 1870. The assessed value of all taxable property, as reported by the state authorities, was $308,089,738 in 1873 and $389,533,664 in 1874. The amount of state tax levied in 1873 was: East Tennessee, $254,200; Middle, $542,686; West, $435,472; total, $1,232,358. In 1874 it was: East Tennessee, $199,913; Middle, $401,563; West, $410,190; total, $1,106,666. The total valuation of taxable property in 1872 was $265,874,258; taxation, $1,090,694. The constitution provides that all property shall be taxed according to its value, so that the taxes shall be equal and uniform throughout the state, and that no species of property shall be taxed higher than any other of the same value. But the legislature is empowered to except from taxation property held by the state, counties, cities, or towns, and used exclusively for public or corporation purposes, and such as may be held and used for purposes purely religious, charitable, scientific, literary, or educational. In 1875 the comptroller reported that no railroad company had ever paid any taxes to the state; and that no corporations, excepting insurance companies and a few banks, had paid the taxes levied by law.—The state prison is in Nashville, and there are also several temporary prisons in various parts of the state, where convicts are employed upon railroads, mines, &c. The total number in confinement during the two years ending Dec. 1, 1874, was 1,625, of whom 744 were held on Dec. 1, 1872; 881 were received during that period, and 963 were in confinement at the end. Of the last number, 380 were white and 588 colored; 925 were males and 88 females; 18 had a good and 97 a fair education, 199 could read and write, and 654 had no education; 34 were under 16 years of age, and 275 under 21; 21 were sentenced for life, and 69 for 20 years or longer. The prisoners are employed under lease on public works, buildings, railroads, &c. The revenue thus received is reported to be greater than the cost of supporting the prison. There is preaching and Sunday school instruction. The state hospital for the insane, near Nashville, was opened in 1852. The average daily number of patients during the two years ending with 1874 was 379; the whole number under treatment during that period was 561, of whom 374 remained on Jan. 1, 1875. Of the latter, all but 37 were maintained free of charge. The cost of maintaining the institution during the two years named was $157,987. The accommodations of the hospital are inadequate, the number of insane in the state being estimated at not less than 1,200. The Tennessee school for the blind, in Nashville, opened in 1844, had 55 pupils in 1874. Its cost during that year was $33,800. It is estimated that there are not fewer than 1,200 blind in the state. This school has recently been very much enlarged. The Tennessee deaf and dumb school is in Knoxville, and was opened in 1845. The number of pupils in attendance during the two years ending with 1874 was 155, of whom 121 remained on Jan. 1, 1875. There were seven instructors. The ordinary expenditures during this period amounted to $53,356.—There was no satisfactory system of common schools in Tennessee prior to 1873, when the present law providing for a general state system was enacted. The school fund, which had been lost or diverted to other purposes, was restored, together with the suspended interest. A per-
mendal fund, amounting in 1875 to $2,512.50, was thus secured; the interest on this, at the rate of 6 per cent, per annum, is distributed semi-annually among the counties according to school population. The law also authorizes for school purposes a poll tax of $1, and a tax of one mill on the dollar upon all the taxable property of the state, and provides that when the money derived from the school fund and the taxes imposed by the state shall be insufficient to support a public school for five months in the year in each of the districts in any county, the county court shall levy an additional tax for the purpose, or submit the proposition to a vote of the people. About one half of the counties of the state have levied an additional tax to prolong the schools. The total annual income from the permanent fund and state taxation is about $800,000. The state superintendent of public instruction is appointed for two years, and receives an annual salary of $3,000. County superintendents are elected biennially by the county courts. Three directors are elected in each district for three years. The public schools are free to all persons between the ages of 6 and 18 years; but there must be separate schools for colored persons. The school population (one county not reporting) on June 30, 1875, was 425,901; white, 319,671; colored, 106,230. The number of pupils enrolled (one county not reporting) was 198,085; average attendance (16 counties not reporting), 136,118; number of schools (13 counties not reporting), 3,942; school revenue, $740,316; total expenditures, $706,358. In 1873-4 public schools in various parts of the state received aid from the Peabody education fund to the extent of $34,300. The state normal university, under the control of the state board of education, was opened as a department of the university of Nashville in December, 1875. It has an annual revenue of $6,000 from the Peabody education fund and $6,000 from the university of Nashville. Normal instruction is also afforded in several of the colleges. In several of the cities there are efficient systems of free schools, supported in part by the cities and in part from the state and county school revenues. The universities and colleges of Tennessee, with the number of instructors and pupils in 1874-5, were as follows:

The East Tennessee university embraces the state college of agriculture and the mechanical arts, for which provision was made by congress in 1862. The university was organized in 1840 (the East Tennessee college having been opened in 1808), and the agricultural college in 1869. There are three courses of study of four years each, agricultural, mechanical, and classical; and two preparatory courses of three years each. Each senator is entitled to one tutor, and each representative three students, who may attend the institution without charge for tuition, and may also pass free on railroads between their homes and the university. For others, the annual cost of tuition is $36 in the college and $30 in the preparatory department. Students are required to perform manual labor during the freshman and sophomore years. The university has a considerable library, and cabinets of geology, mineralogy, and zoology. The university of the South, at Sewanee, is under the control of the Protestant Episcopal church. It has separate schools for each department of learning. The institution has about 10,000 acres of land on a plateau of the Cumberland mountains, 2,000 ft. above the sea and 1,000 ft. above the surrounding country. Owing to the favorable climate of this elevation, studies are continued during the summer, and a long vacation occurs in the winter. The university has a library of over 8,000 volumes. The East Tennessee Wesleyan university, at Athens, has a collegiate department, with classical and scientific courses, and preparatory and academic departments. Fisk university was organized in 1866 through the efforts of the American missionary association of New York. It is designed for the instruction of colored persons, and has made the training of teachers a prominent part of its work. It was named after Gen. C. B. Fisk, then commissioner of the freedmen's bureau, through whose efforts government buildings were obtained for the institution. Since 1871 upward
of $100,000 have been raised for it by concerts given in the north and in Great Britain by the "Jubilee Singers." With this money 25 acres of land have been purchased, on which has been erected Jubilee hall, 128 by 145 ft. and six stories high. For the university of Nashville and Central Tennessee college, see Nashville; for Cumberland university, see Lebanon; see also Vanderbilt University. Instruction in theology is provided by Central Tennessee college; in law, theology, and medicine, by Cumberland and Vanderbilt universities; and in medicine and surgery, by the university of Nashville and the Tennessee college of pharmacy in Nashville. The last named was organized in 1872, and in 1875-6 had seven instructors. In 1870 the state contained 3,505 libraries with an aggregate of 862,113 volumes. Of these, 2,732 with 597,399 volumes were private, and 773 with 264,713 other than private, including the state library of 19,000 volumes. The total number of newspapers and periodicals in 1875 was 141, including 9 daily, 1 tri-weekly, 1 semi-weekly, 110 weekly, 1 bi-weekly, 1 semi-monthly, 17 monthly, and 1 quarterly. In 1870 there were 3,180 religious organizations, having 2,842 edifices with 878,524 sittings, and property valued at $4,697,675, divided as follows:

The name of Tennessee is derived from Tannassee, the Indian name of the Little Tennessee river. De Soto probably visited the spot where Memphis now stands. The first settlement was attempted in 1754 by a small body of North Carolinians, but they were speedily driven from the country by the Indians. In 1756 the first permanent settlement was made, and Fort Loudon built on the Tennessee river about 30 m. from the present site of Knoxville. This was the first Anglo-American settlement W. of the Alleghanies and S. of Pennsylvania. In 1760 the fort was besieged by the Indians, and the whites capitulated, stipulating that they should be allowed to return to North Carolina. On the second day of their march they were overtaken by the savages and many of them butchered, and the survivors reduced to captivity. In 1761 another armed force from Virginia and North Carolina entered the district, and after a number of successful battles with the Indians compelled them to sue for peace. A treaty was made with them, and the settlements along the Watauga and Holston rivers increased rapidly, being known from 1769 to 1777 as the Watauga association. In the colonial assembly of North Carolina in 1776 the territory was represented by deputies as the district of Washington; and in the revolutionary war the settlers flocked to the standard of the colonists. At the close of the revolution a settlement was made on the Cumberland river where Nashville now stands. From 1777 to 1784 the territory formed part of North Carolina, which set apart a portion of the district in the vicinity of Nashville for bounty lands for her revolutionary soldiers. In 1785 the people became dissatisfied with the manner in which they were treated by the government of that state, and organized the state of Franklin, which was maintained until 1788, when it was again united with North Carolina. In 1789 that state ceded the territory to the general government, and in 1790 it was organized, together with Kentucky, as the territory of the United States. In 1803 Ohio. In 1794 a distinct territorial government was granted to Tennessee; and in 1796 a state constitution was formed at Knoxville, and Tennessee was admitted into the Union. The constitution was amended in 1834-5, and again in 1853. The seat of government was at Knoxville from 1794 to 1811, excepting in 1807, when it was at Kingston; from 1812 to 1816 at Nashville; in 1817 at Knoxville; in 1816 and from 1819 to 1825 at Murfreesboro; and from 1826 to the present time it has been at Nashville. The general assembly of Tennessee was convened in extra session Jan. 7, 1861, to consider what action should be taken by the state in view of the impending difficulties between the north and the south. In East Tennessee the people were generally opposed to secession; in West Tennessee there was a strong popular sentiment in favor of separation. The governor, Isam G. Harris, actively favored the southern cause. On Feb. 9 the people of the state voted on the question whether a convention should be held to consider the subject of withdrawing from the Union, and also for delegates to the convention. In a total vote of 127,000, there was a majority of nearly 12,000 against a convention. Of those who voted for delegates a majority of about 64,000 were in favor of the Union. The requisition for troops made upon Tennessee by the president after the firing upon Fort Sumter was refused by Gov. Harris, who again summoned the legislature to meet in extra session. Early in May a military league was formed with the Confederate States by commissioners appointed for that purpose, and was ratified by the legislature. On May 6 the legislature again provided for submitting the question of secession to the people. The election was held on June 8, and resulted in a majority of 57,675 for secession, the total vote being 102,151. In East Tennessee there was a large majority in favor
of the Union. Troops were now recruited and armed by the state for the confederate army and to resist invasion from the north. Batteries were erected to command the Mississippi from Memphis to the Kentucky line; troops were concentrated in West Tennessee under Gen. Pillow; and the confederate forces took possession of the three gaps in the mountains of East Tennessee. The invasion of Tennessee by the federal forces was begun early in 1863 by a combined naval and military expedition, which captured Forts Henry and Donelson in February. (See Fort Donelson.) Nashville, the headquarters of the confederate general A. S. Johnston, was taken a few days afterward, when the state government was removed to Memphis. (See Nashville.) A large portion of the state having now been restored to federal authority, Andrew Johnson was appointed military governor by President Lincoln, and assumed the duties of the office in Nashville on March 12. In the same month a formidable fleet of gunboats left Cairo, Ill., for the purpose of regaining the Mississippi river from confederate control. The advance of this fleet forced the confederates to abandon Island No. 10, Forts Pillow and Randolph, and other strongholds; and on June 6 Memphis was taken by the federal forces after a severe engagement between the gunboats. In November Gen. Rosecrans advanced from Nashville upon Murfreesboro, which was the centre of Gen. Bragg's operations in Tennessee. After a severe engagement lasting several days, the place was abandoned by the confederates, Jan. 4, 1863, and then became the depot of supplies for Gen. Rosecrans's army. The confederates now fell back to Shelbyville, and on the advance of Rosecrans in June retired to Chattanooga, which they abandoned on Sept. 8 upon the approach of Rosecrans. On the 19th and 20th a severe battle was fought about 12 m. S. W. of Chattanooga. The Confederate and Union forces were repulsed, but continued to occupy Chattanooga, which however was besieged by the confederates. In the latter part of November an advance was made upon the confederate lines by Gen. Grant, which resulted in the complete rout of the confederates. In this engagement were fought the battles of Lookout mountain and Missionary ridge. (See Chattanooga.) In the mean time Gen. Burnside had marched into East Tennessee, and he took peaceable possession of Knoxville early in September. In November, 1864, the state was invaded by a confederate force under Gen. Hood. Battles were fought with the federal forces at Franklin and at Nashville, the latter resulting in the complete rout of the confederates, under Gen. Hood, and their retreat from the state. (See Nashville.) During 1864 numerous raids were made in different parts of Tennessee by the confederates. On Jan. 9, 1863, a state convention assembled in Nashville and proposed amendments to the constitution, abolishing slavery and prohibiting the legislature from recognizing property in slaves. A schedule was adopted annulling the military league made in 1861 with the Confederate States, also the declaration of independence, the ordinance of secession, and all acts of the confederate state government, and prohibiting the payment of any debts contracted by that government. These amendments were ratified by the people on Feb. 22. W. G. Brownlow was subsequently chosen governor, and members of the legislature were elected. Each voter at these elections was required to take an oath that he had been and would continue to be loyal to the United States. The legislature met in Nashville early in April, ratified the 13th amendment to the federal constitution, reorganized the state government, and elected senators to congress. Among the acts passed was one prescribing the qualifications of voters, which disfranchised those who had not been "publicly known to have entertained unconditional Union sentiments from the outbreak of the rebellion until the present time." The 14th amendment to the federal constitution was ratified in 1866, and the state was soon after admitted to representation in congress. The revision of the constitution by a convention sitting at Nashville from Jan. 10 to Feb. 22, 1870, was ratified on March 26 by a popular vote of 98,128 to 33,872.—See "The Geology of Tennessee," by Dr. J. M. Safford (1869), and "The Resources of Tennessee," prepared under the direction of the state board of agriculture by J. B. Killebrew (Nashville, 1874).

TENNESSEE RIVER, the largest tributary of the Ohio, formed by the union of the Clinch and Holston rivers, which rise in S. W. Virginia, and unite near Kingston, Roane co., Tenn. At first the course of the Tennessee is S. W. to Chattanooga, near the S. line of the state, where it passes through a part of the Cumberland range of mountains in a series of bends, and again turns S. W., entering the state of Alabama, and at Gunter's Landing, Marshall co., Ala., assumes a direction nearly W. by N. Between Lauderdale and Lawrence counties it spreads in a broad but shallow expansion called Muscle shoals, flowing over flint and limestone rocks in a succession of rapids for 36 m., and affording a large amount of water power. It afterward passes near Tuscumbia and Florence, on opposite sides, and at Chickasaw on the Mississippi line turns N. W., and forms the boundary thence to the Tennessee line between Alabama and Mississippi. Reentering Tennessee after a circuit of nearly 300 m. in Alabama, it flows almost due N. till it reaches Birmingham, Ky., when it turns W. N. W. and enters the Ohio at Paducah, McCracken co., 50 m. from the mouth of the latter. Its length from Kingston to Paducah is estimated at 800 m., but from the source of its longest affluent, the Holston, it is more than 1,100 m. Its principal tributaries are the Sequatchie,
tennis

Tennyson, Alfred, an English poet, born at Somersby, Lincolnshire, in 1809. His father was the Rev. George Clayton Tennyson, rector of Somersby and vicar of Bennington and Grimby. His mother was a daughter of the Rev. Stephen Frythe, vicar of Louth. Alfred is the third of twelve children. He received his early education from his father, and was sent to Trinity college, Cambridge, where in 1829 he gained the chancellor's medal for a poem in blank verse entitled "Timbuctoo." In 1827, with his brother Charles (who has since become vicar of Grasby and assumed the name of Turner), he had published a small volume entitled "Poems, by Two Brothers." Coleridge expressed the opinion that only the pieces signed "C. T." gave promise of a coming poet. In 1830 Alfred published "Poems, chiefly Lyrical," in which the only striking piece was "Mariana;" but a revised and enlarged edition (1833) contained "The Lady of Shalott," "The May Queen," "Cenone," "A Dream of Fair Women," and "The Lotos-Eaters." This volume attracted comparatively little attention. In 1842 he published "English Idyls, and other Poems" (2 vols.), which contained all that he cared to preserve of the previous volume, and included also "Locksley Hall," "Morte d'Arthur," "The Talking Oak," "The Day-Dream," "The Two Vics," "Simeon Stylites," and "Ulysses." Tennyson's acknowledged rank as the first of living poets dates from the publication of these volumes. In 1847 he published "The Princess, a Medley," in blank verse, which has for its theme the question of the proper sphere of woman. The songs that form the interludes were introduced in the second edition. "In Memoriam," a series of 129 brief elegiac poems, suggested by the death of his friend Arthur Henry Hallam (see Hallam), and written at intervals since 1833, appeared anonymously in 1850. On Nov. 21, 1850, after the death of Wordsworth, Tennyson was appointed poet laureate. His only notable performances in that capacity are the "Ode on the Death of the Duke of Wellington" and the "Charge of the Light Brigade at Balaklava," the popularity of each of which has been inversely as its merits. Both of these were included in the volume entitled "Maud, and other Poems" (1855). "Maud" was so anomalous, both in narrative treatment and metrical construction, that critics and readers were widely at variance concerning it; but there was no dissent from the applause which greeted the "Idyls of the King" (1859), four stories in blank verse, under the titles "Elin," "Vivien," "Elaine," and "Guinevere," drawn from the legends of King Arthur. These began a series which was continued in "The Holy Grail," "Gareth and Lynette," "Felles and Etarre," "The Last Tournament," and "The Passing of Arthur" (1869–73). The whole "Vicars," been foreshadowed in the prelude to the fragment entitled "Morte d'Arthur," which after 80 years found its place in the closing poem of the series. "Enoch Arden, and other Poems" (1864), included "Sea Dreams, an Idyl," for which Tennyson had received £10 a line on its original publication in "Macmillan's Magazine." With the exception of "Tithonus," "The Northern Farmer" (in dialect), and one or two other short pieces, the volume contained nothing worthy of the laureate; but the national poem met with a wide popularity, and its title has become proverbial, from the supposed peculiarity of its
plot. "The Window, or the Songs of the Wrens," written for music by Arthur Sullivan, appeared in 1870, and "Queen Mary, a Drama," in 1873. TENNYSON, an invalid, at various places, much of the time in London, till 1851, when he married Emily, daughter of Henry Sellwood, and settled at Farringford, Freshwater, Isle of Wight. In 1869 he removed to Petersfield, Hampshire. He has also a residence at Aldworth, Haslemere, Surrey, and is lord of the manors of Grasby and Prior's Freshwater. The university of Oxford conferred on him the degree of D. C. L. in 1859. Since 1850 his poems have been regularly reprinted in the United States, and two rival editions (New York and Boston, 1871) contain the suppressed pieces of his early volumes, and also some never collected by himself. His "Poems" have been translated into German by W. Herzberg (Dessau, 1854); "In Memoriam" by R. Waldmüller-Duboe (Hamburg, 2d ed., 1872) and Agnes von Bohlen (Berlin, 1874); and "Enoch Arden" by C. Hessel (Leipsic, 1874). "Elin" and "Elaine" have been translated into Spanish by Lope Gisbert (1875). His "Idyls of the King" have been illustrated by Doré. D. B. Brightwell has published a concordance to Tennyson's works (London, 1889).—See "Analysis of Tennyson's In Memoriam," by the Rev. F. W. Robertson (1887); "A Study of the Works of Alfred Tennyson," by E. C. Tanish (1898); and "Victorian Poets," by E. C. Stedman (1875).—FREDERICK, his elder brother, obtained at Cambridge a prize for a Greek poem in 1828, and in 1834 published "Days and Hours," a volume of poems.

**TENOR** (Lat. tenere, to hold), the second of the four parts in harmonic composition, reckoning from the bass, or the highest natural adult male voice, having a general compass from G, the second space in the bass, to A or B flat in the treble, though composers in chorus writing do not find it prudent often to write higher than G for this voice. The term is derived from the fact that in the ancient part compositions the tenor sustained or held the plain-song or principal air.

**TENSAIS**, a N. E. parish of Louisiana, bordering on the Mississippi, and drained by Ten- sas river and Macon bayou; area, 680 sq. m.; pop. in 1875, 18,520, of whom 17,100 were colored. The surface is low and flat, and the soil fertile. It has steamboat communication with the interior by way of the Tensas river, which runs nearly parallel with the Missis- sippi, and joins the Washita in Catahoula parish to form Black river. The chief productions in 1870 were 94,600 bushels of Indian corn, 13,950 of sweet potatoes, and 25,371 bales of cotton. There were 1,211 horses, 2,404 mules and asses, 2,748 cattle, 1,043 sheep, and 2,654 swine. Capital, St. Joseph.

**TENT** (Lat. tentorium, from tendere, to stretch), a portable habitation, formed generally of cloth or skins stretched upon cords or frames, and supported by poles. Tents have always been the dwellings of nomadic tribes. The natives of the East brought them at an early period to a high state of perfection, and they are frequently mentioned in the Bible. The patriarchs were dwellers in tents, and St. Paul was a tent maker. Skins are first mentioned as a tent covering in Exodus xxvi. 14, where the tabernacle is ordered to be cov- ered with rams' and badgers' skins. Tents of cloth made of camels' and goats' hair, like those of the Arabs of the present day, were also used. The Persian monarchs passed por- tions of the summer in tents in the mountains, and the custom of living in them during the hot months still prevails in the East. The Greeks encamped in tents at the siege of Troy, and the magnificence of the Persian tents and tent equipage is attested by many ancient writ- ers. Tents were early used by the Roman armies, the first being made of skins or leather, and Hannibal's forces were provided with them when they crossed the Alps into Italy. The Roman tabernaculum resembled the house tent, and the tentorium the wedge tent of the present day. A later and more elaborate tent was called papilio; it was probably circular, with a conical roof, but its exact form is not known. The armies of the crusades were pro- vided with elaborate tents, and their Saracen antagonists were equally well furnished. Medi- eval tents were sometimes of the most splen- did description. The finest were very large, of the pavilion form, and divided into several apartments. Their hangings were frequently of silk and damask of many colors, and their cords and stay ropes of twisted gold.—Tents are said to have been first issued to modern armies by Louis XIV., but they were furnished only to certain privileged corps. According to Bardin, the Prussian army was the first regularly provided with them. Until near the middle of the 18th century there was little uniformity in their shape or quality. The earliest form in use in modern armies was probably the wedge tent, formed of a square piece of cloth over a ridge pole, and without stay ropes. A wedge tent rounded at one end and open at the other was called a cannonière in the French service in the last century. The cortine or courtine was an oblong wall tent, used by officers; when furnished with a fly or second roof, it was called a marquise or marquee. The use of tents in the French armies was almost abandoned after the begin-
ning of the revolution, and during the wars of the empire even the officers were rarely provided with them. It was not until about 1830, during the Algerian war, that the tente abri or shelter tent began to be regularly furnished to troops. This is made of two rectangular pieces of canvas, each 5 ft. 9 in. long and 5 ft. 4 in. wide, which are buttoned together and raised upon two sticks so as to form a roof open at both ends. Each soldier carries one of these pieces, one of the supporting sticks, and three pegs, which together weigh 3 lbs. 11 oz., and every two men are thus enabled to provide a shelter for themselves. This is still the French regulation tent, and was used in the Crimea, in Mexico, and in the Franco-German war. Besides this the French have three troop tents: the bonnet de police, which has the form of a triangular prism, to each end of which is joined a hemisphere; the tente elliptique or Taconnet, a slight modification of the former; and the tente conique or marabout, a cone 22 ft. 4 in. in diameter at base and 10 ft. 8 in. high, with an interior curtain 14 in. high, which drops down around its base, leaving an interior diameter of 18 ft. 8 in. Each of these tents has two doors, opposite to each other. The French use also a marquee for general officers and a tente de conseil, the latter a round wall tent 20 ft. in diameter, with a conical roof. In the British service the use of tents was more generally adhered to after their introduction than in the continental armies. The troop tent principally used is the "bell" tent, a con-}

sian infantry tent is square, with a centre pole and four corner poles. It is 14 ft. in diameter and the side walls are 7 ft. high; it is intended for 12 men. The officers' tents are like those of the men, excepting that the roofs are of double canvas. The Italians use shelter tents, conical tents, and marquees. The shelter tent is formed of three rectangular sections, one of which is spread on the ground. The pieces are a little larger than those of the tente abri, and are supported by muskets instead of sticks. The conical tent, which is used by officers, is a modification of the French tente conique.

A similar tent is in use in the Turkish army also, for both officers and men. In the United States the tents used most commonly have been the wedge, the Sibley, and the shelter. The wedge tent is 6 ft. 10 in. long, 8 ft. 4 in. wide, and 6 ft. 10 in. high; it is intended for five or six men. The Sibley tent is a modified Comanche lodge: it is a cone about 13 ft. high, with a diameter at base of 18 ft., and will shelter 12 or 14 men. During the last years of the civil war the shelter tent was used almost exclusively. The sections of the regulation tent are each 6 ft. long by 5 ft. 6 in. broad, and are made of cotton cloth with a coating of caoutchouc. Each section has a slit in it, through which the head may be passed, thus forming a poncho on the march, in rainy weather. It can also be used as a blanket. Shelter tents are sometimes formed in the American service into "half-faced camps," by fastening together two or three sections and stretching them from a ridge pole to the ground, thus making a back and roof. The triangular ends are then closed with other sections, and a fire built in the front, which is left open. This contrivance makes a very comfortable shelter, the heat which is reflected from the roof and sides keeping the men sufficiently warm. — The coverings of tents are now made generally of flax or cotton, hemp being rarely employed. The French tissu is of Belgian or Picardy flax, the English of the best long Baltic flax. The Austrian and the German canvas is also linen. The Italian government uses cotton canvas for large tents, and the Turkish government uses it altogether. In the United States army tents are made of cotton only, which is cheaper here than linen, while in Europe linen canvas can be produced at a lower price than cotton. The relative merits and demerits of the two tissues depend greatly on their mechanical structure and on

---

**Fig. 2.** 1. French Tente elliptique. 2. English Bell Tent.
the quality of the materials used, but the weight of authority seems to favor cotton in preference to linen. In the beginning of the American civil war, when the price of cotton became excessive, the United States government purchased a large number of linen tents, but the troops objected to using them, and they were replaced by cotton ones. — *Hospital Tents.* In ancient times sick and wounded soldiers were treated in their general quarters. Tents specially set apart for the sick are said to have been first provided by Queen Isabella of Spain during the wars of Granada, but they did not come into general use. Invalids were occasionally treated in tents during the 17th and 18th centuries, but no organized tent hospitals, the records of which have any sanitary value, were established before the Crimean war. The enforced use of tents at Varna, made necessary by the absence of houses, first aroused attention to the subject of tent hospitals. The tent used was the hospital marquee of the British service, which is a double tent, a large one completely enveloping a smaller one, with an air space of about 18 in. between them. The outer tent is 89 ft. long, 15 ft. wide, and 12 ft. high in the middle, with walls 5 ft. high, and it has a floor cloth of painted canvas. It will accommodate 12 or 14 persons. The Prussian hospital tent, adopted in 1867, is house-shaped, double, supported by an iron frame, and large enough for 12 beds. In the Franco-German war a small square tent, supported by a light wooden frame and having a projecting pyramidal roof, was used. It was intended for but two beds, and was specially devoted to the treatment of those suffering from contagious diseases. The Turks have made use of a hospital tent which is described as of a long oval shape, supported by a pole at each end, and made of double canvas. The Russians, Austrians, and Italians have no special tent set apart for this purpose. The hospital tent used by the United States government is a rectangular house tent, 14 by 15 ft. in diameter, and 11 ft. high in the centre, with a wall 4 ft. 6 in. high, and a fly forming a second roof which overlaps the wall about a foot. At one end it is furnished with a lapel so that two or more tents can be joined together to form one long tent. Each tent accommodates eight or ten patients. — See "The American Ambulance," by Dr. Thomas W. Evans (London, 1873).

**TENURE** (Lat. *tenere*, to hold), in its most general sense, the mode of holding property, In law it is usually confined to the manner of holding land or real property. The first grand division of tenures is into alodial tenures and feudal tenures. Of the word alodial, both the origin and the exact original meaning are uncertain. Practically it means a tenure which unites the right of the lord and the right of the tenant, or all right and title to or interest in the land. Hence, one who held land by alodial tenure had full and unencumbered possession of it, with an absolute right to use and dispose of it at his own pleasure, with no control of any one, and no responsibility to any one. An alodial holding stands in direct contrast with a feudal tenure, of which it was the essential quality that a tenant held it of a lord, and that tenant and lord had each their separate rights and interests in it and over it, or, in the language of the law, their separate estates in it. From this characteristic of alodial tenure, it is sometimes said that all the land in the United States is held by this tenure. — It seems to be generally admitted that previous to the prevalence of the feudal system the lands of European nations were held by alodial tenure, and that during the convulsions of the 8th, 10th, and 11th centuries, it became common for holders of land voluntarily to convert their alodial tenure into a feudal tenure, and so hold of some lord. One reason, and probably the strongest, was to obtain his support and protection in return for the allegiance of the tenant; but it may be believed that another cause of this change was the general desire to profit by the opportunity which the feudal system offered of escaping from the disorder and fragmentary condition of society then prevalent. This feudal system was nowhere more fully developed or more firmly established than in Normandy. It was therefore a matter of course that when William acquired England for holders of land voluntarily to convert their alodial tenure into a feudal tenure, and so hold of some lord. He divided the land in unequal portions, observing that gradation of rank and of possession which constituted a characteristic feature of the system. While he who received a single manor became a baron, and had his own court, they who received six or more were originally classed as greater barons; and to some of his principal chiefs he gave as many as 700 manors. In this way he divided most of the valuable land of England. His immediate successors followed the same system, and before a century had elapsed the feudal system and the feudal tenures were established over nearly all England. All these tenures rested upon the fee (see *Fee*); but they were very various, and divided the interest in and the beneficiary use of the land, between
the lord and the vassal, in very different proportions. There were generally many lords, for the system of subinfeudation prevailed, and the vassal held of his immediate lord, he of the next higher, and he of the next, the series always going up to and ending with the sovereign. Hence we may say that all tenure rested upon two principles: one, that all land was held of the sovereign, who retained certain rights and interests therein; the other, that all the rights and interests of all the lords, and of the tenant finally in possession, added together, constituted that allodial tenure already mentioned. There were various kinds of tenure, as for example tenure by copyhold, tenure in gavelkind, and the tenure of borough English. Of copyhold there is nothing in the United States. The principal feature of tenure in gavelkind was that all the sons inherited equally and together, instead of the eldest son alone, which latter is the rule of the feudal system, and is nearly universal in England. (See Gavelkind, and Heir.) Of tenure by borough English, the essential principle is, that neither the eldest nor all the sons inherit, but the youngest takes as heir. For this strange custom Littleton accounts by the lesser ability of the youngest son to take care of himself; but a custom prevalent in many parts of the United States offers a more probable explanation of this tenure. It is common in New England, for example, for the eldest son, as he comes to maturity, to receive what assistance his father can give, which is considered as his share of the estate; the same thing is done with other sons as they reach full age; until at length only the youngest son is left to take charge of his parents. When they die he has the homestead; or while they live they relinquish it to him, taking his obligation or trusting to his affection for support. The same custom is said to exist in Tyrol, Bavaria, and other parts of Germany. —The tenure with which we have most concern is that of socage. This was wholly liberated from the stringent military services which generally prevailed, and the civil services on which land was held under it were for the most part easy and honorable. At an early period it became known as "free and common socage," as this tenure spread over England, the severities, restrictions, and encumbrances of the common feudal tenures passed away, until this process was completed by the statute 12 Charles II. (1661), and nearly all the old feudal tenures (all in fact which were in any way burdensome or restrictive of the proper rights of the tenant) were reduced to the tenure of free and common socage. This tenure has all the actual advantages of allodial ownership. The beneficial use which one who holds by this tenure has in the land comprises, for all practical purposes, a sole, undivided, and unencumbered interest. Escheat remains as a feudal incident to the tenure, but the lord cannot profit by it if the tenant has an heir or chooses to make a will. The tenant in fee simple of lands held in free and common socage can make any disposition of them, and carve any estates out of them, which the law of real estate permits; and any one to whom he grants it by sale or gift, or devises it by will, takes title directly from the grantor or testator, and his title is complete without the consent or concurrence of the lord or any action whatever on his part. It may be added that this tenure, unlike most other feudal tenures, has no reference whatever to the rank or occupation of the tenant, or to the purposes to which the lands are applied. This was the tenure created or prescribed by all the early colonial charters or patents from which our titles are now derived; as the charter of Virginia in 1606; the patent of New England in 1620; the charter of Massachusetts in 1629; of Maryland in 1632; of the province of Maine in 1639; of Connecticut in 1662; of Carolina in 1663; of Rhode Island in 1663; of Pennsylvania in 1681; the act of the general assembly of the colony of New York in 1691; and the charter of Georgia in 1752. But in New York, Pennsylvania, Connecticut, and Michigan all feudal tenures, including of course that of free and common socage, are abolished by statute; and it seems to be held, that under the provisions of the ordinance of 1787 the doctrine of tenures is not in force in any of the states formed out of the territory to which that ordinance applied. Substantially, our tenure unites what is best in both the allodial tenure and that by free and common socage. Nor is the fact without its historical value, that the alodial tenure, which formerly prevailed over all Europe, among all the nations who were the ancestors of European nations and so of our own, after being displaced for more than 1,000 years by the feudal system, is at length reestablished in full force throughout the United States. And yet there are reasons for thinking the tenure of free and common socage, freed as it certainly is now from all feudal encumbrance, explains and illustrates our law of real estate better than the other theory. One reason is, that the principles of the feudal system do in fact underlie all the doctrines and all the forms of the common law in regard to real estate; and wherever the common law prevails, which it does in all the states excepting Louisiana (where the municipal law is founded upon the Roman civil law), the principles of the feudal law and of feudal tenure must be understood and made use of. Another reason is, that the law of escheat is universal with us (see Escheat), and it is governed by the law of feudal tenure, modified by our statutes. A third reason is, that the important and universal law of eminent domain is far better understood and applied by the theory that all property is held from the sovereign, that is, the state or people; and that in the original grant on which all title is founded, the sovereign reserved the right to resume the same for his own, that is,
for the public use, on making adequate compensation. Yet another reason is, that the obligation of fealty remains in full force. It is now and here an obligation only to the sovereign. It is implied, or rather it is expressed, in the oath of allegiance; but it does not depend on this oath. It is the obligation and the duty which rest on every citizen of the United States, as the condition upon which he holds all property, all interests, and all rights, to be "feall and loyall," as the old law expressed it, to be faithful and loyal to his sovereign, that is, to the state and to the Union.

TEOS, an ancient Ionian city, on the W. coast of Asia Minor, about 25 m. S. W. of Smyrna. It is noted as the birthplace of Anacreon. It had two good harbors, and was a flourishing commercial town till the Persian conquest. The village of Sighajik, 14 m. N. of Teos, has walls constructed from its ruins. The chief ruin is that of the temple of Bacchus.

TEPLITZ, or Töplitz, a watering place of N. Bohemia, in the circle of Leitmeritz, 45 m. N. W. of Prague; pop. in 1870, including the adjoining village of Schonau, 11,618. In the season of 1875 it was visited by about 30,000 invalids and tourists. Of the 17 alkaloe-saline springs, 11 are now used, chiefly for the gout and rheumatism. A treaty of alliance between Russia, Prussia, and Austria, against Napoleon, was concluded here, Sept. 9, 1813.

TEQUENDAMA, Falls of. See Bogotá.

TERAMO. I. A province of S. Italy, formerly Abruzzo Ultraiore I. (See Abruzzo). II. A town, capital of the province (anc. Interamna), 85 m. N. E. of Rome; pop. about 19,000. It is the sea of a bishop, and has a modernized Gothic cathedral, and manufactories of hats and cream of tartar. Interamna, which is also the ancient name of Ternti and other places, was a city of Picenum. Many vestiges of the ancient city have been discovered on the site of Teramo.

TERATOLOGY (Gr. τέρας, a wonder or monster, and λόγος, discourse), that branch of physiological science which treats of the malformations and monstrosities of plants and animals. On account of its greater interest, more attention has been given to the latter, particularly within the present century, by French and German physiologists. There was no attempt to systematize the study of monstrosities till the time of Geoffroy Saint-Hilaire, who gave the science the above name. His classification is given in the article Moxarein. He divides the history of monstrosities into three periods, viz.: the fabulous, the positive, and the scientific. The fabulous period is all that prior to the 16th century; the positive embraces the first half of the 18th century; while the scientific dates from the middle of that century. In the fabulous period the prevalent belief attributed the formation of human monsters to divine anger as punishments to parents, or to demonic influence, and as the progeny of the devil they were destroyed. As late as the beginning of the 17th century it was said by learned men that children with six fingers were made in the image of the devil, and a remnant of such superstition still exists. The first important work was published by Leicetus in 1616, in which he gives a great collection of the most fabulous monsters. He quotes largely from a work on monsters by Lycothenes (1557), and his pages abound in wonders. A work published by Haller in 1768 is the first which may be regarded as scientific. Buffon gives a classification of monsters in his "Natural History." Meckel, the celebrated physiologist, published a complete treatise on monsters in his Handbuch der pathologischen Anatomie (1812—18), and Tiedemann makes important observations on the genesis of monsters in his Anatomie der kopflosen Missgeburt (1818). Works of the greatest importance were those of the two Geoffroy Saint-Hilaire (1822, 1829, and 1832—0). A work on monsters in Dutch and Latin, by W. Vrolik, is one of the most complete manuals on teratology (Amsterdam, 1840—42; new ed., fol., with 100 plates, 1849), and contains the most complete atlas that has ever been published. See also articles in the transactions of the New York state medical society for 1865, '66, '67, and '68, on "Diploteratology," by Dr. J. G. Fisher of Sing Sing, N. Y., giving a brief history of the subject of teratology, adding to the classification, and giving also the history of many cases of double monsters; J. North, "Lectures on Monstrosities" (London "Lancet," 1840); Allen Thompson, "Remarks upon the Early Condition and Probable Origin of Double Monsters," in "London and Edinburgh Monthly Journal of the Medical Sciences," (1844); J. Vogel, Pathologische Anatomie des Menschen (Leipsic, 1845); C. Rokitansky, Lehrbuch der pathologischen Anatomie (Vienna, 1851—61); William F. Montgomery, "Account of a very remarkable Case of Double Monster," &c., in "Dublin Quarterly Journal of the Medical Sciences" (1855); A. Förster, Die Missbildungen des Menschen (2 vols. 4to, with 26 plates, Jena, 1861); and M. Lerbouillet, Recherches sur les monstrosités du brochet observées dans l'eau, et sur leur mode de production, in the Annales des sciences naturelles (Paris, 1869).

TERBIUM, a supposed metal discovered by Muschenbroek, is associated with terbium and yttrium in the mineral gadolinite. Very carefully conducted experiments of Bahr and Bunen throw great doubt on the existence of terbium, and further experiments are required to afford a perfectly satisfactory answer to the question whether crude yttria is a mixture of three earths or of only two. According to Delafontaine, terbia is an earth of a pale rose color, the solutions of which exhibit an absorption spectrum, whereas the salts of erbia do not exhibit the same phenomenon by prismatic analysis. The metal terbium has never
been isolated, and a majority of chemists at present discredit its existence.

TERBURG, Gerard, a Dutch painter, born in Zwolle in 1608, died in Deventer in 1681. He painted cabinet size conversation pieces, musical parties, and ladies at their toilets. In 1648 he painted a picture of the pleiophontenaries assembled at the congress of Münster, which led to his being invited to Madrid by Philip IV. He excelled in color and the finishing of his draperies, especially white satin.

TERCÈRA, one of the Azore islands, near the centre of the group; lat. 38° 40′ N., lon. 27° 10′ W.; extreme length 20 m., general breadth about 12 m.; pop. about 50,000. The coast is generally bold and precipitous, and the central part of the island is mountainous, the summits consisting mostly of fertile plains. Many of the mountain masses are composed of soft pumice. The island is well watered, and the soil fertile. Grain, wine, and cattle are produced, and it exports oranges and lemons. Capital, Angra.—In 1829 Tercèra became the seat of the regency for Dona Maria da Gloria during Dom Miguel’s usurpation in Portugal, and Dom Pedro I. of Brazil collected there forces for the recovery of his daughter’s throne.

TEREDO. See Sip Wurm.

TERENCE (Publius Terentius Afer), a Roman comic poet, born in Carthage about 195 B.C., died about 159. He became a slave of P. Terentius Lucanus, a Roman senator, who gave him an excellent education, and finally freed him. The Andræa, his first play, was acted in 166, and its success introduced him into the best society of Rome, Lælius and the younger Scipio being among his associates. Later in life he went to Greece, and there translated 108 of Menander’s comedies. The manner of his death is uncertain, though the common account ascribes it to grief at the loss of all his translations of Menander. Six of his comedies are extant, and besides the Andræa (“The Woman and the Man”), the plot of which was adopted by Steele in his “Conscious Lovers,” there are Hecyra (“The Stepmother”), produced in 165; Haetton - Timororumenos (“The Self-Tormentor”), produced in 163; Eunuchus (“The Eunuch”), the most popular of his plays, for which he received 8,000 sesterces, produced in 162; Phormio, produced in 162; and Adelphi (“The Brothers”), acted first in 160. The dramas of Terence all belong to the fabula palliata, and with the exception of the last two were first performed at the Megalesian games. The plots were borrowed from Menander. Terence’s Latinity is elegant, and his works have been handed down in a very correct state. There have been numerous imitations of his comedies by the moderns, and they have been translated into nearly all the languages of Europe. The first edition is probably that of Milan (fol., 1470). Recent editions of the text with notes are those of Davies (London, 1869), Wagner (London, 1869), and Umpfenbach (Berlin, 1870). Among English translations are those of Colman (London, 1765), Patrick (Dublin, 1829), and Riley (London, 1853).

TERHUNE, Mary Virginia (Hawes), an American novelist, under the pseudonym of Marion Harland, born in Amelia county, Va., about 1855. At the age of 16 she published in “Godey’s Lady’s Book” a sketch, entitled “Marrying from Prudential Motives,” which was copied into an English periodical, translated into French, retranslated into English, and published in England and America as an English tale. In 1856 she married the Rev. E. P. Terhune, and since 1859 has resided at Newark, N. J. Her works are: “Alone” (Richmond, 1854; 19th ed., 1856); “The Hidden Path” (New York, 1856); “Moss Side” (1857); “Miriam” and “Nemesia” (1860); “Husbands and Homes” (1865); “Sunnybank” (1865); “The Christmas Holly” (1867); “Ruby’s Husband” (1868); “Phemie’s Temptation” (1869); “Helen Gardner,” “The Empty Heart,” “Common Sense in the Household, A Manual of Practical Housewifery,” and “At Last” (1870); “True as Steel” (1872); “Jessamine” (1873); and “From my Youth Up” (1874).

TERMINI-IMERESI (anc. Thermae Himerenses), a town of Sicily, part of the ancient northern Himera, in the province and 20 m. S. E. of the city of Palermo, E. of the mouth of the San Leonardo; pop. in 1872, 25,780. It has fine churches, a good harbor, fisheries, and an active trade in local products, including macaroni, which is the best in Sicily.—After the destruction of the Greek city of Himera by Hannibal, the son of Gisco, in 409 B. C., the surviving inhabitants fled to the neighboring Therma, so named from its celebrated hot sulphur springs. The town appears to have existed during the Roman empire, and considerable portions of the Roman part are still visible. The southern Therma and the Thermae Sichuntiae is described under Sciacca, its modern site. (See also Himera.)

TERMITES, the proper name of the white ants, or the neuropterous insects of the family termitinae. Though they resemble the common ants (formicæ) in their social habits, they belong to a different order, and in many respects come near the orthoptera. In the genus termes (Linn.) the antennæ are thread-shaped, with about 20 joints; the eyes small but prominent, and the ocelli three; the mouth as in orthoptera; thorax distinct, and wings large, long, and membranous; legs short with four-jointed tarsi; abdomen with a pair of minute caudal appendages. They live in vast communities, principally in the tropics, and do great damage by devouring everything but metals and stone which comes in their way, gnawing even the interior of the beams of houses, leaving only a thin shell. According to Latreille there are five classes in their communities, males, females, workers, neuters, and soldiers. The males and females are at first
exactly alike, and are furnished with four very long, nearly equal wings; after impregnation the abdomen increases greatly from the immense number of eggs which it contains; as many as 80,000 may be laid by one female in 24 hours, making about 30,000,000 in a year. Most of the community is made up of wingless individuals, resembling the winged insects, but without eyes; these are the workers, which perform all the labors of construction. Others without wings apparently pupae, resemble the workers, but have four tubercular wing cases on the thorax; these are supposed to be neuters or incomplete females, which attend upon the king and queen and take care of the young brood; the extraordinary fecundity of these ants renders necessary a large class of neuters, which possess the affections of maternity without the power of reproduction. The fifth class, apparently neuters still further developed, have very large jaws, and are the soldiers and defenders of the rest. From the researches of Fritz Müller ("Nature," 1874) it appears that, unlike the social hymenoptera, the neuters of the termites are not sterile females, but modified larva which undergo no further metamorphosis; that both sexes are represented among the neuters; and that there are in many (if not in all) species two forms of sexual individuals, winged and wingless males and females; the former produced in vast numbers, leaving the nest, and most of them perishing; the latter never leaving the termitary where they were born. The constitution of their societies in its general characteristics does not vary essentially from that noticed under Ant. They make edifices of a most remarkable size and complexity, usually on the ground, but sometimes among branches of trees and in houses, communicating with the ground by long spiral galleries. When on the ground, the most usual shape is that of a group of irregular cones, frequently 12 ft. high, looking like huts of the natives, and so firmly constructed that man and beast can stand on them securely; they are built of earth softened in the jaws of the workers, which dries quickly and becomes very hard. A nest is divided internally into numerous chambers and galleries, in one of which the queen is imprisoned, and waited upon by numerous special attendants whose apartments are in close proximity to the royal cell; the male is said to lie concealed under one side of the enlarged abdomen of the female. The attendants carry off the eggs as soon as they are laid into separate chambers, where the young when hatched are tended by the nurses. There are generally two or three roofs within the dome-shaped interior, and the thick walls are perforated by passages leading in various directions to the nurseries, magazines of food, ground floor, and subterranean entrances; the food consists principally of decaying and dried wood, though gums and thickened vegetable juices are stored in their magazines. The king and queen have no regal authority. Destru-

tive as the termites often are, they play a most important part in the economy of nature by removing decaying wood, which otherwise in a short time would seriously interfere with vegetation in the tropics.—The largest and best known species is the warrior white ant of Africa (T. fatalis, Linn., or T. bellicosus, Smeath.); in each nest there are a king and queen, and about 100 workers to one soldier; the workers are about a quarter of an inch long, always busy and very fast runners; the soldiers, which appear to be the same further developed, are about half an inch long, and the perfect insects from \( \frac{1}{16} \) to \( \frac{1}{4} \) of an inch long; it is supposed

*Nest of the White Ant (Termes bellicosus).

ity by the natives and even by Europeans, who roast them in the manner of coffee. (See "In-
spect Architecture," by James Rennie, in the
"Library of Entertaining Knowledge," Lon-
don, 1830—31.)—There are other species in
tropical Asia, and even two or three in south-
ern Europe. In the United States a represen-
tative species, the T. frontalis (Haldeman), has
been noticed at Salem, Mass., where it did
considerable mischief in greenhouses and granaries,
not only attacking decaying and dead wood,
but also excavating the roots of living vines
and causing their destruction. (See "Pro-
ceedings of the Boston Society of Natural His-
tory," vol. vii., pp. 287, 288, May 2, 1860.)

TERN, the proper name of the birds of the
gull family and subfamily sternina, among
which is included the noddy, previously de-
scribed. The terns have a rather long, usually
slender, nearly straight, and sharp-pointed bill;
wings elongated, with long and pointed prima-
daries; tail long, forked; tarsus slender, anterior toes with a deeply notched web, hind toe small, and the claws curved
and sharp. They are found on and near the
sea shore, and sometimes on inland lakes and riv-
ers, most of the time hovering with rapid and
easy flight over sandy bars and shallows, dart-
ing suddenly upon small fishes and crustaceans;
they are often seen swimming and resting on
the water, but never diving; from their forked
tail, small size, and swift and graceful flight,
they are popularly called sea swallows.—In
the typical genus sterna (Linn.) the upper
mandible is slightly curved, with the frontal
feathers extending to the nostrils; the outer
quill is the longest. It contains more than
60 species, in both hemispheres, migrating in
bands from place to place according to sea-
son; the eggs are two to four, usually depos-
ced in a slight hollow in the sand on rocks sur-
rounded by the sea; the hatching is left most-
ly to the sun, the females sitting only at night
and in cold weather; the young are carefully
fed and bravely defended. The largest spe-
cies is the Caspian tern (S. Caspia, Pall.), 214
in. long, 51 in. in alar extent, with a very
stout bill of 3 in.; the back and wings are
pale bluish ash, the upper parts of the head
black with a greenish gloss, the quill shafts
and the under plumage pure white, the bill ver-
million, and the legs and feet black; the tail
is not much forked; the young are mottled above
with blackish brown. It is found in the
United States from the coast of New Jersey
northward, and all over Europe, in the vicinity
of the Caspian sea (where it was first found
and described by Pallas), and also in Africa.
The eggs, as in most of the terns, are yellowish
stone-colored, with ash-gray and dark reddish
brown spots; they are 2 by 1 1/4 in. The Cay-
enne or royal tern (S. Cayana, Bonap.) is 21
in. long and 49 in. in alar extent, with a deep
red bill of 28 in.; the mantle is bluish gray,
lower parts white, legs and feet black, and the
tail forked. It is found on the Atlantic coast

from Labrador to Florida, being abundant
about the southern keys; it also occurs in
California. It is very shy, and utters loud and
harsh cries during flight; when any are killed
out of a flock, the rest dart toward the gunner;
when wounded they eject the contents of the
stomach, and bite severely; the eggs are 2 1/2 by
1 1/4 in., and like those of the other species afford
good eating; the flesh is very oily. The sooty
tern (S. fuliginosa, Gmel.) is 16 in. long and
35 in. in alar extent; bill 1 1/2 in. and black, as
are the legs and feet; it is deep black above,
the forehead and lower parts white; tail deeply
forked, black, with the outer and basal half of
the inner web of the outside feathers white.
It is found in the gulf states from Texas to
Florida, arriving from the south in May and
departing by the beginning of August; it rare-
ly alights on the water, where it would be in-
conmoded by its long tail; it feeds principally
on fish, which it seizes by a sweeping curve;
the cries are very loud when the breeding places
are disturbed; the eggs are three in number,
2 1/2 by 1 1/4 in., and in former times were the
source of a considerable trade with Havana.
Wilson's tern (S. Wilsoni, Bonap.) is 15 in.
long, with an alar extent of 32 in.; the bill is
1 1/2 in., slender, coral red, black near the end
with a yellow tip; mantle light grayish blue;
upper part of head and neck deep black; be-
neath pearl-gray; tail deeply forked, with the
outer web of lateral feather blackish gray;
legs and feet coral red. It is found from Texas
to Labrador, and on the coast of Massachusetts
goes by the name of mackerel gull, from the
supposition that it announces the arrival of
this fish in its summer quarters; it formerly
bled on Egg Rock near Nahant, and was very
abundant in summer on Nantasket beach; the
eggs are three, 1 1/2 by 1 1/4 in. Its European
representative is the common sea swallow (S.
hirundo, Linn.), spread over Europe and Afri-
can; it is 14 1/4 in. long, and the eggs 1 1/2 by 1 1/4 in.
The arctic tern (S. macrura, Naum.) is 14 1/4
in. long, and 32 in. in extent of wings; the bill
1 1/2 in., slender, and deep carmine; mantle light
grayish blue, and under parts plumbeous gray;
tail very deeply forked; legs and feet crimson.
It is found from the coast of New England to
the arctic seas and the fur countries, also
coming down to N. Europe; it is a very rapid and graceful flier, dashing boldly into the water after fish and shrimps; the eggs are delicious, 1ѣ by 2 in. There are several other species, and another genus, the short-tailed or black tern, *hydrochelidon* (Boie), with the species *H. plumbea* in America and *H. nigra* in Europe.

**TERNATE.** See Moluccas.

**TERNAUX.** J. Guillaume Louis, baron, a French manufacturer, born in Sodan, Oct. 8, 1763, died in St. Ouen, April 2, 1838. When scarcely 16 years old he managed his father's woollen factory, and retrieved the fortunes of his family. He was a supporter of reform in 1789, but was one of the king's defenders in 1792. After the fall of Robespierre he established large manufactories at Louviers and Sedan. He naturalized Thibetan goats in France, and manufactured shawls in imitation of the Indian ones, known as cachemires-Ternaux. He was made a baron by Louis XVIII.; in 1818 he was elected a deputy; was re-elected in 1827, and was one of the 221 deputies whose decision against the government brought about the revolution of July, 1830. The commercial crisis which followed ruined him, though he paid all his debts. He published several treatises on finance and manufactures. *H. Henri*, nephew of the preceding, known as Henri Ternaux-Campans, born in Paris in 1807, died there in 1864. He was distinguished for his devotion to the study of American history, and published two series, in 10 vols. each, of *Voyages, relations et mémoires*, from inedited Spanish manuscripts, relating to the discovery and conquest of America (Paris, 1836-40); *Bibliothèque américaine*, 1493-1700 (8vo, 1837); *Bibliothèque asiatique et africaine* (1841-2); and various other works.—Montmass, his brother, born in 1809, died in 1848; he was published a novel, *La chute de la royauté*, 10 août 1792 (1864); *Le peuple aux Tuileries*, 20 juin 1792 (1864); and *Histoire de la terreur* (1792-4), from inedited documents (7 vols. 8vo, 1862-9).

**TERRI** (anc. Interamna), a town of Italy, in the province of Perugia, on an island formed by the Nera, 49 m. N. by E. of Rome; pop. about 10,000. It has a cathedral built from the designs of Bernini, with a high altar rich in marbles; and there are many Roman remains and inscriptions. Silk and oil are the chief articles of trade. About 5 m. from Terri are the celebrated falls of the Vehilo (*cadute delle Marmore*), about 800 ft. high, fed by an artificial channel laid out by the Romans to drain the plains of Terni. The water descends by three separate leaps, respectively 50, 500, and 250 ft. high, forming one continuous sheet of foam, described by Byron "as worth all the cascades and torrents of Switzerland put together."—The ancient Interamna, originally belonging to Umbria, was celebrated under the Romans, as Terni still is, for the remarkable fertility of the surrounding country.

**TERPANDER** (*Terpandros*), a Greek musician, born at Antissa in the island of Lesbos, flourished in the earlier half of the 7th century B. C. He removed to Sparta, where in 676 he was crowned victor in the first musical contest at the feast of Apollo Carneius, and where he established the first musical school or system in Greece. He enlarged the compass of the lyre from a tetrachord to an octave, but with the omission of the third string, counting from the highest down, making it really a heptachord; and he was the first who regularly set poetry to music.

**TERPSICHORE,** one of the nine Muses, daughter of Jupiter and Mnemosyne. She presided over choral song and dancing, and is generally represented as crowned with flowers and holding a lyre and plectrum.

**TERRA,** or Tellus, a goddess of the Roman mythology, in whose form the earth was personified and worshipped, and who is thus often named in contrast with Jupiter, the god of heaven. A festival in her honor was celebrated on the 15th of April, and private sacrifices were offered to her at seedtime and harvest, and also when any member of a family died. Terra corresponds to Gaia or Ge in Greek mythology. In the Hesiodic theogony Gaia was the first born of Chaos. She gave birth to Uranus, whom she afterward married, and from this union sprang the Titans, the Cyclopes, and the hundred-handed giants. Her worship was universal among the Greeks.

**TERRACINA,** a town of Italy, in the province of Rome, on a gulf of its own name in the Mediterranean, at the S. W. end of the Pontine marshes, 26 m. S. W. of Frosinone; pop. about 5,000. It has a cathedral occupying, according to some authorities, the site of the celebrated ancient temple of Jupiter Anxur, from which its beautiful fluted marble columns are said to have been taken. The most picturesque of the many ruins are those of the palace of Theodoric, on the summit of the hill above the town. Near the shore is a palace built by Pius VI., who made considerable but not successful efforts to drain the marshes and to restore the ancient port, which is still filled with sand, though a new pier affords protection to small craft. The bishopric of Terracina is said to date from A. D. 46.—Terracina was the Anxur of the Volscians and the Romans; the latter had fine villas and a naval station here, and also called the place Tarracina.

**TERRA COTTA** (lt., baked clay), an earthenware manufactured by the ancient Greeks and Egyptians in the manufacture of moulds, architectural ornaments, statuary, utensils, sarcophagi, and various other objects. An important use of it among the Assyrians and Babylonians was for the preservation of records, which were stamped upon terra cotta slabs and cylinders. The material is clay of considerable purity, and the articles are generally slack-baked, or merely hardened by continued exposure to the sun. The color is usually a red or buff, and the vases are often ornamented with designs of leaves, vines, &c., painted...
in black or other colors. While these adorn the rim, neck, and stand, the body is sometimes covered with allegorical representations of gods, men, and animals. The Romans employed finer materials for their terra cottas, and moulded these into lamps, urns, &c., which they ornamented with depressed or raised figures. From the 12th to the 17th century terra cotta was much used in Italy for architectural decorations, and Michel Angelo and other sculptors employed it for their models and clay sketches. The manufacture of decorative works in terra cotta has been an important branch of industry in England since the latter part of the 18th century. The mixtures employed are of pure clays and fine quartz sand or calcined flints with pulverized potsherds or old pottery. The coats of arms seen over many of the shop front in London are moulded and baked in this material.

It is also used for statues, baptismal fonts, fountains, and ornamental pieces of various forms in different parts of buildings. The ware is much more firmly baked than that of the ancients. Of late years it has been extensively employed for elaborate architectural ornaments, such as are ordinarily carved in stone, and also for architectural models. Drain tiles and similar ware are made of it. It is also an important manufacture in France, and there was a remarkable display of terra cotta statues and other objects in the Paris exhibition of 1867.

**TERRA DEL FUEGO.** See TERRA DEL FUEGO.

**TERRA DI BARI.** See BARI.

**TERRA DI LAVORO.** See CASERTA.

**TERRA D'OTRANTO.** See LECCE.

**TERRAPIN.** A name commonly applied to several species of land tortoises, but in the United States generally limited to the few freshwater species of the family emydidae, extensively used as food. They have a depressed head, and the neck can be wholly retracted within the shell; eyes large, and the beak somewhat like that of a bird of prey; they are good swimmers, and out of the water move with more quickness than the land-tortoises; their food consists of small reptiles, fish, and other aquatic animals, though in captivity they eat vegetables readily. — The yellow-bellied terrapin (trachemys scripta, Ag.; emys serrata, Daud.) is 12 in. long, 7 1/2 in. wide, and about 11 in. high; the shell is rounded, very convex, notched in front, deeply serrated behind, wrinkled longitudinally, and rough all over. The color is blackish brown with yellow lines and marks more or less radiating; sternum yellowish, notched behind; snout short and pointed; upper jaw with a very slight notch; eyes large, with golden iris having a broad black stripe extending horizontally through it; fingers five, each with a short strong nail, and toes five, fully webbed, four only having nails; tail short, thick, and pointed; head and limbs black, varied with yellow lines, a broad transverse band of the latter across the neck behind the eyes. This species lives in stagnant ponds and pools, and is fond of basking in the sun on the margins and on stones and stumps, whence it can readily plunge into the water if disturbed; it is found from Virginia to Georgia, south of the latter being replaced by the Florida and north of the former by the red-bellied terrapin; it is abundant about Charleston, S. C., where it is seen in great numbers in the markets. — The red-bellied terrapin, or potter (ptychemys rugosa, Ag.; E. rubriventris, Le Conte), is 11 in. long, 7 in. wide, and about 6 in. high; the shell is entire in front, widest and notched behind; upper jaw deeply notched, and the lower serrated with three teeth in front; shell, head, neck, and limbs dusky brown, with blotches, spots, and lines of red; sternum dusky red. It lives in running waters, preferring rocky bottom; it is found between the Delaware river and Chesapeake bay, and is abundant about Trenton, N. J.; its flesh is less esteemed than that of the preceding and following species. — The Florida terrapin (P. concinna, Ag.; E. Floridana, Harlan) is the largest of the species, being 15 in. long, 10 in. wide, and 7 1/2 in. high; the shell is entire, compressed on the sides; the jaws without teeth, the lower somewhat serrated; the shell, neck, head, and limbs brownish, with numerous yellow lines and bands; sternum pale yellow, the marginal plates with a black spot having a yellow centre; throat ashy, striped with yellow. It is extensively distributed through the southern states, in lakes and rivers, from North Carolina as far as western Louisitana, and up the Mississippi valley to Arkansas; it is very common in E. Florida, especially in the St. John's river; its flesh is delicious. — The chicken terrapin (deirochelys reticulata, Ag.; E. reticulata, Schweig.) is 9 1/2 in. long and 5 1/2 in. wide; the shell is oval, entire, longitudinally rough; upper jaw slightly notched, lower entire with a hook in front; neck very long; above, head, neck, and limbs dark brown, with numerous yellow lines communicating so as to form a network, whence the specific name; lower parts yellow, with black spots on some of the marginal plates. Its habits are the same as in the other species, the long neck giving it
in the water somewhat the appearance of a snake, as it swims with this part and the head alone visible above the surface. It is found from North Carolina and Georgia to Louisiana, not far from the sea coast; it is often brought to market, and is the most esteemed of the terrapins for food. — The salt-water terrapin (malacoclemmys palustris, Ag.; E. terrapin, Holbr.) is 7½ in. long and 3 in. high; the shell is nearly entire, slightly notched posteriorly; the head is very large; jaws strong and cutting, the upper slightly notched and the lower hooked; eyes small with a gray iris; neck short and thick. The color is dusky olive-green, with darker concentric lines; sternum generally yellowish with concentric dusky lines; side of the head, neck, and limbs brownish white with innumerable black dots; the male are the smaller, and have deeper stripes. It lives in salt water and in salt marshes, where it hibernates; it is very shy, a rapid swimmer, and a quick runner on land; it is found from Rhode Island to Florida, along the gulf of Mexico, in South America, and perhaps in the West Indies; it is abundant about Charleston, S. C.; the flesh is excellent, and in the middle states most esteemed during hibernation.

**TERREBONNE,** a S. E. parish of Louisiana, bordering on the gulf of Mexico, and drained by the Terre Bonne, Black, and Caillou bayous; area, 1,644 sq. m.; pop. in 1875, 15,466, of whom 7,988 were colored. The surface is flat and marshy, and diversified by numerous shallow lakes. Morgan's Louisiana and Texas railroad intersects the N. part. The chief productions in 1870 were 209,050 bushels of Indian corn, 233,000 lbs. of rice, 180 bales of cotton, 6,537 hogsheads of sugar, and 306,282 gallons of molasses. There were 876 horses, 1,798 mules and asses, 696 milch cows, 1,537 other cattle, and 2,426 swine; 4 saw mills, 64 manufactories of molasses and sugar, and 4 of upholstery. Capital, Houma.

**TERREDONNE,** a S. W. county of Quebec, Canada, on the N. bank of the St. Lawrence, opposite Montreal; area, 541 sq. m.; pop. in 1871, 19,591, of whom 18,151 were of French and 970 of Irish origin or descent. It is drained by the North River, an affluent of the Ottawa, and by several streams that empty into the St. Lawrence. Capital, St. Jerome.

**TERRE HAUTE, a city and the capital of Vigo co., Indiana, on the E. bank of the Wabash river, here spanned by three bridges, 70 m. W. S. W. of Indianapolis, and 55 m. N. of Vincennes; pop. in 1850, 4,061; in 1860, 8,594; in 1870, 16,103. It is situated on an elevated plateau, is well built, and has broad streets ornamented with shade trees. It is the centre of trade for a rich and populous region, abounding in coal. It is connected with Lake Erie by the Wabash and Erie canal. The Wabash river is navigable a portion of the year for steamboats, and shipments are made direct to and from points on the Ohio and Mississippi rivers. The city is an important railroad centre, being the point of intersection of seven lines, viz.: the Cincinnati and Terre Haute; Evansville, Terre Haute, and Chicago; Terre Haute, Paris, and Decatur; Evansville and Crawfordsville; Indianapolis and St. Louis; St. Louis, Vandalia, Terre Haute, and Indianapolis; and Logansport, Crawfordsville, and Southwestern. There are numerous large factories, blast furnaces, glass and iron works, machine shops, nail works, &c. Pork packing is extensively carried on. Terre Haute has a handsome court house, a commodious market house and city hall, a good opera house, two orphan asylums, eight fine public school buildings, and several private schools and academies, and is the seat of the state normal school. There are three daily, a tri-weekly (German), and six weekly (one German) newspapers, two public libraries, and 20 churches. Terre Haute was laid out in 1816, and incorporated as a city in 1853.

**TERRELL, a S. W. county of Georgia, drained by affluent of Flint river; area, about 300 sq. m.; pop. in 1870, 9,053, of whom 5,284 were colored. The surface is nearly level. The Southwestern railroad traverses it. The chief productions in 1870 were 158,130 bushels of Indian corn, 13,973 of oats, 22,898 of sweet potatoes, and 6,163 bales of cotton. There were 444 horses, 938 mules and asses, 982 milch cows, 2,088 other cattle, 1,069 sheep, and 6,742 swine; several manufactories, 6 saw mills, and 1 tannery. Capital, Dawson.

**TERRESTRIAL MIGENETISM.** See MAGNETISM, TERRESTRIAL.

**TERRIER (canis terrarius, Flem.), a small variety of dog, so named from its propensity to pursue and attack its prey in subterranean retreats. It is considered by Hamilton Smith as descended from an indigenous European canine.**

Skye Terrier.

There are two well marked varieties, the result of fancy or accident. One, the English or black and tan, is smooth, rounded, elegant in shape, usually black, with tan-colored spots over the eyes and the same on the legs and lower parts; the nose is sharp, eyes bright, ears pointed or slightly turned down, and the tail carried high and bowed over the back. The other, the Scotch terrier, the oldest and purest breed, has shaggy and wiry hair, a shorter and fuller muzzle, bearded snout and face, stouter limbs, less elegant form, and a pale sandy or
ochre color; it is sometimes white. The isle of Skye breed is one of the most prized, and one of the ugliest. The terrier has an acute sense of smell, and is a good attendant on a pack of hounds, foreboding foxes and other game from their coverets and dens; it is a determined enemy of the weasel, badger, and rat families. The jaws are very powerful. The Scotch terrier has been known to kill 100 rats in a room in less than seven minutes. In England the terrier blood is visible in most of the sheep and cattle dogs; but the most prized variety is the bull terrier, from a cross with the bulldog, the most determined, pugnacious, and savage of the dog tribe; in this the ears are pointed, and the general characters are those of the bulldog; it is usually white, with some black about the head.—The turnspit is a cross of the terrier with larger and less pure breeds; the body is long and heavy, with disproportionately short and generally crooked legs; it is bold, vigilant, and spirited, and, though larger, is used in Europe for the purposes of the terrier; it is, when best, a cross with a hound; it received its name from its being in old times employed to turn the spit in the kitchen, walking round in a kind of wheel. The C. vertagus of the ancients, sometimes erroneously translated turnspit, is the lurcher, a degenerate greyhound.

TERTIARIANS (Fr. tertiariare, from Lat. tertiarium, containing a third part), men or women belonging to the "third order" in any one of the monastic orders. The tertiarians, without living in cloistered communities, bind themselves by simple vows to certain prayers and observances of the order. Such an organization of secular persons occurs for the first time in the history of the Premonstratensians, and another was connected with the order of the Templars. But it did not become generally known until Francis of Assisi, after founding the orders of the Franciscans (the first order) and the order of the Poor Clares (second order), founded a third one for the numerous laymen who wished to conform themselves to the mode of life of the Franciscans as much as secular occupations would permit. When their number increased, many of them resolved to adopt the common life, and thus the third regular order of Franciscans arose. (See FRANCISCANS, vol. vii., p. 425.) The example of the Franciscans was followed by the Dominicans, Augustinians, Carmelites, Servites, and other orders, all which have connected with them both tertiarians living in the world, and regular tertiarians living in common.

TERTULLIAN (Quintus Septimius Florens Tertullianus), one of the early church fathers, born in Carthage about A. D. 150, died between 220 and 240. He was the son of a Roman centurion, became a lawyer, embraced Christianity about 190, and entered the Christian priesthood. He preached at Carthage and probably at Rome, and became widely known by the publication of several controversial treatises, as well as his ascetic practices. About the year 202 he joined the Montanists, and at once became the champion of the sect, with which he remained until his death. The difference between his works written before and those after he became a Montanist seems to be more a difference of spirit than of doctrine; and his writings are classed in authority with those of the other church fathers. He was the fearless champion of Christianity against Jews and pagans, and of catholic orthodoxy in the church. His Apologieus has been called the first plea for religious liberty in Christian literature, and is one of the best defences of Christianity and the Christians against their pagan adversaries. In his treatise "On the Testimony of the Soul" he unfolds the profound thought that Christianity is grounded in the nature of man, and meets its deepest wants. He led the way in ecclesiastical anthropology and soteriology, was the teacher of Cyprian, and the forerunner of Augustine. Among his controversial works are his books "Against the Gentiles," "Against the Jews," "Against Hermogenes" (showing that matter is not eternal, but created by God), "Against the Valentinians," "On the Presence of Heretics" (asserting vehemently that no doctrine contrary to the received faith had a claim to toleration from the church, or to appeal to the Scriptures, and contradicting the principles of his "Apology"), "Against Marcion," "Against Praxeas," "On the Soul," "On Baptism," "On the Flesh of Christ," and "On the Resurrection of the Body," in all of which he opposes growing errors, and seeks to show what is the true doctrine of the church. Among his practical works belong the book "On Penance;" that "On Prayer," which explains the Lord's prayer; "On Patience;" "To the Martyrs," "On the Treasures," "On Idolatry," a casuistical discussion of the degree to which idol worship may be tolerated by Christians; "On the Dress of Women," and on the "Veiling of Virgins," which teach that modesty and the hiding of the features are proper for women in the house of God; and the book "To his Wife," in which he proclaims his aversion to second marriages. His specially Montanist works are the "Exhortation to Chastity" and "On Monogamy," in which he carries to absolute prohibition the theory of the book "To his Wife;" "On Chastity," which denies that those who are guilty of gross sins can be absolved; "On Repentance;" "On Fasting;" "On the Soldier's Crown;" and "On Flight," which insists that Christians ought not to flee from persecutions. Tertullian's works are written in a rude Latin similar to that of the Apologists, often somewhat laboured in style, and abrupt, often obscure or ambiguous. The first collected edition is that of Beatus Rhenanus (col., Basel, 1521). Among the numerous later editions are those by Semler (6 vols., Halle, 1770-73), Leo-
pold in Gersdorf's *Bibliotheca Patrum Latinitum* (vols. iv. to vii., Leipsic, 1839-41), Migne (vols. i. to iii. of *Patrologie latine*, Paris, 1844), and Oehler (3 vols., Leipsic, 1853). Translations of several, especially of the "Apology," have been published in most of the modern European languages. - The life of Tertullian has been written by Jerome in the early 4th, and in modern times by Neander (*Antiquitates*, Berlin, 1825) and Hesselberg (Dorpat, 1848). See also the special works on Montanism by Wernsdorf (1751), Münter (1829), Schwegler (1841), and Baur (1851).

**TERUEL.** I. A N. E. province of Spain, in Aragon, bordering on Saragossa, Tarragona, Castellon, Valencia, Cuenca, and Guadalajara; area, 5,494 sq. m.; pop. in 1870, 292,201. The Albarracin mountains traverse it E. and W., sending off numerous spurs on both sides, which are covered with forests and abound in game. Muela de San Juan, one of the principal summits of the main range, is covered with snow during the greater part of the year, and the rivers Tagus, Guadalaviar, and Jucar have their sources on its sides. The province is well watered by the Guadalupe and the Jiloca, affluent of the Ebro, the Guadalaviar, and numerous smaller streams. There are extensive plains producing grain, wine, oil, silk, hemp, flax, saffron, and fruit. Numerous sheep, swine, and cattle are reared. Coarse woollen goods, linen, canvas, leather, paper, and earthenware are manufactured. II. A town, capital of the province, on the left bank of the Guadalaviar, 136 m. E. of Madrid; pop. about 10,000. It stands on elevated ground, is surrounded by old walls, and entered by a number of gates surmounted by Aragonese towers. There is a cathedral, episcopal palace, several convents, two hospitals, and a bull ring capable of accommodating 9,000 spectators.

**TESCHEN,** a town of Lower Silesia, Austria, on the right bank of the Olsa, 38 m. S. E. of Troppau; pop. in 1870, including suburbs, 9,779. There is some trade in local products. The principal manufactory is one for yarns, and there is also a large publishing house.—The peace concluded at Teschen, May 18, 1779, between Maria Theresa and Frederick the Great, terminated the war of the Bavarian succession. The former duchy of Teschen comprised till 1849 most of an extensive circle of the same name, now divided into eight bailiwicks.

**TESSIN.** See Trino.

**TESTAMENT.** See Will.

**TESTAMENT, Old and New.** See Bible.

**TESTIMONY.** See Evidence.

**TESTUDINATA,** a term employed by Klein, and adopted by Agassiz, synonymous with chelonians, and embracing the reptiles known as tortoises and turtles. They are the highest of the class, approaching the birds in form, mode of existence, and in some points of structure; the regions of the body are distinctly marked, and the head has a considerable mobility on the neck. Dumérist and Bibron divide the order into four families: *thalassitres or marine turtles; potamites or river tortoises; elodites or marsh tortoises*, with the subfamilies *cryptodères*, which bend the short neck like the letter Z, and conceal the head on the median line beneath the carapace, and *pleurodères*, which curve the long neck horizontally and on the side of the body under the shell; and *cheronites* or land tortoises, the highest in rank. Agassiz ("Contributions to the Natural History of the United States of America," vol. i., part 2) adopts Oppel's subdivision of the order, making the suborders: I., *chelonii*, with the families: 1. *chelonii*, marine turtles, and 2. *spharigidae*, leather or trunk turtles; and II., *amyda*, with the families: 3. *trionychidae*, soft-shelled tortoises; 4. *chelydiae* (matamata); 5. *hydraspidae*, like plate-mys and other flattened species, mostly South American, united by J. E. Gray to the preceding family; 6. *chelydidae*, snapping turtles; 7. *cinosternoidae*, mud turtles; 8. *amydoidae*, fresh-water species like the terrapins; and 9, *testudinina*, land tortoises like the great Galápagos, gopher, and common European tortoises. The characters of the suborders with their families will be given under Tortoise.
or dermal skeleton, divided into many pieces united by sutures; in the marine turtles this dermal skeleton is imperfect (especially below), less developed in the trionyx, and least of all in the trunk turtle (spharigis). The epidermic plates in the tortoise-shell turtle grow only on the anterior edge, the older parts moving backward, much as in the human nail; but in the land tortoises they increase below and on all sides, in concentric rings, like the annual growths of a tree; there is every intermediate stage between these types; a molting of the epidermis takes place in all chelonians, scale by scale. In all except the inbricated turtle the colors are in the lowest layers of the epidermis; in this they exist in the external dry horny layers, displaying the beautiful and permanent hues of tortoise shell; in the corium or true skin is deposited the phosphate of lime of the dermal skeleton. The skull is solid and compact, and the facial bones are immovably fixed to the cranium; the lower jaw consists of a firm bony arch; the occipital bone strikingly resembles a vertebra; the parietals principally enclose the brain; there are two pairs of frontals, and the nasals are almost always wanting. The cervical vertebrae are nine, if the odontoid process be considered distinct, and have no transverse processes; some have a concave-convex articulation, others a convex-convex, one a biconvex (toward the lower part of the series), and one a biconvex (in the middle), giving considerable freedom of motion in certain directions without the flexibility of the bird's neck. The dorsal vertebrae are 11, of which the first is movable, the rest united into a firm arch by the continuous growth of the spinous processes; the ribs extend from between the vertebrae, being strongest where the dermal skeleton is least developed, as in trionyx, spharigis, &c.; the sternum consists of four pairs and one odd bone, varying much in size and form, united to the ribs by a bony bridge, the marginal plates bearing dermal bones; the caudal vertebrae are very movable, convex behind, concave before, and without spinous processes. The scapular and pelvic arches are withdrawn under the bony roof of the body; the bones of the shoulder are long, straight, and narrow, the scapula and acromion united at right angles, the coracoid running backward among the muscles, and the three united to form the glenoid cavity; the humerus is short, crooked, and turned inward; the forearm and hand have their transverse diameter vertical, the ulna overlying the radius, so that the limb may be drawn back under the carapace by the bending of all the joints in the plane of the scapula; the form of the hand varies in the different families, according as it is used for terrestrial or aquatic locomotion. The pelvic arch is formed by three permanently distinct bones, which meet in the cotyloid cavity; the bones of the hind legs are like those of the anterior, but the femur is straighter than the humerus; there are great differences in the relative size of the two pairs of legs in the two suborders. The cervical muscles are largely developed; the muscles of the limbs are much like those of mammals. The cerebral hemispheres are hollow and larger in proportion than in other reptiles, with a generally smooth surface. There is a tympanic cavity and membrane, the former divided into two parts by a bony partition; the eyes are larger and more movable than in the lower reptiles, similar to those of birds in the lids, nictitating membrane, osseous framework of cornea, and round pupil; a lachrymal gland is present. Hearing and vision are acute, but smell is dull, the nostrils being used chiefly for their slow respiration; they chew their food, and the tongue is broad, thick, and fleshy, with an acute sense of touch; the tongue is of use also in the respiratory process, as they swallow air into the lungs. The upper jaw always shuts over the lower, and both are covered with a peculiar horny sheath; the intestines, as in the higher classes, are longest in the herbivorous families, but the proportions of the different parts vary much without any special reference to the food; the liver and gall bladder are large; spleen and pancreas always present, the former solid and generally attached to the latter, and this to the duodenum; the pancreas is lobular and irregular, and much the largest in the carnivorous feeders; digestion is performed very slowly, and hunger can be endured a long time. Respiration is effected by swallowing air, on account of the immobility of the thoracic cavity, assisted, according to Agassiz, by the diaphragm, which is well developed in the order, and by the scapular and pelvic muscles; the lungs are voluminous, most so in the land tortoises; the trionyx can remain half an hour or more under water, aeration of the blood in this and other aquatic species being doubtless partly effected, as in frogs, through the naked skin; many species have the power of emitting vocal sounds, independent of the sharp hiss which they all produce; respiration is reduced or entirely suspended in the hibernating species, according to the degree of this state. The heart is just above the liver, between its halves; the ventricle is single, divided into two cavities by an imperfect partition, and gives rise both to the two aortæ and the pulmonary artery; it beats about ten times a minute; the lymphatic system is greatly developed, two hearts near the base of the tail sending the lymph over the body. The kidneys are comparatively small, flattened and lobed, in the pelvic cavity, outside the peritoneum; the ureters short, and bladder large; the ovaries are much like those of birds, and the number of eggs matured in a year varies in different members of the order; the cloaca is very large in both sexes. All are oviparous, and the eggs are spherical, covered with a hard shell, and laid in moist or dry ground or hot sand, the number varying from four or five in the land tortoises to more than 100 in the marine turtles; the young, which
TETANUS

appear from the egg in from six weeks to four months or more, are generally very different in form from the parents; there is a hard tubercle on the snout of the young for breaking through the shell of the egg. The growth is very slow, and they attain the period of puberty the latest of all reptiles; they can exist a long time without nourishment, and give signs of vitality, according to Redi's experiments, 23 days after decapitation; the same experimenter ascertained that a land tortoise lived for six months, blindly groping about, after the brain had been entirely removed; they live more than a century.—Chelonians first appeared in the oolitic period, according to Agassiz, when neither genuine birds nor mammals existed; the so-called tortoise footprints in the new red sandstone and Devonian strata were undoubtedly made by crustaceans or other articulate; according to Pietet, impressions of their shields first occur in the Jura limestone, the mouth of Stonefield oolite, and the four types of Duméril and Bibron together; they also are found in the tertiary and diluvial deposits. In the diluvium of the Sivalik hills of the Himalaya range have been found the remains of a gigantic chelonian (colossochelys atlas, Cautli, and Falc.), which must have been 18 to 20 ft. in length; it appears that its existence was known to the natives, as this figure enters largely into the old East Indian cosmogonies. In geological times chelonians existed in northern regions of Europe and Asia, now too cold for them; marine and fresh-water species also are often found together, a fact explained by estuary deposits, a more uniform constitution of the early waters of the globe, and a mixture by sudden inundations and surface changes. The present geographical range of chelonians is less extensive than that of the other orders of reptiles, the marine turtles having the greatest and the terrestrial species the least; the marine species are also the largest except the Galápagos tortoise.

TETANUS, a spasmodic disease characterized by painful, involuntary, and protracted contraction of a greater or smaller number of the voluntary muscles. As seen in temperate climates, the disease is almost invariably consequent upon a wound or injury; but in particular localities and in hot climates, it may occur without any lesion either external or internal. The disease usually begins with chills and a feeling of depression and debility, with vertigo and sleeplessness. At first there is commonly a feeling of stiffness and uneasiness about the muscles of the neck and jaws. The patient thinks he has taken cold or has a slight rheumatic affection. He finds he is unable to separate the jaws to any distance, and more or less gradually they close, so that he is unable to open the mouth at all; a condition called locked jaw. As the disease advances, the acute pain at the bottom of the stomach, extending through toward the back; and this pain, like the contractions of the voluntary muscles, is aggravated in paroxysms. Gradually the large muscles of the trunk and extremities become affected. In some cases all the muscles are firmly contracted, and the body remains stiff and straight. Ordinarily the strong extensors of the trunk and limbs are more affected than the flexor muscles, or their super imposed power overcomes the resistance of these latter, and during the paroxysm the body is forcibly curved backward, the patient resting upon his hands and heels only. This constitutes opisthotonos. Occasionally, though it must be very rarely, the body is bent forward, constituting emprosthotonos; and still more rarely there is lateral curvature, forming pleurosthotonos. The muscles concerned in deglutition are early affected, so that swallowing is rendered difficult or impossible. Later, spasms of the muscles of the face occur, the brow becoming knitted, the eyes wide open, fixed and staring; the nostrils distended, and the angles of the mouth drawn back exposing the clenched teeth, and producing an expression called risus sardonicus. When the disease has once set in, the muscles affected are rarely at any time afterward wholly relaxed. At intervals more or less closely approximated to each other according to the severity of the disease, paroxysms occur during which the spasm is aggravated, the muscles affected becoming tense and hard as boards. During these paroxysms the patient commonly suffers from intense pain in the muscles affected, and the subternal pain, dependent probably on spasm of the diaphragm, is likewise aggravated. Cases have occurred in which the teeth have been broken, bones fractured, or muscles torn across. The spasms come on even when the patient is perfectly at rest; but they are evidently excited by the slightest attempt at voluntary motion, by efforts at deglutition, or by mental emotion. The patient's mind is commonly unaffected throughout the disease; the bowels are apt to be obstinately constipated, and when evacuations are obtained they are offensive and unnatural. Death may occur either suddenly during a paroxysm or from suffocation, the muscles of respiration becoming fixed and the spasm in some instances probably affecting the glottis. In other cases death results from exhaustion, the patient being worn out by pain, sleeplessness, and want of nourishment.—Tetanus is fatal in the large majority of cases. Post-mortem examination throws but little light on its pathology. Dr. Lockhart Clark believes that degeneration of the cells of the spinal cord is always present; but the fact that the symptoms are so similar to those of poisoning by strychnia would lead to the opinion that the cause of the disease is in a morbid condition of the blood, although the medulla oblongata and spinal cord are the parts attacked. In cases derived from wounds, the nerve fibers running from the wound show evidences of inflammation, being commonly red and swollen; but with this exception no lesions have been
found which are constantly connected with the disease.—Idiopathic tetanus, rare in temperate, is not uncommon in hot climates; but though heat acts as a predisposing cause, the exciting cause is generally exposure to damp and cold. In traumatic tetanus, exposure to cold, particularly when the body is debilitated by previous warm weather, seems to be an efficient cause. Thus the wounded in the battle of Dresden, who were exposed to cold and wet just after the battle, while the previous weather had been hot and oppressive, suffered severely from tetanus; and after the battle of Bouzten, where the wounded lay on the field exposed to cold and rain during the night, Larrey found more than 100 attacked with tetanus the next morning. Tetanus is more liable to follow punctured and lacerated than incised wounds; and wounds of the palmar surface of the feet and hands, which are abundantly supplied with nerves, are particularly dangerous, but it may follow wounds of every character. Even those made by the knife of the surgeon and the stroke of a whip, the cutting of a corn and extraction of a tooth, have all been followed by this formidable and fatal disease. Cases are on record in which lying-in women have been seized by the disease. The time which elapses between the receipt of the injury and the period of invasion of the disease varies greatly. Larrey says that during the campaign in Egypt it rarely appeared before the fifth or after the fifteenth day; yet some cases are on record in which it came on in a few hours, and others in which it was delayed for more than a month. When the paroxysms come on suddenly, recur at short intervals, and increase in violence, treatment is rarely of any avail; death in such cases occurs often as early as the second, and is rarely delayed beyond the fifth day. When the attack is less violent, and the interval between the paroxysms longer, the prospects of the patient are better, and if life is protracted beyond the tenth day he will frequently recover.—The treatment of tetanus is unsatisfactory. The inhalation of chloroform has been strongly recommended, and where it is well borne, it mitigates greatly the sufferings of the patient. Opium has been given in large and repeated doses; when recourse is had to it, it should be administered in a liquid form, or some salt of morphia should be used. A strong solution of the sulphate of morphia may be given by subcutaneous injection. Wine and distilled spirits, with or without opium, have been given in large quantities, and in many cases apparently with benefit. The bowels should be occasionally moved by active purgatives. But as the paroxysms are mainly excited by external sources of irritation, even slight ones, the principle of the treatment should be to keep the patient perfectly quiet. Stillness, a darkened apartment, few attendants, and the absence as far as possible of all causes of physical or mental disturbance, promise a better chance of recovery than any active interference or the repeated administration of medicinal agents.

TETIAN, a city and seaport of Morocco, in the province of Fez, at the W. end of the Mediterranean, 21 m. S. by W. of Ceuta; lat. 35° 37' N., lon. 5° 18' W.; pop. about 20,000. The town is about 6 m. of the coast, on high ground, which rises on the south into a ridge 3,000 ft. high. It is surrounded by a wall flanked with towers, and is defended by a castle. The streets are narrow and dirty, but there are some fine buildings, particularly mosques, of which there are 40. Its harbor is an open roadstead unprotected on the east, and is fit for small vessels only. The town has manufactures of leather, leather goods, swords, and firearms, and a considerable inland trade through Fez. Its foreign trade consists principally in supplying Gibraltar with provisions. In 1873, 211 vessels, of 2,716 tons, entered its port. The value of its imports was $111,555; exports, $55,775. Tetuan was captured by the Spaniards in 1860, but was given up in the following year.

TETZEL, or Tetzel, Johann, a German monk, born in Leipzig about 1460, died there in August, 1519. He studied theology and philosophy at the university of Leipzig, and in 1489 entered the order of Dominicans. He gained celebrity as a popular preacher, and was repeatedly engaged to preach indulgences granted by the pope to raise money for religious purposes. The early Protestant biographers of Tetzel say that he sold certificates of indulgence without requiring previous confession, and indulgences for future sins; that he led a very immoral life, and was even convicted at Innspruck of adultery; but Catholic historians have generally qualified these statements as gross exaggerations, though they admit that he often offered the indulgences in an offensive and mountebank way. In 1516 Tetzel began the publication of an indulgence designed to procure means for the construction of St. Peter's at Rome, receiving at the same time an appointment as inquisitor. Never before had the preaching of an indulgence produced such a commotion. He is said to have assured the people that as soon as the money resounded in the chest their sins would be forgiven, and the souls of the departed received into heaven; but Catholics maintain that this is conclusively refuted by the Instruc-tio Summaria Sacerdotum ad Producindos Indulgencias, prepared by Tetzel in 1517, in which he makes the gaining of an indulgence expressly dependent upon repentance and confession. As a delegate of the highest ecclesiastical authorities, Tetzel was generally received with great pomp, but at the same time met with a powerful and rapidly increasing opposition. On Oct. 31, 1517, Luther posted the celebrated 95 theses against the abuses in preaching indulgences on the doors of the church in Wittenberg. Tetzel publicly burned the theses at Jütteberg, and in January, 1518,
in a public disputation at the university of Frankfurt-on-the-Oder, defended several antitheses. The students of Wittenberg, in their turn, burned 800 copies of the antitheses of Tetzel. Tetzel replied once more, in May, by a refutation of the sermon of Luther on indulgences and grace, but seems to have had no longer any influence on public opinion. Among the latest biographers of Tetzel are Hoffmann, a Protestant (Lobendabeschreibung von Tetzel, Leipzig, 1844), and Gröne, a Roman Catholic (Tetzel und Luther, oder Lebensgeschichte und Rechtfertigung des Ablasspredigers und Inquisitors Dr. Johann Tetzel, &c., Soest, 1853).

TEUTER (Gr. Τευτος). I. The first king of Troy, son of the river Godamander by the nymph Idee, after whom the Trojans are sometimes called Teuvian. II. A Grecian hero in the war against Troy, the son of Telamon, king of Salamis, and Heleone of Crete, and a stepbrother of Ajax. He was the best archer among the Greeks; but on his return from Troy his father refused to receive him in Salamis because he had not avenged the death of Ajax nor brought back his body. He therefore settled in the island of Cyprus, and founded there the city of Salamis.

TEUFFEL, Wilhelm Sigismund, a German philologist, born in Luedwigsburg, Sept. 27, 1820. He studied at the university of Tubingen, devoted himself to the critical study of Horace, and published valuable papers on the works and times of that author. In 1848 he became editor of the Realencyklopdie der classischen Alterthumsweisenchaft, begun by Pauly. In 1849 he was appointed professor of classical philology in Tubingen. He has especially studied the literary history of Greece and Rome, and of late also of Germany, and his various publications on single authors, as Juvenal, Aristophanes, and Æschylus, were universally received as important. His principal work, Geschichte der römischen Literatur (2 vols., Leipsic, 1868-70), has been translated into several languages (London, 1874).

TEUTOBURG FOREST, a mountain chain of Germany, partly in the principality of Lippe, partly in Prussia, extending, at first under the name of Egze, in a N. direction through the territory of Paderborn to Driburg, then N. W. toward Bielefeld and Halle, and terminating at the Bervergern, 5 m. E. of Rheine on the Ems. Its total extent is about 80 m. It reaches its highest point of more than 1,500 ft. near Horn in Lippe. According to Tacitus, the Roman legion of Varus were defeated (A. D. 9) in this mountain region, which he calls Teuto- burgiensis saltus, by Arminius, prince of the Cherusci, whose memory is celebrated as that of the liberator of Germany. (See ARMINTIUS.) His colossal monument by Bander was unveiled by the emperor of Germany, Aug. 16, 1875, amid national rejoicings, on the summit of the Grotenberg near Detmold. (See BANDEL.)

TEUTONIC KNIGHTS, or KNIGHTS of the Hospital of St. Mary in Jerusalem, a powerful religious and military order which originated during the crusades. The hospital of St. Mary in Jerusalem, from which the order derives its canonical name, was founded soon after the capture of Jerusalem by the crusaders in 1099. A. C. 1158, the first grand master, his friends traded on their dwelling to the poor and sick of their own nation; a chapel was afterward attached to the house by permission of the patriarch and dedicated to St. Mary. The establishment, to which the founder devoted all his wealth, was after its extension maintained by alms collected among the Germans; and a number of distinguished persons also devoted their property and services to the same purpose, assuming a religious dress and binding themselves by monastic vows (1110), with the approbation of Pope Calixtus II. During the siege of Acre in 1182 charitable burghers of Bremen and Lübeck established a guild of hospitalers for German soldiers, whose numbers were so great after the death of Frederic Barbarossa that the merchants made tents with the sails of their vessels, and called to their assistance the brethren of St. Mary in Jerusalem. Both confinaterrorines were then organized into one order by Duke Frederick of Swabia, who obtained the approbation of Pope Celestine III., Feb. 23, 1192. The new order retained the rule of St. Augustine adopted by the German brotherhood in Jerusalem. None were at first admitted to membership but Germans of noble birth; about 1221 half-knights or sergeants, as among the templars and hospitalers, were added, as well as priest-chaplains. The dress was black with a white mantle, upon which was a black cross with a silver edging. The order had an elective grand master, who first dwelt at Jerusalem, then when Palestine fell into the hands of the Turks at Venice, and at the close of the 13th century at Marburg. Conrad, duke of Mosavia, called the Teutonic knights, then under the famous grand master Hermann of Salza, to his assistance about 1226, to repel the invasions of the heathen Prussians and Livonians, and to help in spreading the gospel among them. He gave them the territory of Culm on the Vistula, and from this point they extended their conquests over the territory of Prussia, and with the aid of the knights sword-bearers over Courland and Livonia, exterminating the pagan inhabitants with fire and sword. In 1309 the grand master fixed his seat at Marienburg. Possessing the richest and most commercial provinces of the north, the order became exceedingly powerful; and at the beginning of the 15th century, when it had reached its greatest prosperity, its territory extended from the Oder to the Gulf of Finland, and its yearly revenue was estimated at 800,000 marks. Nobles from all parts of Europe flocked to its banner. Internal dissensions, luxury, and unjust and oppressive acts threatened its decline from this period, and a conflict with the Polish kings hastened it. In the
battle of Grünwald or Tannenberg in 1410 they were totally defeated by Ladislas Jagel- lon; and after a subsequent long war with Casimir IV., West Prussia was given up to Poland, and for East Prussia they were compell'd to do homage (1466). An attempt to regain their independence deprived them of East Prussia, which in 1525 was presented by Sigismund I. of Poland to the grand master, the margrave Albert of Brandenburg, as a hereditary duchy. The order was now reduced to a mere shadow of its former great- ness. In 1527 the grand master fixed his seat at Mengenthelm in Swabia, became a spiritual prince of the German empire, and had under him 11 provinces divided into commanderies. In 1806 the peace of Presburg gave to the emperor of Austria the rights, revenues, and possessions of grand master of the Teutonic order; but in the campaign of 1809 Napoleon while at Ratisbonabolished the order on April 24, its widely scattered territory, comprising about 580 sq. m. with 88,000 inhabitants, falling to the princes in whose dominions it was. It was revived in the Austrian empire in 1854 and placed under the protection of the imperial family; it was more fully reorganized in 1840. From 1863 till his death in Mexico, the archduke Maximilian was grand master. The present grand master is the archduke Wilhelm.

**TEUTONS** (Lat. *Teutones* or *Teutoni*), a pow- erful people of ancient Germany, who prob- ably dwelt on the southern shores of the Baltic, in the vicinity of the Cimbri, together with whom they invaded the dominions of the Roman republic at the close of the 2d century B. C., when they were annihilated by Marius. (See Cimbri.) The name Teutons is also ap- plied to the ancient Germans in general. (See GERMANIC RACES AND LANGUAGES.)

**TEXAS,** a S. W. state of the American Union, the 15th admitted under the constitution, situated between lat. 25° 30' and 36° 30' N., and lon. 95° 30' and 106° 40' W.; greatest length, from the mouth of the Rio Grande to the N. W. corner, about 825 m.; greatest breadth, along the 32d parallel, about 740 m.; area, 274,326 sq. m., being greater than that of any other state or territory except Alaska, and nearly six times as great as that of New York. It is bounded N. by New Mexico (W. of the 103d meridian), the Indian territory, and Ar- kansas, the Red river being the dividing line E. of the 100th meridian; E. by the Indian territory (N. of lat. 34° 30'), Arkansas, and Louisiana, from the last of which it is mostly separated by the Sabine river and lake; S. E. by the gulf of Mexico; S. W. by Mexico, from which it is separated by the Rio Grande; and W. by New Mexico. The state is (1876) divided into 174 counties, of which 26, marked with an *; are unorganized, viz.: Anderson, An- gelina, Aransas, Archer, *; Atascosa, Austin, Bandera, Bastrop, Baylor, * Bee, Bell, Bexar, Blanco, Bosque, Bowie, Brazoria, Brazos, Brown, Burleson, Burnet, Caldwell, Calhoun, Callahan, * Cameron, Camp, Cass, Chambers, Cherokee, Clay, Coleman, Collin, Colorado, Comal, Comanche, Concho, Cooke, Coryell, Crockett, * Dallas, Dawson, * Delta, Denton, De Witt, Dimmitt, * Duval, * Eastland, Edwards, * Ellis, El Paso, Eucinal, * Erath, Falls, Fan- nin, Fayette, Fort Bend, Franklin, Freestone, Frio, Galveston, Gillespie, Goliad, Gonzales, Grayson, Greer * (see Green), Gregg, Grimes, Guadalupe, Hamilton, Hardeman, * Hardin, Harris, Harrison, Haskell, * Hays, Hender- son, Hidalgo, Hill, Hood, Hopkins, Houston, Hunt, Jack, Jackson, Jasper, Jefferson, John- son, Jones, * Karnes, Kaufman, Kendall, Kerr, Kimble, * Kinney, Knox, * Lamar, Lampasas, * La Salle, * Lavaca, Lee, Leon, Liberty, Lim- stone, Live Oak, Llano, McCallough, * McLennan, McMullen, * Madison, Marion, Mason, Matagorda, Maverick, Medina, Menard, Milam, Montague, Montgomery, Morris, Nacogdoches, Navarro, Newton, Nueces, Orange, Palo Pinto, Panola, Parker, Pecos, Polk, Presidio, Rains, Red River, Refugio, Robertson, Rockwall, Runnels, * Rusk, Sabine, San Augustine, San Jacinto, San Patricio, San Saba, Shackelford, Shelby, Smith, Somerville, Starr, Stephens, * Tarrant, Taylor, * Throckmorton, * Titus, Tom Green, Travis, Trinity, Tyler, Upshur, Uvalde, Van Zandt, Victoria, Walker, Waller, Wash- ington, Webb, Wegefarth, * Wharton, Wichita, * Wilbarger, * Williamson, Wilson, Wise, Wood, Young, Zapata, Zavala.* An extensive region in the W. part of the state N. of the 32d paral- el is not divided into counties, the N. portion being known as the Bexar territory and the S. portion as Young territory. The principal cities are Galveston (pop. in 1870, 13,818), San An- tonio (12,256), Houston (9,382), Brownsville (4,905), Austin (the capital, 4,428), and Jeffer-
son (4,190). Other important places are Bastrop, Bonham, Brazoria, Bremond, Brenham, Columbus, Corpus Christi, Dallas, Eagle Pass, Fairfield, Fredericksburg, Gonzales, Henderson, Huntsville, Independence, Ingleside, Ingleside, Grange, La Grange, Marshall, Nacogdoches, Navasota, New Braunfels, Richmond, San Marcos, Seguin, Sherman, Sulphur Springs, Victoria, Waco, and Waxahachie. The population of Texas in 1806 has been estimated at 7,000; in 1834, at 21,000; in 1836, at 38,500; and in 1845, at 150,000. The results of the three federal censuses are as follows:

The total for 1860 includes 403 Indians, and that for 1870 379 Indians and 25 Chinese. There are very few inhabitants W. of the 100th meridian, except along the Rio Grande. In the vicinity of San Antonio there is a large population of German origin. Of the total population in 1870, 423,597 were males and 395,022 females, 756,159 native and 62,411 foreign born. Of the natives, 388,510 were born in the state, 62,234 in Alabama, 51,453 in Tennessee, 42,587 in Mississippi, 41,206 in Georgia, 27,290 in Louisiana, 23,357 in Arkansas, 23,153 in Virginia and West Virginia, 18,655 in North Carolina, 18,419 in Missouri, 17,313 in Kentucky, 17,717 in South Carolina, 5,584 in Illinois, 2,873 in New York, 2,783 in Indiana, 2,385 in Maryland, 2,052 in Ohio, 1,934 in Florida, and 1,877 in Pennsylvania. Of the foreigners, 23,985 were natives of Germany, 23,020 of Mexico, 6,762 of the British isles (including 2,037 English and 4,031 Irish), 2,292 of France, and 1,745 of Austria (proper). Of the colored population, 225,058 were blacks and 27,917 mulattoes. There were 145,194 males and 139,667 females between 5 and 18 years of age, 153,765 males from 18 to 45, and 184,094 males 21 and upward, of whom 109,258 were citizens of the United States and 14,736 unnaturalized foreigners. The number of families was 154,483, with an average of 5-3 persons to each; of dwellings, 141,658, with an average of 5-78 to each. Of persons 10 years old and upward, 189,423 could not read, and 221,703 could not write; of the latter 208,834 were natives and 18,369 foreigners, 110,562 males and 111,141 females, 70,895 whites, 150,617 colored, and 191 Indians; 47,698 were between 10 and 15 years of age, 41,765 between 15 and 21, and 132,299 21 and upward of whom 64,819 were males. There were 404 blind persons, 232 deaf and dumb, 270 insane, and 451 idiotic. Of the 237,126 persons 10 years old and upward returned as engaged in all occupations, there were employed in agriculture 166,753, including 81,123 agricultural laborers, 79,015 farmers and planters, 3,338 stock raisers, and 2,049 stock herd- ers; in professional and personal services, 40,882, including 801 clergymen, 18,692 domestic servants, 14,371 laborers, 1,027 lawyers, 1,006 physicians, 1,047 traders, and 1,209 engaged in trade and transportation, 13,612; and in manufactures and mining, 15,879.—Texas may be divided into four sections, eastern, central or middle, western, and northern Texas. Eastern Texas embraces the territory between the Sabine and Trinity rivers, and is the great timber region of the state, there being only a few prairies confined to the gulf coast. The southern portion is low and level, the northern rolling and elevated, but not mountainous. The greater portion of central Texas, between the Trinity and Colorado rivers, is prairie, but there is considerable timber along the streams. Northern Texas, including two or three tiers of counties from Red river, is about equally divided between prairie and forest. Western Texas embraces the region between the Colorado and Rio Grande rivers. Prairies cover about four fifths of its surface; with the exception of occasional districts covered with post oak or the mesquite tree, timber is confined almost entirely to the valleys of the streams, which are densely wooded. The N. W. extremity of the state, between Indian territory and New Mexico, is known as the "panhandle." In general, the S. and E. portion, along the coast, is level and of little elevation; N. of this the country is undulating; the W. and N. W. region is mostly an elevated table land; while the district between the Pecos and Rio Grande is mountainous. The table land includes a large portion of the Llano Estacado, and has been but imperfectly explored; it is said to vary from 2,000 to 4,000 ft. in height. The Llano Estacado or Staked Plain (so named from the great abundance of yucca stems, resembling stakes) extends from the Rio Pecos in New Mexico on the west to the head waters of the Colorado, Brazos, and Red rivers on the east, and from the valley of the Canadian on the north to the Pecos on the south. Its surface is gently undulating; vegetation is scanty, owing to the dryness of the climate and the lack of streams. The principal ranges between the Pecos and Rio Grande are the Guadalupe, Sierra Huerca, Eagle, Sierra Blanca, and Apache mountains, attaining in places an elevation of between 5,000 and 6,000 ft. Between the upper waters of the Colorado and Brazos is a large tract of timbered land known as the "mezquite timber," and between the upper Brazos and Trinity a long tract from 5 to 80 m. in width, extending from Johnson co. to the Canadian river in Indian territory. —The coast of Texas, which extends along the gulf of Mexico about 400 m., is bordered with a chain of low sand islands, between which and the mainland lie a series of bays, sounds, and lagoons; the most important of these, beginning at the northeast, are Galveston, Matagor-
da, Espiritu Santo, Aransas, and Corpus Christi bays, and the Laguna del Madre. Galveston bay is the largest, and has the best entrance, its inlet having 13 ft. of water; while in good anchorage just outside there is 24 ft.; it extends inland from the gulf of Mexico 53 m. Matagorda bay, nearly 60 m. long by 6 to 10 m. wide, and Laguna del Madre, nearly 100 m. long by 3 to 6 m. wide, are properly sounds, and run parallel with the shore. The entrance of Matagorda bay, which is rapidly filling up, has only 7 ft. of water; and San Luis inlet, the entrance to West bay, a sound connecting with Galveston bay, has but 6 ft. Aransas bay is 25 m. long from N. E. to S. W. and about 10 m. wide, and Copano bay, a sound opening into it, 20 m. long by 3 m. wide; Corpus Christi bay is 20 m. long by 15 m. wide, and Espiritu Santo 20 by 10 m. The entrance to all these is much obstructed by the bars at the inlets.—E. of the 100th meridian the state is generally well watered. The Rio Grande forms the boundary with Mexico, and is navigable for 400 or 500 m. The Rio Pecos, its principal tributary, entering from New Mexico, flows S. E. through the western extremity of the state. The most important rivers, proceeding N. E. along the coast from the mouth of the Rio Grande, are: the Nueces, emptying into Corpus Christi bay; the San Antonio and Guadalupe, into Espiritu Santo bay; the Lavaca, into Lavaca bay and thence into Matagorda bay; the Colorado, into Matagorda bay; the Brazos, into the gulf of Mexico; the San Jacinto and Trinity, into Galveston bay; and the Neches and Sabine, into Sabine lake, which discharges into the gulf of Mexico through Sabine pass. The Sabine rises in the N. E. part of Texas, flows S. E. to the Louisiana border (about lat. 32°), and thence S., separating the two states. It is navigable in some portions by small craft. The Neches and its chief tributary, the Angelina, are navigable for about 200 m. from Sabine lake. The Trinity rises in the N. part of the state near the Red river, and flows S. S. E.; it is navigable for about 250 m. The Brazos, Colorado, Guadalupe, San Antonio, and Nueces rivers are during most of the year navigable, but short distance, though susceptible of improvement. The chief tributary of the Nueces is the Rio Frio. The Colorado and Brazos rise on the E. edge of the Llano Estacado, and flow S. E. across the state. The chief tributaries of the former are the Concho, San Saba, and Llano from the west; of the latter, the Little river from the west and the Navasota from the east. The N. E. corner of the state is watered by the Sulphur fork of Red river, which joins the main stream in Arkansas. A little S. of this are Big and Little Cypress bayous, which discharge through lakes into Red river in Louisiana. Red river rises by small forks in the N. W. part of the state, flows E., and after crossing the 100th meridian separates Texas from Indian terri-

tory and Arkansas, and enters the latter state. It is navigable for nearly its whole course on the boundary, though obstructed somewhat by shifting sands for a part of the distance. Its largest Texas tributary is the Big Wichita entering near lon. 98°. The N. extremity of the state is crossed by Canadian river, running E. from New Mexico into Indian territory.—The principal geological formations are the alluvial, tertiary, cretaceous, and carboniferous. The alluvial extends along the gulf coast; back of this is the tertiary, having its widest expansion in the east, where it reaches Red river in Lamar co.; N. W. of the tertiary is the cretaceous, extending W. on Red river to Cooke co. and S. to San Antonio, and probably forming the table lands and plains of the west and southwest. The carboniferous formation extends through the counties W. of Cooke to the Staked Plain, stretching S. from Red river to and beyond the upper Colorado. Coal beds have been discovered here, but scarcely anything has been done to test the quality or quantity of the mineral. Coal has also been found at various points in the tertiary, particularly in Bastrop co., W. of the Colorado; in Milam, Robertson, Leon, and Limestone cos., near the Brazos and Trinity; and in Anderson and Rusk cos., in eastern Texas. The tertiary coal has to some extent been proved valuable for fuel. Iron ores are abundant in the tertiary in eastern and central Texas; they also occur in the N. W. part of Grayson co., on Red river, and in the upper Cross Timbers; in Burnet and Llano cos., N. W. of Austin; and also, it is said, in Stephens co., further N. They were worked during the civil war in Cherokee and Nacogdoches cos., in eastern Texas, and in Bowie and other counties in the N. E. corner of the state. Copper ore occurs in the carboniferous formation, particularly in the N. part. Lead has been found in connection with silver in western Texas; steatite or soapstone in Llano co.; and marble of various colors and fair quality in Burnet, Llano, and San Saba cos. In the N. W. part of the state, about the head waters of Red river, is an extensive gypsum region. There are salt wells in Van Zandt co., in the northeast, in Young and Wise cos., in the northwest; and in Lampasas and Llano cos., on the Colorado. Salt beds are reported in the gypsum region and on the Rio Pecos. Between Corpus Christi and Brownsville are many shallow lagoons or arms of the gulf, which during the prevalence of winds blowing inland are filled with salt water. This is evaporated, depositing the salt, which is collected upon the subsidence of the water. Chalybeate springs are common in the iron districts of the tertiary. At Lampasas in the county of the same name are the sulphur springs, which also exist in Grimes, Rusk, and Hopkins cos., in the E. part of the state.—The climate is remarkably salubrious, and though warm enough for the production of most of the semi-tropical and some of the tropical
fruits, it is less enervating and more free from malarious diseases than that of any other of the gulf states. Northers, cool, dry winds, occur from October to May at intervals of about a week, rarely lasting more than three days. They produce sudden depressions of the temperature, but are said to make the climate more healthful and the air purer. The heat of summer is tempered by winds from the gulf, which blow far inland. The mean annual temperature in the southwest, near the mouth of the Rio Grande, is 73°; about the parallel of Austin, 68°; thence N. it gradually diminishes to 60° along the Red river. The highlands in the west are cooler, and in the extreme northwest the mean annual temperature is not more than 56°. The thermometer seldom falls below 25° in winter or rises above 95° in summer. The E. and S. portions have the most rain; as we proceed N. W. from the gulf, the moisture diminishes. The average annual rainfall in the northeast is 48 in., decreasing to 24 in. in the southwest near the gulf. In the extreme northwest it is only 16 in., and at some points between the Pecos and Rio Grande not more than 8 in. The following are the results of observations for 17 years (1858 to 1874 inclusive) at Austin (lat. 30° 15', lon. 97° 47'): mean annual temperature, 67°-61°, varying from 65°-82° in 1869 to 68°-92° in 1862; mean temperature of the hottest month (July), 94°; of the coldest month (January), 50°; minimum observed, 6°; maximum observed, 106°; average annual rainfall, 44-54 in., varying from 23-17 in 1862 to 48-79 in 1874. The most rain fell in September (average 4-96 in.) and the least in December (average 1-93 in.). Corn planting usually begins about the middle of February, and grain is harvested in the latter part of May, and Indian corn in July. Cotton picking begins about July 10, and continues to Dec. 1. The number of deaths, according to the census of 1870, was 11,197, of which there were from general diseases 3,948, including 680 from consumption, 464 from enteric fever, 596 from intermittent fever, and 327 from remittent fever; from diseases of the nervous system, 1,490; of the circulatory system, 204; of the respiratory system, 1,079, including 1,499 from pneumonia; of the digestive system, 1,498.—The soil of Texas is in general very fertile. The river bottoms are unsurpassed in this respect by those of any state of the Union. There are three or four varieties of soil, each well adapted to certain crops. The stiff black soil of the river bottoms is fittest for sugar and cotton, though the latter grows well on the prairies and uplands; the finer black or chocolate-colored soil of the prairie lands yields abundant crops of corn and the cereals, and the lighter copper-colored soil of the uplands is admirable for the grasses and fruits; while the fine silt of the islands produces the best sea island cotton known. The soil of the desert tracts of the northwest is sandy and charged with carbonate of soda and other alkalies; but even this, wherever it can be irrigated, produces grass and herbage moderately. Irrigation has been successfully practised in some instances in the west, where rain is scanty. In 1878 an act was passed granting land in pairs to persons engaged in constructing canals for irrigation and navigation. Texas is especially noted as a stock-raising country, for which the mildness of its climate and the great variety of its nutritious grasses peculiarly fit it. The W. portion, even where too dry for agriculture, is particularly adapted to cattle and sheep, and here are vast herds and flocks. Large numbers of horses and hogs are also kept. The buffalo and deer are found in the northwest, and wild horses or "mustangs" roam over the W. prairies. The other wild animals and the birds are similar to those of other portions of the Union. Among the more important grasses are the mezquite grasses of the west, which afford excellent pasturage at all seasons. The principal forest trees, of some of which several species occur, are the oak, elm, maple, hickory, pecan, sycamore or buttonwood, magnolia, willow, pine, Cypress, mulberry, cedar, sweet gum, ash, walnut, palmetto, cottonwood, Osage orange, and mezquite. Eastern Texas is an extensive pine region. The principal species in the north is the short-leaved pine (Pinus mitis), and in the south the long-leaved (P. palustris); the latter is valuable for timber and turpentine. The soil of the pine lands, though sandy, is productive. The cypress occurs in swamps and on the river banks in various parts of the state, and attains a great size. The live oak extends N. through central and western Texas to the Red river. The Osage orange is especially valuable for hedges, and in northern Texas attains a large size. The mezquite is one of the indigenous trees of Texas, growing in the west, valuable for fuel and for various other uses. (See Mezquite.) Numerous species of cactus are abundant W. of the Nueces river. Peaches do well in a large portion of the state, and apples thrive in the north. Pears, blackberries, and strawberries are also raised. Seven species of grapes are indigenous. In the south figs and oranges may be produced. The chief crops are cotton, Indian corn, and wheat. Cotton and corn may be grown in nearly every part of the state. Wheat is raised chiefly in the north. The sugar cane is cultivated principally on the Brazos near its mouth, and rice in the S. E. corner of the state. Oats, barley, beans, tobacco, and sweet and Irish potatoes are also raised to some extent. — The number of acres of land in farms according to the census of 1870 was 18,386,928, of which 2,964,836 were improved. The number of farms, 61,125, of which 717 contained under 3 acres each, 4,659 from 3 to 10, 13,594 from 10 to 20, 24,620 from 20 to 50, 10,890 from 50 to 100, 6,268 from 100 to 500, 305 from 500 to 1,000, and 72 more than 1,000; cash value of farms, $60,149,950; of farming implements
and machinery, $3,396,793; amount of wages paid during year, including value of board, $4,777,638; estimated value of all farm productions, including betterments and additions to stock, $49,185,178; value of orchard products, $69,172; value of produce of market gardens, $74,924; value of forest products, $66,841; amount of wages paid during year, including value of board, $4,777,638; estimated value of all farm productions, including betterments and additions to stock, $49,185,178; value of orchard products, $69,172; value of produce of market gardens, $74,924; value of forest products, $66,841; value of produce of market gardens, $74,924; value of forest products, $66,841; value of home manufactures, $293,308; of animals slaughtered or sold for slaughter, $4,885,284; of all live stock, $37,425,194. The productions were 66,173 bushels of spring wheat, 348,939 of winter wheat, 50,944 lugs of rice, 53,706 of tobacco, 1,251,328 of wool, 3,712,747 of butter, 34,942 of cheese, 51 of hops, 25 of flax, 12,255 of wax, 375,169 of honey, 6,516 gallons of wine, 5,032 of maple molasses, 246,026 of cane molasses, 2,020 hops-heads of cane sugar, 5 tons of hemp, 18,982 of hay, and 350,628 bales of cotton. There were on farms 424,504 horses, 61,322 mules and asscs, 428,046 of grass, 2,072,407 working oxen, 2,538,888 other cattle, 714,351 sheep, and 1,202,445 swine; besides which there were 150,137 horses and 496,115 neat cattle not on farms. The number of cattle was greater than in any other state. In 1873 718,247 horses and mules, 3,175,628 cattle, and 1,476,844 sheep were returned by the assessors. There were 2,399 manufacturing establishments in 1870, having 540 steam engines of 11,214 horse power, and 116 water wheels of 1,830 horse power; hands employed, 7,957; capital invested, $2,284,110; wages paid, $1,787,835; value of materials used, 6,273,193; of products, $11,517,302. The particulars of the principal branches are as follows:

The entrances and clearances in the coastwise trade during the same period, with the number and tonnage of vessels registered, enrolled, and licensed on the above date, are as follows:

On Oct. 1, 1875, there were 10 national banks in the state, of which the resources were as follows: loans and discounts, $1,366,805 99; bonds for circulation, $789,000; bonds for deposits, $175,000; total, including other items, $3,617,757 88. The following were the chief liabilities: capital stock, $1,200,000; surplus and undivided profits, $344,287 28; circulation, $673,103; individual deposits, $1,081,196 02. There are 15 or 20 state banks.

There were 32 m. of railroad in operation in 1875, 451 in 1862, and 711 in 1870. The following table contains the particulars of the different lines for 1875:
The Galveston, Harrisburg, and San Antonio railroad is in progress (1876) toward San Antonio, and the extension of the Gulf, Western Texas, and Pacific railroad to that city is contemplated. The Houston and Texas Central railroad connects at Red River City with the Missouri, Kansas, and Texas railroad for St. Louis. The International railroad is intended to extend S. W. to Laredo on the Rio Grande. The Texas and Pacific railroad has permission by its charter to continue its line across the continent to San Diego, Cal.; the Transcontinental division, when completed, will extend from Texarkana to Fort Worth, Tarrant co., on the main line. The Texas and New Orleans railroad was in operation to the Sabine river previous to the civil war, during which it was nearly destroyed; it is to be repaired. The Galveston and Santa Fé railroad has been chartered to connect those two points, and 40 m. are in course of construction from Galveston. The Texas and Pacific railroad (narrow gauge), from Houston to San Antonio, is in progress. W. from Houston.—A new constitution was adopted by the people, Feb. 15, 1876, which was to go into effect on the third Tuesday in April following. The executive officers are a governor (annual salary, $4,000), lieutenant governor, secretary of state (2,000), comptroller of public accounts (2,500), treasurer (3,500), commissioner of the general land office (2,500), and attorney general (2,000, besides fees not exceeding $2,000). They hold office for two years, and are all elected by the qualified voters, except the secretary of state, who is appointed by the governor and senate. The lieutenant governor is ex officio president of the senate, and in that capacity receives the pay of a senator. The legislature consists of a senate of 31 members, elected by districts, and a house of representatives of 93 members, distributed among the counties. At the apportionment in 1880 the number of representatives may be increased to not more than 150. The representatives are elected biennially; the sen-

The Galveston, Harrisburg, and San Antonio railroad is in progress (1876) toward San Antonio, and the extension of the Gulf, Western Texas, and Pacific railroad to that city is contemplated. The Houston and Texas Central railroad connects at Red River City with the Missouri, Kansas, and Texas railroad for St. Louis. The International railroad is intended to extend S. W. to Laredo on the Rio Grande. The Texas and Pacific railroad has permission by its charter to continue its line across the continent to San Diego, Cal.; the Transcontinental division, when completed, will extend from Texarkana to Fort Worth, Tarrant co., on the main line. The Texas and New Orleans railroad was in operation to the Sabine river previous to the civil war, during which it was nearly destroyed; it is to be repaired. The Galveston and Santa Fé railroad has been chartered to connect those two points, and 40 m. are in course of construction from Galveston. The Texas and Pacific railroad (narrow gauge), from Houston to San Antonio, is in progress. W. from Houston.—A new constitution was adopted by the people, Feb. 15, 1876, which was to go into effect on the third Tuesday in April following. The executive officers are a governor (annual salary, $4,000), lieutenant governor, secretary of state (2,000), comptroller of public accounts (2,500), treasurer (3,500), commissioner of the general land office (2,500), and attorney general (2,000, besides fees not exceeding $2,000). They hold office for two years, and are all elected by the qualified voters, except the secretary of state, who is appointed by the governor and senate. The lieutenant governor is ex officio president of the senate, and in that capacity receives the pay of a senator. The legislature consists of a senate of 31 members, elected by districts, and a house of representatives of 93 members, distributed among the counties. At the apportionment in 1880 the number of representatives may be increased to not more than 150. The representatives are elected biennially; the sen-
eral elections are held biennially on the Tuesday next after the first Monday of November in even years (commencing with 1878). Amendments to the constitution must be proposed by two thirds of each house of the legislature, and approved by a majority of the people. Texas is entitled to six representatives and two senators in Congress, and therefore has eight votes in the electoral college. — The valuation of property, according to the United States censuses, has been as follows:

The decrease from 1860 to 1870 was due to the civil war, and particularly to the emancipation of the slaves. The assessed value of property in 1870 was $2,416,841,860; in 1875 it was believed that with a proper system of assessment it would amount to $300,000,000. The taxation of 1873 amounted to $3,517,394, of which $1,256,183 ($168,254 on polls and $1,177,934 on property) was state and $1,231,206 county. The estimated receipts during the year ending Aug. 31, 1876, available for the general expenses of the state, are $1,289,348; available for school purposes, $715,129; total, $3,004,477 70, of which $1,400,130 are from taxes on property, $279,000 from occupation tax, $170,947 70 from poll taxes, $155,000 from interest on permanent school fund, and $30,000 from office fees. The appropriations for the same period are as follows: for executive departments, $182,230; judicial department, $255,625; school department, $505,400, including $500,000 for teachers’ wages; blind asylum, $16,120; deaf and dumb asylum, $14,000; lunatic asylum, $33,300; penitentiary, $40,000; interest, $480,000; frontier defence, $150,000; other purposes, $5,610; total, $1,688,285. The bonded debt on Aug. 31, 1875, amounted to $4,107,588; floating debt, $614,326 36; total, $4,721,914 36. Besides this there was a debt of doubtful validity, amounting to $929,687 66, and consisting of bonds issued by the state to the school and university funds, with accrued interest thereon. — The state institutions are the penitentiary, at Huntsville, and the institution for the deaf and dumb (opened in 1857), the Institute for the blind (1856), and the lunatic asylum (1861), at Austin. The labor of the convicts is leased to contractors. The number registered at the penitentiary in November, 1875, was 1,086, of whom 452 were employed at the penitentiary and the rest elsewhere. The institution for the deaf and dumb in 1874 had 46 pupils (31 males and 15 females); the blind institute, 40 (16 males and 24 females); and the lunatic asylum, 127 inmates (68 males and 59 females). In 1875 an act was passed providing for the erection of two additional penitentiaries, one N. E. of the Trinity river and the other W. of the Colorado river. — The governor, comptroller, and secretary of state constitute a board of education. The public schools are regulated by an act of 1873, with amendments. In each county a board of five school directors is elected for four years; these choose one of their number president, who is ex officio county superintendent of public instruction. In each school district three trustees are elected annually. Cities may assume control of the schools within their limits, subject to the general school law. The schools for white and colored children are separate. Under the provisions of the constitution one fourth of the revenue from general taxation and a poll tax of $1 on males between 21 and 60 years of age, together with the interest on the permanent school fund, are annually set apart for the support of public schools; there is also a landed endowment, consisting of 60,014,000 acres of the public domain. In 1874 there were 2,129 public schools, with 98,808 pupils enrolled, out of a school population (0 to 18 years) of 313,061; private schools, 152, with 4,981 pupils; public school houses, 1,007; amount of state school fund apportionment, $490,930 50; teachers’ wages, $612,878 67. Only 77 counties reported the number of pupils enrolled in the public schools; the number enrolled in the entire state was estimated by the superintendent of public instruction at 161,670. The permanent school fund on Aug. 31, 1875, amounted to $2,967,673 31. Under the act of congress of 1862 and 1866, the state received a donation of 180,000 acres of land scrup for the establishment of an agricultural and mechanical college. This was sold in 1871, and the proceeds were invested in 7 per cent. gold bonds of the state ($174,000). Buildings have been erected by the state near Bryan. The following table gives particulars of collegiate institutions for 1874—5:

These institutions, besides the ordinary college course, have preparatory and inferior departments, which embrace the greater part of the students. Several of them admit both sexes. A law department has been organized in Trinity university. The American dental college at Austin, organized in 1873, and the Galveston medical college, founded in 1864, have each six professors. The Barnes institute, at Galveston, Coronal institute at San Marcos, Hays co., St. Mary’s Catholic institute, at San Antonio, and the Texas military institute, at Austin, are important. Among female seminaries are the Andrew female college, at Huntsville; Baylor female college, at Independence; Bryan female seminary, Brazos co.; Chappell Hill female college; Lamar female college, at Paris, Lamar co.; Ursuline academy, at Galveston; and Waco female college. The state has set apart 1,221,000 acres of land for the establishment of a university, but no steps have yet been taken to found the institution. There were also in the treasury on Aug. 31, 1874, bonds to the amount of $134,472 26 belonging to the university fund. —The number of libraries returned by the census of 1870 was 455, with an aggregate of 87,111 volumes, of which 135, with 28,018 volumes, were other than private, including 131 Sunday school libraries, with 19,318 volumes. There were 112 newspapers and periodicals, issuing 4,214,800 copies annually and having a circulation of 55,250, viz.: 12 daily, circulation 3,500; 5 tri-weekly, 2,450; 5 semi-weekly, 3,700; 89 weekly, 45,300; and 1 semi-monthly, 300. The following are the statistics of churches, according to the census:

—In 1685 a colony of French emigrants led by the sieur de La Salle, designing to found a settlement in the delta of the Mississippi, sailed past it unaware, landed in Matagorda bay, and erected Fort St. Louis on the Lavaca. In 1689 Capt. La Hontan, a Spanish officer, was despatched to the Lavaca to scour the country and hunt out the French. He arrived there on April 22, found the garrison scattered, and returned the next year with 110 men and some friars, and established on the site of Fort St. Louis the mission of San Francisco. In 1691 a Spanish governor of the region was appointed, and soldiers were sent to enforce his authority; but in 1693 the hostility of the Indians, the failure of the crops, and the death of their cattle discouraged the colonists, and the mission was abandoned. Spanish Spaniards had settlements at El Paso and at San Juan Bautista, both on the right bank of the Rio Grande, but none within the present bounds of Texas. In 1714 the French again attempted to effect a settlement within its limits, and Crozat, to whom Louis XIV had granted the whole of Louisiana, sent Huchereau Saint-Denis upon an expedition thither. He penetrated from the Sabine to the Rio Grande, and visited the Spanish mission of San Juan, where he was taken prisoner by the governor of Coahuila; but having subsequently married the daughter of the commandant of that mission, he introduced Spanish missionaries into Texas, who established a mission on the bay of San Bernardo or Matagorda, another west of the Sabine and near the coast (the famous mission of Dolores), and a third on the right bank of the San Pedro, near San Antonio, subsequently removed eastward, and known as the Alamo. Two other missions were established soon after, one near Nacogdoches, the other not far from San Augustine. The name of “the New Philipines” was now given to the country, and in 1715 the marquis de Agua- yo was made governor general of the colony. For 20 years the Spaniards held sole sway, and multiplied their settlements. In 1735 Saint-Denis, who had acquired great influence over the Texas Indians, aided in removing a French settlement on Red river into Texas; the Spaniards protested, but owing to quarrels among themselves did not drive them out, and finally conceded that they had a right to the region they were occupying. In 1758 the Indians attacked the mission of San Saba, and killed all its inhabitants. This caused the decline of the missions in Texas, as the slaughter was never avenged; in 1765 there were not more than 750 European inhabitants, with about the same number of Indians. In 1762-3 the feud between France and Spain was finally settled by the cession of the vast Louisiana territory by the former power to the latter. In 1803, Spain having re-ceded Louisiana to France, that power sold it to the United States; and as there had been no well-defined boundary between Louisiana and the old Spanish possessions W. of it, a controversy at once ensued between Spain and the United States on the question of boundaries, Spain claiming a region E. of the Sabine, and the United States urging that they were entitled to the country W. as far as the Rio Grande. In October, 1806, Gen. Herrera, the Spanish commander, entered into an agreement with Gen. Wilkinson establishing the territory between the Sabine and Arroyo Honda as a neutral ground, and retired W. of that line. At this time the population of Texas was about 7,000, many of the settlers being adventurers engaged in illicit trade between the United States and Mexico. From 1806 a series of revolutionary efforts com-
menced, beginning with the projected movement of Aaron Burr, and embracing the expedi-

tions of Megee, a former lieutenant of the U. S. army; of Col. Kemper, his successor; of

Bernardo Gutierrez; of Col. Ellis P. Bean, who had suffered a protracted and cruel impris-
one from the Spanish authorities; of Gen. J. A. Toledo, a Cuban republican; of

Col. Perry, an American officer; of Anzy, who styled himself governor of Texas; and of

Xavier Mina, a Spanish refugee, who aided in the capture of Galveston island in 1816. In

these expeditions there were several severe battles fought between the invaders and the

Spanish authorities; on two occasions in 1813, the invaders defeated the Spanish forces, and

caused them a loss of more than 1,000. In the same year, of a force of 2,600 Americans

and Mexicans, all were slain but about 100, a considerable number being butchered in cold

blood, and nearly 700 of the peaceable inhab-

nants of San Antonio murdered. In 1817 Mina won several victories in conflict with the

Spanish troops, but was finally defeated, taken prisoner, and shot on Nov. 11 of that year.

After the close of the war of 1812 Lafitte, the pirate of the gulf, made Galveston island his

headquarters, and established a town there named Campeachy. He remained here till

1821, when a naval force was despatched by the United States government to break up the

settlement. In 1819 the long controversy be-

tween the United States and Spain in regard to the Texan boundary was terminated by the

establishment of the Sabino as the boundary line. This treaty occasioned much dissatisfaction

on the part of the western and southwestern states. Mr. Clay and other prominent men opposed it. A revolutionary expedition was organized at Natchez the same year, under

the command of Dr. James Long, a Ten-

nesseean, which penetrated as far as Nacog-
doches and established a provisional govern-

ment there, and the leader went to Galv-

eston island. He secured the services of La-

fitte; but while he was absent his force was

routed and cut to pieces by the royalist troops. In a second expedition Long took possession of La Bahia without difficulty; but, though Mexico had become independent under Iturbide, he and his followers were taken prisoner and sent to the city of Mexico, where after a brief imprisonment he was set at liberty, but was almost immediately assassinated, in 1822. Texas at this time was almost wholly deserted, the settlement at Galveston entirely abandoned, and the few inhabitants at other points reduced to poverty by the civil war. In 1820 Moses Austin, then residing in Missouri, received from the Spanish authorities of Mexico a grant of lands in Texas. He died before he was able to avail himself of it, and his son, Stephen F. Austin, received a confirmation of the grant in 1823, having already in the beginning of 1822 conducted a considerable number of colonists to the site he had selected in the vicinity of the present county of Austin. The colony increased rapidly, and Austin obtained permission to bring in 500 more families (his first grant was for 300). Others also followed in the establish-

ment of colonies in the same vicinity. The Mexican constitution, adopted in 1824, united Coahuila, hitherto a separate province, with Texas in a single state, and the congress of the united state placed a Mexican as commandant of the department of Texas. The injustice of this commandant toward the American citi-

zens, especially those attached to the colony of Hayden Edwards, created difficulty; and an appeal being made to the governor of the state, who was also a Mexican, he without trial or examination annulled Edwards's grant and ordered his expulsion from the state. Ed-

wards and his colonists attempted unsuccess-

fully to effect a revolution; and in January, 1827, they were compelled to retreat into the United States. In 1830 Bustamante, who had seized the dictatorship of Mexico, issued a de-

ree forbidding the people of the United States to enter Texas as colonists, and suspending all colony contracts which interfered with this prohibition. In 1832 the Texans sustained the pronunciamiento of Vera Cruz in favor of the constitution, and in opposition to the rule of Bustamante, and defeated a force under Col. Piedras, who favored the dictator. In 1833 the American settlers, now numbering over 20,000, held a convention, determined to sepa-

rate themselves from Coahuila, and prepared a state constitution and an address to the general government, of which Santa Anna was now the head, requesting admission as a separate state into the republic. Col. S. F. Austin went to Mexico to present the request of the memorialists. He was unsuccessful, and was detained in Mexico till September, 1835, but in 1834 procured the revocation of the decree of Bustamante prohibiting the ad-

mission of colonists from the United States, and several other favorable concessions. Santa Anna sought to amuse Austin and the Texans with promises of allowing them a separate state government till he could occupy the country with his troops. The government of the state of Coahuila and Texas having been overthrown, committees of safety were established, the first being appointed at a meeting at Mina (now Bastrop), May 17, 1835. The first battle, or rather skirmish, was fought near Gonzales, Oct. 21. Other battles followed. Goliad was captured by the Texans on Oct. 9, and the battle of Concepcion, near San Antonio, was fought on the 28th. On Nov. 3 the "Con-

sultation," a body composed of delegates from the municipalities, met at San Felipe de Aus-

tin, and proceeded to the organization of a provisional government. Henry Smith was elected governor and J. W. Robinson lieu-

tenant governor, and a general council was organized. At the same time Sam Houston was elected commander-in-chief, and Austin
was appointed a commissioner to the United States. San Antonio de Bexar was taken on Dec. 10, after being cannonaded for six days. By this victory the entire armed Mexican force was driven out of Texas. On the 20th a "Declaration of Independence" was issued at Goliad by Capt. Philip Dimitt and others there. Santa Anna set out with an army of 7,500 men, well provided with artillery, ammunition, and stores. On Feb. 23, 1836, he invaded the Alamo, a strong fort near San Antonio, which was garrisoned at this time by 140 men under command of W. B. Travis, and 32 more subsequently forced their way through the Mexicans into it. Santa Anna with 4,000 men bombarded it for 11 days, and finally carried it by storm. On March 6 the whole garrison were put to the sword, and but three persons, a woman, a child, and a servant, were spared. The Mexican loss was 1,600. On March 1 a convention assembled at Washington on the Brazos, and on the 2d issued a declaration of independence; on the 16th a provisional president (David G. Burnet) and civil officers were elected, and a constitution was adopted, which was signed on the 17th. Meanwhile Gen. Houston found it necessary on the approach of Santa Anna to evacuate Gonzales. The tragedy of the Alamo, the murder of Col. Fannin's command in cold blood at Goliad, March 27, 1836, by Santa Anna's order, in violation of the terms of surrender (see FANNIN, JAMES W.), and the successive defeats of the Texan troops, produced a temporary panic. This was increased by the continued retreat of Gen. Houston, who fell back first to the Colorado, then to the Brazos, and finally to the San Jacinto, his design being to scatter and divide the Mexican forces, in which some eminently successful. The alarm soon passed away, and having collected a force of about 800 troops, he gave battle on April 21 to the Mexican forces which had pursued them, of about twice the number, and defeated them completely, killing 630, wounding 208, and taking 730 prisoners; among the latter (though not captured till the next day) was the Mexican president, who had commanded in person. The Mexicans were at once demoralized, and retreated rapidly westward in disorder. Santa Anna was held a prisoner, but the war was practically ended; and though the Mexicans government made several attempts to fit out other armies to reconquer Texas, and refused to acknowledge its independence, their forces did not again invade the country. Gen. Houston, who had been wounded in the battle of San Jacinto, and had resigned his command of the army, was elected president in September, 1836, and on Oct. 22 was inaugurated. The first congress of the republic assembled about the same time, the constitution having been adopted in the election of September. In March, 1837, the United States acknowledged the independence of Texas. In 1838 Mirabeau B. Lamar succeeded Gen. Houston as president. Repeated incursions were made by the Comanches and other Indian tribes; and in 1840 the Texans pursued them after one of their forays, penetrated into their country, and inflicted summary and severe punishment. In 1839 the independence of the republic was acknowledged by France, and in 1840 by England, Holland, and Belgium. But while thus recognized by leading powers as independent, her financial condition was every month becoming more deplorable. In September, 1841, Gen. Houston was again elected president. In 1841 and 1842 the Mexican government sent several marauding expeditions into Texas, and in the latter year San Antonio was twice captured and plundered. The Texans attempted reprisals by two ill-judged expeditions, neither under the direction of the government, the first in 1841 to Santa Fé, the second in 1842 to Mier in the state of Tamaulipas. Both were unsuccessful, and many of the Texans were taken prisoners by the Mexicans and executed. In the spring of 1845 a third expedition, intended to intercept the Mexican traders to Santa Fé, was fitted out by private parties, but with the approbation of the government, which also proved a failure. The same year, on the remonstrance of the British chargé d'affaires to Mexico, Santa Anna informed Gen. Houston that he would agree to an armistice, and commissioners were appointed. While the negotiations were pending, President Tyler made propositions to the president of Texas for her annexation to the United States, which after a time were favorably received, and a treaty was made looking to annexation. This treaty was completed and signed by the Texan commissioners and Mr. Calhoun, secretary of state, April 12, 1844, but was rejected by the United States senate on June 8. The agitation of this subject greatly irritated Mexico, and caused her to terminate the armistice and threaten the renewal of hostilities; it also displeased Great Britain and France, who desired to see Texas under an English or joint protectorate, without slavery, and free from the influence of the United States. In December, 1844, Dr. Anson Jones was inaugurated president of the republic. Its revenues were now increasing, and its population growing with great rapidity, and the threats of war from Mexico were rendered powerless by her weakness and discontents. The only disturbances within the boundaries of Texas were the conflicts between the "regulators" and the "moderators" in Shelby and adjacent counties. These were finally put down by armed force. Joint resolutions providing for the annexation of Texas passed the United States house of representatives by a vote of 120 to 28, Jan 25, 1845, and the senate by a vote of 27 to 25 on Feb. 27, with an amendment, which was concurred in by the house the next day by a vote of 132 to 70. On March 1 these resolutions were approved by President Tyler.
President Jones called a convention of 61 delegates to meet on July 4 to consider the propositions for annexation, and that convention ratified the act and prepared a constitution for the republic as a state of the federal Union, which was submitted to the people and approved by them. On Dec. 29 a joint resolution of congress declared Texas admitted into the Union as a state. Its annexation led to a war with Mexico, which terminated in 1848. (See Mexico.) Under the Spaniards Texas was bounded W. by the Nueces and N. by Red river, but at the time of its annexation the republic claimed as its W. boundary the Rio Grande and a line running N. from the source of that stream to the 42d parallel, making its area 376,133 sq. m. In 1850 the state ceded to the United States its claim to all territory beyond its present limits, in consideration of $10,000,000 in bonds, with the proceeds of which the state debt was paid. At the presidential election in 1860, 47,548 votes were cast for the Bell Democratic electors, and 15,438 for the Bell electors. As soon as the election of Lincoln became known, the secessionists began to urge the governor (Sam Houston) to call an extra session of the legislature, which he refused. The secessionists, having called an irregular convention, the governor assembled the legislature on Jan. 21, 1861, which sanctioned the convention thus called. The convention met on Jan. 28, and on Feb. 1 adopted an ordinance of secession by a vote of 166 to 7, which on Feb. 26 was ratified by the people by a vote of 34,794 to 11,295. The governor having neglected to take the oath of allegiance to the confederacy, as required by the convention, an ordinance was passed on March 16 declaring his seat vacant, which action was confirmed by the legislature on the 29th. The permanent constitution of the Confederate States was ratified on March 23 by a vote of 68 to 2. In the mean time, on Feb. 18, Gen. Twiggs, in command of the United States forces in Texas, surrendered his entire command and all the military posts and munitions of war to the state authorities. No very important military operations occurred in the state during the war. Galveston was occupied by a federal force on Oct. 8, 1862, but it was reoccupied by the confederates on Jan. 1, 1863. On Oct. 26 Gen. Banks set out from New Orleans with an expedition under the immediate command of Gen. Dana, and landed at Brazos Santiago on Nov. 2. Brownsville was entered on the 16th, and other points in western Texas were occupied. The last fight of the war took place in western Texas on May 13, 1865, between a federal force under Col. Barret and a confederate force under Gen. Slaughter, the latter being victorious. On the 26th Gen. Kirby Smith surrendered the last confederate army. On July 21 Gen. A. J. Hamilton, appointed provisional governor by President Johnson, arrived at Galveston. An election was held on Jan. 8, 1866, for delegates to a state convention, those being entitled to vote who were qualified according to the laws in force prior to secession, and who had taken the amnesty oath prescribed by the president’s proclamation of May 29, 1865. The convention met on Feb. 10 and adjourned on April 23, having adopted amendments to the constitution declaring the ordinance of secession void, abolishing slavery, and repudiating the war debt. At an election held in June these amendments were ratified, and J. W. Throckmorton was chosen governor. On Aug. 13 he entered upon his duties. Under the reconstruction acts of 1867 Texas with Louisiana was constituted the fifth military district under Maj. Gen. Sheridan, and was placed in immediate command of Brev. Maj. Gen. Charles Griffin. Gen. Sheridan assumed command March 19, 1867. On July 30 Gov. Throckmorton was removed, and E. M. Pease appointed in his place. Several detachments of military commanders subsequently took place. On a registration, 59,633 white and 49,479 colored voters were enrolled. At an election in February, 1868, a convention was called, which assembled on June I and remained in session till Aug. 31, when it took a recess. Reassembling on Dec. 7, it adopted a constitution, and adjourned in February, 1869. At an election held Nov. 30 to Dec. 3, 1869, the constitution was ratified by a vote of 72,366 to 4,928, and E. J. Davis, republican, was chosen governor over A. J. Hamilton, conservative republican. The legislature elected at the same time assembled on Feb. 8, 1870, and ratified the 14th and 15th amendments to the constitution of the United States. On March 30 an act was passed readmitting the state to representation in congress, and on April 16 the government was turned over to the civil authorities. Within the last few years Texas has suffered severely from Indian incursions on the N. W. frontier and Mexican raids on the Rio Grande. Texas, a S. county of Missouri, bounded by Current river and affluent of the Gasconade; area, 1,250 sq. m.; pop. in 1870, 9,618, of whom 95 were colored. The surface is hilly, with large forests of yellow pine, and the soil fertile along the streams. The chief production in 1870 were 51,778 bushels of wheat, 256,252 of Indian corn, 2,876 of oats, 16,318 of potatoes, 44,349 lbs. of tobacco, 13,283 of wool, 67,231 of butter, and 601 tons of hay. There were 2,061 horses, 2,359 milk cows, 4,424 other cattle, 7,399 sheep, 15,284 swine, and 56 saw mills. Capital, Houston. Texel, an island of the Netherlands, in the North sea, pr. of North Holland, separated from the mainland by the channel called Mars Diep, about 2 m. broad; extreme length 14 m., breadth 6 m.; area, 74 sq. m.; pop. in 1869, 6,145. It contains several villages, the most important of which is Burg. The surface is low and a great deal of it marshy, but it is protected from inundations by the line of
dunes or sand hills on the W. side, and strong dikes in other parts. The soil is remarkably fertile, and is chiefly occupied by pastures.

TEXIER, Charles Félix Marie, a French archaeologist, born in Versailles, Aug. 29, 1802. He studied architecture at the school of fine arts in Paris, was employed for ten years in explorations in the East under the patronage of the government, and was afterward inspector of public buildings in France and Algeria. His works, remarkable for learning and magnificent illustrations, include Description de l’Armenie, de la Perse et de la Mesopotamie (2 vols. fol., Paris, 1842-5); Description de l’Asie Mineure (4 vols., 1839 et seq., and simultaneously in English by R. P. Pullan); Edesse et ses monuments en Mesopotamie (1859); and in conjunction with Pullan, “Byzantine Architecture” (London, 1864), and “The Principal Ruins of Asia Minor” (1865).

TEZUCO, or Tezoco, a town of Mexico, in the state and about 16 m. E. N. E. of the city of Mexico, near the E. shore of the lake of the same name; pop. about 5,000. It contains several handsome buildings, public and private. Woolen and cotton goods are manufactured. In ancient times Tezucu was the second city in Mexico. One of the palaces of Montezuma is said to have stood in the N. W. quarter, and in the S. part there are massive remains of three pyramids, each measuring 400 ft. along the base of their fronts.

THACKERAY, James, an American physician, born in Barnstable, Mass., Feb. 14, 1754, died in Plymouth, May 26, 1844. On the breaking out of the revolution he was appointed surgeon’s mate to Dr. John Warren in the general hospital at Cambridge; in 1778 he was made chief surgeon to the first Virginia state regiment, and in 1777 was transferred to a New England regiment. In March, 1783, he settled as a physician at Plymouth, Mass., where he also gave some attention to the manufacture of salt and iron. He published “The American New Dispensatory” (Boston, 1810), which was long a standard work on pharmacy, medical chemistry, and materia medica; “Observations on Hydrophobia” (1812); “The Modern Practice of Physic” (1817; 2d ed., 1826); “The American Orientalist” (1822; 2d ed., 1825); “A Military Journal during the Revolutionary War” (1833; 3d ed., Hartford, 1854); “American Medical Biography” (2 vols. 8vo, 1828); “A Practical Treatise on the Management of Bees” (1829); “An Essay on Demonology, Ghosts, Apparitions, and Popular Superstitions” (1831); and “History of the Town of Plymouth” (1832; 2d ed., 1835).

THACKERAY, Peter, an American clergyman, born in Milton, Mass., March 21, 1752, died in Savannah, Ga., Dec. 16, 1802. He graduated at Harvard college in 1769, and settled at Mal- den, Mass., in 1770. He soon attained a high reputation as a preacher, and received the name of the “silver-tongued Thacker.” From January, 1785, till his death, he was pastor of the Brattle street church in Boston. His “Oration against Standing Armies,” delivered at Watertown in 1776, still retains its reputation. For 15 years he was chaplain of one or both branches of the legislature. He published 22 distinct works, including “Observations on the State of the Clergy in New England” (1753), and “Memoirs of Dr. Boylston” (1789).

THACKERAY, William Makepeace, an English author, born in Calcutta in 1811, died in Lon- don, Dec. 24, 1863. He was descended from an old Yorkshire family, and was at an early age in the civil service of the East India company. He was educated at the Charterhouse in Lon- don, and at Cambridge, but did not take a degree. Coming into possession of £20,000 at the age of 21, he travelled on the continent, and studied art for several years. But he lost the bulk of his fortune by speculation, and about the age of 30 adopted literature as a profession. He wrote for “Fraser’s Magazine” under the pseudonyms of Michael Angelo Tita- marsh and George Fitz-Boodle, and contributed to “Punch” three series of papers: “The Fat Contributor,” “Jeannes’s Diary,” and “The Snob Papers.” These and other works appeared in book form from 1840 to 1848, but he attained no very marked success in literature till the publication of “Vanity Fair, a Novel without a Hero,” in monthly numbers, in 1846-8. This gave him a reputation as a novelist which, though amply sustained, was hardly increased by any of his later works. In 1845 he visited the East for his health. He was called to the bar in 1848, but did not practi- ce. In 1851 he delivered to brilliant audiences in London a series of lectures on “English Humorists of the Eighteenth Century.” He visited America in 1852, and again in 1855-6, where he preached the course of lectures he had delivered for the first time another course on “The Four Georges,” which he repeated in the principal cities of Great Britain. In 1857 he was an unsuccessful candidate, as a liberal, for the representation of the city of Oxford in parliament. The “Cornhill Magazine” was commenced at the close of 1859 with Thack- eray as editor, and quickly attained an enorm- ous circulation. He resigned the editorship in April, 1862. He was found dead in his bed, from effusion on the brain. He was buried in Kensal Green cemetery. A bust of him, by Marochetti, was unveiled in West- minster Abbey, Oct. 21, 1865. He was tall and powerfully built, with a massive head and silvery white hair. His geniality, even temper, and kindly disposition toward every- body with whom he came into personal rela- tions, were curiously at variance with the charge of cynicism so often brought against his works. His domestic life was clouded for several years by the insanity of his wife. His novels and tales, with the dates of their publication in book form, are: “The Great Hoggarty Diamond” (1841); “The Memoirs of Barry Lyndon” (1843); “Vanity Fair” (1848);
“The History of Pendennis” (1850); “The History of Henry Esmond” (1852); “The Newcomes” (1855); “The Virginians” (1859); “Lovell the Widow” (1860); “The Adventures of Philip on his Way through the World” (1862); and “Denis Duval,” left unfinished (1864). His Christmas books are: “Mrs. Perkins’s Ball” (1846); “Our Street” (1848); “Dr. Birch and his Young Friends” (1849); “Rebecca and Rowena” (1850); “The Kicklebursys on the Rhine” (1851); and “The Rose and the Ring” (1854). His other publications include “The Paris Sketch Book” (1840); “Comic Tales and Sketches” (2 vols., 1841); “The Second Funeral of Napoleon” and “The Chronicle of the Drum,” in verse (published together, 1841); “The Irish Sketch Book” (2 vols., 1845); “Notes of a Journey from Cornhill to Grand Cairo” (1846); “The Book of Snobs” (1848); “English Humorists of the Eighteenth Century” (1853); “Ballads” (1855); “The Four Georges” (1860); “Roundabout Papers” (1862); and “The Orphan of Pinblets” and other Sketches, Fragments, and Drawings,” with notes by his daughter (1875).

Most of his books were illustrated by himself. James T. Fields has made a collection of his fugitive articles, under the title “Early and Late Papers” (12mo, Boston, 1867). There are numerous approximately complete editions of Thackeray’s works, the latest of which reproduces the original illustrations (22 vols., London, 1875 et seq.).—See “Studies on Thackeray,” by James Hannay, and “Thackeray, the Humorist and the Man of Letters; the Story of his Life,” by Theodore Taylor (London, 1864).—His daughter Anne Isabella has published “The Story of Elizabeth” (London, 1868; German translation, Leipzig, 1864; Dutch, Amsterdam, 1864); “The Village on the Cliff” (1867); “Old Kensington” (1873); “Toilers and Spinsters, and other Essays” (1873); “Bluebeard’s Keys” (1874); “Miss Angel,” a novel founded on the life of Angelica Kauffmann (1876); and numerous short tales and sketches.

THAER, Albrecht, a German agricultural writer, born in Celle, May 14, 1752, died at Möglin, near Potsdam, Oct. 26, 1828. He studied at Göttingen, and in 1780 was appointed court physician at Hanover. In 1790 he established an agricultural school at Celle, in 1804 entered the Prussian civil service, and in 1807 erected on his estate of Möglin an institution since known as the royal school of agriculture. In 1810 he was appointed professor of agriculture and political economy in the university of Berlin, with a seat in the ministry of the interior. In 1815 he became superintendent of the royal establishments for breeding sheep. His great work, Grundriss der rationellen Landwirthschaft (4 vols., Berlin, 1809; 6th ed., 1868), has been translated into English by W. Shaw and O. W. Johnson (“The Principles of Agriculture,” 2 vols., London, 1844; 1 vol., New York, 1849), and into other lan-

THALBERG, Sigismond, a Swiss pianist, born in Geneva, Jan. 7, 1812, died in Naples, April 27, 1871. He was the natural son of Prince Dietrichstein, and was placed under the instruction of Hummel, whom he subsequently surpassed in firmness of touch and grace of expression. At 15 he began to be known in the concert rooms, and soon afterward published his first compositions. From 1830 to 1839 he made extended concert tours through Europe, appearing in England in 1837. He visited South America and the United States in 1856–8. His playing was distinguished by precision, delicacy, and finish, rather than by the production of surprising effects; but his chief merit, both as a performer and a composer, consisted in his successful attempts to combine the elements of song and harmony and of brilliant execution, as exemplified respectively in the schools of Mozart and Beethoven and of Clementi. In pursuance of this design he discovered many ingenious combinations for the fingers, whereby the song or melody, which he kept in the medium keys of the piano, could always be heard strongly accented in the midst of rapid passages, scales, arpeggios running from end to end of the instrument, and other complicated forms of accompaniment. This species of composition has since become exceedingly common, through the works of a host of imitators. Among the productions by which Thalberg and his method acquired their celebrity are a series of fantasies of great beauty and brilliancy, including those on themes from Don Giovanni, Robert le Diable, L’Elisir d’amore, Les Huguenots, La donna del lago, and More en Egitto, the performance of any one of which by the composer realized the perfection of pianoforte playing. In 1851 he produced at London under Balfe’s direction an opera entitled Florinda, founded on a libretto by Scribe, which failed to attract much attention.
In 1845 he married a daughter of Lablache. His last public appearance was at Paris in 1865. After that he retired to his estate near Naples, where he devoted himself to the cultivation of the vine.—His daughter Zaire, born in New York in 1858, made a successful début as Zerlina in Don Giovanni, at Covent Garden, London, April 10, 1875.

**THALER** (Dan. and Swed. daler), a coin and money of account of Germany, Austria, Holland, Belgium, Denmark, Sweden, and Norway. Silver coins of an ounce weight were struck in the early part of the 16th century at Joachimsthal, a town in Bohemia, whence the name. (See Dollar.) Other countries after a time began to coin thalers, but not always of the same value, and hence originated the Laubthal or leaf dollar, the Philippenthal, the Swedish copper dollar, &c. In most of the countries of Europe the royal or imperial mints coined thalers, hence called rigsdaler, riksdaler, or Reichsthaler, that is, dollar of the realm. These varied in value according to the amount of alloy. (See Corse.) As money of account there is still greater diversity of values, owing to the depreciation of the issues of the national banks or treasuries. In Sweden the riksdaler riksmunt, now the authorized money of account, is about 27 cts. In Denmark the riksbank daler is about 54 cts. In Germany generally the thaler of account is reckoned at 69 to 73 cts. American currency.

**THALES**, a Greek philosopher, and one of the seven wise men, born in Miletus, Ionia, about 636 B. C., died probably about 546. He took an active part in the political affairs of his native country. He visited Crete and Egypt, and acquired in the latter country an acquaintance with geometry. Various physical discoveries are attributed to him. He measured the height of the Egyptian pyramids by observation of the time at which a shadow exactly in the height of the object, and he is said to have computed the sun’s orbit, to have fixed the length of the year at 365 days, and to have been the first among the Greeks to predict eclipses, though very vaguely. Aristotle calls him the originator of the Ionic natural philosophy, and hence, indirectly, of Greek philosophy in general. He taught that all things are instinct with life, and originate from water. The writings attributed to him were declared spurious in antiquity, and his sayings recorded by Aristotle and Diogenes Laërtius are probably conjectural.

**Thallium** (Gr. thallos, a green bough), one of the three metals forming the class of triads, the others being iridium and gold. It was discovered by Crookes of London in 1861, in the seleniferous residue from the manufacture of sulphuric acid from iron pyrites. Its discovery resulted from the observation by Mr. Crookes of a green band in the spectrum of the vaporized portion of the residue. It is widely diffused as a constituent of iron and copper pyrites, but forms only about the 4,000th part of the mass. It also exists in the lepidolite of Moravia, in mica from Zinnwald in Bohemia, in the mother liquors of the salt works at Nauheim, and in the mineral crookesite from Skrikorum in Norway. It is most economically prepared from the flue dust of pyrites burners. This dust is stirred with boiling water in wooden tubs, and the decanted or syphoned liquor treated with an excess of strong hydrochloric acid, by which impure monochloride of thallium is precipitated. This impure chloride is then treated with hot oil of vitriol, and contaminations of other metals are separated by sulphurretted hydrogen. A pure sulphate is obtained, from which the metal may be separated by electrolysis or the action of zinc. Thallium resembles cadmium in color, but approaches lead in specific gravity, having a density of 11.8 to 11.91, according to its metallurgical treatment. The symbol of thallium is Tl; its atomic weight, according to recent extended researches by its discoverer, is 203.642. (See "Chemical News," London, 1874.) It has a highly crystalline structure, and cracks like tin when bent, but is easily hammered into leaves. It melts at 561°. A polished piece of the metal tarnishes rapidly when exposed to the air, but the action continues only a short time, as the thin film of oxide protects it from further oxidation. The metal and its compounds impart an intense green color to colorless flames, which when viewed by the spectroscope is found to be monochromatic, appearing as a sharply defined green band. It forms numerous compounds, including three oxides, the most important being thallous oxide, TlO; this dissolves readily in water, producing a caustic alkaline solution which absorbs carbonic acid from the air. The sulphate forms with alumminic sulphate an octahedral salt. The salts of thallium are poisonous. The metal has been used to render glass highly refractive.

**Thames**, a river of Connecticut, formed by the junction of the Quinebaug (with its branch the Shetucket) and Yantic rivers at the city of Norwich, and flowing thence S. about 15 m. to Long island sound, which it enters below New London. It is wide and beautiful, navigable for large vessels to Norwich, and has an excellent harbor at its mouth. The streams which form it possess numerous valuable mill sites, and the large amount of manufactured goods from the factories on their banks make the Thames an important avenue of commerce.

**Thames**, a river of Ontario, Canada, flowing through a fertile country in the peninsula formed by Lakes Huron and Erie, and after a S. W. course of about 160 m. discharging into Lake St. Clair. It is navigable for small vessels from its mouth to Chatham, 18 m. The city of London is the most important place on its banks.—At the Moravian settlement on this
THAMES, or Isis (anc. Tamesis or Tamea), the largest and most important river of England. Its source, called Thames Head, is in the Cotswold hills, about 3 m. S. W. of Cirencester, 375 ft. above the sea level. In the first 30 m. of its course it receives the Cherwell, the Coln, and the Lech, and below Lechlade becomes navigable for barges; from Lechlade its course, as far as Oxford, is bordered by a lighthouse. The surface, elevated and nearly level, is cultivated with great care. In the time of the Romans the channel on the N. W. side, now almost closed, was from 1½ to 4 m. wide, and was used as the main passage for vessels going toward London; and it continued to be navigable for vessels of considerable size till the time of the Norman conquest. The island was then nearly circular, but it is now an irregular oval. The washing away is still going on, and the average annual loss is estimated at 2 ft. on the N. side, and 3 ft. on the E. side between Ramsgate and Pegwell bay.

THANKSGIVING DAY, an annual religious festival, observed in the United States, and particularly in New England, suggested by the Hebrew feast of tabernacles, or "feast of ingathering at the end of the year." The occasional observance of a day of thanksgiving, formally recommended by the civil authorities, was not unusual in Europe, and such a day was observed in Leyden, Holland, Oct. 3, 1576; the first anniversary of the deliverance of that city from siege by the British, 1608; the Pilgrim church, erected from England, went to Holland, and remained there till 1620, when it sent off the Mayflower colony to New England. After the first harvest of the colonists at Plymouth in 1621, Gov. Bradford sent four men out fowling, that they "might after a more special manner rejoice together." In July, 1628, a day of fasting and prayer was appointed on account of drought. Rain came abundantly while they were praying, and the governor appointed a day of thanksgiving, which was observed with religious services. The Charlestown records show a similar change of fast day into thanksgiving in 1631 on account of the arrival of supplies from Ireland. In June, 1632, Gov. Winthrop, of the Massachusetts Bay colony, recommended a day of thanksgiving on account of action of the British privy council favorable to the colonies, and invited the governor of Plymouth colony to unite with him. There is record of the official appointment of days of thanksgiving in Massachusetts Bay in 1632, 1634, 1657, 1658, and
1639, sometimes of more than one day in the same year, and in Plymouth in 1651, 1668, 1680 (when the form of the recommendation indicates that it had become an annual custom), 1689, and 1690. The earlier of these appointments were at different seasons of the year, and for special reasons, particularly for the arrival of ships with provisions and new colonists; but the later were more generally for the harvest, and were in the late autumn or early winter. Occasional thanksgiving days were appointed by the Dutch governors of New Netherland in 1644, 1645, 1655, and 1664, and by the English governors of New York in 1755 and 1760. During the revolution thanksgiving day was a national institution, being annually recommended by congress; but after the general thanksgiving for peace in 1784 there was no national appointment till 1789, when President Washington, by request of congress, recommended a day of thanksgiving for the adoption of the constitution. Washington issued a second thanksgiving proclamation in 1795 on account of the suppression of insurrection. President Madison, by request of congress, recommended thanksgiving for peace in April, 1815. But the official recommendation of thanksgiving day was mainly confined to New England, where regular annual proclamations were issued by the governors of the states, and the day was observed almost universally with religious services, and was the principal social and home festival of the year. The prayer book of the Protestant Episcopal church, ratified in 1789, recommends for a day of thanksgiving the first Thursday in November, unless another day be appointed by the civil authorities. There was occasional recommendation by other religious bodies, and various local customs prevailed in different parts of the country; but the day was not regularly recommended by the governor of New York till 1817, and its adoption in the southern states was much later. In 1855 Gov. Johnson of Virginia recommended a day of thanksgiving; but in 1857 Gov. Wise, being requested to do so, publicly declined, because unauthorized to interfere in religious matters. In 1858 thanksgiving proclamations were issued by the governors of eight of the southern states. During the civil war President Lincoln issued proclamations recommending special thanksgiving for victory in 1862 and 1863, and a national proclamation of the annual thanksgiving day in 1863 and 1864. Since that time such a proclamation has been issued annually by the president, as well as by the governors of the states and the mayors of the principal cities; and custom has fixed the time for the last Thursday in November.

THASOS (now Thasos), the most northerly island of the Grecian archipelago, belonging to Turkey, lying off the S. coast of Roumeli (village of Skala), nearly circular in form; area, about 85 sq. m.; pop. about 6,000, mostly Greeks. The centre of the island is occupied by Mt. Ipsario, a summit about 3,500 ft. above the sea, and thickly covered with fir trees. The principal ancient town, bearing the same name, was upon three eminences near the N. coast, and some remains of it still exist. The soil is not fertile, and the inhabitants, scattered in about a dozen small villages, do not produce grain enough for their own consumption. The vine was formerly cultivated, and the wine of Thasos was celebrated, but little or none is now produced. In ancient times it contained also valuable gold mines, opened by the Phoenicians, and marble quarries.—Thasos was one of great importance. It was said to have been settled by the Phoenicians, led by Thasos, the son of Agenor, when in search of Europa. Toward the close of the 8th century B. C. it was colonized by settlers from Paros, who very soon became powerful, and obtained considerable possessions also on the coast of Thrace. The gold mines worked by the islanders were very productive, leaving them a clear surplus revenue of about $30,000 a year. They were subdued by the Persians, and afterward became dependent on the maritime empire of Athens; but in 465, in consequence of disputes, the Athenians subdued and despoiled the island, after a siege of more than two years. Its subsequent history is one of almost constant conflict with Athens, to which it was nominally subject, until the time of the Roman wars, when it submitted to Philip V. of Macedon; but after the battle of Cynosephales (197) it became a free state.

THATCHER, Benjamin Bussey, an American author, born in Warren, Me., Oct. 8, 1809, died in Boston, July 14, 1848. He graduated at Bowdoin college in 1826, and studied law, but devoted himself to literature. In 1836 he visited England for his health, and spent two years there. His published works are: "Biography of North American Indians who have been distinguished as Orators, Statesmen, Warriors, &c. (2 vols. 18mo, New York, 1832); "Memoir of Phillis Wheatley" (Boston, 1834); "Tales of the Boston Tea Party" (1835); "Tales of Indian Manners, Character," &c. (2 vols. 18mo, 1835); and "Tales of the American Revolution" (1846).

THAYER, a S. E. county of Nebraska, bordering on Kansas, formed since 1856; area, 576 sq. m.; pop. in 1875, 2,139. It is intersected by the Little Blue river and Big Sandy creek, and is crossed in the N. part by the St. Joseph and Denver City railroad. It has an undulating prairie surface and a fertile soil. Capital, Hebron.

THEATINES, an order of regular clerks, founded at Rome in 1524 by Gaetano di Tione (died in 1547; canonized by Clement X.), Bonifazio di Colle, Giovanni Pietro Caraffa (afterward Pope Paul IV.), and Paolo Consiglieri. Gaetano and Bonifazio were the first who united to form a society of priests following the rules of apostolic life as set down in the New Tes-
tament; hence its members were popularly known as Cajetans (Gaetani). But the ex-
tension and establishment of the order were
mainly due to Gaetano Caraffa, who was archbishop of
Chieti (Lat. Theate) when he was received by
Gaetano as his associate, and thus gave the
order its official name. It was approved in
1524 by Clement VII., under the designation of
"regular clerks," the dress of the members
being that of the secular clergy. Caraffa had
been elected superior general. Their first res-
idence on Monte Pincio was sacked by the Spaniards May 6, 1527, and Gaetano was sub-
jected to the most cruel tortures to make him
give up the riches he was thought to possess.
He soon after retired to Venice with his com-
panions, and was chosen superior, and he and
they displayed extraordinary charity during
the plague and famine of 1528. They were
afterward united with the congregation of
Somascha, founded about this time in a town
of that name near Bergamo by St. Girolamo
Emilianio. The two congregations were sepa-
rated on the elevation of Caraffa to the papal
chair, May 23, 1555. In 1547 they had only
two establishments, one at Venice and another
at Naples. Through the influence of Paul IV.,
they spread rapidly, and soon possessed four
provinces in Italy, one in Germany, one in
Spain, two establishments in Poland, one in
Portugal, and one in Goa. In France they
had only the Parisian residence, which pro-
duced several remarkable men. They also
founded missions in Tartary, Tiflis, and Cir-
cassia. At the beginning of the present cen-
tury the Theatines did not exist outside of
Italy, where they had nine establishments.
These were all suppressed in 1870.—There
were also two communities of Theatine nuns
(one a congregation of hermits), both founded
by Ursula Boninessa, the one in 1558, the oth-
er in 1569. Neither had ever more than two
establishments, and both are now extinct.

THEATRE (Gr. θέατρον, a seeing place, from θεάναι, to view), a building in which plays are
represented. The first theatres of the Greeks,
who were the founders of the drama in our sense
of the word (see DRAMA), were exceedingly rude
affairs. Thespis is said to have acted his plays
in a wagon, and in the time of Eschylus the per-
formances took place upon temporary wooden
scaffolds, one of which having broken down
during a representation in which Eschylus and
Pratinas were rivals (about 500 B. C.), the Athenians in that year began to build the great
theatre of Dionysus (Bacchus), the first perma-
nent stone structure of the kind. It was prob-
ably used for dramatic purposes within a few
years, though it was not finished until about
340; and in the mean time theatres had been
erected in many parts of Greece, Asia Minor,
and Sicily. The seats of the spectators, compris-
ing the θέατρον proper, rose one above another
in a row of concentric circles, each row forming
nearly two thirds of a circumference. The space
immediately in front of the spectators, corre-
spending nearly to the modern pit or parquet,
was called the orchestra, and was appropriated
to the chorus. It was floored with boards,
and in the centre of it stood the θυμήλον or altar of Bacchus, upon a raised platform which was
sometimes occupied by the leader of the chorus,
the police, the flute player, and the prompter;
the last two were placed on the side next the
stage, and concealed from the spectators by
the altar. The stage was behind the orchestra
and above it, and the chorus, whenever they had
to take a part in the real action of the drama,
ascented to it by steps. The back was closed
by a wall called the όπνη (Lat. scenae); the whole
space between the scena and the orchestra
was known as the proscenium; and the part near-
est the audience, where the actors stood when
they spoke, was the kolyphon. There was no
scenery properly so called, but the scena was
architecturally decorated and made to repre-
sent as far as possible the locality in which the
action was going on. It had an entrance in
the centre called the royal door, through which
the principal characters made their appearance,
and doors on the right and left for the subor-
dinate personages. The plays of Aeschylus
and Euripides seem to require frequent changes
of scene, but probably they were rather hinted
at than actually made; they perhaps consisted
merely in turning the πτεραξ (Lat. curvus) or
"wings," which were prism-shaped frames
moving on pivots at each side of the proscen-
ium. The whole stage was never concealed
from the spectators; there is mention of a
curtain, which instead of being drawn up was
lowered through a crevice in the stage, but it
covered only the background, or according to
some authorities the wings. The machines for
producing supernatural effects must have been
numerous and elaborate, but are now imper-
fectly understood. They included the "Cha-
lonian steps," by which shades ascended from
the lower world; the μύκων, by which gods
and heroes were represented passing through
the air; and the βεόλογιστας, an elevated place
above the scena, where the deities appeared in
full majesty. Neither the stage, the orchestra,
nor the auditorium was roofed, but there were
porticoes running around the building, to which
the people retreated in case of rain, and aw-
nings were sometimes used to ward off the heat
of the sun, for the performances always took
place by daylight. The vast size of the ancient
theatres, intended as they were to accommo-
date almost the entire population of a city at
each performance, made it impossible for the
unaided voice to be heard by the whole audi-
ce. Metallic vases were therefore placed
under the seats to serve as reflectors of sound,
and the actors wore masks with metallic mouth-
pieces to answer the purpose of speaking trump-
ets. The spectators were seated according to
their rank. A price was charged for admission,
at least until the performance was pretty far
advanced; but in Athens from the time of Peri-
cles the poorer class and subsequently all the
citizens were admitted at the cost of the public treasury. Women, it appears, were allowed to witness tragedies; boys were admitted to both. The actors were invariably males. The performances began early in the morning, and not unfrequently lasted 10 or 12 hours.—The Roman theatres were copied from those of the Italian Greeks. They were at first temporary structures of wood, which were sometimes extravagantly magnificent. One built by M. Emilius Scaurus (58 B. C.) was capable of seating 30,000 people, and the scene was decorated with 3,000 statues and 860 columns in three stories, the lowest of white marble, the middle one of glass, and the uppermost of gilded wood. The first stone theatre was pulled down when nearly finished at the instance of P. Scipio Nasica (155 B. C.), on the score of public morality. In the Roman theatre women performed in interludes and mimics, but not in regular dramas. The orchestra was occupied by the senators, foreign ambassadors, and other distinguished persons. There was nothing corresponding to the θυήξ or altar of Bacchus. The depth of the stage was proportionally greater than in the Greek theatre, being in the latter about one seventh of the diameter of the orchestra, and in the Roman one fourth. Thus, in the theatre of Bacchus at Athens the diameter of the orchestra (and consequently the width of the available part of the stage) was 72 ft., and the depth of the stage only a little more than 10 ft. A Roman stage of the same width would have been 17½ ft. deep. The following are some of the largest ancient theatres the ruins of which are now known:

—in the middle ages the only theatrical performances were the miracle plays, mysteries, and interludes. These were given for the most part in convents, colleges, and churches, or in the halls of palaces and castles. The first theatres in France were built for miracle plays. In 1548 the confraternity of the Trinity had a theatre in Paris in which they were licensed by the parliament to perform only "profane pieces of a lawful and honest character." So late as 1651 the French had no scenery, and the performers remained on the stage during the whole representation. The first Italian theatre is said to have been erected at Florence in 1561, by Bernardo Buontalenti, but it was probably not public. About the same time Palladio made an attempt to revive the classical theatre in the still existing teatro Olimpico at Vicenza, but with reduced proportions. From 1618, when a theatre was built at Parma by Aleotti, the modern arrangement began to prevail. By narrowing the stage opportunity was given for the use of painted scenery, and by increasing its depth for the introduction of a variety of complicated machines and the production of spectacular pieces.—In England there were regular companies of players as early as the reign of Edward IV., long before were regular play-houses. Churches, universities, private houses, and the yards of inns served at first for their performances. Probably the first play house was the London "Theatre," built before 1576; the Curtain in Shoreditch, and the theatres in Blackfriars and Whitefriars, were built near the same time. In Shakespeare's day London had three "private" and four "public" theatres, the difference between which is not clearly understood. His own plays were produced at the house in Blackfriars and at the Globe, both of which belonged to the same company, known as his majesty's servants. The Globe was a hexagonal wooden edifice partly open at the top and partly thatched. In the middle was probably an uncovered court where the common people stood, and around three sides ran galleries or "scaffolds," under the lowest of which were enclosed boxes called "rooms." The prices of admission ranged from a penny or twopence to a shilling. The performance began at 3 o'clock; in the private theatres it took place by candle light. The stage at this period was strewed with rushes and concealed by curtains, which opened in the middle and drew backward and forward on an iron rod. In the background was a balcony or upper stage, lined with curtains, from which parts of the dialogue were spoken, and at each side of this balcony was a private box. In the private theatres the wits, critics, and other persons of consequence were furnished with seats on the stage. Movable scenery was first used in a regular drama in a public theatre by Davenant in 1662, though something of the sort had been arranged at Oxford by Inigo Jones as early as 1605, on the occasion of an entertainment given to James I. Shakespeare had no other scenery than tapestry hangings and curtains, but the use of stage machinery is as old as the drama itself. Women first appeared upon the English stage about the period of Shakespeare, and in the following are some of the largest ancient theatres the ruins of which are now known:
heard about 90 ft. in front of the speaker, and 75 ft. each side. In an opera house the dimensions may be vastly increased, as singing can be heard at a greater distance than speaking, and it is not requisite to bring the audience near enough to see the facial expression of the performers. The theatres of New York are among the best in the world, and the seating arrangements of American theatres generally are more convenient than in foreign theatres. The opera houses and leading theatres in the United States are described in the articles devoted to the different cities. The best form for the auditorium is either three fourths of a circle, or a semicircle with divergent ends. The latter affords the best opportunities for seeing, but involves either a disproportionate and inconvenient width of stage, or a considerable useless space on each side of the proscenium. Most American theatres differ from those of Europe in having no private boxes, except a few on and adjoining the proscenium, by which means a vast gain is effected in the capacity of the house; they are also generally better lighted.—The largest and finest theatre in the world is the new Grand Opera of Paris. It was begun in 1860, and opened to the public for the first time on Jan. 5, 1875. It was built at the expense of the government, and cost $5,600,000, exclusive of the land which it occupies. Notwithstanding the vast size of the building, the auditorium contains only 2,194 seats, which are the same as the academies of music in New York and Brooklyn. By far the greater part of the building is occupied by a vast number of rooms, halls, staircases, shops, &c., appurtenances designed for the convenience and pleasure of the spectators and of those connected with the theatre. The stage is about 100 ft. in width by 220 ft. in depth, and 700 singers can be grouped upon it. In its facilities for ingress and egress, in the completeness of its machinery and appliances, and in the magnificence and costliness of its decorations, it far surpasses any theatre in the world.

The following are some of the largest theatres in the world, with the number of spectators they are capable of accommodating:

—In China every little village has its theatre, and each great town has several. They have no scenery and no auditorium, the spectators remaining in the open air. The expenses are defrayed sometimes by mandarins or other rich persons, but more frequently by associations formed for the purpose among the inhabitants of the neighborhood. The actors are generally strollers, and the female parts are played by young men or boys. In Japan the stage has scenery, the audience are furnished with seats, and women are allowed to perform.

THEBES, the ancient name of southern or Upper Egypt, from its capital Thebes. This division of the country extended from the islands of Elephantine and Philae, near Syene (lat. 24° N.), to Thebais Phylace, S. of Hermopolis Magna (about 27° 40' N.).

Thebes (called Pto No or Nermou by the Hebrews, and Diospolis the Great by the later Greeks and the Romans), anciently the capital of Upper Egypt, and for a long time, known as the period of the middle empire, of the whole country. Its Egyptian name was Ap, or Apé, and with the feminine article Tappe, the head, which, being pronounced Thaba in the Memphis dialect, was easily converted by the Greeks into Ḫeba Thabe. Pliny and Juvenal, desiring to render its real name more closely, call it Thebe. From the fact that the names of the oldest kings appear only about Memphis, it is generally inferred that Thebes was not founded as early as the capital of Lower Egypt, though in antiquity it was reputed to be the oldest city in the world. It stood near the centre of the Thebaid, extending on both sides of the Nile to the mountain chains which enclose the valley. Strabo speaks of the vestiges of the city as extending 80 stadia (10 m.) in length. Diodorus estimated its circuit at 140 stadia or about 17 m., and Sir Gardner Wilkinson infers from its ruins that its length was 85 m. and breadth 30 m. Its most flourishing period was that of the 18th dynasty; it began to decline about 800 B. C. (See Egypt, vol. vi., p. 460.) Assur-bani-pal pillaged it in the 7th century, and Cambyses in the 6th. After its destruction by Ptolemy Lathyrus (86 B.C.), it lost all its political and commercial importance, though it remained the sacerdotal capital of the worshippers of Ammon. The trade which had contributed to its prosperity had found new channels after the foundation of Alexandria; and as the capital of a Macedonian and Roman prefecture it took little part in the affairs of Egypt. It was desolated successively by Christians of the Thebaid, in their zeal against idolatrous monuments, by barbarians from Arabia and Nubia, and by the Saracens; after whose invasion its name scarcely occurs for many centuries. —The ruins of Thebes, which are among the most magnificent in the world, are found at the modern villages of Luxor and Karnak on the E. bank of the Nile; and Gurna and Medinet-Abu on the western. The eastern quarter of the ancient city contained the mass.
of the population, while the western side was covered with temples and palaces and their avenues of sphinxes, and with the rock-hewn tombs of the kings. The principal structures at Gurna are the palace temples Mernephtheum and Ramessseum. The former, approached by an avenue 128 ft. long, has pillars in the oldest style of Egyptian architecture and remarkable bass-reliefs. The latter, which for symmetry of architecture and elegance of sculpture may vie with any other Egyptian monument, occupies a series of terraces communicating with each other by flights of steps. It is supposed to be the Memnonium of Strabo, and that he corrupted Miamun, the title of Rameses II., into Memnon. Its entrance is flanked by two pyramidal towers; its first court has a double avenue of columns on either side, and in the area a pedestal on which was a syenite sitting colossal of Rameses; its second court has walls covered with sculptures representing the wars of Rameses III., and Osiride pillars which are doubtless the monolithical figures 16 cubits high described by Diodorus; the third stairway, from the foot of which Belzoni took the head of a royal statue of red granite, now in the British museum and known as the young Memnon, conducts to a hall for public assemblies, with columns and walls covered with civil and religious sculptures; and beyond the hall extended nine smaller apartments, two of which remain, supported by columns, one of them being the sacred library or "dispensary of the mind" mentioned by Diodorus. Among the other monuments in this vicinity are two colossal statues, with the pedestals about 60 ft. high, the wonder of the ancients, one of them known as the vocal Memnon. (See Memnon.)

The village of Medinet-Abu stands upon a lofty mound formed by the ruins of the most splendid temple palace in western Thebes, the Thothmesium, connected with the palace of Rameses by a dromos 265 ft. long. The sculptures in the latter are of singular interest, being the only examples that have been found of the decoration of the private apartments of an Egyptian palace. The whole sweep of the Libyan hills, for the space of 5 m. and to the height of 300 ft. from Gurna to Medinet-Abu, is full of sepulchres, excavated in the native calcareous rock. This was the necropolis of the whole city, no tombs existing on the eastern side. The mummies are laid in rows by the side of or in tiers above each other, but never stand erect. The tombs of the lower classes are unsculptured, but abound in mummies of sacred animals. The royal sepulchres are in the valley of Bab el-Muluk, or Biban el-Muluk (the gate or gates of kings), the most spacious and highly adorned belonging to those monarchs who enjoyed a long reign. The tombs near the entrance of the gorge belong entirely to the 19th and 20th dynasties, and those in a branch path are of the 18th dynasty. The monuments, as also those in the separate burial place allotted to the queens, are chiefly inter-

ting from their inscriptions.—Still more remarkable are the ruins on the E. bank of the river, in the villages of Luxor and Karnak. At Luxor the most striking monuments were two beautiful obelisks of red granite, covered with inscriptions, one of which has been removed to the Place de la Concorde in Paris. In the rear are two sitting statues of Rameses,

one 39 ft. high, but now covered to the breast with accumulations of earth and sand. Two courts and a series of apartments, connected and surrounded by colonnades and porticoes,
THEBES

extend beyond. The road from Luxor to Karnak lies through fields of halfa grass, though they were once united by an avenue of andro-sphinxes. The great palace temple of Karnak stands within a circuit wall of brick, the enclosure being 1,800 ft. long and somewhat less broad. It was approached by an avenue of crio-sphinxes, of which only fragments remain. Between the end of the dromos and the main body of the building, five lofty pylones and four spacious courts intervene. In the first court were two obelisks of Thothmes I., one of which still remains; in the second court is another obelisk, the loftiest known except that of St. John Lateran at Rome; and in one of the chambers are the sculptures which compose the Karnak tablet, called the "hall of the ancestors" or the "tablet of Tuthmosis" (Thothmes III.), now in the Louvre. The king is represented on it as making offerings before the images of 61 of his predecessors. In the British museum is now a tablet of the same kind, known as the "tablet of Abydos." The great hall is 80 ft. high, 329 ft. long, and 179 ft. wide; the roof is supported by a central avenue of 12 massive columns, 66 ft. high and 12 ft. in diameter, together with 129 columns of less gigantic dimensions. These vast courts, halls, and esplanades were reared by kings of the 18th and successive dynasties for purposes partly religious and partly secular. The sacred calendar abounded in days for periodical meetings; the troops were reviewed and the spoils of victory apportioned in the courts of royal palaces, which also served for the administration of justice and occasionally for the encampment of the army.

THEBES (Gr. Ἱθάκη; Lat. Theba; modern Gr. Θεία), in Greek antiquity, the chief city of Boeotia, built on and around a hill between the streams of Ismenus on the east and Dirce on the west. The citadel occupied the height and the greater part of the town stood in the valleys. Of its ancient buildings, monuments, and walls, only a few scattered fragments remain, and its topography is entirely uncertain. It is impossible to harmonize the ancient writers as to the position or even the names of its seven gates. Thebes was equally illustrious in the mythical and the historical ages of Greece. Its two sieges and the fortunes of its royal houses were favorite subjects of tragedy; and it was for a time the ruling city of Greece. Tradition ascribed to Cadmus the foundation of the city, which was hence called Cadmea, a name afterward restricted to the citadel. From the five Sparti, the survivors of the progeny of the dragon's teeth, the noblest Theban families claimed descent. The expulsion of Oedipus, and the successive sieges by the "Seven against Thebes" and by the Epigoni, and the principal recorded events before the Cadmeans were driven out by the Boeotians, a tribe from Thessaly. This occurred about 60 years after the Trojan war, according to Thucydides. The legislation of Philolaus, in the 8th century B.C., gave it an oligarchical instead of monarchical form of government, and made it the head of the confederacy of Boeotian towns. The first entirely certain event in its history is the revolt of one of these towns, Platea (about 519), which applied to Athens for protection. A war ensued between the Thebans and Athenians, in which the latter were successful, and which initiated lasting enmity between the two states. Thebes lost credit by abandoning the cause of Greece in the Persian war, and fighting against the Athenians at Platea (479). The victorious Greeks appeared before its walls, and compelled the inhabitants to surrender their "Medizing" leaders, who were immediately put to death. An Athenian invasion supplanted its oligarchy by a democratic government in 466, but in 447 the exiled aristocratic leaders returned, defeated the Athenians, and reestablished the former government. During the Peloponnesian war the Thebans were more anti-Athenian than even the Spartans, but they joined the coalition against the latter in 395, and were the only portion of the allied army which was not routed by them at Corinth. The peace of Antalcidas (387) deprived them of their supremacy over the other Boeotian towns. The Spartans, who treacherously seized the citadel in 392, were expelled by Pelopidas about the close of 379, and were defeated by Epaminondas at Leuctra in 371. Epaminondas invaded the Peloponnesus, and established there the Arcadian confederation and the state of Messenia as political powers antagonistic to Sparta. But the Thebans sought in vain to establish their supremacy by a general treaty, and lost it after the death of Epaminondas at Mantinea (362). In 358 Athens wrested Euboea from Thebes. In the sacred war (357-346) the Thebans were opposed to Athens and Sparta, and received support from Philip of Macedon; but when the design of the latter to conquer the whole of Greece became apparent, they joined the Athenians against him. Philip, however, was victorious at Cheronea (338). Thebes received a Macedonian garrison, and its leading citizens were put to death or banished. Alexander the Great razed it to the ground in 335, sparing only the house of Pindar, after which it never again formed an independent state. Cassander restored the city in 315, and it was taken by Demetrius Poliorcetes in 292 and 289. In the time of Strabo it had dwindled down to the condition of a village, but it was a flourishing town during the 10th and 11th centuries. It was plundered by the Normans of Sicily in 1146. The present town is small and poor.

THEET. See Larceny.

THEINE. See Caffern, and Tea.

THEINER. 1. Augustin, a German historian, born in Breslau, April 11, 1804, died in Civita Vecchia, Aug. 9, 1874. He studied at Breslau and Halle, and from 1826 to 1829 assisted his brother Johann Anton in his work on the history of celibacy. An essay on the papal decre-
tals procured for him from the university of Halle the degree of doctor of laws, and from the Prussian government a stipend for a literary journey to Vienna, London, and Paris. In 1831 he visited Rome, and became a member of the oratory of St. Philip Neri, professing thenceforward an ultramontanism as extreme as had been his Gallicanism. He continued to reside in Rome, and was consultant of the holy office, of the congregation of bishops and regulars, and of the division of the propaganda on oriental rites. In 1848 he published Lettore historio-politiche intorno alle “Cinque piaghe della santa chiesa” del chiarissimo D. Antonio Bozanni Serbati. In this work Theiner denounced the election by laymen of bishops and parish priests, and maintained that the temporal sovereignty of the popes was “indispensable, under the modern formation of society, to the spiritual independence of the supreme pastor of the church.” It was translated into Latin (Naples, 1849). Being appointed prefect or keeper of the secret archives of the Vatican in 1851, he issued in succession various compilations therefrom illustrating the ecclesiastical history of nearly all the different Christian nations. Six folio works were printed in the Vatican. He also began in 1856 a continuation of the Annales Ecclesiastici of Baronius, of which 3 vols. fol. have appeared, and an edition of the original work to consist of about 60 vols. 4to, of which 15 had appeared in 1866 (Bar-le-Duc). In 1853, in answer to Crétilane-Joly’s history of the suppression of the Jesuits, he published Geschichte des Pontificats Clemens XIV. (2 vols., Leipsic and Paris), which led to a long and bitter pamphlet controversy. In 1861 he began a documentary history of the pope’s temporal dominion, existing from 755 to 1798, entitled Codes Diplomatique Domini temporales SpecerSedit (3 vols. fol., Rome, 1861–3). This was followed by a smaller work in 1864 destined to answer Passaglia’s appeal to the Italian bishops, and maintaining the necessity of the temporal power from the declarations of the councils of Lyons (1245) and Constance. At the approach of the Vatican council in 1869, Theiner entered into a correspondence with Dr. Döllinger and Prof. Friedrich, in which he advocated the Old Catholic doctrine and position. The discovery of this caused him to be debarred all access to the archives, while, in consideration of his age, he was permitted to retain his salary and his apartment in the Vatican. In 1874 Theiner visited Austria to make arrangements for publishing another important literary work, and on his return to Italy died suddenly at the seaside, the pope having sent him his forgiveness and blessing on hearing of his danger. His other works include Geschichte der geistlichen Bildungsanstalten (Mentz, 1835); Versuche des heiligen Stuhls die Völker des Nordens wiederum mit der Kirche zu vereinen (Augsburg, 1837); and Die neuesten Zustände der katholischen Kirche beider Riten in Polen und Russland seif Katharina II. (Augsburg, 1841). II. Johann Anton, a German theologian, elder brother of the preceding, born in Breslau, Dec. 15, 1799, died there, May 15, 1860. He studied Roman Catholic theology at Breslau, and was appointed there in 1824 professor of Scriptural exegesis and canon law. He was from the beginning a zealous advocate of Gallican principles, and eagerly sought to have them introduced and carried out among the clergy of Silesia. Assisted by his brother Augustin, he published in 1829 an extensive work on the history of celibacy (Die Einführung der erwungenen Ehelosigkeit, Altenburg, 1828; new ed., 1845). He resigned his chair in 1830, and held a pastoral charge till 1845, when he joined the German Catholics, publishing in vindication of this step Die reformatorischen Bestrebungen in der katholischen Kirche (Altenburg, 1845); but soon afterward he joined the Protestant church, and received an appointment in the library of the university of Breslau. He wrote a commentary on the minor prophets, forming part of the Bibelwerk of Derser, and Das Seligkeitsdogma der römisch-katholischen Kirche (Breslau, 1847). THEISS (anc. Tisichus; Hun. Tiszas), a river of Hungary, which rises in the northeast, in the county of Mármars, flows westward to Tokay, thence to S. W. to Szolnok, when it turns S. and enters the Danube S. of Titel, near the southern boundary of Hungary. Its length is upward of 600 m., for most of which it is navigable. Its principal tributaries are the Bodrog, Hernád, Sajó, and Zaggya on the right, and the Szamos, Körös, and Maros on the left. Its lower course for nearly 300 m. is parallel to the Danube, and about the beginning of the present century the Francis canal was dug from one river to the other, which shortens the route down the Theiss and up the Danube 106 m. The canal has been enlarged, and a branch canal from Szátpár to Neusatz on the Danube, completed in 1875, passes through one of the most fertile districts in southern Hungary. Among the principal towns on the banks of the Theiss are Csongrád, Szegedin, Zenta, and Old Beece. THELWALL, John, an English author, born in London, July 27, 1764, died in Bath, Feb. 17, 1834. In his 22d year he abandoned the profession of law for literature. In 1787 he published “Poems” (2 vols.); and embracing liberal opinions, he became a member of the “Corresponding Society.” Taking a prominent part in the political agitation of the times, he was prosecuted for high treason along with John Horne Tooke and Thomas Hardy, and after a trial of five days was acquitted. He afterward lectured on political subjects, and in 1801 began to act as tutor of eloquence. His works include “The Peripatetic” (3 vols. 12mo, 1793); “The Tribune” (3 vols. 8vo, 1796); “Poems, with Memoir of his Life” (1802); “The Daughter of Adoption,” a novel; essays on the treatment of im-
perfections in speech, &c.—His son Alger-
on Sydney (1795–1863), a clergyman of the
established church and teacher of elocution,
published religious works, "Iniquities of the
Opium Trade" (1839), &c.

THEMIS, in the Greek mythology, a daugh-
ter of Uranus and Gea, married to Zeus. She
dwelt in Olympus, and convened the assem-
bly of the gods. She is represented in Homer
as the personification of the order of things
established by law, custom, and equity. At
Thebes she had a sanctuary in common with
Zeus Agoraeus, and at Olympia in common
with the Hora, her daughters.

THEMISTOCLES, an Athenian general, born
about 514 B. C., died in Magnesia, Asia Mi-
nor, about 449. He took part in the battle
of Marathon in 490. After the exile of Ari-
tides in 483 Themistocles was the great politi-
cal leader in Athens. His main endeavor was
to make Athens a great naval power, and to
prepare it to resist the inroads of the Persians.
In 490, when the force of Xerxes was on the point
of passing the Helles-
pon, he and the Spartan Eucratides were in
command. At the defeat of Tempe, which
they abandoned on finding that troops could
be landed in their rear, retreating to their ships.
Afterward he took charge of the Athenian
portion of the fleet stationed at Artemisium.
When the vast number of Persian ships
was discovered, the Spartans were disposed to
draw back to the Peloponnesus; but the Euboeans
gave 30 talents to Themistocles, with which he
induced them to remain and defend Euboea.
In the ensuing battle the Greeks had the ad-
vantage; but the Athenian ships being much
crippled, it was determined to retire. (See
GREECE, vol. viii., p. 190.) At the instance
of Themistocles the Athenians abandoned their
city, and removed mainly to Salamis, where
the whole naval force of Greece was gath-
ered. It was only by his influence and devices
that the fleet was kept together, and the naval
battle was fought which resulted in a com-
plete victory for the Greeks. The Athenians
were desirous of pushing on to the Hellespont
to prevent the retreat of Xerxes, but their
confederates refused. Herodotus says that
Themistocles privately sent word to the king
that he had restrained the Greeks from pur-
suing his ships and breaking up his bridges
over the Hellespont; and that he did this in
order to induce Xerxes to return, and for the
purpose of securing for himself a safe retreat
in case any mischance should befall him at
Athens. Modern historians consider this high-
ly improbable. After the division of the booty
gained at Salamis, the Greeks sailed to the
isthmus, where Themistocles, though deprived
of the first prize for skill and wisdom by each
of the commanders voting for himself, was
declared the wisest man in Greece, and the
whole country was filled with his fame. He
was received in Sparta with unprecedented
honors; and though the Lacedemonians gave
to Eurybiades the crown of valor, they gave
to Themistocles the crown of wisdom. When
the Athenians returned to their city, the Spar-
tans opposed their rebuilding their fortifica-
tions on an enlarged scale; but Themistocles
was sent to them as ambassador, and he con-
trived to deceive them until the walls were
far enough advanced to be in a state of de-
ference. Athens was now secure against ex-
ternal enemies, and Themistocles was more
than ever desirous of making her a great mar-
time power. The work on the Piraeus was
resumed on a far grander scale, and by his
advice the three harbors were enclosed by a
wall nearly seven miles in circuit. He also
persuaded the Athenians to add 20 triremes
to their navy every year. His political ascen-
dancy soon declined. His opponents in Athens
were headed by Cimon, son of Miltiades, and
by Alcmeon. He was acquitted of treason-
able intercourse with the Persians, but about
471 he was ostracized and went into exile at Ar-
gos. According to some versions, Themis-
tocles was accused by the Lacedemonians of
sharing the treasons of Pausanias; but he,
having notice of his impending arrest, fled to
Susa, where he addressed to Artaxerxes, the
son of Xerxes, a letter claiming protection on
the score of his services to his father after
the battle of Salamis, and asking permission to
wait a year and then to come before him in
person to explain his views. His request was
granted. At the end of a year, having mas-
tered the Persian language, he entered into
personal communication with the king; and
no Greek, says Thucydides, had ever before
attained such a commanding influence and po-
sition at the Persian court. He excited Ar-
taxerxes with plans for the subjugation of
Greece, and was presented by him with a
Persian wife and with large presents. After
having visited various parts of Asia, he lived
at Magnesia on the Maeander, and received his
maintenance from the revenues of that and
two other cities. Some of his property at
Athens was secretly sent him by his friends,
but the bulk of it, amounting to 80 or 100
talents, was confiscated. He is said to have
poisoned himself because he knew his promis-
tes to the Persian king could not be fulfilled.
This is perhaps the most popular form of the
story, of which other versions relate that the
Persian king had set a price of 200 talents up-
on his head, that he went to Susa in the dis-
guise of a stranger for the king's harem, and
that he was actually put on trial to answer the
accusations of Mandane, the sister of Xerxes,
for the loss of her sons who fell at Salamis.
We have no contemporary history of the life
of Themistocles, and when Thucydides wrote
his history his enemies had done their best to
heighten prejudice against him. His life was
written by Nepos and by Plutarch.

THÉNARD, Louis Jacques, baron, a French chem-
ist, born at La Lonptièr, Champagne, May 4,
1777, died in Paris, June 21, 1857. He studied
chemistry in Paris under Vaquelin and Fourcroy, in 1798 became a teacher of that science in the polytechnic school, in 1804 professor in the collège de France and the Sorbonne as successor of Vaquelin, and in 1810 also in the polytechnic school. In the latter year he was elected a member of the academy in place of Fourcroy. Charles X. on his accession to the throne made him a baron, and under Louis Philippe he was created a peer in 1832, and in 1838 director of the collège de France. He was president of the society for the encouragement of national industry, and founded a society for the benefit of inventors impoverished by useful researches. His most popular work, Traité élémentaire de chimie théorique et pratique (4 vols. 8vo, 1813–18; 7th ed., 5 vols., 1836), has been translated into several languages.

**Theobald, Lewis**, an English author, born at Sittingbourne, Kent, died in September, 1744. He was an attorney, but did not practise. His tragedy "Electra" appeared in 1714; and in 1717 he contributed to Mist's "Weekly Journal" papers under the title of "The Censor," which provoked attacks from other writers, one of whom was Dennis. He published a pamphlet entitled "Shakespeare Restored, or a Specimen of the many Errors as well committed as unamended by Mr. Pope in his Edition of this Poet, designed not only to correct the said Edition, but to restore the true Reading of Shakespeare in all the Editions ever yet published" (4to, London, 1729). For this Pope made him the hero of the "Dunciad." (See Pope, Alexander, vol. xiii., p. 709.) Theobald then brought out an edition of Shakespeare's works (7 vols. 8vo, 1733), which destroyed the reputation of Pope's edition. Theobald wrote or translated 20 plays, now all forgotten, and also brought on the stage a play entitled "The Double Falsehood, or the Distrest Lovers," the greater part of which he asserted was composed by Shakespeare. He also published a life of Sir Walter Raleigh.

**Theocritus**, a Greek poet, born in Syracuse, who flourished about 370 B. C. He went to Alexandria, and secured the favor of Ptolemy Philadephus, but returned to Syracuse during the reign of Hiero II. He wrote in a mixed dialect in which the Doric predominated, and was the creator of pastoral poetry as a department of literature. There are extant 30 poems, called by the general name of "Idys," which are attributed to him, and 23 epigrams. He had several imitators, of whom the greatest was Virgil. The first edition, containing only 18 idyls, appeared at Milan probably in 1495, and the Aldine edition in 1495. Among the more important subsequent editions are those of Reiske (2 vols., Leipsic, 1765–70), Warton (Oxford, 1770), and Paley (Cambridge, 1863). The principal English translations of the poems are those of Creech (London, 1681), Fawkes (1767), Polwhele (1786), Chapman (1836), and Calverly (1869).

**Theodolite**, a surveying instrument for measuring vertical and horizontal angles and taking levels, combining the uses of the ordinary transit, the quadrant, and the level. In the American form of the instrument, the telescope turns over and the vertical angles are read on a graduated circle. In the English form the vertical angles are read on a semicircle beneath the telescope and level; the telescope cannot therefore turn over, but is reversible. The American form is preferable by reason of the greater facility and precision of the adjustments. In common with all such kinds of instruments, it is made of brass. The principal parts are the vertical circle E and the horizontal circle F, which rests upon the plate H. A magnetic needle also rests upon the horizontal plate, which may be used when desired for ascertaining the earth's meridian or the deviation of a line from it. The telescope, B, revolves on a horizontal axis, also the axis of the vertical circle, and which rests upon the supports S S. Beneath the telescope and attached to it by adjusting screws is the long spirit level L, with a scale attached for marking the position of the air bubble. The small spirit levels D and E serve to level the horizontal circle. The vertical axis of the instrument

---

**Theodolite**

Theodolite.
is held by a socket in the plate immediately above the tripod, and is furnished with a clamp C, and slow-motion screws TT. The horizontal circle revolves upon the plate H, upon which there is a vernier the divisions of which are sometimes read by means of an attached microscope, although it is preferable to employ a pocket microscope for the purpose. The vertical circle is also supplied with a vernier, and both circles have clamps and slow-motion screws. It is evident that if the vernier of the vertical circle in the adjusted instrument reads zero when the telescope is level, and then is moved through an arc of 30° to bring the cross hairs upon an object, such object will have an elevation of 30° above the point of observation; and also that if the horizontal circle is moved through an arc of any number of degrees to bring the cross hairs of the telescope from one object to another, the lines passing through such objects will make corresponding angles with each other at the point of observation. When used for important surveys the circles are 30 in. or more in diameter; in the smaller instruments they are 5 or 6 in.—See Gillespie's "Treatise on Levelling, Topography, and Higher Surveying" (new ed., New York, 1875).

THEODORI. See JUSTINIAN.

THEODORUS. See]?.

THEODORIS (Theodoretus), a Syrian theologian, born at Antioch probably in 395, died in 457 or 458. He was of a noble family, entered a cloister, became in 423 bishop of Cyr-rhus on the Euphrates, and reunited many members of the sects with the orthodox church. He declared against the Nestorians, and at the council of Chalcedon, in 451, subscribed the condemnation decree against Nestorius. He is esteemed as an exegetical writer (see Rich-ter, De Theodoreto Epistolarium Paulinarum Interprete, Leipzig, 1829), and he also wrote homilies, a history of the Christian church from 324 to 429, an epitome of heretical fa-bles, the lives of 30 hermits, and various other works, including 180 letters. Collective ed-i-tions of his works have been edited by Sirmond (4 vols, Paris, 1642; supplement by Garnier, 1804), and by J. L. Schulze and Nosselt (10 parts, Halle, 1789-74), and in Migne's Pato-logie grecque, vols. xii., xili., and xiii. A trans-lation of his "Ecclesiastical History" was pub-lished in Bohn's "Ecclesiastical Library" (1854).

THEODORUS (Ger. Dietrich), a Roman general, was born in Pannonia about 455, died in 526. He was the son of Theodemir, one of the chiefs of the Ostrogoths, born in Pan-nonia about 455, died in 526. He was the son of Theodemir, one of the chiefs of the Ostrogoths settled on the banks of the Danube, and when eight years old was sent as a hostage to the court of Constantine. At the age of 18 he was restored to his father, and, after greatly distinguishing himself in war, he succeeded him as sole king of the Ostrogoths in 475. The southern part of Pannonia and Dacia had pre-viously been ceded to them by the emperor Zeno the Isaurian, of whom Theodoric was for some years a faithful ally; but the emperor broke his promises, and Theodoric ravaged the Byzantine territories till 483, when Zeno con-firmed upon him large gifts and many honors, and in 484 he named him consul. The war was renewed in 487, and Theodoric marched upon Constantinople, and to get rid of him Zeno proposed to him the invasion of Italy, then ruled by the usurper Odoacer. Consequently in 488 he marched toward the peninsula at the head of his whole people, amounting to about 200,000, with a large number of wagons. He first met in the Alpine passes and routed an army of Gepidae and Sarmatians, then defeated Odoacer himself on the banks of the Sontius (Isonzo) in 489. After two other victories, one on the banks of the Adige and the other on those of the Adda, he shut his opponent within the walls of Ravenna, and after a siege of three years received his capitulation in 493, apparently consenting to share the kingdom of Italy with him; but Theodoric soon after had his rival assassinated at a solemn banquet, and firmly established his power over the whole peninsula. He distributed one third of the lands to his soldiers in military tenures, but preserved as far as possible the administr-a-tive organization of the Roman empire. Un-der his fostering care Italy became prosperous again; agriculture and industry revived; liter-ature and the fine arts flourished; internal im-provements went on, and new monuments were erected. Through well devised alliances, he controlled nearly all the barbarians that had settled in western Europe. He checked the triumphant progress of Clovis after the victory of Vouillé in 507, protected the Visigoths, and secured for himself the possession of Provence. His latter years were embittered by religious troubles. The Arians, to whom sect he be-longed, being persecuted in the East, he retali-ated against the Catholics of Italy; this brought on a conspiracy, in which the philosopher Bo-thius, a great favorite with him, and the vener-able Symmachus were apparently involved, and in a moment of passion he ordered them to be put to death. Their innocence being af-terward demonstrated, remorse preyed upon his mind and hastened his death. He is the Dietrich of Bern of the Nibelungenlied.

THEODOSIA, or Teodosia. See Kappa.

THEODOSIUS, a Roman general, beheaded in Carthage, A. D. 376. During the reign of Va-lentinian he was sent to the defence of Britain, in 367 crossed the channel at the head of a large army, and in two campaigns freed the country from the barbarians, strengthened the fortifications, and confirmed the Roman power. In 370 he returned, was made master general of the cavalry, and was stationed on the upper Danube, where he defeated the Alemanni. When in 372 Firmus, a Moor, had made him-self master of Mauritania and Numidia, and Count Romanus, the governor of Africa, un-able to oppose, had joined him in rebellion, Theodosius was sent to that province to reduce
THEODOSIUS I.

Theodosius, son of Fixing, was summoned to Spain, where he led a private life until the emperor Gratian summoned him to take the supreme command, declared him Augustus, Jan. 19, 379, and assigned to him the administration of Thrace, Asia, and Egypt, with Dacia and Macedonia. Fixing his headquarters at Thessalonica, Theodosius prepared for the war against the Goths during four campaigns (379-382). The Goths, divided by dissensions and jealousies after the death of their leader Fritigern, were again united under Athanaric, who made peace and visited Constantinople, where he died; and the magnificent funeral honors paid him by Theodosius so won over his followers that they enlisted in the Roman army. In 383 Gratian, the emperor of the West, was dethroned and put to death by Maximus, and Theodosius entered into a treaty with the usurper, by which he recognized him as emperor of the countries north of the Alps, Valentinian, the brother of Gratian, retained the possession of Italy, Africa, and western Illyricum. Theodosius now devoted his attention to the affairs of the church. Fixing his residence at Constantinople, the stronghold of Arianism, he determined to do away with that creed, and gave to the archbishop Demophilus the alternative of subscribing to the Nicene creed or instantly resigning. Demophilus resigned, and Gregory Nazianzen was installed in his place. Six weeks afterward Theodosius commissioned his lieutenant Sapor to expel all the Arian clergy from the churches in his dominions, and gave him a military force sufficient to carry out the decree. In May, 381, he assembled the first council of Constantinople, to confirm and complete the Nicene creed; and during 15 years he issued at least 15 edicts against all heretics, especially against those disbelieving the doctrine of the Trinity. In the mean time Maximus had entered Italy, and dethroned Valentinian II. Theodosius, who had married a sister of Valentinian, marched against Maximus, then encamped at the Pannonian city of Siscia (now Sisak) on the Save, defeated him, and pursued him to Aquileia, where Maximus was given up by his own troops and put to death. Theodosius entered Rome in triumph, June 13, 380. The people of Thessalonica having for a slight cause murdered Bothero and the other principal officers of the little garrison, the emperor sent thither an army of barbarians, who, when the inhabitants were assembled by invitation at the circus, massacred them to the number of many thousands. For this St. Ambrose forbade him to enter a church in Milan until he had done public penance. He remained in Italy three years. When Valentinian was strangled in 392 by his general Arbogastes, who had secured for himself all the real power of the government, and now set up as emperor the rhetorician Eugenius, Theodosius undertook again the conquest of the West. After a severe and long uncertain contest he defeated Arbogastes near the passes of the Julian Alps. Theodosius was now master of the whole Roman world. Honorius, his younger son, was called to Milan to receive the sceptre of the West, and here Theodosius died immediately after his arrival. In the eastern empire he was succeeded by his elder son Areladius.

THEODOCUS, a Greek elegiac poet, who flourished about 540 B.C. He was a citizen of Megara; and as in the contests between the aristocratic and democratic parties he belonged to the former, he shared in their defeat, and went into exile at Thebes. He visited Sicily, Eubea, and Sparta, and survived the Persian war of 490. He is the author of numerous elegies, originally comprising 2,800 verses, of which 1,359 are extant. They discuss oligarchical education and the humanities. The best editions are Welcker's (Frankfort, 1826) and Bergk's in Poeta Lyrici Graeci (3d ed., Leipzig, 1860).

THEOLOGY (Gr. ὑστερία, God, and ἀδιόνος, discourse), the science which treats of God and divine things. The term 'Theology' was given by the Greeks to the authors of theogonies (as Orphes and Hesiod), and to those who wrote poems (as Empedocles) or philosophical treatises (as Pherecydes) on divine things and the origin of things through the gods. A distinction was early made, as by Varro, between "mythical theology," a knowledge of the myths and legends concerning the deities in the classic poets; "physical theology," the investigations of philosophers on the origin of the world; and "civil theology," a knowledge of public worship. The ecclesiastical writers of the 9th and 4th centuries used the word, but applied it only to doctrinal treatises on the nature of the Godhead, or on the Trinity. Somewhat later the term was used by Theodoret, Maximus, and others, of the aggregate doctrines of the Bible, but its most common signification remained the doctrine of God. Abélard was the first to apply the term to the entire science of the Christian religion, which signification it has since retained. With regard to the sources from which theology derives its contents, it is common to divide it into natural or philosophical theology, which confines itself to its allegiance. At the head of a small body of men, he advanced into the heart of an unknown and hostile country, driving his en-
THEOLOGY

to the development of the religious ideas rest-
ing on rational arguments only, and positive or revealed theology, which sets forth and sys-
tematizes the doctrines of the Scriptures and of the church. Revealed theology or Biblical theology is occupied solely with the investiga-
tion and representation of the doctrines con-
tained in the Bible. A distinction is made be-
tween theoretical theology or dogmatics and prac-
tical theology or ethics. Theology, viewed as the whole of religious science, is commonly regarded as consisting of four main branches, historical, exegetical, systematic, and practical or moral theology. These are again variously subdivided, and several auxiliary sciences are connected with them. Thus historical theology embraces the history of the church, of Chris-
tian doctrines, of heresies, of councils, &c. To exegetical theology belong the interpretation (exegesis) of the Bible; hermeneutics, the science which teaches the right principles to be observed in interpreting the Bible; criticism, which investigates and tries to establish the genuine original text; the introduction to the Bible, which discusses the time when and place where each book of the Bible originated, its authenticity, and kindred questions. Syste-
matic theology, also called merely theology, comprises the system of Christian doctrines (dogmatics); the system of Christian ethics; symbols, the comparative statement of the doctrines of the several religious denomina-
tions, &c. Practical theology includes homilet-
ces, catechetics, liturgies, ecclesiastical law, &c. Polemics and apologies, which are also often treated as separate branches of theology, belong to several of the above four principal divisions at the same time.—Until the time of Abelard little attention was paid to comprehending theology in its totality, and to establishing the connection of the branches with each other. Although nearly all the theologians of the middle ages whose writings are extant belonged to the same church, yet they were divided into two fundamentally different schools, the scholastics and mystics. The theologians of the churches which grew out of the reformation of the 16th century followed, in their treat-
ment of theology, either the scholastics or mys-
tics, though the name of the former was dis-
carded both by their Protestant and Roman Catholic followers. A new era in the history of theology was inaugurated by the philosophy of Kant, who fully developed and systematized a new theory of Christian theology, commonly called rationalism, which more or less made the belief in a religious doctrine dependent on its demonstrability by reason. This view gained the ascendancy in several Protestant churches. Its opponents, who defended the Bible as the absolute rule of faith, were called supranatu-
ralists, and the subsequent history of theology is a contest not yet ended between these two systems. The chief arena of this controversy has been Germany; but it has had little or no influence over Roman Catholic schools. It has also been attempted to build up theoretical systems in opposition to Christianity, such as deism and pantheism.—In Roman Catholic schools, theology is divided into dogmatic and moral. Dogmatic theology, considered in its various methods of exposition and demonstra-
tion, is termed positive theology when it bases its proofs on Scripture and tradition. Moral theology treats of divine and human law as the rule of our actions. It aims at determining the true sense of the decalogue and the gospel precepts, discusses virtues and vices, examines the principles of justice and the foundations of injustice, points out what is needful and unlawful, and teaches all Christians their re-
spective obligations in all states, conditions, and offices. Moral theologians are often called casuists, from their treating ex probo of "cases of conscience." Scholastic theology is that pecular method introduced into the schools during the 11th and 12th centuries. It reduced all doctrinal matters into one body, so coor-
dinating them that one question explained and completed another, binding them into a con-
ected and systematic whole; it observed in its every demonstration the strict process of syllogistic reasoning, making use of the admitted principles of metaphysics, and thus con-
ciliating faith with reason, and religion with philosophy.—Valuable systematic works, giv-
ing a survey of the entire field of Christian theology, have been published by President Dwight, Dr. J. Fye Smith, Prof. Hodge ("System-
atic Theology," 3 vols. Svo, New York, 1872—8), and others, and useful encyclopedic manuals by Hagenbach, Pelt, and Standenmaier.

THEOPHRASTUS, a Greek philosopher, born at Eresus, in the island of Lesbos, about 372 B.C., died about 287. His original name was Tyrtamus, and he was named Theophras-
tus probably for his eloquence. He studied at Athens under Plato and Aristotle, and suc-
cceeded the latter at the lyceum. The num-
ber of his pupils from all parts of Greece was at one time 2,000. His infatuation of public affi-
airs excited a party spirit against him, and being brought before the Areopagus on a charge of impiety, he pleaded his own cause, and was acquit-
ted. After this he taught in tranquillity till 305, when Sophocles, son of Amphiclides, carried a law which prohibited all philosophers, under pain of death, from giving any public instruction without the permission of the state. Theophratus left Athens; but in the next year the law was abolished, and he returned. He wrote works on politics, laws, legislators, and oratory, which are lost, and "A Disserta-
tion on the Senses and the Imagination," a work on "Metaphysics," "Characters," and two works on botany, "The History of Plants" and "The Causes of Plants," which are extant in whole or in part. The book of "Charac-
ters" consists of 30 sketches of the general vices of humanity as developed in individuals. His extant works were first printed with those of Aristotle (Venice, 1495—8); the best edition
THEOPHYLACT and THERESA

is Wimmer's (Leipsic, 1854, and Paris, 1866). His "Characters" were translated into French and prefixed to his own by La Bruyère (1858), and into English, among others, by Francis Howell (London, 1824).

THEOPHYLACT (Θεοφύλακτος), surnamed STOMACATA, a Byzantine historian, born of an Egyptian family in Locris in the latter part of the 6th century, died about 629. From 610 till about the close of his life he held various offices at Constantinople. He wrote a history of the reign of the emperor Maurice (582–602), of which a Latin translation, Historia Mauriicii Tiberii Imperatoris Libri VIII, was published at Ingolstadt in 1648. Besides 85 letters (Epistulae Morales, Rustica et Amatorias, 4to, Cairo, 1509), he wrote a work on the nature of animals, especially of man (Ἀναπολωθάκως, or Questions Physica, 4to, Leyden, 1598; Leipsic, 1653). These two works were published together at Paris in 1835.

THEOPHYLACT, a Greek theologian, born in Constantinople probably about the middle of the 11th century, died after 1112. He was instructed by Clement, archbishop of Bulgaria, and became archbishop of Achris or Achrida, a chief city of Bulgaria, between the years 1070 and 1077. He engaged in the controversies of his day, especially those relating to the true character, procedure, and office work of the Holy Ghost, and the question whether or not common bread or only unleavened should be used in the sacrament, opposing the views of the Latin church. He compiled commentaries upon the minor prophets and a large part of the New Testament from the works of Chrysostom, and wrote a treatise on royal education (IIadetia Basilich, or Institutio Regia) for the instruction of his pupil Prince Constantine Porphyrogenitus, the son of Michael VII. There exist 75 of his letters, with some homilies and orations and a few small treatises. An edition of all his works in Greek and Latin was issued at Venice (4 vols. fol., 1754–93).

THERA (now Santorini), an island of the Ægean sea, now forming with Amorgos and other islands an eparchy of Greece, in the north of the Cyclades; length about 9 m. from N. to S., average breadth about 4 m.; pop. about 13,000; of the eparchy, in 1870, 21,907. It was originally circular, but the islet Therasia was torn from it by an earthquake about 237 B.C., and it now resembles a horseshoe. The harbor thus formed is the crater of a volcano, and as no bottom is found, vessels make fast at the brim and rocky shores. The soil is volcanic and inclined to dryness, but very fertile. The annual production of wine is about 1,750,000 gallons. Ship building is the only considerable industry. Thera, the capital, had a population in 1870 of 5,142.

Though an ancient Lacedaemonian colony, Thera is only of historic importance as having sent a colony to found the city of Cyrene in Africa, 631 B.C. The dates of the eruptions known to have taken place in or near this island are 197 B.C. and A.D. 46, 726, 1573, 1707, and 1866. By that of 197 B.C. the island of Palea (Old) Cammeni was formed, by that of 46 Mikra (Little) Cammeni, and by that of A.D. 1707 Nea (New) Cammeni. The last was at first composed of white pumice, but subsequently received additions of brown trachytic rock. The eruption did not wholly cease or the island assume its present form till 1712. In the beginning of 1866 stones flew up from the port of Volcano, and a new volcano arose which attained a height of about 100 ft. The eruptions continued until the autumn of 1870, and enormous quantities of lava were thrown out, surpassing in size those projected in 1707–12. Near Nea Cammeni a regular cone was formed 325 ft. high.

THERAMENES, a political leader at Athens toward the end of the 5th century B.C., born in Cos. In 411 he became a member of the council of 400; but he deserted it and became one of the leading agents in its overthrow. In 410 he joined the fleet under Thrasylulus, and took part in the battle of Cyzicus; and in 408 he participated in the siege of Chalcedon and the capture of Byzantium, under Aleiabades. He was one of the inferior generals at the battle of Arginusae in 406; and it was chiefly through his influence that six of the commanders were condemned to death for not saving the drowning crews, although, as they asserted, he had himself been sent with others to perform that office. During the siege of Athens by the Spartan general Lysander, when the city was reduced to great extremity, Theramenes was sent as envoy to the Lacedemonians. He remained three months with Lysander, who pretended detained him that length of time without informing him that the envoys only had power to grant peace; and upon his return to the city, which was now suffering under a terrible famine, he was sent back to make peace on any terms. The harsh conditions imposed by the Lacedemonians were assented to (see GREECE, vol. viii., p. 195), and in 404 Theramenes, who during his three months' stay, with Lysander had made arrangements with the Athenian oligarchical exiles, was among the most active in subverting the constitution, and became one of the thirty tyrants. He warmly supported the first measures of the government in crushing the democracy and putting to death its prominent leaders; but he afterward opposed the violent measures of Critias and his colleagues. His party daily increased; but Critias, after charging him with being a public enemy, caused him to be dragged off to prison by partisans with concealed daggers whom he had brought into the senate house, and compelled him to drink the hemlock.

THERESA, or Teresa, Saint, a Spanish mystical writer, born in Ávila, March 28, 1615, died at Alba, Oct. 4, 1682. She was called Teresa de Ahumada (her mother's family name) till Au-
Thermo-Electricity

Thermo-Electricity, electricity developed by heat, and also the science which treats of the phenomena and mode of production. Prof. Seebeck of Berlin, in 1822, was the first to make any well directed observations upon the subject. He found that when two rods or bars of different metals were soldered together or otherwise held in intimate contact at their ends, and the junction heated, an electrical disturbance took place, and that if the ununited ends were connected by a conductor an electric current was established. Several crystals, while their temperature is rising or falling, also become oppositely electrically excited at their opposite ends. The term pyro-electricity is usually applied to the electrical phenomena which arise from changes of heat in crystals. These phenomena were first observed in tourmaline, a double-refracting silicate crystalizing in hexagonal prisms. (See Tourmaline.) Its electrical manifestations are confined within certain limits of temperature, chiefly between 50° and 300° F., but these limits vary with the length of the crystal. If a crystal of tourmaline is suspended by a thread at its middle, and heated, its ends will be attracted and repelled by electrically excited bodies. Many other crystals exhibit like phenomena, but less in degree, which in many cases can only be detected by a delicate electroscope, written in 1562; El camino de la perfección, written in 1568 as a guide for the nuns of her reformed order; El libro de las fundaciones, an account of the convents founded by her; El castillo interior, ó las moradas, written in 1577, and the most celebrated of her mystic works, in which she portrays in glowing colors the gradual progress of the soul to the seventh heaven, the celestial castle of Christ, her spouse; and Santos conceptos de amor de Dios, the original of which she burned in obedience to her confessor, but which has been preserved from a copy taken by one of the nuns. The original manuscripts of the first four works are preserved in the library of the Escorial. The first complete edition appeared at Salamanca in 1587, and a recent one, edited by Ochoa, at Paris in 1847 (Tesoro de las obras místicas de Santa Teresa de Jesus). A collection of letters of St. Teresa, addressed to different persons, was published at Saragossa in 1658. The abbé Migne edited a complete collection of her works in French (4 vols., Paris, 1840-46), and they have been translated into most other European languages. A French translation from the original manuscripts was published by Père Marcel Bouix (3 vols. 8vo, Le Mans, 1832-76). Among the many lives of St. Teresa are those of Ribera (Salamanca, 1590; French by Père Bonix, Paris, 1865), the Bollandist Vandemoere (Brussels, 1845), and Maria French (London, 1875).

A French translation from the original manuscripts was published by Père Marcel Bouix (3 vols. 8vo, Le Mans, 1832-76). Among the many lives of St. Teresa are those of Ribera (Salamanca, 1590; French by Père Bonix, Paris, 1865), the Bollandist Vandemoere (Brussels, 1845), and Maria French (London, 1875).
silver, copper, zinc, iron, antimony. The direction of the current often changes when the couple is heated beyond a certain degree. Thus, in a copper and an iron circuit, the current passes from the copper to the iron through the heated part when the temperature is not higher than 570°; above this the current passes in the opposite direction. The cause of thermo-electric currents is diversity in the molecular structure of the elements, and Becquerel ascribes them to unequal propagation of heat in the different parts of the circuit. A thermo-electric pile, or battery, in which a series of several couples are joined somewhat like the arrangement in a voltaic pile, or at least with the opposite poles of the elements in contact with each other, was devised by Nobili. A modification of this is shown in fig. 2, in which the lowest plate is bismuth, the next above antimony, the next again bismuth, and so on, the last plate being antimo-ny. These sets of elements are arranged in a copper frame, P, in four vertical series, making in all 20 couples. The terminal plates are con- nected with binding-screws, η and σ, by which they may be connected with a resistance measurer or rheostat, or with a sine or a tangent galvanometer. (See Galvanism, vol. vii., pp. 593-5, and Diathermancy, vol. vi., p. 81.) When the pile is composed of a great number of pairs and connected with a very delicate galvanometer, it may be used to detect the slightest changes of temperature; it is much employed in physical investigations, and will undoubtedly in time have extended practical use in physiology and medicine.

**THERMOMETER** (Gr. θερμή, heat, and μέτρον, a measure), an instrument to measure temperatures. It is formed of two or more different substances, the volumes of which expand and contract to different extents when they are simultaneously exposed to the same differences in intensity of heat. The first attempt at indicating to the eye differences of temperature seems to have been by the contrivance variously ascribed to Drebble of Holland and Sanc-torius of Italy, about the beginning of the 17th century, and known as a weather glass. This was very rude and inaccurate, consisting of a glass bulb and tube inverted, opening below into a cup of colored liquid, which, the air of the bulb having been partly expelled by heat, rose in the tube, and stood at different heights according as the air remaining in the bulb was more or less expanded by heat. This, the origin of the common air thermometer, as improved by Boyle and by the Florentine academicians, became transformed to a smaller bulb with upright stem of somewhat fine bore, the contained liquid being colored spirits of wine; boiling this to expel air, the tube was hermetically sealed, and the whole then affixed to a case. A scale of degrees was also introduced, with the zero point scaled at the solid of snow or ice and the greatest heat known at Florence; it was of necessity very variable in its indications. At this stage in the progress of thermometry, much discussion in regard to the most suitable fixed points for the scale, the best substance for use in the instrument, &c., including that of the question whether water did not freeze at different temperatures in different latitudes, was carried on in England and on the continent. Hooke advocated as the lower fixed point the temperature of freezing water. Newton seems first to have discovered or taken advantage of the facts, that a thermometer placed in melting snow or ice always indicates the same temperature, and always very nearly one temperature in boiling water; but of oil, which he suggested for the liquid in the bulb, the movements were found to be too sluggish and uncertain. Römer, overcoming a prejudice that seems to have ex-isted in regard to unequal expansion of mer-cury, first adopted that liquid; and he doubt-less devised the instrument and scale usually attributed to Fahrenheit of Amsterdam (1720), the latter constructing and introducing the in-strument, so that it became generally known throughout Europe in the first half of the 18th century. Of this thermometer, the lower fixed point, or zero, was taken at 32° below freezing point of water; but whether as the cold obtained by its maker by mixing salt and snow, or as the greatest cold observed in Iceland, and in either case as the supposed point of absolute cold, is not now definitely known; and since Fahrenheit kept his graduation of thermome-ters a secret, the same must be said respecting the choice of a scale of 180° between the fixed points. Celsius of Sweden (1742) introduced a scale of 100° between the fixed points; this was adopted in France at the time of the revolution, and named the thermomètre centi-grade; and owing to its convenient decimal division, it has been wholly adopted in sev-eral countries of Europe, while it is coming into general use among scientific men through-out the world. For the general principles upon which the use of the thermometer de-pends, see Expansion, Heat, and Pyrometer.

—An increase in the temperature of a body is generally accompanied by an increase in its volume, and a decrease in its temperature by a contraction in its volume. Definite changes in the volume of a given substance may be used as indications of this substance having different definite temperatures, and this substance will have the temperature of the bodies by which it is surrounded, or of the medium in which it is immersed, and thus serve to measure their temperature. The substances generally used in the thermometer are glass and mercury, and the observed change of volume is the difference in the change of volume of the glass and of
the mercury. The instrument which shows
this difference in expansions is known as the
mercurial thermometer. It consists of a tube
of very small interior diameter, terminating in
a bulb or reservoir. The bulb and a portion
of the tube are filled with mercury, and with
an increase or a diminution of temperature the
mercury will rise or fall in the tube; and the
position of the mercury in the tube can be
noted on a scale of equal parts either etched
on the tube or marked on the surface or a
plate to which the tube is attached. Mercury
has several advantages as a thermometric sub-
stance. The successive increases in its volume
for equal and successive additions of tempera-
ture, indicated by the air thermometer (see
PYROMETER, vol. xiv., p. 111), are quite uni-
form; especially this is the case when we
use the differential expansion of mercury and
ordinary glass. The ordinary thermometer
when constructed with care is trustworthily
in the measure of temperatures up to 300° C.
Up to 100° C. mercurial thermometers made
of any kind of glass indicate almost exactly
the same temperatures as those given by the
air thermometer. Another advantage of mer-
cury is that it does not freeze above the low
temperature of -40° C., and does not boil
below 860° C. But the mercury thermometer
only gives accurate indications between -35°
and +800° C. For temperatures above 800°
C. some form of pyrometer must be used.
Mercury has a low specific heat, and this prop-
erty combined with its high conductivity causes
it rapidly to indicate the changes in the tem-
perature of surrounding bodies or of the medi-
in which it is immersed.—Construction of
the Mercurial Thermometer. The tube of the
thermometer should be of uniform calibre
throughout its whole interior. To ascertain
whether this is the case, a short column of
mercury is introduced into the tube; and if its
length remains the same when it is moved
throughout the length of the tube, we may be
sure that the tube has a uniform bore and
hence that equal amounts of expansion of the
mercury will cause equal additions in the length
of the mercurial column in the tube. Since
tubes of uniform bore are very rare, it is gen-
erally necessary to calibrate the tube before
its graduation. This is done by etching on
the tube a scale of equal parts, and then, from
observations on the different lengths occupied
by a column of mercury which is made to pass
through the tube, forming a table which gives
the temperatures corresponding to the arbitra-
ary divisions on the tube. A bulb is now blown
on the tube, and this bulb and a portion of
the tube are filled with mercury as follows: The
air in the bulb is heated while the open end
of the tube dips into mercury. The heat having
been withdrawn, the air in the bulb contracts
and the mercury rises in the tube and partly
fills the bulb. To the open end of the tube
a funnel containing mercury is adapted, and
the mercury in the bulb is boiled and thus
expels all air and moisture from the instru-
ment, which on cooling necessarily fills com-
pletely with mercury. The bulb is now placed
in some fluid heated to a few degrees above
the highest temperature which the thermom-
eter is intended to measure, and when the
mercury ceases to overflow the open end of
the tube is sealed with a blowpipe flame. In
order to graduate the instrument, the bulb and
part of the tube are surrounded with melting
ice, and when the top of the mercury column
has remained some time stationary, its posi-
tion is marked by means of a line, or a note is
made of this position, referred to the arbitrary
scale etched on the tube. The point on the
thermometer determined as above is designa-
ted as 0°, or zero degree, on the thermometers
known as centigrade (Celsius) and Réaumur,
and as 32° on the Fahrenheit system of grad-
uation. To determine a higher point on the
thermometer, the instrument is placed in the
interior of a metallic vessel with double walls,
between which circulates the steam from wa-
ter boiling in the bottom of the vessel. When
the top of the mercury column in the ther-
ometer has become stationary its position is
marked on the tube. The boiling point of
water is constant at the same atmospheric
pressure, and when the barometric column has
a height of 29-922 inches or 760 milli-
meters, the boiling point of water is design-
nated as 100° on the centigrade thermome-
ter, 212° on the Fahrenheit, and 80° on the Réaumur.
Hence, between the melting point of ice and the boiling
point of water there are 100 equal degrees in the centi-
grade graduation, 180 in the Fahrenheit, and 80 in the
Réaumur. To convert the indications of one of these
thermometers into those of the other, we use the follow-
ing formula, in which F, C, and R denote equivalent
temperatures expressed in de-
gress of Fahrenheit, centi-
grade, and Réaumur, respec-
tively:
\[ F = C + 32 = \frac{9}{5} R + 32 \]
[\[ C = R - \frac{32}{9} (F - 32) \]
\[ R = \frac{9}{5} C - \frac{32}{9} \]
Fig. 1 shows a thermometer
graduated according to the
three systems. A few weeks
after a thermometer has been
made and graduated it may
be observed that the mercury
will not quite descend to the
melting point of ice when the
instrument is immersed in
pounded ice. It has been
found that this "elevation of the zero point," as
it is called, goes on gradually for about two
years after the thermometer has been con-

---

**Fig. 1.—Thermometer with Fahrenheit, Réaumur, and Centigrade Scales.**
THERMOMETER

structured, and at the expiration of that period the readings may all be too low by nearly a degree; hence it is necessary either to add the proper correction to the readings of the thermometer, or to slide down and refix the scale to which the thermometer is attached, so that it will read accurately. Alcohol, commonly used where temperatures much below 0° F. are to be observed, is liable at such range to much variation, although it does not freeze even at —182° F.; and Capt. Parry, in his arctic voyages, observed differences of full 10° C. between alcohol thermometers by the best makers.—Self-recording Thermometers. Various instruments have been invented which record the indications of the thermometer. They may be divided into two classes, those which record only the maximum and the minimum of the temperatures occurring in any definite period, and those which produce continuous records. In the first class may be mentioned the two following instruments. An ordinary mercurial thermometer has its tube constricted to a thin passage at some point between its bulb and the beginning of its scale. This thermometer is placed in a horizontal position, and then as long as an increase of temperature takes place small portions of the mercury will go in a series of jumps across the constricted passage; but on a fall of temperature the mercury contracts into the portion of the thermometer below the constriction, leaving a column of mercury above it. The upper end of the latter column marks the highest temperature reached during the time of exposure. To readjust this instrument, the mercury is sent into the vacant space below the constriction by swinging the instrument. Fig. 2 shows this "maximum thermometer," the invention of which has been claimed by several persons. The "minimum thermometer" of Rutherford, which is generally used, is made of alcohol contained in the ordinary glass bulb and tube. In the column of alcohol is a small index made of black glass and shown at a, fig. 3. This piece of glass is brought up to the end of the fluid column by inclining the instrument. The thermometer is then placed in a horizontal position, and as the temperature falls the top of the liquid column during its retraction carries the glass index with it, and leaves it at the point which indicates the minimum temperature reached during the exposure of the instrument. The thermometers of the second class give continuous records, either by causing a tracer attached to some simple or compound metallic bar to mark a continuous line on a cylinder which revolves once in 24 hours, or by the aid of photography a continuous impression of the image of the top of a thermometric column is obtained by illuminating a thermometer placed in front of the lens of a camera, while at the back of the camera is a sensitized plate on which the image is formed. The plate traverses athwart the beam issuing from the lens by a known distance each hour.—Differential Thermometer. This is a modification of the air thermometer, in which two large glass bulbs above are connected by a glass tube bent twice at right angles; the horizontal and parts of the upright tubes are filled in the common form with a colored liquid, which is depressed on either side as the corresponding bulb is more heated; thus the instrument indicates differences of the temperatures to which the two bulbs may be exposed. It is very sensitive; and by a scale the results it affords are comparable with each other.

THERMOPYLÆ, or simply Pyke (from ἰπνός, hot, and ἰβίκος, gate), a defile between Thessaly and Locris, in antiquity the only passage for an enemy from northern into central Greece, situated between Mt. Æta and an inaccessible morass forming the edge of the Maliai gulf, and containing several hot springs. There was a road wide enough only for a single wheel track, which formed the western gate. About a mile to the eastward Mt. Æta again approached the sea in a similar manner, and the passage there formed the eastern gate. The space between these two gates was wider, and many years before the Persians occupied the pass, the Phocians had so conducted the warm springs over the ground as to render the pass impracticable. They had also built a wall near the western gate to prevent the incursions of the Thessalians, which was in ruins when the Spartans came. This pass is celebrated for its defence against the army of Xerxes by the Greeks under the Spartan king Leonidas, in 480 B. C. His forces numbered probably about 7,000; but when during the battle he learned that one Ephialtes, a Thessalian, had betrayed to the Persians a circuitous path over the mountains leading to their rear, he dismissed all but his chosen band of 300 Spartans, with a number of helots, about 700 Thespians who volunteered to share his fate, and apparently 400 Thebans. This small host sallied out and fought till Leonidas and all the Spartans and Thespians were killed. The fate of the Thebans is uncertain; according to some they surrendered to the Persians. One Spartan, Aristodemus, who was prevented by illness from partaking in the combat, returned home, and was received with scorn, but in the following year retrieved his honor by a heroic death at
Théories De Méricourt

Platea. Many other battles took place at Thermopylae in later times. The pass is now of little importance as a strategic point. Nature has widened it into a swampy plain from the alluvial deposit of the Sperchen and the retreat of the Malian gulf. At the S. end of the pass a mound, supposed to be that to which the Spartans finally retreated and on which they were slain. In a small plain is the Polyanarium, one of the sepulchral monuments of the Greeks who fell at Thermopylae, and a few miles beyond are the remains of the wall mentioned above, which can be traced from the Malian gulf to the gulf of Corinth.

Théories De Méricourt (more properly Marcoury), a French revolutionary, whose real name was Anne Joseph Terwagne, born at Marcoury, Luxemburg, Aug. 13, 1792, died in Paris, June 9, 1817. She was the daughter of a farmer, and was educated at a convent. In 1798 she went to Paris, where she became notorious as the "Amazone of the revolution" and the "handsome Liégeois." She lived in luxury, gathered around her many conspicuous revolutionists, and appeared with arms in the revolutionary assemblies, in which she spoke with eloquence. In 1798 she was threatened with arrest for participating in violent outbreaks, and fled. Early in 1791 the Austrian authorities arrested her near Liége, and incarcerated her at Kufstein, Tyrol, for alleged conspiracy against Marie Antoinette, and subsequently detained her at Vienna till November. On her return to Paris she became still more popular. In June, 1792, she led a corps of insurgents, and received a civic crown for her courage. Suleau, a journalist, having reviled her, she turned the mob upon him during the outbreak of Aug. 10, 1792, and he was murdered. But when a little later she advocated greater moderation, she was publicly stripped and whipped by infuriated women. This drove her mad, and for the rest of her life she was in a lunatic asylum. See Théories de Méricourt, dite de belle Liégeoise, et de ses contemporains (Liége, 1854).

Theseus, a legendary hero of Attica. He was the son of Ægeus, king of Athens, and Æthra, daughter of Pittheus, king of Trozen. Ægeus on his departure from Trozen hid his sword and shoes under a stone, and charged Æthra if she gave birth to a son to send him to Athens as soon as he was able to roll away the stone. When Theseus arrived at maturity his mother informed him of his parentage, and taking possession of the tokens he set out for Attica by land, destroying various robbers and monsters on the way. At Athens he was recognized by his father, but narrowly escaped death from the hands of Medea. He engaged in a war with the Pallantids, the sons and grandsons of Pallas, the brother of Ægeus, in regard to the succession to the throne, and was victorious. Next he voluntarily sailed to Crete as one of the tribute youths to be offered to the Minotaur, for the purpose of attempting the destruction of the monster. He gained the affection of Ariadne, daughter of Minos, who furnished him with a sword and a clue of thread, with which he killed the Minotaur and escaped from the labyrinth. Hereupon he carried off Ariadne, whom however he left behind at the island of Naxos. Theseus, if successful, was on his return to hold white sails instead of the black ones which this vessel always carried; but this arrangement was forgotten, and Ægeus, imagining his son was destroyed, threw himself into the sea. Theseus now ascended the throne. He invaded the territory of the Amazons, defeated them, and carried off their queen Antiope. In revenge the Amazons marched into Attica, and entered Athens itself, but were finally vanquished. He married Phædra, and to her passion his son Hippolytus fell a victim. (See Phædra.) Theseus figures in the principal heroic legends of ancient Greece. He was one of the Argonauts, was engaged in the Cretan hunt, fought with Piritones and the Lapithae against the Centaurs, and also assisted Adrastus in regaining the bodies of those slain before Thebes. Aided by Piritheus, he carried off Helen from Sparta when she was only nine years old. Attica was in consequence invaded by Cnestus and Pollux. Menestheus invited the Athenians to rise against their ruler; and Theseus, finding it impossible to sustain himself, retired to the island of Seryos, where he was destroyed by the treachery of King Lycomedes. In 476 B.C. the oracle directed his bones to be brought from the island to Athens, and in 469, when Seryos was taken by Cimon, it was pretended the body was found. His bones were laid in the interior of the city, and the temple called the Theseum, built over the spot, served as a sanctuary for poor men in dread of the powerful, and for slaves in case of cruel treatment. At the battle of Marathon Theseus was reported to have been seen armed and aiding the Athenians. Festivals in his honor were celebrated on the eighth day of each month, and the festival termed Osephoria was said to have been originated by him after his return from Crete. To him was popularly ascribed the re-institution of the Pythian games.

Theseiger, Sir Frederick. See Celemisford.

Thespis, the founder of Greek tragedy, a native of Icaria in Attica, lived in the time of Pisistratus (about 540 B.C.). The ancient traditions represent him as the inventor of tragedy, and to him is also ascribed some of the invention of masks. According to one account, Thespis was in the habit of traveling through Attica at the time of the festival of Bacchus in a wagon, and upon this portable stage performed comic plays. It is also said that he found tragedy already existing in Athens, but made it in the simple and important alteration of introducing an actor for the sake of giving rest to the chorus. Nothing which he wrote is extant, but the titles of four of his tragedies have been preserved.
THESSALONIANS. Epistles to the, two canonical books of the New Testament, addressed to the church at Thessalonica by the apostle Paul. They are expressly referred to by Ireneaus, Clement of Alexandria, and Tertullian. In modern times the authenticity of both epistles has been doubted by Noack, Van der Vries, and Volkmann, and that of the second by Lipsius, Hilgenfeld, Weiss, Hausrath, Pfeiderer, and others. Special treatises in support of their authenticity have been written by W. Grimm, Lüemann, and others. The first epistle to the Thessalonians, commonly believed to have been the first of the Pauline epistles, is supposed to have been written from Corinth about A. D. 52 or 53. The occasion seems to have been the favorable report of the faith of the Thessalonians which Timothy brought on his return from Macedonia. Chapters i. to iii. express the apostle's feelings respecting their religious condition, and his own kindly reception among them. Then follow an exhortation to holiness (iv. 1-12), an instruction on the fate of the dead at the expected return of Christ (iv. 13-18), an admonition to be always prepared for that event (v. 1-11), several other admonitions, and the conclusion. The second epistle is believed by most of the theologians who regard it as authentic to have been written soon after the first, in the year 53 or 54. It was designed to correct some errors into which the church had fallen, especially respecting the coming of Christ. The apostle commends the Thessalonians for their patience and faith in their persecutions, and announces that those who trouble them will be punished (ch. i.); he shows that the arrival of Christ was not near at hand, but must be preceded by a great apostasy and the appearance of the Antichrist (ii. 1-12), and gives them appropriate admonitions (ii. 13-17, and iii.). Among the most valuable commentaries on these epistles are those by Schott (Leipsic, 1834), Jowett (London, 1856), Lüemann (Göttingen, 1859), Ellicott (2d ed., 1862), Hofmann (1862), and Aubelen and Riggenbach in Lange's Bibelwerk (2d ed., 1867; English translation by Lillie).

THESSALONICA. See Salona.

THESSALY (Gr. Θεσσαλία or Θεσσαλία), the largest political division of ancient Greece, comprising in its fullest extent the country between Thermopylae and the Cambunian mountains in the north, the plain between the range of Pindus and the Ægean sea in the east, the mountains of the north, Ossa and Pelion on the east, Mt. Othrys on the south, and the Pindus range on the west. This plain, whose natural enclosure of mountains is broken only at the northeast by the vale of Tempe, was the most fertile region and the largest that was continuously productive in Greece, and was supposed by its inhabitants to have once been a lake, of which the lakes Nessonis (now Kara Tchait) and Boebeis (Karla) were the remains. It was drained by the Peneus (Selembria or Salamvria) and its tributaries, and was divided into two plains, which in antiquity were called Upper Thessaly and Lower Thessaly; the former embracing Thessaliots and Hestimotias, between Æginium in the northwest and Thaumaci in the south, and having Pharsalus for its chief city; the latter, Pelasgiots, stretching from Mt. Olympus and Ossa on the north to Mt. Othrys and the gulf of Pagase (now of Volo) on the south, and having Larissa as its most important town. Thessaly proper was early divided into the four districts of Thessaliots, Hestimotias, Pelasgiots, and Phthiotis; and this division, the origin of which is sometimes ascribed to Aeolus, the founder of the Athenæ, was continued down to a very late time. In addition to Thessaly proper, the name was extended over Malis or Malia, a narrow valley between Mt. Othrys and Æta, through which the river Spercheus enters the Malian gulf; and to Magnesia, a region lying along the coast and stretching S. from the vale of Tempe, and almost encircling the gulf of Pagase.—The Thessalians were said to have been originally emigrants from Thespotina in Epirus, who conquered the Pelasgian inhabitants of the plain of the Peneus, which is said by Herodotus to have then been called Æolis. During the historic period three classes inhabited the country. The first was a body of rich oligarchical proprietors, who owned most of the soil. Of these the most powerful families were the Aleuadae of Larissa, the Scopaeae of Crammon, and the Orôneidae of Pharsalus; the second were the subject Achaeans, Magnetes, and Perrhebii, who retained their tribe names and separate votes in the Amphictyonic council; the third were the Penestae or serf cultivators of the soil, who could not be sold out of the country, and who kept up among themselves the relations of family and community. These were no doubt earlier inhabitants reduced to serfdom; but whether they were Pelasgians or Boeotians, as Grote suggests, it is impossible to determine. The language spoken in Thessaly was Æolic Greek. The four divisions of the country formed a political union, existing rather in theory than in fact. To enforce obedience to the common authority a chief or regus was sometimes elected; but constant feuds between the larger cities prevented Thessaly from occupying its rightful position in Greece. The inhabitants were early engaged in a constant war with the Phocians; they joined by constraint the army of Xerxes in his invasion of Greece, but took no part in the Peloponnesian war. About 400 B. C. Phere rose to political supremacy in Thessaly under Lycomphon, who had made himself tyrant, and his successor Jason, who reduced all Thessaly to his authority, and mediated not only the conquest of Greece, but the overthrow of the Persian empire; but before he had time to mature his designs he was assas-
sinated. Alexander of Pherae maintained and extended his power (see PHERAE); but after his death the country fell into the hands of Philip of Macedon. It formed a part of the Macedonian monarchy until the defeat of Philip V. at Cyznaeophale in 197, when it came under the Roman dominion, and the government was given to wealthy persons, who met in Larissa.—Thebes now forms a part of the Turkish vilayet of Janina, excepting the southernmost portion, from Mt. Othrys, which belongs to Greece. (See Thessalonica.) The chief town of Turkish Thessaly is Trikala, and of the Greek portion Lamia or Zeitun.

THETIS, in Greek mythology, the mistress and chorus leader of the 50 Nereids, the wife of Peleus and mother of Achilles. She dwelt in the depths of the sea with her father Nereus, and was sought in marriage by both Jupiter and Neptune; but the gods relinquished their suit when Themis declared that the son of Thetis should be more illustrious than his father. At her wedding with Peleus all the gods and goddesses were invited, excepting Ere (who revenged herself by throwing the apple of discord among the guests. (See Paris, and Achilles.) She had a temple in Thessaly, and was worshipped in Sparta and Messenia.

THERIENOT, J. Melchisedeck, a French traveller, born in Paris about 1620, died at Issy, Oct. 29, 1622. He early explored Europe, learned oriental languages, and in 1640 became keeper of the royal library, of which he published a catalogue in 1694. The gatherings of learned men at his house formed the nucleus of the future academy of sciences. In 1645 he was sent on an official mission to Genoa, and from 1652 to 1655 he was employed by the government in Rome. He published compilations of travels, including Relations de divers voyages curieux (2 vols. fol., Paris, 1633–72), and Recueil de voyages, comprising Marquettet's Découvertes dans l'Amérique Septentrionale (1811).—H. Jean de, a French traveller, nephew of the preceding, born in Paris, June 16, 1633, died at Miana, Armenia, Nov. 28, 1667. After traveling through Europe, he made two extensive journeys in Asia and Africa, and is said to have first introduced coffee into France. The narratives of his travels were collected under the title Voyages de M. Thérenot tant en Europe qu'en Asie et en Afrique (5 vols. 12mo, Paris, 1689), and were translated into English, German, and Dutch.

THEZEL, or TES, a fortified town of Morocco, on the Wad el-Ashar (Yellow river), or Sebu, about 60 m. E. of Fez; lat. 34° 9' N., lon. 5° 55' W.; pop. about 5,000, of whom 800 are Jews. Its great mosque is a fine building, supported in the interior by antique monolithic columns. The chateau is the centre of the trade between Algiers, Tlemcen, and Fez, and caravans lead from it to Figgis and Taflet.

THIBAUT (Theobald) IV. or VI. as count of Champagne, I. as king of Navarre, a French troubére or poet, born at Troyes in 1201, died there or at Pamplona, July 10, 1253. He was a posthumous son of Count Thibaut III. or V., was educated at the court of Philip Augustus under the supervision of his mother, Blanche, daughter of Sancho the Wise, king of Navarre, and became an early adept of the "gay science." Several of his poems were addressed, under an assumed name, to Blanche of Castile, the queen of Louis VIII., whom he loved to distraction, although she was 14 years his senior. When her husband died prematurely at Montpensier in 1226, while returning from an expedition against the Albigenses, Thibaut, who accompanied him, was suspected of being his poacher. He soon after joined the league of feudal lords who rose against Blanche, then regent; but her influence brought him back to his duty to the king, and through his assistance she baffled the designs of her confederates. In 1234 Sancho died without male issue, and the count of Champagne inherited the kingdom of Navarre in right of his mother. In 1239 he went to the Holy Land; but he met with a dreadful defeat near Gaza, and had to pay a heavy ransom for the release of his brother. His provinces were very prosperous under his government, and he was a patron of literature and the fine arts. He allowed the Albigenses to be persecuted in his dominions, and assisted, May 13, 1229, in the burning at the stake of 83 of them, at Montrimer, near Vertus. Of his poems, 66 songs were published by Lévesque de la Ravallière (2 vols. 12mo, Paris, 1742; best ed. by Recqmore and Michel, 1829). A collection of 81 songs is contained in Tarbè's Collection des poètes champenois (Svo, Rheims, 1851).

THIBET, or Tibet (Sansk. Bhut; Thib. Bod; Pers. Tibet), a region of central Asia, between lat. 27° and 38° N., and lon. 78° and 104° E., bounded N. by East Turkestan and China proper, E. and S. E. by China, S. by Burmah, Bootoon, Sikkim, Nepal, and British India, and W. by Cashmere; area estimated at from 650,000 to 800,000 sq. m.; pop. about 6,000,000. Tibet forms the S. E. portion of the great central Asiatic plateau, with a mean elevation of about 15,000 ft. toward its southern edge, which is bordered by the Himalaya. The Kuen-Lun range is generally regarded as the northern boundary of the country. The transverse
chains which connect the western extremities of these two great ranges separate Thibet from Cashmere. It appears now to be established beyond doubt that a third lofty and snow-capped chain intervenes between the Himalaya and the Kuen-lun, parallel with them, probably a prolongation eastward of the Karakorum mountains, under the name of Nian-ts'in-tan-gla according to Huc. Hodgson calls it the Nyen-chen-thanga range. It forms the northern boundary of Great Thibet, a region which extends thence southward about 200 m. to the outer Himalaya overlooking India, and 750 m. from W. to E. along the basin of the Sanpo or upper course of the Brahmapootra. Western Thibet (Thib. Arj.), in the widest sense, comprises Ladakh (outside of the limits above stated; see LADAKH) and the lofty Himalaya region about the sources of the Ganges and the Sutlej; while of eastern Thibet (Thib. Ram) little is known except that it is deeply indent- ed by the gorge-like valleys of the numerous great rivers which flow thence into China, Indo-China, and Burma.—In its main physical features Thibet is a vast, arid, mountainous plateau, with an altitude seldom less than 10,000 ft. above the sea, except in the lowest valleys, and over a great part of its area more than 14,000 ft. The northern portion of the country, between the Nyenchen-thanga range and the Kuen-lun, consists of a series of lofty table lands, uncultivated, and inhabited only by nomads and robbers and the residents of the Buddhist monasteries, which are the only permanent dwellings met with in the region. Great Thibet is comparatively a cultivated country, of settled habitations, and contains the capital and principal cities; but by far the largest part of its surface is occupied by vast grassy steppes, which afford abundant and valuable pasture. In western Thibet the area capable of cultivation, or even habitable by man, is proportionately very small, owing to the exceedingly mountainous character of the region.—Thibet has four systems of drainage. North of the great middle range of mountains, on the slopes of which are numerous glaciers, the drainage is wholly interior, the streams being received by the salt lakes which occupy some of the principal depressions. The most considerable of these is that known as Tengri- nor, or more properly Nam-cho, the Sky lake, 15,190 ft. above the ocean, about 50 m. long and from 16 to 35 m. wide. One of the transverse ridges extending northward from the Himalaya separates the southern part of the country into two basins, forming a watershed with the Indus and the Sutlej flowing off its W. slope, while its E. side sends the Brahmapootra to water Great Thibet, which finally likewise makes its way down to the Indian plain. North of the great Kailas peak of the Himalaya are Lakes Rhaswan—rhe, Manasarowar, out of which last pours the Sutlej; and the remarkable ring-shaped lake of Paloe, or Yandok-cho, is about 35 m. S. W. of Lassa, in the valley of the Sanpo or Brahmapootra. Lake Koko-nor, in eastern Thibet, is near the head waters of the Hoang-ho.—The nature of the rocks near the southern edge of the table land indicates that the Thibetan plateau must be of recent geological origin. The plains consist of horizontal gravel strata on which rest bowlders, and extensive fossil-bearing deposits occur in the vicinity of the Himalayan range. In the north metamorphic rocks alternate with beds of granite. Among the Nyenchen-thanga mountains are numerous hot springs, as well as geysers the waters of which freeze as they fall, forming lofty columns of ice.—The climate in the higher districts is cold, dry, and almost rainless, and even the snowfall is light. Timber never rots, but becomes so dry as to break, and the flesh of animals exposed to the air dries till it can readily be reduced to powder. The limit of perpetual snow is higher on the Thibetan than on the Indian side of the Himalaya, which is attributed to the excessive dryness of the atmosphere on the N. slope of the range. It is there 18,000 or 19,000 ft. above the sea, while in India it descends to 15,000 ft. During summer the sky is clear and the atmosphere wonderfully transparent, but the plains are subject to violent winds and dust storms in winter, and the cold is intense. A warmer climate prevails in many of the valleys, where European fruits and vegetables are raised.—With the exception of the pasturage on the steppes, the vegetation of Thibet is scanty. Forest trees are unknown except in some of the mountainous districts, and in such as have been explored they consist principally of cedar and birch. In the warmer valleys the apple, fig, pomegranate, apricot, peach, vine, and several varieties of nuts are grown. Wheat and rice are cultivated sparsely, and some buckwheat, but gray or black barley is the principal grain and the chief article of diet. The mineral productions comprise gold, silver, mercury, cinnabar, lead, iron, salt, and borax, as well as several kinds of precious stones, including lapis lazuli. Gold occurs, not only in the sands of some of the rivers but in many mines, of which perhaps the most productive are in western Thibet N. of the Kailas mountain. There are rich silver mines in the neighborhood of Lassa, and although it is said that the authorities prohibit working them, large quantities of silver are constantly exported from Thibet into China. Salt, which is also an abundant article of export, is obtained by solar evaporation from the saline lakes. The number of animals is greater than might be expected from the scantiness of vegetation; among them are the tiger, ounce, lynx, wolf, fox, bear, buffalo, wild ox, wild goat, long-hair sheep, and yak, which abounds throughout Thibet. The shawl goat is the most important of the domestic animals, and the musk deer the most valuable object of the chase.
Wild fowl and fish are abundant, but Lamaism prohibits them as articles of food.—The Thibetans belong to the Mongolian race, and it is believed that all were once nomadic, as those in the north still remain. They are pliant and agile, usually brave, generous, frank, and honest, eminently commercial in their habits, and many of them skilled workers in gold, silver, and precious stones. They are rude agriculturists. The fine wool which their flocks afford, and the hair of the shawl goat, enable them to manufacture superior woollens and shawls of fine texture. Sacking and other articles are also woven in considerable quantities for the Chinese market. Clothes are dyed with great skill, and the manufacture of pottery and of idols is a thriving trade. The traffic with China is carried on along the great road between Lassa and Tashluno, a town in the western part of the Chinese province of Szechuen. The exports are drugs, blankets and other woollens, furs, musk, salt, and silver, in return for which China sends cotton goods and thread, ponies from Yunnan, porcelain, and tea. The chief trade routes from India lead through Cashmere and Ladakh, Nepal, and Bootan, over lofty mountain passes. English woolen cloths, flowered calicoces, indigo, rice, and precious stones, including pearls, turquoises, and dark corals (which here sell for their weight in gold), reach the country by these highways; while gold and silver, salt, borax, wool of the shawl goat, coarse blankets, ponies, and yak's tails are sent southward into India over the same routes. The roads throughout the country are poor.—The language which is common to Thibetan and Bootan, and hence called indifferently Thibetan or Bhotanta, is classed with the monosyllabic languages, though possessing some polysyllables. Its alphabet is phonetic, read from left to right, and is evidently borrowed from the Sanskrit; but the language owes most of its derivatives and some of its root words to the Chinese. It is copious and well adapted for the expression of philosophic and religious ideas. There is an extensive literature, mainly composed of translations and commentaries on the Buddhist sacred books. The religion of Thibet is Lamaism. (See La-

dism.) There are some Mohammedans in western Thibet, chiefly natives of Cashmere, and, according to Hue, several thousand Ro-
nan Catholics. Polyandry prevails in many districts.—Politically Thibet is tributary to the emperor of China, and is therefore usually classified as a part of the Chinese empire. But the direct government of the country is vested in the two great lamas or priestly rulers, who hold sway respectively in the two prov-

inces into which Great Thibet is divided for spiritual and administrative purposes. These are the province of U, of which Lassa is the capital, ruled over by the dalai lama, and the province of Tsang, to the southwest, over which presides the equally sacred teshu lama, with his capital at the city of Shigatze, about 140 m. further up the Sanpo valley. The comb-

ined names of these two provinces form the native appellation Utsang, applied to Great Thibet. As Lassa is the sacred capital of all Buddhistic countries, it is regarded as the capital of Thibet in preference to Shigatze. There are many other large towns, in most of which the Chinese government has its governors or representatives, who exert great influence if not positive authority over the Thibetan rulers. A considerable Chinese military force has usu-

ally been maintained in the country.—As a kingdom Thibet is said to date from A. D. 318. Buddhism was first introduced, according to some authorities, as early as the 4th or 5th century; but its general diffusion there is of later date. After various struggles with China, Thibet finally became tributary to that empire about the middle of the 17th century. The country was visited by Jesuit missionaries in the 17th and 18th centuries. Thomas Manning, an English traveller, made his way to Lassa in 1812, and the abbé Huc in 1845—6. Although western Thibet has been frequently and quite thoroughly explored, Great Thibet and the eastern and northern parts of the country are very imperfectly known. Much valuable geographical information has recently been acquired, however, through the efforts of the trigonometrical survey of British India, by which native Asians trained for the purpose have been despatched to explore the regions N. of the Himalaya. In 1865 and 1871 Great Thibet was visited by three of these trans-Himalay-

an explorers, and many of the results of their observations are incorporated in this article.

THIERRY. I. Jacques Nicolas Augustin, a French historian, born in Blois, May 10, 1796, died in Paris, May 22, 1856. He was educated at the college of Blois and the normal school in Paris, where he began his career in 1814 as a disci-

ple and literary collaborator of Saint-Simon, whom he accompanied to England in 1817 to elaborate his new historical theories according to the principles of nationalities. He wrote much for the Cen-
sieur européen (1817—20), and established his reputation as the most original historian of his day by his Histoire de la conquête de l'Angle-
terre par les Normands (3 vols., 1825; 10th ed., 2 vols. 8vo, 1858, and 4 vols. 12mo, 1860), English translations of which were published in 1825 and 1847, the latter by Hazlitt. These labors impaired his sight, which he lost alto-
gether in 1826, but he continued them with the assistance of secretaries, of whom Armand Carrel was one of the first. After the acces-
sion of Louis Philippe, he spent several years with his brother Amédée at Vesoul. At Lux-

euil, where he resided in summer, he married in 1831 Julie de Querangal, daughter of a rear admiral, who became of great assistance to him as an amanuensis, and who published sev-

eral works of her own. She died in 1844, and after residing for some time with the princess Belgioioso, he spent the rest of his life with his brother's family. Guigniaut characterized.
him, in an essay read in 1862 before the academy of inscriptions, as a martyr, and as the first historical scholar who had vindicated the rights of oppressed nationalities. His works include Lettres sur l'histoire de France (1827; latest revised ed., 1859); Dix ans d'études historiques (1834; 9th revised ed., 1857; English translation, "Historical Essays," 1845); Récits des temps mérovingiens (1840; 8th ed., 1864; English translation, 1846); Recueil de monuments de l'histoire du tiers état, prepared under the direction of the government and with the assistance of several writers (vols. i. to iii., 1850-'56); and Essai sur l'histoire de la formation et des progrès du tiers état (1855; English translation by Francis B. Wells, 3 vols. 12mo, London, 1855). He prepared a complete edition of his works (8 vols. 18mo, 1846-'77; new ed., 10 vols., 1856-'60). II. Amédée Simon Dominique, a French historian, brother of the preceding, born in Blois, Aug. 2, 1797, died in Paris, March 28, 1873. He was educated at the college of Blois, and in 1820 received an office in the ministry of marine. In 1828 he was for a short time professor of history at Besançon. At Guizot's recommendation he was appointed in 1830 prefect of the department of Berry, and in 1834 he became chief of the council of state, of which he was also a member during the second empire, and in 1860 was made a senator. He was less brilliant but more judicious than his brother. His works include Histoire des Gaulois jusqu'à la domination romaine (3 vols., 1828; 6th ed., 1866); Histoire de la Gaule sous l'administration romaine (3 vols., 1840-'47); Histoire d'Attila et de ses successeurs (2 vols., 1856; 3d ed., 1864); Récits et nouveaux récits de l'histoire romaine (1860-'64); Tableau de l'empire romain (1862); Saint Jérôme: la société chrétienne à Rome et l'émigration romaine en Terre Sainte (2 vols., 1867); and La Jean Chrysostome et l'immigration Eusebienne: la société chrestienne en Orient (1872).—His son, Gilbert Augustin, published in 1875 a historical drama entitled Aventures d'une âme en peine.

THIERS, a town of Auvergne, France, in the department of Puy-de-Dôme, on the Dourolle, 23 m. E. N. E. of Clermont; pop. in 1872, 16,635. It has two interesting churches, and is chiefly noted for extensive manufactures of cutlery. Paper, playing cards, candles, ribbons, and thread are also manufactured.

THIERS, Louis Adolphe, a French statesman, born in Marseilles, April 16, 1797. He was educated at the lyceum of Marseilles and the law school of Aix, where he practised at the bar from 1818 to 1821. He then followed Mignet to Paris, and wrote for the Constitutionnel and other journals. He became a favorite of Lafayette and Talleyrand, and wrote Histoire de la révolution française (10 vols., 1823-'7; English translation with notes by F. Shoberl, 5 vols., London, 1838). In January, 1859, he, Mignet, and Carrel started the National, which promoted the change of dynas-ty effected by the revolution of the following July. Under Louis Philippe he became an official in the treasury and a member of the chamber of deputies. The ministry of finance was tendered to him, but he recommended Lafayette as its chief, though he virtually acted in that capacity, and retired with him, March 13, 1831. On joining Soulé's cabinet, Oct. 11, 1832, as minister of the interior, he procured with Deutz the arrest (Nov. 6) of the duchess de Berry (see BERRY), and immediately left the department. This act he had deemed necessary for the pacification of the Vendée at the time when all the military resources were needed for the relief of Antwerp in the interest of Belgian independence. Resuming office in December as minister of commerce and agriculture, he obtained large appropriations for public works. Early in 1834 he returned to the interior department, and quelled the bloody insurrections at Lyons and Paris. After ministerial combinations which revealed his disagreement with Soulé and Molé and his rivalry with Guizot, he finally retained his office under the duke de Broglie, and at the same time (December) took his seat in the French academy. The attempt of Fieschi upon the king's life (July 28, 1835), from which he himself barely escaped, made him support the restrictive press and jury laws, known as the laws of September. He resigned with the other ministers in January, 1836, on the rejection of the bill for the conversion of the rentes, but in February became premier and minister of foreign affairs. On Aug. 25 he retired, chiefly on account of the king's opposition to armed intervention in Spain. His successor Molé in vain tempted him in 1838 with the Russian mission, to get rid of his influence. He was reinstated as premier March 1, 1840, and proposed the fortification of Paris and extraordinary armaments to prepare for war, in view of the complications arising from Mehemet Ali's conflict with the sultan; but being again baffled by the king's "peace at any price" policy, he resigned, and was succeeded by Guizot, Oct. 29. He now began his Histoire du consulat et de l'empire (20 vols., 1845-'62; English translation by F. F. Campbell, London, 1845-'62), for which he visited England and examined the battle fields in Germany, Italy, and Spain. At the same time, as the recognized leader of the opposition, he advocated enlightened measures of education and progress, and opposed ultramontane schemes and political corruption. He also denounced the right of search, and the excessive complacency toward England in the Pritchard question (see Dr Petit-Thiariés), and in adopting her objections against the incorporation of Texas with the United States, on which occasion he deprecated alienation from the "great American nation, the harbinger of French liberty." Shortly before the outbreak of the revolution of 1848 he made withering attacks upon Louis Philippe's pusillanimity in foreign affairs, and favored politi-
cal reforms, but not a republic. Yet when this became an accomplished fact (Feb. 24), he accepted it as a protection against monarchical factions, and in June was elected to the constituent assembly. When Cavaignac asked for extraordinary powers against the socialists, he was the first to concede them; but subsequently he supported Louis Napoleon for the presidency, and fought a duel with Bixio for repeating a rumor, which he denied, that he had previously disparaged such an election. Elected to the legislative assembly, he was one of the most active leaders of the reactionary majority. In January, 1851, however, after the removal of Changarnier, he raised his warning voice against a new Napoleonic empire. In November he adjured the assembly to adopt Baze's resolution for its military protection, and in vain admonished the radicals that the rejection of this measure threatened the safety of the most truly representative body which France ever had. He was arrested on the coup d'etat of Dec. 2, imprisoned till Jan. 9, and banished till Aug. 7, 1852. He kept aloof from politics until the apparent relaxation of the autocratic régime encouraged him in 1863 to soliciting the suffrages of Paris liberals, who returned him (May 31), despite governmental opposition. In 1865 he referred in his great speech on the budget to the extravagant expenditures for the Italian war, the Mexican expedition, and Haussmann's stupendous enterprises. In 1866 and 1867 he exposed the fatal blunders of the emperor in permitting the aggrandizement of Prussia and the unification of Italy, to the detriment of the grandeur of France. In 1870 he opposed the declaration of war against Prussia, maintaining that the government, being unprepared, was rushing to a certain defeat; and his influence rose with the verification of his predictions. He urged the vigorous defence of Paris, and visited the principal foreign courts to secure their influence in favor of an armistice. On his return in October, he had several interviews with Bismarck, but without results excepting that his efforts increased his popularity and the universal confidence in his statesmanship. On Feb. 8, 1871, he was elected to the assembly in 26 departments, and selected that of Seine-Inferieure. On Feb. 17 he was chosen by the assembly as chief of the executive. His great measures were the immediate negotiation of the preliminary treaty of peace, his crushing of the commune, and the wonderfully successful national loan for paying the German indemnity and the redemption of the territory. On Aug. 31 his term of office was prolonged by the assembly for three years, with the title of president of the republic. He was always a protectionist, and on the rejection of the tariff bill he resigned (Jan. 20, 1872); but he was finally induced to remain, and his subsequent intention to withdraw was arrested (Nov. 29) by the appointment of a commit-tee for regulating his relations with the assembly. In foreign affairs he favored peace and non-intervention. After he had succeeded in substituting Verdun for Belfort as a pledge in German hands, he concluded in March, 1873, a new convention providing for the whole indemnity and for the final withdrawal of the remaining German troops in September, for which he received the thanks of the legislature as one "who deserved well of his country." But on May 24 he was baffled in his attempt to make the republic permanent by legislative enactment, and therefore resigned, and was succeeded by MacMahon. He has ever since upheld the republican form of government, which he advocated with great force at Arcachon, Oct. 17, 1875. On Jan. 30, 1876, he was elected to the new senate for Belfort, and on Feb. 20 to the assembly for Paris; and in March he took his seat in the latter body.—His literary fame rests upon his historical works. His other publications include Histoire de Law (1826; now ed. 1883); English translation by E. S. Fiske, New York, 1859); Le monarquie de 1830 (1831); De la propriété (1848); and L'Homme et la matière (1875 et seq.). Lately he has visited Italy to gather additional materials for a long projected history of art, and has also been engaged upon his memoirs. As a speaker his vivacity, parliamentary experience, and perfect mastery of the questions discussed make him exceedingly effective. His house in the place St. Georges, destroyed under the commune, has been restored by the government, and is still the centre of the most influential society.

---

TIERSCH

I. Friedrich Wilhelm, a German philologist, born at Kirchschleidungen, near Freiburg, June 17, 1874, died in Munich, Feb. 25, 1860. He studied in Leipsic and Göttingen, and in 1809 became professor at the gymnasium in Munich. Being looked upon as a foreigner by the Bavarians, he wrote a vigorous pamphlet entitled Ueber die angenanommenen Unterschiede zwischen Süd- und Norddeutschland (1810). Soon after its publication an attempt was made to assassinate him. In 1811 he founded a philological institute, which in the following year was incorporated with the university of Munich, and from 1811 to 1829 he edited the Acta Philologorum Monacensium. He took a special interest in the Hellenic struggle for independence and in the amelioration of education in Greece, and published in 1833, after a two years' sojourn in that country, L'état actuel de la Grèce, and des moyens d'arriver à sa restauration. In his work Ueber die neuen Angriffe auf die Universitäten (1837) he expressed anew his conviction of the importance of classical studies, and in 1838 initiated a bitter literary warfare against Dieterweg, Linde, Schmitthenner, and others, by his Ueber den gegenwärtigen Zustand des öffentlichen Unterrichts in den westlichen Staaten von Deutschland, in Holland, Frankreich und Belgien. He wrote a Greek grammar, with special reference to the Homeric dialect, which passed
through several editions, and has been translated into English and other languages. He published also a school edition of this work, an account of his travels in Italy (1829), an edition of Pindar (2 vols., 1850), and other school books and philological treatises. His life has been written by his son Heinrich (2 vols., Leipzig, 1866). II. Heinrich Wilhelm Josias, a German theologian, son of the preceding, born in Munich, Nov. 5, 1817. He was professor at Marburg from 1843 to 1864, and subsequently resided at Heidelberg. He is the principal representative of Edward Irving’s doctrines in Germany. His works include Geschicht e der Kirche im apostolischen Zeitalter (2 vols., Frankfurt, 1852; English translation, London, 1854), and Uber christliches Familienleben (6th ed., 1872).

THIONVILLE. See Diedenhofen.

THIRD ESTATE. See States General.

THIRLWALL, Connop, an English historian, born at Stepney, Middlesex, Feb. 11, 1797, died July 27, 1875. He was educated at Cambridge, was tutor, Craven scholar, Bell’s scholar, and senior chancellor’s medallist, received the degree of master in 1821, and became a fellow. He was called to the bar in 1825, but in 1828 entered the church, and became rector of Kirby-under-Dale, Yorkshire. In 1840 he was created bishop of St. Davids, which office he resigned in June 1874. With J. C. Harford he translated the first two volumes of Niebuhr’s ‘History of Rome’ (1828), and he contributed to Lardner’s ‘Cabinet Cyclopaedia’ a history of Greece (1833 et seq.), afterward enlarged (8 vols., 1845–52). He published a speech delivered in the house of lords in 1869 on the Irish church, and several sermons. His ‘Literary and Theological Remains’ were edited by Canon Perowne (3 vols., London, 1875–6).

THIRST, the sensation by which the want of fluid in the system is made known, dependent on the condition of the stomach, throat, and faucial membrane; a tolerably faithful indication of the requirements of the body. It is generally considered as immediately resulting from an impression on the nerves of the stomach, as it is alloyed by the introduction of liquids through a tube, so that the fauces are not touched; in this way speedy relief is obtained, because of the instantaneous absorption of the fluid by the veins of the stomach. This, however, must be taken with some qualification, as the intensity of thirst bears no necessary relation to the amount of liquid in the stomach, but indicates a want of the system which can be supplied through the blood vessels, the rectum, or the skin. In fact, the conditions are very analogous to those mentioned under Hunger. A supply of fluid, as indicated by thirst, is necessary to make up for the losses by cutaneous and pulmonary exhalation, and by the urinary and other secretions, which are effected chiefly at the expense of the water in the blood. Thirst is greatest in a dry and hot air, when the perspiration and other secretions are excessive; salted or highly spiced food, strong fermented liquors, and irritating substances and poisons applied to the intestinal mucous membrane, excite thirst, no doubt, by inducing an ingestion of fluid by which they may be diluted. A sudden loss of blood, either by the lancing or from a wound, or a rapid drain on the vascular system, as in Asiatic cholera, diarrhoea, or diabetes, causes thirst in proportion to its amount. Thirst is less when the food is watery, and when liquid can be absorbed by the skin from the surrounding air or water. The thirst of fever does not necessarily indicate a pressing demand for fluids, but depends on the dryness and heat of the throat, mouth, and skin, with diminished transpiration, and is better relieved by small pieces of ice than by copious draughts of water. Animals with naked skins, like batrachians, living in water or moist air, have no need to drink to quench thirst, cutaneous absorption supplying the necessary fluid. The camel, on the other hand, supports thirst for a long time, carrying a supply of fluid in the water stomach. The daily quantity of fluid taken by a man depends upon the temperature, the amount of exercise and perspiration, and the nature of the food. As a general rule, a man in good health, taking a fair amount of bodily exercise, consumes about 2½ lbs. of solid food and rather less than 1 lb. of fluid. Of this, most articles of solid food, such as meat, bread, and vegetables, themselves contain a notable proportion of water, they contribute so far to satisfy the daily demand for liquids. The body requires to be supplied, either in the solid or liquid form, with about 4½ lbs. of water daily; and if this quantity from any cause be deficient, the sensation of thirst indicates the requirements of the system. Every loss of water from the body, as above mentioned, increases this demand. Consequently, when from any accidental circumstance, as in cases of shipwreck, a sufficient supply of water for drink cannot be obtained, even very small quantities should be taken to prevent the loss of fluids from the system. The avoidance of perspiration, the protection of the skin from evaporation, and frequent bathing in salt water when practicable, are all efficient in diminishing the danger, and in protracting as long as possible the period of endurance.

THIRTY YEARS’ WAR, a religious and political conflict which involved the German empire, and with it the principal states of Europe, from 1618 to 1648. The causes which led to this struggle reach back to the early part of the 16th century, when the reformation divided Germany into two hostile religious parties, Protestantism and Catholicism. The Catholic league, led by Maximilian of Bavaria and Sigismund of Jerusalem, was defeated by the Protestant league, led by Maurice of Saxony, at the battle of Parnawa in 1613. The peace of Stadtilm in 1619 did not bring peace, but only a truce. The war continued until 1648, when the peace of Westphalia was signed. The war was a period of great suffering and devastation, and the loss of life was enormous. The war was a period of great suffering and devastation, and the loss of life was enormous. The war was a period of great suffering and devastation, and the loss of life was enormous. The war was a period of great suffering and devastation, and the loss of life was enormous.
state of prescribing the form of worship within its limits, and to all subjects, Lutheran or Catho-
lic, the privilege of emigrating from the states where their creed was prohibited. The Pro-
estants were to retain the ecclesiastical pos-
sessions which they had appropriated previous-
to the peace of Passau in 1552. But though the basis of a definite settlement was estab-
lished, two important points remained on which no agreement could be reached. The Catholic party, to guard against the danger that would accrue to the church in the future appropria-
tion of her prelacies by the Protestants, intro-
duced an article, known as the ecclesiastical reser-
vation, by which all prelates who should henceforth abjure Catholicism were to for-
feit their benefits. This article was inserted against the protest of the Lutheran members of the diet. The other point related to Pro-
estant subjects in the ecclesiastical states, for whom the Protestant members sought to se-
cure the right of worship in such territories. The Catholics refused to admit such an article, and they could only obtain instead a personal declaration to the same effect from the empe-
ror's brother Ferdinand, who presided at the diet of Augsburg. The exclusion of the Cal-
vinists proved another source of contention. Under the rule of Ferdinand I. (1556-64) and his son, the mild Maximilian II. (1564-76), a general tranquillity was maintained, while the balance was fast turning toward the side of the Protestants, who in the Austrian territories began to tyrannize over the Catholics. The bigoted Rudolph II. (1576-1612), swayed by the Jesuits and the court of Spain, resolved to re-
press Protestantism, and in his immediate do-
minions proceeded to restrict, and finally even to abolish the Protestant worship. Religious disputes again distracted Germany. The en-
ergy between Lutherans and Calvinists equalled their mutual hate for the Catholics. The aulic council, whose decisions were inspired by the imperial court, usurped an unlawful jurisdic-
tion in the empire. In Aix-la-Chapelle the Prot-
estants established their worship in spite of the Catholics (1580), and at first beat back the troops sent to execute the imperial ban. About the same time an opportunity was pre-
minated of enforcing the ecclesiastical reserva-
tion. Gebhard, archbishop of Cologne, ab-
jured his faith to marry a Calvinist lady, but determined not to renounce his see. He was accordingly placed under the ban of the em-
pire, and a war ensued, which ended in his defeat and expulsion in 1584. A violent con-
test followed for the see of Strasburg. In 1607 the Protestant imperial city of Donauwörth, whose inhabitants an abbott had provoked to acts of violence by processions, prohibited within the town, was deprived of its liberties, in open violation of the peace of religion. Alarmed for their safety, the Protestant princes, in May, 1608, formed at Anhausen in Franco-
nia an offensive and defensive league styled the "Evangelical Union." It soon comprised

the Palatinate, Neuburg, Baden, Württemberg, Brandenburg, Strasburg, Nuremberg, and other
states of the empire. Frederick IV., elector pulatine, a Calvinist, was placed at its head, though its most active member was Christian of Anhalt. The Lutheran elector of Saxony, however, declined to join the union. On their side the Catholic states, independently of Aus-
tria, established the league (July, 1609), with Maximilian, duke of Bavaria, at their head. In the mean while the Protestants of Hung-
gary and Austria had risen against Rudolph and recovered their rights (see Rudolph II., and MATTHIAS); and thus encouraged, their brethren in Bohemia, in July, 1609, wrung the Majestätbrief from the emperor. Amid these disorders the heirless duke of Julich died (March, 1609), leaving a host of claimants to his dominions, which were at once jointly seized by Brandenburg and Neuburg. Rudolph ordered a levy of troops to enforce their se-
questration. The Protestant princes flew to arms, and invoked the aid of France, the Dutch, and other powers. Henry IV. of France now hoped to execute his design of humbling the house of Hapsburg, and was pre-
paring to invade Germany when the dagger of Ravaillac terminated his career (May 14, 1610). Hostilities ceased, but under the em-
peror Matthias, who succeeded in 1612, the unsettled claims of Julich again led to war, and Dutch and Spaniards, called in by Branden-
burg and Neuburg respectively, occupied the disputed lands. Matthias, being without heirs, was induced to put forward as his successor his cousin Ferdinand of the Styrian line, whose big-
otry and rigor alarmed the Protestants. Fer-
dinand was nevertheless crowned in Bohemia in 1617 and in Hungary in 1618. But already in Bohemia an event had occurred which pre-
cipitated the thirty years' war. The Prote-
estant inhabitants of Klostergraben and Braunau had erected new churches against the prohi-
bition of the archbishop of Prague and the abbot of Braunau, lords of the two places, who enforced their authority by seizing the buildings. Protestants and Catholics appealed to a somewhat obscurely worded clause in the Majestätbrief, which the former contended gave the right of building new churches to the Protestants of the towns in general, while the latter maintained that it extended only to the states and royal towns. The court sup-
ported the Catholics, and refused all redress. The storm now burst. On May 28, 1618, an assemblage of Protestants, led by Count Thurn, entered the palace at Prague, and seizing Slav-
ava and Martinitz, the most eloquent members of the council of regency appointed by the crown, hurled them together with their secre-
tary from a lofty window. They escaped as if by a miracle. Thurn and his associates organ-
ized a general rising, and evoked the assistance of the union and of Bethlen Gábor of Transyl-
varia. In a short time nearly all Bohemia was in their hands. They were joined by the Slie-
sians, and by Mansfeld with 4,000 men raised by the union. Matthias was forsaken by the empire, and the troops of Spain sent to his aid, under Bucquoy and Dampierre, were unable to check the insurrection, which spread into Upper Austria and Moravia. In the midst of this crisis Matthias died (March, 1619), and Ferdinand, abandoned by his subjects, was soon shut up in Vienna by the victorious Thurn. His firmness and timely succor from Dampierre saved his sinking throne. Thurn withdrew, and Ferdinand, hastening to Frankfurt, was elected emperor (August, 1619). The Bohemians, who had declared their throne vacant, offered it to the young elector palatine Frederick V., son-in-law of James I. of England, and he was crowned in Prague. Bethlen Gabor overran Hungary, and Vienna was again threatened, but again saved. The emperor now prepared to conquer Frederick by means of the duke of Bavaria, who was to be indemnified for his services. Maximilian assembled the forces of the league, avowed the union into action, and quickly subdued Upper Austria. John George, the elector of Saxony, though a Protestant, took up arms against Frederick, and overran Lusatia, and the Spanish general Spinola invaded the Lower Palatinate, while Maximilian joined Bucquoy in Bohemia. The battle of the White mountain, before the walls of Prague, Nov. 8, 1620, drove Frederick from his throne, and left Bohemia to the vengeance of the emperor. Executions and confiscations followed. The Protestant worship was abolished, the kingdom given over to the Jesuits, and the Majestätbrief cut into pieces. The electoral dignity, forfeited by Frederick, and the Upper Palatinate, were eventually transferred to Maximilian. The battle of Prague was followed by the dissolution of the Protestant union, but the intrepid Mansfeld, who had not shared in the defeat, determined to retain his army. He marched from Bohemia to Alsace, and struggled with Tilly, the general of Maximilian and the league. George Frederick, margrave of Baden-Durlach, and Christian of Brunswick, a lawless adventurer like Mansfeld, who made war support war, took up arms for Frederick. Tilly crushed the margrave at Wimpfen on the Neckar, and routed Christian at Höchst (1622). Christian and Mansfeld passed into the Netherlands, but soon renewed the contest with Tilly, who finally drove them from the field. Bethlen Gabor, who had broken the peace of Nikolsburg and penetrated into Moravia, made a truce with the emperor in 1624. The Catholic party was triumphant, but the persecutions and the excesses which now ensued rekindled the flames of war. The states of Lower Saxony rose in 1623, and united with Christian IV. of Denmark, who took the lead in the struggle. England sent subsidies, Holland aided with troops, and Christian of Brunswick and Mansfeld reappeared in the field. Hitherto it was not with the forces of Austria but with those of the league and Spain that Ferdinand had carried on the contest. Wallenstein now came forward with his remarkable offer, and with his own resources raised a vast and independent army for the emperor. In April, 1626, he nearly annihilated the army of Mansfeld at Dessau, and pursued him into Hungary, while Tilly in August overwhelmed the king of Denmark at Lutter. Wallenstein returning drove back the Danes into Jutland and their islands, occupied Mecklenburg and Pomerania, and extended his designs to the Baltic, when the walls of Stralsund arrested his career (1628). Peace was made with Christian IV. at Lébeck, May, 1629. The Protestants were everywhere subdued. Ferdinand had proceeded to consummate the work of the Catholic reaction. He issued the edict of restitution, dated March 6 (N. S.), 1629, ordering the surrender by the Protestants of all mediatised church property secularized since 1552, and the transfer to Catholic prelates of all immediate sees held by Protestants against the ecclesiastical reservation, including two archbishoprics and many important bishoprics. The influence of this act was to refresh the Protestant states. Magdeburg firmly resisted its execution. But the power of Austria and the league was suddenly repressed by a new attack from the north. Ferdinand was combating France in the contest for Mantua. Richelieu, eager to involve him in a foreign war, mediated a truce between Gustavus Adolphus and Poland, and the Swedish hero came forward to the rescue of German Protestantism. At the very moment of this new danger, the league, exasperated by the conduct of Wallenstein, compelled Ferdinand to dismiss him, and Tilly received the chief command. In June, 1630, Gustavus landed in Pomerania and entered into a treaty with the aged and overawed duke Bogislas XIV., and in January, 1631, concluded a subsidiary alliance with France. John George of Saxony, George William, elector of Brandenburg, and other Protestant princes met at Leipsic in February, 1631, and formed a league of neutrality. William V. of Hesse-Cassel became the bold ally of Sweden. Gustavus forced the imperialists from Pomerania and advanced through Brandenburg, but was unable to prevent the terrible fate of Magdeburg, which on May 10 (N. S., 20) was stormed by Tilly and Pappenheim. He now compelled the elector of Brandenburg to enter into a treaty, avoided an engagement with Tilly, and restored Mecklenburg to its dispossession. Tilly, who had received orders to break up the Leipsic union, attacked Saxony, and drove the mean-spirited elector into an alliance with Sweden. Gustavus marched against him, and on Sept. 7 (N. S., 17), 1631, Tilly sustained a crushing defeat at Breitenfeld near Leipsic. The Catholic power lay prostrate. While the Saxon general Arnhelm invaded Bohemia and occupied Prague, Gustavus carried his victorious arms to the Rhine and into Swabia, forced the passage of the Lech,
where Tilly was mortally wounded (April 5, 1632), and overrunning Bavaria threatened the Austrian dominions. He was checked by Wallenstein, who, after witnessing with secret joy the misfortunes of the Catholics, had been reinstated by Ferdinand with the supreme command. A new army had arisen at his call. He was joined by Maximilian and Aldringer with the forces of the league, and at Nuremberg the contending armies stood face to face till their ranks were wasted away. Then carrying the war northward, they fought a desperate battle at Lützen, Nov. 6 (N. S., 16), 1632. Gustavus fell, but the Swedes remained masters of the field. Pappenheim was among the slain. The death of the Swedish king, which was followed by that of the unfortunate Frederick V., spread consternation among the Protestants. But the Swedish chancellor Oxenstien was equal to the occasion, while generals like Bernhard of Weimar, Horn, Baner, and Torstenson, trained in the school of Gustavus, emulated his deeds. In 1633 Oxenstiern assembled the states of upper Germany at Heilbronn, and was charged with the conduct of the war. Wallenstein, instead of securing to the emperor the advantages resulting from the death of his great adversary, surprised the world by his inactivity and mysterious conduct. He led his army into Silesia, and confronted the Saxons and Swedes, but wasted the campaign in negotiations. With a devoted army at his command, he was now bent exclusively on schemes of personal ambition. The suspicions of the court were aroused, and his treasonable designs ended in his assassination in February, 1634. (See Wallenstiin.) The chief command was transferred to the emperor's son Ferdinand, who, seconded by Gallas and Piccolomini, advanced through Bavaria. He was joined by Charles of Lorraine and a Spanish army, and on Sept. 6 the Protestant forces under Bernhard of Weimar and the Swedish general Horn were nearly annihilated at Nordlingen. This blow was followed by the defection of the elector of Saxony, who in May, 1635, entered into the peace of Prague with the emperor and turned his arms against his recent allies. The acceptance of the terms of this peace, which sacrificed the Calvinists and Swedes, was to be made compulsory in all the states and enforced by an army of execution. Many of the Protestant states assented or were forced to yield, but Sweden, having no alternative short of relinquishing her conquest, determined to continue the struggle. Richelieu seized the opportunity offered by the depression of the Protestant cause to promote the aggrandizement of France. He renewed the alliance with Sweden, declared war against Spain, and made Bernhard commander of his German allies. Baner began a series of brilliant campaigns, won a great victory over the armies of John George and Hatzfeld at Wittstock, Sept. 24, 1636, and carried the war into the Austrian territories. In the mean while France was attacked by the Spaniards, the imperialists, and Charles of Lorraine, and John de Weert spread terror to the gates of Paris. In February, 1637, the emperor died, and was succeeded by his son Ferdinand III. The year 1638 opened with the successes of Bernhard, who in February captured John de Weert and other generals at Rheinfelden. In December he took the important fortress of Breisach, and outwitted the French by appropriating his conquests. On his sudden death in 1639, France obtained control of his army, and pressed the war with vigor. Torstenson, a general unsurpassed in the celerity of his movements, who became the Swedish commander-in-chief on the death of Baner in 1641, shook the Austrian throne by repeated invasions, overthrew the archduke Leopold William and Piccolomini at Breitenfeld, Oct. 23, 1642, chastised Christian IV. for his designs against Sweden, completely defeated Gallas in 1644, won a great victory at Jankau in Bohemia, Feb. 24, 1645, taking Hatzfeld prisoner, and marched on Vienna. Rákóczy, prince of Transylvania, advanced through Hungary, and Vienna barely escaped the combined attack. On the side of the French, Guébriant signalized himself at Kempen in January, 1642, and the young duke d'Enghien (the future Condé) beat the Spaniards at Roeroy in 1643. But in November, 1643, the French suffered a great defeat at Tuttlingen in Swabia through the genius of John de Weert. Condé and Turenne retrieved this disgrace near Nördlingen in August, 1645, where Mercy, their eminent adversary, fell. Turenne and Wrangel, the successor of Torstenson, reduced Maximilian of Bavaria, the steadfast ally of Austria, to the last extremity. Königsmark, another Swedish general, made himself master of a part of Prague in July, 1648, and the old town, on the opposite bank of the Moldau, had been attacked, though fruitlessly, when on Nov. 3 the news came of the signing of the peace of Westphalia. This peace terminated a struggle which had converted Germany into a vast field of desolation and horror. —As early as 1641 the preliminaries regarding the conduct of the negotiations had been arranged at Hamburg, and Münster and Osnabrück in the circle of Westphalia assigned for the meeting of two separate congresses. At Münster the empire, France, Spain, and the Catholics generally were to negotiate, under the mediation of the pope; and at Osnabrück the empire, Sweden, and the Protestants, under that of Denmark. But discussions on cernomal and the varying fortunes of the war caused years to elapse before the congresses could assemble and enter upon earnest deliberations. Denmark and the pope ultimately withdrew, and Venice became the mediator. Separate treaties were concluded at Osnabrück (Aug. 6, 1648) and Münster (Sept. 8), and on Oct. 24, 1648, the definitive signatures were annexed. Nearly every power of
Europe was represented. Holland and Switzerland were declared independent of the empire. France gained Alsace, and was confirmed in the possession of the bishoprics of Toul, Metz, and Verdun. Sweden received Pomerania W. of the Oder, together with Stralsund and other towns, the island of Rügen, Wismar, and the secularized sees of Bremen and Verden; the whole to be held as a fief of the empire, with three votes in the diet. The Swedes were furthermore accorded 5,000,000 thalers. Brandenburg retained further Pomerania, received the secularized sees of Halberstadt, Minden, and Cammin, and secured the succession to the see of Magdeburg. The elector of Saxony was to retain Lusatia and some minor acquisitions; and the secularized bishoprics of Schwarin and Ratzeburg were allotted to Mecklenburg. The Upper Palatinate with the dignity of elector was confirmed to Maximilian of Bavaria, and an eighth electorate was created for Charles Louis, son of Frederick V., who recovered the Lower Palatinate. By a singular article the see of Osnabrück was to be alternately vested in a Catholic bishop and a prince of the house of Brunswick-Lüneburg. The possession of the ecclesiastical benefices was placed on the basis of Jan 1 (N.S.), 1624; and in the case of the Palatinate, Baden-Durlach, and Württemberg, the Catholics were obliged to pay 20,000 gulden in 1618 as the normal year. The treaty introduced an age of more general toleration in Germany. The peace of religion of 1655 was confirmed and extended to the Calvinists, and the equality of the Catholic, Lutheran, and Reformed creeds was established. In all religious questions the Protestants were to have an equal weight with the Catholics in the diet and high courts of the empire. Each state of the empire was to exercise the right of sovereignty, with the liberty of concluding treaties and alliances. The autonomy thus accorded to the states, and the still further diminution of the emperor's authority, weakened the structure of the Germanic body, and paved the way for foreign intervention. The constitutional provisions of the treaty became the fundamental law of the empire. The peace of Westphalia terminated the religious wars of Europe, and forms a grand landmark in its history. The empire had declined into little more than a confederation of states, and the era of French greatness succeeded to that of Hapsburg ascendency. Spain acknowledged the independence of Holland, and continued the war against France with disastrous results.—See the histories of the thirty years' war by Schiller, K. A. Menzel (3 vols., Breslau, 1835—9), Gindeley (Prague, 1869), and S. R. Gardiner (London, 1874); also Sir Edward Cast, "Lives of the Warriors of the Thirty Years' War" (London, 1865); Ranke, Gewichte Wallenstein's (Leipzig, 1869); and Felix Steive, Ursprung des dreissigjährigen Krieges, 1607—1619 (vol. i., Munich, 1875).

**THISTLE.** See *Pyramus and Thisbe.*

**THISTLE**, the common name for plants of the genus *cnicus* (Gr. *cndos*, to prick), of the composite family. In most works the American species are placed under *cirium*, a genus mainly differing from *cnicus* by the character of the pappus, and some European authors unite all the thistles under *carduus*. Gray in a late revision of the North American thistles ("Proceedings of the American Academy") restores them to the Linnean genus *cnicus*. The name is sometimes used in combination for plants not closely related; thus the teasel is called fuller's thistle. The thistles are herbs, often with perennial roots, with sessile alternate leaves which are often much divided and prickly; the branches of the stem terminated by heads of flowers (often very large), with an ovoid or spherical involucre, the scales to which are imbricated in many rows, and tipped with a point or prickle; the flowers in the head are all tubular and similar, usually perfect, but sometimes dioecious; their usual color is purple, but in some species they are yellowish or cream-colored; the receptacle on which the flowers are placed is furnished with numerous soft bristles; the one-seeded akenes bear at the top a pappus, or tuft of numerous hairs, which are united into a ring at the base and are feathery with smaller hairs, forming the well known thistle down. About 30 species are found in the United States; two of them are introduced, and are among the most common and most annoying weeds. The common thistle (*C. lanceolatus*), often called in this

![Common Thistle (Cnicus lanceolatus).](image-url)
outer ones spreading; flowers purple. This is a large showy species; its stems in rich soil are 3 to 4 ft. high, and its robust spreading leaves give it a formidable appearance, while in reality it is very easily destroyed; its root being biennial, there is no danger that it will retain possession of the soil. In Great Britain this is called spear thistle; it is the Scotch national emblem. The other introduced species is C. arvensis, known as the creeping thistle in Europe, and in this country by the misnomer of the Canada thistle; it is a perennial, spreading rapidly and extensively by its long creeping rootstocks, which send to the surface numerous stems 18 in. to 3 ft. high; the handsomely cut leaves are smooth, or somewhat woolly below, and very prickly on the margins with slender spines; the heads about half an inch in diameter, on short pedicels and forming a loose terminal corymb; the outer scales of the involucre with minute prickly points; flowers pale lilac. In this species the flowers are dicotyledeous, the male heads nearly globular, with more conspicuous flowers than the female heads, which are longer; plants of each sex form separate patches. This plant, which has followed cultivation to nearly all parts of the world, is supposed to have received the name by which it is exclusively known in this country from its having been introduced in the fleeces of sheep brought from Canada; it is justly regarded by our farmers, as it was in Lapland in the days of Linnaeus, as "the greatest pest of our fields!" its deep roots, below the reach of the plough, and its abundant seeds, furnish it with ample means for spreading; the creeping rootstock is exceedingly tenacious of life, and when broken every fragment is capable of forming a new plant. Many states have a law which makes it obligatory on each owner to destroy it upon his land, under penalty of its being done by the authorities and the cost charged as a tax. Like other perennial weeds, it soon yields to frequent mowing; but to be effective this must be persistent. None of our native thistles can be regarded as troublesome weeds. The yellow thistle (C. horridulus) is found near the coast; the pasture thistle (C. pumilus) is a low species with very large heads of fragrant purple (or white) flowers; the tall thistle (C. altissimus), a more southern species, is often 10 ft. high and a rather showy plant. The blessed thistle (C. benedictus), so called on account of its former use in medicine, is barely naturalized southward.—The cotton thistle, of a closely related European genus, is onopordon acanthium; it is a stately plant covered with whitish cottony hairs, and is occasionally met with in the older states. This is said to be cultivated in Scotland as the Scotch thistle, but the best authorities give the common species already described as the emblematic thistle. The milk thistle is silibybum Marianum, related to the true thistles, and sometimes cultivated in old gardens; it has purple flowers, and leaves blotched with white. Torch thistle is a name given in tropical countries to the tall species of cerasus of the cactaceae. Sow thistles are coarse composite weeds of the genus sonchus.

**THISTLE, Order of the** (also called the order of St. Andrew), a Scottish order of knighthood, reputed on very insufficient grounds to be of great antiquity. The thistle is mentioned as the national emblem of Scotland in the inventory of the effects of James III., who is thought to have adopted it. It appears on coins of James IV., James V., Mary, and James VI., on the last with the motto nem me lancea sit. A collar of thistles appears on the gold bonnet pieces of James V. of 1539, and with the royal ensigns depicted in Sir David Lindsay's armorial register of 1542. But this was a mere device. The order had no distinct existence previous to 1687, when a warrant for its restitution was issued by James VII. of Scotland and II. of England. It fell into abeyance after the abdication of James, but was restored by Anne in 1708, and is now one of the recognized orders of the British empire. The warrant of 1687 confined the number of knights to 12, besides the sovereign; but since May, 1827, it has been permanently extended to 16.

**THOLUCK, Friedrich August Gotttren**, a German theologian, born in Breslau, March 30, 1799. He completed his education at the university of Berlin, and was thoroughly converted from his skeptical tendencies under the influence of Schleiermacher and Neander, and more especially through Baron von Kotzwitz, a member of the Moravian brotherhood. In 1824 he became professor of oriental literature at Berlin, and in 1826 was transferred to Halle, where he has labored ever since, except in 1828—9, when he was chaplain to the Prussian embassy at Rome. He at first suffered persecution from the prevailing rationalism of his colleagues, but succeeded in effecting a radical
La double échelle (1837); Le perruyer de la régence (1859); La Gypsy, a ballet (1899); Le guerillero (1849); La comte de Carmagnola (1841); Le guerrillero (1849); Angéligue et Mıdır (1843); Le caïd, a comic opera (1849); and Le songe d'une nuit d'été.

His later works were Raymond, La Tonelli, La cour de Célimène, Peyché, Le carnaval de Venise, Mignon (1866), and Hamlet (1866). The last two are the best of this composer's efforts, though Hamlet is redeemed from dullness only by the fine music of the fourth act. The opera was written for Mile. Nilsson, who created the rôle of Ophelia. He is now (1870) engaged upon a grand opera, Francesca da Rimini.

THOMAS, George Henry, an American soldier, born in Southampton co., Va., July 31, 1816, died in San Francisco, March 28, 1870. He graduated at West Point in 1836, was assigned to the artillery, and served in the Florida war (1840–42). In the war with Mexico (1846–8) he was engaged in the defence of Fort Brown, and took part in the battles of Monterey and Buena Vista, being successively brevetted as captain and major. He served in the war against the Seminole Indians in 1849–50, from 1851 to 1854 was instructor of artillery and cavalry at West Point, and was afterward on frontier duty, principally in California and Texas, till 1860, and was wounded in a skirmish with the Indians near the head waters of the Brazos. On the outbreak of the civil war he was made colonel of cavalry, and took part in the operations in the valley of the Shenandoah in the summer of 1861. In August he was made brigadier general of volunteers, and, being in command of a division of the army of the Ohio, took part in the operations in Tennessee and Mississippi. He was made major general of volunteers, April 25, 1862, and was engaged in the operations in Alabama, Tennessee, and Kentucky. During Rosecrans' campaign in Tennessee and Georgia he commanded a corps of the army of the Cumberland, and bore an important part in the battle of Murfreesboro, Dec. 26, 1862, to Jan. 2, 1863, and in that of Chickamauga, Sept. 19, 20, 1863, where his firmness prevented that check from becoming a disaster. In October he was placed in command of the department and army of the Cumberland, and was made brigadier general of the regular army. At the battle of Chattanooga three divisions of his army gave the finishing blow at Missionary ridge. During Sherman's Atlanta campaign the army of the Cumberland, comprising three corps and three cavalry divisions, was constantly engaged. In October, 1864, Thomas was sent to Nashville, to concentrate the forces in Tennessee against the invasion of Gen. Hood, whom he finally routed before Nashville, Dec. 15, 16. He was made major general, and received the thanks of congress for his conduct in these operations, March 3, 1865; and on the first anniversary of
the battle of Nashville a gold medal was presented to him by the state of Tennessee. From June, 1865, to March, 1867, he was in command of the military division (afterward the department) of the Tennessee, his headquarters being at Nashville and Louisville. He was subsequently assigned to the command of the third military district, comprising Georgia, Florida, and Alabama, and next to that of the Cumberland; and in 1868, having declined the brevet rank of lieutenant general, on the ground that he had since the war done nothing to entitle him to such promotion, he was placed in command of the fourth military division, comprising the territory on the Pacific coast, including Alaska, respecting which he made a valuable report.

THOMAS, Isaiah, an American printer, born in Boston in 1749, died in Worcester, April 4, 1851. He commenced business as a printer in Newburyport in 1767. In 1770 he removed to Boston and established the "Massachusetts Spy," in which he attacked with great boldness the oppressive measures of the British government toward the colonies; and Gov. Hutchinson vainly endeavored to procure his indictment. In 1775 he took an active part in the skirmish at Lexington, and on May 3 commenced issuing his paper from Worcester. In 1788 he opened a bookstore in Boston, and soon after established branches of his business in various parts of the United States, while continuing to reside in Worcester. In 1791 he printed an edition of the Bible in folio, and subsequently issued numerous editions of smaller size. For many years most of the school books of the country were printed and published by him. In 1810 he published his "History of Printing in America" (2 vols. 8vo). The American antiquarian society of Worcester was founded through his efforts in 1812, and liberally endowed by him.

THOMAS, Joseph, an American author, born in Cayuga co., N. Y., about 1811. He was educated at the University of the United States, Troy, and at Yale college, was for some time professor of Latin and Greek in Haverford college, Pa., took the degree of M. D. in Philadelphia, and settled there as a physician. In 1857-'8 he was in India studying oriental languages. He is the author of the pronunciation geographical names in "Baldwin's Pronouncing Gazetteer" (Philadelphia, 1845), of the geographical and biographical vocabularies in several editions of Webster's Dictionary, and of "Travels in Egypt and Palestine" (1853). With Thomas Baldwin he edited "A New and Complete Gazetteer of the United States" (1854), and "Lippincott's Pronouncing Gazetteer of the World" (1855; new ed., 1866); and he edited alone a "Comprehensive Medical Dictionary" (1864), and a "Universal Pronouncing Dictionary of Biography and Mythology" (2 vols. large 8vo, 1870-71).

THOMAS, Saint, also called Didymus, one of the twelve apostles. Both names, the Hebrew Thomas (Th'om) and the Greek Didymus, denote a twin. Thomas is rarely mentioned in the New Testament, and little is known of him. The principal traits of his character are given in the Gospel of John. When Jesus after his crucifixion appeared to his disciples, Thomas was not present, and refused to believe until he himself saw and touched Jesus. As to the scene of his apostolic labors, the statements of the ecclesiastical writers of the first centuries do not agree; according to some it was Parthia, according to others Egypt and Ethiopia, and according to others India, where the Portuguese in the 16th century asserted that they had found his body. An ancient sect (see CHRISTIANS OF ST. THOMAS), who early in the middle ages were numerous in Persia and still survive in India, claim St. Thomas as their founder; but many theologians consider the account of the labors of St. Thomas in India as having been invented by the Manicheans, and as early as the 5th century the Thomas of India was regarded by Theodoret as a disciple of Manes. To the apostle Thomas an Evangelium Infantis Christi (also called Evangelium secundum Thomam) is ascribed, which pretends to fill up the gaps left by the canonical Gospels in the time from the infancy of Jesus until his public appearance; but it has always been regarded as apocryphal. (See Tilh, Acta Thomas Apo

THOMAS À KEMPIS. See KEMPIS.

THOMAS AQUINAS. See AQUINAS.

THOMASIANI, I. Christian, a German philosopher, born in Leipsic in January, 1655, died in Halle, Sept. 23, 1728. He was educated by his father, the rector of the celebrated Thomasian school, until 1675; 1675-'9 studied at Frankfort-on-the-Oder. Returning to Leipsic in 1679, he undertook a course of lectures at the university, and in 1687 he began to lecture in the German instead of the Latin language. From 1688 to 1690 he issued a monthly series of papers devoted chiefly to current literature. Persecution finally forced him to flee from Leipsic, and he went to Berlin, where he was kindly received by the elector Frederick III., afterward King Frederick I. of Prussia. He subsequently delivered lectures at Halle, and his success induced the elector in 1694 to found the university of Halle, of which in 1710 Thomasian became rector and dean of the faculty of jurisprudence. It was principally by his exertions that trials for witchcraft and torture were abolished in Germany. His most important works are: Historie der Weisheit und Thorheit (Halle, 1699), and Vernünftige und christliche, aber nicht scheinheilige Gedanken und Erinnerungen über allerhand auserlesene, gemischte philosophische und juristische Händel (3 vols., 1723-26). His life
THOMASSIN has been written by Luden (Christian Thoma-
sius nach seinen Schiksalen und Schriften,
Berlin, 1805), and by Wagner (1872). II. Got-
fried, a German theologian, a descendant of the
preceding, born in 1802, died in 1875. He was
a Lutheran pastor and teacher in Nuremberg
from 1829 to 1842, and for the rest of his life
professor of dogmatics at Erlangen. He was
one of the founders of the Zeitschrift für
Protestantismus und Kirche. His works in-
clude, besides treatises on the Lutheran church,
Origines: ein Beitrag zur Dogmengeschichte des
3. Jahrhunderts (1897); Beiträge zur kirch-
lchen Christologie (1845); and Christi Person
und Werk (3 vols., 1856–64).

THOMASSIN, Louis de, a French theologian,
born in Aix, Provence, Aug. 28, 1619, died in
Paris, Dec. 24, 1695. He studied in the college
of Marseilles, became a member of the French
Oratory, was appointed to the chair of philo-
osophy in the college of Pézenas, where he
adopted Platonic principles, and taught dog-
matic theology for six years at Saumur. From
1654 to 1667 he was professor of dogma in the
Military Seminary of Magdeburg, and later de-
ivering lectures on church history and disci-
pline. He seemed at first to favor the opinions
of the Jansenists, but soon declared against
them. In 1667 he published Dissertationes in
Concilia Generalia et Particularia, in which
he taught that to the pope alone belongs the
right of assembling general councils; that these
councils are not in themselves necessary; that
in all matters of discipline and government the
authority of the pope is superior to that of a
general council; that the question of papal in-
fallibility should never be discussed, but that it
was "sufficient to hold that the pope is greater
than the bishops, and at the head of a council
a council inferior to itself when separated from
the pope." These opinions aroused the hos-
tility of the parliament and of the Gallican por-
tion of the clergy, and the regent suppressed
the work. His most important works are:
Mémoires sur la grâce (3 vols. 8vo, 1665; 2
vols. 4to, 1682); Ancienne et nouvelle disci-
pline de l'Église touchant les bénéfices et les
bénéficiaires (3 vols. fol., 1678–9; translated into
Latin by the author, 1688, 1728); Dogmata
Theologica (3 vols. fol., 1680–89; 6 vols., 1864–
8); Traité de l'unité de l'Église et des moyens
que les princes chrétiens ont employés pour y
faire réunir ceux qui en étaient séparés (1680–
85); and Traité des éaits et autres moyens spi-
rituels et temporels dont on s'est servi dans tous
les temps pour établir et pour maintenir l'unité
de l'Église catholique (3 vols. 4to, 1703).

THOMASON, a town of Knox co., Maine,
adjoining Rockland, on the Knox and Lincoln
railroad, 60 m. E. N. E. of Portland; pop. in
1870, 3,092. The state prison is situated here,
and extensive granite quarries in the neigh-
borhood are worked by convict labor, which
is also employed in the manufacture of boots,
shoes, and carriages. The inhabitants are
chilly engaged in manufacturing and export-
ing lime and in ship building. About 140,000
asks of lime are produced annually. There
are a few other manufactories, two national
banks, a savings bank, a fire insurance com-
pany, and six churches. Thomaston was in-
corporated in 1777, and included until 1848
Rockland and South Thomaston.

THOMAS, a S. E. central county of Da-
~otka, recently formed and not included in the
census of 1870; area, about 925 sq. m. It is
intersected by the Dakota or James River and
its N. fork. The surface is rolling prairie.

THOMSON, Augustus Charles, an American
clergyman, born in Goshen, Conn., April 80,
1812. He was educated at Yale college, at the
theological seminary at East Windsor Hill,
Conn., and at the university of Berlin. Since
1842 he has been pastor of the Eliot Congre-
gational church, Roxbury, Mass. In 1864–5
he accompanied the Rev. Dr. Anderson as a
deposition to the missions of the American
board in India. He has published "Songs in
the Night" (Boston, 1845); "The Lambs Fed,"
which has been translated into the Mah-
ratta language; "The Young Martyrs: The
Last Hours or Words and Acts of the Dying"
(1851); "The Poor Widow, a Memorial of
Mrs. Anna E. Waters" (1854; translated into
Tamil); "The Better Land, or Believer's Jour-
ney and Future Home" (1855); "The Yoke
in Youth, a Memorial of H. M. Hill" (1856);
"Gathered Lilies, or Little Children in Heav-
en" (1858); "Feeding the Lambs" (1859);
"Morning Hours in Patmos" (1860); "Lyra
Coelestis" (1863); "The Merry Seat" (1863);
"Seeds and Sheaves" (1868); and "Christus
Consultor" (1869).

THOMSON, Benjamin. See REMPORD.

THOMSON, Daniel Pierce, an American no-
velist, born in Charlestown, Mass., Oct. 1, 1795,
died in Montpelier, Vt., June 6, 1868. He
graduated at Middlebury college in 1820, was
private tutor for several years, and was ad-
mitted to the bar in Virginia. He practised
law in Montpelier, Vt., and held the offices of
register of probate, clerk of the legislature,
compiler of the statutes, judge of probate,
clerk of the county and of the supreme court,
and secretary of state. He published "May
Martin, or the Money Diggers" (1835, many
times reprinted); "Adventures of Timothy
Peacock" (1853); "The Green Mountain Boys"
(Montpelier, 1840); "Locke Amsden," a graph-
ic picture of the New England district school
as it was (Boston, 1847); "Lucy Hosmer"
(1848); "The Rangers, or the Tory's Daugh-
ter." (1850); "Gant Gurlay, or the Trappers
of Lake Umbagog" (1857); "The Doomed
Chief" (1860); and "History of the Town of
Montpelier, Vermont" (1860). From 1849 to
1856 he edited the "Green Mountain Free-
man" newspaper.

THOMSON, Elizabeth, an English painter, born
in London about 1850. In 1874 she acquired
great fame by her "Roll Call," relating to the
Crimean war, which was purchased by the
THOMPSON, Sir Henry, an English surgeon, born at Framingham, Suffolk, Aug. 6, 1820. He was educated at University college, London, became assistant surgeon of the college hospital in 1853, surgeon in 1863, and professor of clinical surgery in 1866, and was knighted in 1867. He has published "The Pathology and Treatment of Stricture of the Urethra" (London, 1853; 2d ed., 1869); "The Enlarged Prostrate, its Pathology and Treatment" (1857; 2d ed., including the Jacksonian prize essay of the royal college of surgeons for 1860, 1861; 3d ed., 1868); "Practical Lithotomy and Lithotrity" (1863; 2d ed., 1871); and "Clinical Lectures on Diseases of the Urinary Organs" (1868; 2d ed., 1870).

THOMPSON, Joseph Parrish, an American clergyman, born in Philadelphia, Aug. 7, 1819. He graduated at Yale college in 1838, studied theology at Andover and New Haven, and was ordained pastor of the Chapel street Congregational church, New Haven, in November, 1840. From 1845 to 1872 he was minister of the Broadway Tabernacle church in New York. While at New Haven he was one of the originators of the "New Englander," a Congregational quarterly review, and he was also one of the founders of the "Independent" newspaper. In 1852 he originated the plan of the Albany Congregationalist convention. He was also a manager of the American Congregational union, and of the American home missionary society. In 1852 he visited Palestine, Mt. Sinai, Egypt, and other oriental countries; and he has since devoted much time to oriental studies, especially Egyptology, the results of which have appeared in his contributions to the "North American Review," the "Bibliothea Sacra," the "Journal of the American Geographical and Statistical Society," Smith's "Dictionary of Biblical Geography and Antiquities," and the revised edition of Kitto's "Cyclopædia of Biblical Literature." Harvard university conferred upon him the degree of D. D. in 1856. He now (1870) resides in Berlin. Dr. Thompson has published "Memoir of Timothy Dwight" (New Haven, 1844); "Lectures to Young Men" (New York, 1846); "Hints to Employers" (1847); "Memoir of David Halle" (1850); "Foster on Missions, with a Preliminary Essay" (1850); "Stray Meditations" (1852; revised ed. entitled "The Believer's Refuge," 1857); "The Invaluable Possession" (1856); "Egypt, Past and Present" (Boston, 1856); "The Early Witnesses" (1857); "Memoir of Rev. David T. Stoddard" (New York, 1858); "The Christian Graces" (1859); "The College as a Religious Institution" (1859); "Love and Penalty" (2d ed.); "On her way" (1859); "Chastity and Emancipation" (1863); "The Holy Comforter" (1866); "Man in Genesis and Geology" (1869); "Theology of Christ, from His Own Words" (1870); "Home Worship" (1871); "Church and State in the United States" (1874); and "Life of Christ" (1875).

THOMPSON, Launt, an American sculptor, born in Queen's county, Ireland, in 1833. He came to the United States at an early age with his mother, a widow, who settled in Albany, N. Y. While studying in the medical college he also attended a drawing school, and was encouraged in his taste for art by William Hart and E. D. Palmer. When the latter opened a studio for sculpture in Albany, Thompson became his pupil, and remained with him nine years, making himself known by his ideal head of "Little Nell," which he twice copied to fill orders, and by his busts and medallion portraits. In 1858 he settled in New York, and was elected an associate of the national academy of design. In 1859 his bust of the "Trapper" secured his election as an academician, and he soon after became a member of the council; and he also served on the committee for the erection of the new building of the academy. He now (1876) resides in Florence, Italy. Among Mr. Thompson's principal works are a statue of Gen. John Sedgwick, erected at West Point; a colossal statue of Napoleon, now owned by Mr. Picknot of Milford, Pa.; a statue of Gen. Winfield Scott, erected at the soldiers' home near Washington; a soldiers' monument at Pittsfield, Mass.; a statue of the Rev. Abraham Pierson, first president of Yale college, erected in the college grounds; and many busts and bass-reliefs.

THOMPSON, Thomas Perronet, an English political reformer, born in Hull, March 15, 1783, died Sept. 6, 1869. In 1805 he entered the navy as midshipman, and in 1806 went into the army as second lieutenant. In 1808 he was made governor of Sierra Leone. One of his first acts was to issue a proclamation for the suppression of the slave trade in the colony; and the opposition raised against him by the slave traders caused his recall. He arrived in England in 1810, returned to the army, and served in the peninsular campaign of 1813, in France in 1814, and afterward in the Pindaree campaign in India. In 1819, having learned Arabic, he accompanied Sir William Keir Grant in the expedition up the Persian gulf, and assisted in the negotiation of the treaty with the Arab tribes, by which the slave trade was declared piracy. In 1854 he was made major general. In 1814 he published a work entitled "On a Constitution." He was one of the contributors to the "Westminster Review" on its establishment in 1824, and five years afterward became joint proprietor, writing for it constantly till 1856. His "Corn Law Catechism" (1827) was the most effective attack upon the protectionist system. He was several times elected to parliament. A selection from his miscellaneous writings was published (6 vols., 1849).
TALLAHASSEE, Fl., Nov. 23, 1868. He graduated at the South Carolina college in 1814, and was admitted to the bar in 1819. He was a member of the legislature from 1826 to 1830, when he became solicitor of the western circuit. During the nullification excitement he was elected by the legislature brigadier general of militia (1835). From 1835 to 1841 he was a member of congress, and was prominent in debate as a leader of the whig party. In 1842 he was appointed minister to Mexico. During his mission, he made two important treaties, and procured the liberation of more than 200 Texan prisoners, many of whom were sent home at his own charge. On his return he published "Recollections of Mexico" (8vo, New York, 1846).

THOMPSONVILLE, a village in the town of Enfield, Hartford co., Connecticut, 17 m. N. of Hartford; pop. about 3,500. It is on the E. bank of the Connecticut river, and on the New Haven, Hartford, and Springfield railroad. Formerly noted for the manufacture of carpets, being the seat of the Hartford carpet company's works, which, according to the latest returns, contain 297 looms and produce 2,600,000 yards annually.

THOMAS, William John, an English antiquary, born in Westminster, Nov. 16, 1808. He was for some years clerk of printed papers in the house of lords, and in 1822 was appointed sub-librarian of that house. His first separate publication was "A Collection of early Prose Romances" (3 vols., 1828). This was followed by "Lays and Legends of Various Nations" (1834); "Book of the Court" (1838); "Three Notelets on Shakespeare" (1865); and "Hannah Lightfoot, Queen Charlotte, and the Chevalier d'Éon" (1867). He has also edited "Anecdotes and Traditions" (1839), "Stow's Survey of London" (1842), and "Caxton's Reynard the Fox" (1844). His reputation rests principally on the establishment of the periodical "Notes and Queries."

THOMSON, I. Anthony Todd, a British physician, born in Edinburgh, Jan. 7, 1778, died at Ealing, Middlesex, July 3, 1849. He was educated at the high school of Edinburgh, studied medicine, in 1796 became a member of the speculative society, and in 1799 of the royal medical society, and in 1800 settled in London as a general practitioner. In 1896 he became a member of the royal college of physicians, in 1898 professor of materia medica in London university, now University college, and in 1893 professor of medical jurisprudence. His works include "The London Dispensatory" (8vo, 1811), and "Elements of Materia Medica" (8vo, 1832), both many times reprinted. H. Katherine Byerly, an English authoress, wife of the preceding, born in Etruria, Staffordshire, in 1800, died in Dover, Dec. 17, 1862. She published "Memoirs of the Court of Henry VIII." (2 vols., 1820, London) and "Memoirs of Sarah, Duchess of Marlborough, and of the Court of Queen Anne" (2 vols., 1839); "Memoirs of the Jacobites of 1715 and 1745" (3 vols., 1845); "Memoirs of the Viscountess Sondun," &c. (2 vols., 1847); "Recollections of Literary Characters and Celebrated Places" (2 vols., 1853); "Court Secrets" (3 vols., 1857); "Life and Times of George Villiers, Duke of Buckingham" (3 vols., 1860); and several novels. "Queens of Society" and "Wits and Beaux of Society" were written with her son, John Cockburn Thomson, under the pseudonyms of Grace and Philip Wharton.

THOMSON, Charles, an American patriot, born at Maghera, county Derry, Ireland, Nov. 29, 1729, died at Lower Merion, near Philadelphia, Aug. 16, 1824. He came to America at the age of 11, was educated in Maryland, taught a Friends' academy in Philadelphia, and afterward went into business in that city, and was an intimate friend of Franklin. He was secretary of the continental congress throughout its existence (1774-88), and of the first United States house of representatives till his resignation in July, 1789. John Adams called him "the Sam Adams of Philadelphia, the life of the cause of liberty." He was the author of "An Enquiry into the Causes of the Alienation of the Delaware and Shawanese Indians" (8vo, London, 1759); a translation of the Bible, the first English version of the Septuagint (4 vols. 8vo, 1808); and "A Synopsis of the four Evangelists" (1815).

THOMSON, Edward, an American clergyman, born in Portsea, England, in October, 1810, died in Wheeling, W. Va., March 22, 1870. In 1819 his parents settled in Wooster, Ohio. He graduated in medicine at the university of Pennsylvania in 1829, and in 1833 joined the Ohio Methodist Conference. In 1838 he became principal of Norwalk seminary, Ohio, and in 1844 was elected by the general conference editor of the "Ladies' Repository." In 1845 he became president of the Ohio Wesleyan university at Delaware, Ohio, and in 1860 was elected editor of the "Christian Advocate and Journal." He was elected bishop in 1864, made an extensive tour of missionary observation in Germany, Scandinavia, Bulgaria, India, and China, and organized the Indian mission into an annual conference. He was a member of every general conference from 1840 to 1864. He published "Educational Essays" (new ed., Cincinnati, 1855); "Moral and Religious Essays" (1856); "Biographical and Incidental Sketches" (1856); "Letters from Europe," notes of a tour through England, France, and Switzerland (1856); "Letters from India, China, and Turkey" (2 vols., 1870).

THOMSON, James, a British poet, born at Ednam, Roxburghshire, Scotland, Sept. 11, 1700, died at Kew Lane, near Richmond, Aug. 27, 1748. He was the son of a clergyman, and passed six years at the university of Edinburgh, the last four of which were devoted to theological studies. About 1724 he went to London, and for several months was tutor in the family of Lord Binning. A fragment of
blank verse, written by him at the age of 14, was first published in a life of the poet by Allan Cunningham in 1841. He published in March, 1726, his blank verse poem of "Winter," for the copyright of which he received three guineas, and three editions were called for in a year. In 1727 appeared "Summer," followed by "Britannia" and a "Poem sacred to the Memory of Sir Isaac Newton." In 1728, "Spring;" and in 1730, "The Seasons," completed by the addition of "Autumn," in a 4to volume, of which 454 copies were subscribed for, at a guinea each. In 1729 he produced "Sophonisba," a tragedy, acted with moderate success at Drury Lane. In 1731-2 he travelled on the continent as tutor, of the son of Sir Charles Talbot, afterward lord chancellor, and in his return to England commenced an elaborate poem on "Liberty" (5 parts, 1735-6). It was abridged by Lord Lyttelton in collecting the author's works for publication, and in that condition it still appears. He had meanwhile been placed in easy circumstances by the appointment of secretary of briefs in the court of chancery, bestowed upon him by Lord Talbot. After the death of the chancellor in 1737 he lost the place, but received from the prince of Wales a pension of £100 a year. He now produced successively his dramas "Agamemnon" (1738), which narrowly escaped being damned on the first night, and "Edward and Eleanor," the representation of which was prohibited under the operation of the act for licensing dramatic performances; the masque of "Alfred," written in conjunction with Mallet, which contains the celebrated song and chorus, "Rule Britannia," set to music by Dr. Arne; and "Tancred and Sigismunda," performed with success at Drury Lane in 1745. About this time he was appointed surveyor general of the Leeward islands, the duties of which were discharged by a deputy, while the clear emoluments amounted to £300 a year; and the latter part of his life was passed in an elegant retreat at Kew Lane. In 1748 appeared "The Castle of Indolence," on which he had labored for many years. His posthumous play of "Coriolanus" was performed at Covent Garden. Thomson was a man of gross appearance and exceedingly indolent disposition. The latest edition of his complete works is in two volumes (London, 1870).

THOMSON, JAMES, a British civil engineer, born in Belfast about 1816. He was educated in Belfast and Glasgow, where his father was professor of mathematics. He took the master's degree in 1840, studied civil engineering and mechanics, became a pupil in the Horsecly iron works, near Tipton, South Staffordshire, entered the service of William Fairbairn, and afterward settled in Belfast as a civil engineer. In 1857 he was appointed professor of civil engineering in Queen's college, Belfast, and in 1872 professor of engineering and mechanics in the university of Glasgow. Prof. Thomson has been prominently employed as a consultant engineer for water supply, irrigation, and other agricultural engineering. He invented the vortex turbine, and the jet pump and intermittent reservoir, for draining swamp lands. His investigations of the lowering by pressure of the freezing temperature of water suggested the perfect solution of the problem of glaciers. About 40 papers by him on physics, mathematics, and mechanics have been published in the "Cambridge and Dublin Mathematical Journal," the "Edinburgh Philosophical Journal," the "Transactions" of the royal societies of London and Edinburgh, the "Proceedings" of the British association, and the "Transactions" of the institution of engineers of Scotland. II. Sir William, a British mathematician, brother of the preceding, born in Belfast in June, 1824. He studied in Glasgow university, and afterward at Cambridge, where he graduated in 1846, and became a fellow of St. Peter's. In 1846 he was made professor of natural philosophy in Glasgow university, which post he still holds (1870). For seven years he was editor of the "Cambridge and Dublin Mathematical Journal," among his contributions to which was one on "Distribution of Electricity on Spherical Conductors" (1848). In 1855 he delivered the Bakerian lecture on "Electrodynamic Properties of Metals." He has constructed several beautiful instruments for the study of electrical phenomena, and is at present engaged in perfecting a tide-calculating machine. He invented the mirror galvanometer and syphon recorder, for ocean telegraphy, which, owing to their extreme delicacy, can be worked by very low battery power. He has made important contributions to the science of magnetism, and investigated the laws of heat. (See Heat.) He was knighted in 1866. Among his published papers are "Thermal Effects of Fluids in Motion," "The Mathematical Theory of Elasticity," and "The Rigidity of the Earth." A volume of his papers on electrostatics and magnetism appeared in 1872.

THOMSON, THOMAS, a British chemist, born at Crieff, Perthshire, April 12, 1773, died at Kilmarnock, Ayrshire, July 2, 1852. He was educated at the university of St. Andrews and at Edinburgh, and in 1796 became a contributor to the "Encyclopedia Britannica," his chemical articles in which formed the basis of his "System of Chemistry" (4 vols. 8vo, 1802). He was one of the first to suggest the use of chemical symbols, and among the first to elucidate the atomic theory of Dalton. In 1810 he published the "Elements of Chemistry" (8vo); in 1812, the "History of the Royal Society of London" (4to); and in 1813, "Travels in Sweden," which country he had visited in the previous year. In 1813 he went to London and commenced the "Annals of Philosophy," which he edited till 1822. In 1817 he was chosen lecturer at the university of Glasgow, and in 1818 was made professor of chemistry. His other works are: "An Attempt to Establish
the First Principles of Chemistry by Experiment" (2 vols., 1825); "The History of Chemistry" (2 vols., 1830–31); "Outlines of Mineralogy and Geology" (2 vols., 1836); and "Brewing and Distillation" (1849).—His son Thomas, superintendent of the East India company's botanic gardens at Calcutta, has published an account of his travels in the western Himalaya and Tibet (8vo, 1862).

THOMSON, William, an English clergyman, born in Whitehaven, Feb. 11, 1819. He was educated at Queen's college, Oxford, of which he was successively fellow, tutor, and provost. He was ordained in 1842, became select preacher at Oxford in 1846, Hampton lecturer in 1853, rector of All Souls, Marylebone, in 1855, preacher of Lincoln's Inn in 1858, bishop of Gloucester and Bristol in 1861, and archbishop of York in 1863. He has published "The Atoning Work of Christ" (London, 1853); "Outline of the Necessary Laws of Thought," a text book in several English and American colleges (1842; 9th ed., 1865); "Life in the Light of God's Word" (1867); "Limits of Philosophical Inquiry" (1868); and sermons, pastoral letters, and lectures.

THOR, in Scandinavian mythology, the first born of Odin and Friggs, the bravest and holdest of all the gods. He directed the winds and the seasons; agriculture and the family relations were under his special care; and, unlike Odin, he was opposed to war among men. In the Eddas he appears as the champion of gods and men, destroying monsters and giants with his bolts of thunder. A terrible hammer was hurled at his victim, and after the blow was dealt the weapon returned to his hand. His waist was bound with a girdle which forever renewed the strength he spent in battle. Thor has been compared with Hercules, Jupiter, and the old Saxon deity Irmun. The fifth day of the week has from him received its name, Thursday.

THORAX (Gr. θώραξ), the chest, or upper part of the trunk of the body, situated between the neck and the abdomen. The osseous framework of the thorax consists of the 12 dorsal vertebrae behind, the sternum or breast bone in front, and the ribs upon each side. The spaces between the ribs are occupied by the intercostal muscles, external and internal. The floor or inferior wall of the thorax is constituted by the diaphragm, a vaulted muscular sheet, with a central tendinous expansion, the convexity of which looks upward toward the chest, while its concavity looks downward toward the abdomen. The general form of the thorax is conical, with a broad base below, and presenting at its upper extremity a comparatively narrow and nearly circular opening, bounded on each side by the curved borders of the first pair of ribs, through which the trachea, oesophagus, nerves, and blood vessels pass from the neck into the chest, or vice versa. The framework of the chest thus constituted has a considerable degree of elasticity, owing to the curved form of the ribs themselves, and to the fact that they are articulated with the sternum by elastic cartilages of variable length, oblique in position. Owing to the mobility of the ribs at their vertebral articulations, they are capable of being rotated outward and elevated by the action of the intercostal muscles, and of thus expanding the cavity of the chest laterally. The expansion also takes place at the same time in an antero-posterior direction, since the sternum itself is elevated by the movement of the ribs and carried further away from the spinal column; in this way is produced the alternate rising and falling of the walls of the chest during respiration. By the contraction of the diaphragm the central tendon of this muscle is drawn downward at the moment of inspiration, thus also expanding the chest vertically. — The cavity of the thorax has a general conoidal form, corresponding with

Cavity of the Thorax in Man, opened anteriorly, showing the internal organs. a, b, c. Upper, middle, and lower lobes of the right lung. d, e. Upper and lower lobes of the left lung. f. Heart. g. Pulmonary artery. h. Pulmonary veins. i. Aorta. k. Superior vena cava. l. Upper surface of the diaphragm. m. Lower extremity of the sternum. n. Trachea.

its external configuration. It is partially divided, however, into lateral halves by the forward projection of the bodies of the dorsal vertebrae, leaving on each side of the spinal column a tolerably deep rounded groove or furrow. The principal organs contained in the cavity of the thorax are the heart, lungs, and great blood vessels. The heart is situated nearly in the median line, with its point directed downward and toward the left side, and the lower part of its inferior and posterior surface resting upon the central tendon of the diaphragm. The superior and inferior veins cave, the aorta, the pulmonary artery, and the pulmonary veins are connected with the base of the heart, mostly about the level of the junction of the third costal cartilage with the sternum. The lungs are on each side, moulded to the form of the cavity in which they are contained, and
partly lapping over the heart and great vessels in an anterior view. The trachea enters the cavity of the chest behind the superior vena cava and the arch of the aorta, and the oesophagus is situated still further backward, in immediate contact with the spinal column. The phrenic nerve passes down on each side, between the subclavian artery and vein, in front of the root of the lung, between the pleura and pericardium, to be distributed to the muscular tissue of the diaphragm. The pneumogastric nerves descend behind the roots of the lungs, where they give off their pulmonary branches, and then accompany the oesophagus through an opening in the diaphragm to the stomach. The thoracic portion of the great sympathetic nerve is on each side of the spinal column, as a chain of ganglia, each ganglion resting upon the head of a rib, and connected by nervous filaments with those above and below.

THOREAU, Henry David, an American author, born in Concord, Mass., July 12, 1817, died there, May 6, 1862. He graduated at Harvard college in 1837, and after teaching school for a short time became a land surveyor. In this pursuit he worked no more than was necessary to gain the means for his simple wants, and devoted most of his time to reading, writing, pedestrian excursions, and study. Emerson says of him: "Few lives contain so many remunerations. He was bred to no profession; he never married; he lived alone; he never went to church; he never voted; he refused to pay a tax to the state; he ate no flesh, he drank no wine; he never knew the use of tobacco; and, though a naturalist, he used neither trap nor gun." In 1845 he built a small frame house on the shore of Walden pond, Concord, and lived in it alone for two years, working and studying. He published "A Week on the Concord and Merrimack Rivers" (Boston, 1849), and "Walden, or Life in the Woods" (1854). After his death were published "Excursions in Field and Forest," with a biographical sketch by R. W. Emerson (1863); "The Maine Woods" (1864); "Cape Cod" (1865); "Letters to Various Persons" with nine poems (1865); and "A Yankee in Canada," with anti-slavery and reform papers (1866).—See "Thoreau, the Poet-Naturalist," by William Ellery Channing (Boston, 1873).

THORIUM, or Thorinum, a rare metal discovered in 1828 by Berzelius in a black mineral called thorite, found in a syenitic rock in Norway. It is obtained by reducing the chloride with potassium or sodium. It is a gray metallic powder having much resemblance to zirconium, and acquires a metallic lustre by pressure. Its specific gravity is 7.6 to 7.8; symbol, Th. It takes fire when heated considerably below redness, and burns with great brilliancy, forming thoria, ThO₂, a white substance of sp. gr. 9.402. Thorin chloride, ThCl₄, is prepared by passing dry chlorine over a heated mixture of thorina and charcoal. It crystallizes in rectangular four-sided tables, which are deliquescent and very soluble in water. Thorinic sulphate, with potassic sulphate, forms thorinic potassic sulphate, K₂SO₄, Th₂SO₄, H₂O, which is soluble in water, but is precipitated by a saturated solution of potassic sulphate. Thorinic sulphate is characterized by being precipitated by boiling its solution, which redissolves on cooling. Oxalio acid gives with salts of thorium a white insoluble oxalate of the metal.

THORN, a name used in combination for various spinescent plants, but by itself restricted to species of the genus crataegus, of the rose family. The genus belongs to that division of the family (tribe pomea) which includes pyrus, the apple, pear, &c., and differs from this chiefly in the structure of the fruit. About 65 species are described (which is probably many more than really exist), found in Europe, Asia, and North America, and a single one in the Andes of Columbia; they are shrubs or sometimes small trees, and often armed with thorns, which are abortive or suppressed branches. The leaves are alternate, simple, often lobed, and in some species evergreen; the abundant flowers, usually in terminal clusters, though much smaller, closely resemble those of the apple in structure, are generally white, sometimes rose-colored, and fragrant; styles one to five; the usually red and sometimes edible fruit is a drupe rather than a pome; the carpels, instead of being parchment-like as in the apple, forming when ripe a hard, bony, one- to five-celled stone, or one to five distinct, bony, one-seeded stones. There are about a dozen species of thorn in the Atlantic states, three or four of which are peculiarly southern, and two naturalized; a few of the native species extend across the continent, and a small number are peculiar to the far west. In their wild state, as well as in cultivation, the species are much disposed to vary.—One of the most noticeable and finest of the native species is the cockspur thorn (crataegus crus-galli), which extends from Canada to Florida and west of the Mississippi. When well developed it is a small tree, 10 to 20 ft. high, with numerous nearly horizontal branches forming a round head; the sharp and slender thorns are 2 to 4 in. long, and often show their branch-like nature by bearing leaves when young; the obvate leaves taper to a wedge-shaped base, are serrate toward the apex, very thick, smooth, dark green, and shining above, 1/4 to 2 in. long; the flowers, produced on spurs shorter than the thorns, are succeeded by bright red, nearly globular fruit, about half an inch in diameter. This produces in the wild state varieties differing much in their foliage, and its synonyms are numerous; there are also some garden varieties, one of them remarkably dwarf. It was introduced into England nearly 200 years ago, and is there valued as an ornamental shrub or small tree; experiments have been made with it here as a hedge plant, to which use it is perhaps better
adapted than any other native thorn, but it has the disadvantages common to plants of this genus mentioned under Hedge. The hard close wood of this and other species takes a

fine polish, and serves for handles to hammers and other tools, but on account of its small size its use is limited. Among the most conspicuous of the native species is the Washington thorn (C. cordata), which grows from Virginia southward, but has been somewhat cultivated as a hedge plant further north; it grows 10 to 20 ft. high, and is very spiny; its broad leaves, sometimes slightly heart-shaped at base, are often three-lobed; the fruit, the size of peas, is bright red. The scarlet-fruiting thorn (C. coccinea), with smooth, thin, roundish-ovate leaves, and coral-red but scarcely edible fruit, is very common. So also is the pear or black thorn (C. tomentosa), which has thickish ovate or obovate, sharply toothed leaves, downy when young, very large fragrant flowers, and globular or pear-shaped fruit three fourths of an inch across, scarlet or orange, and edible, having often a pleasant flavor; there are several varieties of this, one of which has its fruit dotted with white. The parsley-leaved thorn (C. apiifolia), distinguished by its much cut leaves, is found from Virginia southward. The summer haw (C. estivalis) of South Carolina, and growing southward and westward, is a small tree found on the margins of the pine-barren ponds; it has wedge-ovate, thick leaves, and globose, large, red fruit, which ripens in early summer, and, being quite juicy with a pleasant acid flavor, is much esteemed for making tarts and jellies. The remaining native species are only of interest to the botanist.—Among exotic thorns, the best known is the hawthorn (C. oxyacantha), also called white thorn, and in England May or May tree, and also quickset, from its being set to form a quick or living fence or hedge. The term haw is applied to the fruit of this and other thorns; but being from the A. S. haga, a fence or hedge, hawthorn really means a hedge thorn, and the origin of the name points to this use of it in very early times. The species is found throughout Europe, Siberia, and central Asia; and as it was early introduced into this country, it has become more or less naturalized in the older states. Its smooth leaves are wedge-shaped at the base and cut-lobed and toothed above; its abundant flowers appear in May, and are followed by ovoid, coral-red, rather small fruit. The varieties are numerous, the catalogues containing 90 or more, which differ from the normal form in the shape of the tree, some being very pendulous, in the character of the leaves, and in the form and color of the flowers; the bloom, usually white, varies from bluish through pink and rose color up to a recently introduced scarlet, and there are double as well as single flowers of the white and various shades, so that a collection of the forms of this species alone would present a great variety. The Glastonbury thorn, near the abbey of that name in England, is a variety of hawthorn flowering twice a year; it blooms at the usual time, and also bears a crop of very early flowers, which open about Christmas. In England the hawthorn is the almost universal hedge plant, it being as well adapted to that climate as it is unfitted to ours; the early attempts at hedging in this country were, in imitation of the home practice, made with this plant; and the general

failure with it brought all hedging into disrepute. (See Hedge.) The evergreen or pyracanth thorn (C. pyracantha), from the south of Europe, was distributed several years ago as a desirable hedge plant; it has shining, evergreen, mostly oblong leaves, about an inch long, with small clusters of flowers and brilliant red fruit; it has become naturalized near Washington and in some other localities; in a climate not more severe than that of Virginia it makes an excellent hedge. An accidental variety with white or yellowish fruit is (as is sometimes the case with varieties) more robust
THORN

THORNHILL, Sir James, an English painter, born in Weymouth in 1676, died there, May 4, 1734. He settled in London, and during the last 30 years of his life was employed on important works, including the eight pictures in chiaroscuro illustrating the history of St. Paul on the inner dome of St. Paul's cathedral, and the decorations at Kensington palace, Blenheim, and Greenwich hospital. In 1724 he opened an academy for drawing at his house. Hogarth was his pupil and son-in-law. He was knighted by George I., and represented Weymouth in parliament.

THORTON, Bonnell, an English author, born in London in 1724, died May 9, 1768. He was educated at Oxford, and in conjunction with George Colman the elder began a periodical, "The Connoisseur," which lasted from January, 1754, to September, 1756. With Colman also he was one of the original proprietors of "The St. James's Chronicle." In 1762 he published "An Ode on St. Cecilia's Day," adapted to the antient British Music, viz., the Salt-box, the Jews-harp, the Marrow-bones and Cleavers, the Hum-strum or Hurdy-gurdy, &c., with an Introduction giving an Account of those truly British Instruments" (4to, London); the ode was set to music by Dr. Burney, and performed on the instruments named with great success. In conjunction with Colman and Richard Warner he published "The Comedies of Plautus, translated into familiar Blank Verse" (2 vols., 1767), of which he translated "Amphitryon," "The Draggart Captain," "The Treasure," "The Miser," and "The Shipwreck." In 1768 he published "The Battle of the Wigs, an additional Canto to Dr. Garth's Poem of The Dispensary" (4to).

THORNTON, Matthew, a signor of the Declaration of Independence, born in Ireland in 1714, died in Newburyport, Mass., June 24, 1803. His father emigrated to America about 1717. The son was educated at Worcester, Mass., studied medicine, and commenced practice at Londonderry, N. H. In 1746, as a surgeon, he joined a New Hampshire division of 500 men in the expedition against Louisburg. At the beginning of the revolutionary war Dr. Thornton was a colonel in the militia. When a provincial convention was called, he was chosen its president; but he was immediately appointed to represent New Hampshire in the congress, and was permitted to sign the Declaration of Independence after taking his seat in September, 1776. Subsequently he was chief justice of the court of common pleas in New Hampshire, and later a judge of the superior court. He removed from Londonderry to Exeter, and finally fixed his residence at Merrimack, where he purchased a large estate.

THORNSWELL, James Henley, an American clergyman, born in Marlborough district, S. C., in 1811, died in Charlotte, N. C., Aug. 1, 1862. He graduated at the South Carolina college in 1829, studied theology, and commenced preaching as a Presbyterian minister to the Waxhaw
church. In 1836 he was elected professor of logic and belles-lettres in the South Carolina college, and in 1838 became pastor of the Presbyterian church in Columbia. In 1840 he accepted the professorship of the evidences of Christianity and the chaplaincy of the college, and in May, 1852, took charge of the Glebe street church, Charleston. In December, 1852, he was elected president of the college, and in 1856 resigned to take a professorship in the Presbyterian theological seminary at Columbia. He published "Arguments of Romansists Discussed and Refuted" (New York, 1845); "Discourses on Truth" (1854); "On the Rights and Duties of Masters," and "The State of the Country" (1861); and numerous controversial articles in the "Southern Presbyterian Review," defending slavery and secession. His collected works have been edited by the Rev. John B. Adger (2 vols. 8vo, Richmond, 1874).

**THORNYCROFT, Mary** (Francis), an English sculptress, born at Thornham, Norfolk, in 1814. She was a pupil of her father, John Francis (1780-1861), who attained great eminence in London as a portrait sculptor, and executed busts of Queen Victoria, Prince Albert, Wellington, and many of the statesmen of his time. In 1840 she married Mr. Thornycroft, also a pupil of her father, and in 1843 accompanied him to Rome, where she received instructions from Thorwaldsen and Gibson. After her return in 1843 she was employed to execute statues of four of the royal children in the character of the four seasons. Her works include "The Flower Girl," "Sappho," "Sleeping Child," and "Girl Skipping."

**THOROUGH BASS, the art by which harmony is superadded to any proposed bass, such harmonies being indicated by figures placed under the bass notes. The term is also used like counterpoint as synonymous with the science of harmony. (See Music, vol. xii., p. 81.)**

**THOREAUX, See Bonaparte, John.**

**THORPE, Benjamin.** An English philologist, born about 1808, died at Chiswick, July 18, 1870. He devoted himself to the study of Anglo-Saxon, translated the Anglo-Saxon grammar of Rask, superintended a series of editions of Anglo-Saxon works, including the metrical paraphrase of the Bible by Cedmon (1822), and published Analecta Anglo-Saxonica (1834); "The Anglo-Saxon Version of the Story of Apollohnus" (1834); Libri Psalmorum Versio Antiqua Latina, cum Paraphrasis Anglo-Saxonica (1835); the great collection entitled "Ancient Laws and Institutes of England, with a Compendious Glossary," &c. (1840); Codex Eddones (1845); "Northern Mythology" (3 vols., 1851-9), a critical collection of the legends of Scandinavia and northern Germany; "The Anglo-Saxon Chronicle" (2 vols. 8vo, 1861); and Diplomaticum Anglicum Aevi Saxonici, a collection of English charters (1865).

**THORWALDSEN, Bertel,** a Danish sculptor, born at sea between Iceland and Denmark, Nov. 19, 1770, died in Copenhagen, March 24, 1844. He was the son of an Icelandic, who was a wood carver, and was christened Bartholomaeus, but was called by the diminutive Ivert, which the Italians turned into Alberto. At the age of 11 he entered the free school of the academy of arts in Copenhagen. At 17 he gained the silver medal of the academy; at 20 the small gold medal for his "Heiodorus driven from the Temple;" and in 1798 the grand prize, which entitled him to a small stipend for studying abroad. For several years after his arrival in Rome (March 9, 1797), his progress, owing to illness and his own diffidence, received no adequate recognition. He was preparing in 1803 to return to Denmark, when his model of "Jason bearing the Golden Fleece" attracted the notice of Thomas Hope, who offered him a liberal sum for the execution of the statue in marble, which reached England only in 1824. His earliest efforts reflected the idealism of classic art, and his Mars, Mercury, Ganymede, the Graces, Venus, Cupid and Psyche, Hector and Priam, and "Dance of the Muses on Mount Helicon" are among the best modern imitations of the antique. A more important work was the magnificent bass relief of the "Triumphant Entry of Alexander into Babylon," the plaster cast of which was completed in 1813 by order of Napoleon, for the Quirinal. Two copies in marble are in existence, one of which is in the palace of Christiansborg, Copenhagen. As Thorwaldsen gained in confidence and executive power, he rose above the mere imitation of Greek sculpture, and devoted himself to original works. In 1819 he made a brief visit to Copenhagen. His progress thither through Italy and Germany was one continuous ovation, and on arriving at his native city he was escorted in triumph to apartments prepared for him in the royal palace of Charlottenborg. Returning to Rome in 1820, he began the series of religious works which stamp him as one of the regenerators of sculpture. Among these was his colossal group of "Christ and the Twelve Apostles," now in the cathedral church of Copenhagen. In the same church are his statues of the four great prophets and many fine bass reliefs, and the exterior is adorned by his frieze of "Christ bearing the Cross," and by a group in alto relievo representing the "Preaching of St. John," which fills the pediment. He also executed seated statues of Galileo, of Copernicus, in Warsaw, and of Byron, in Trinity college library, Cambridge; a monument to Pius V.; and a vast number of other works. His largest single work is the colonnion near the Lion of St. George at Lucerne, Switzerland, commemorating the Swiss guards who fell in defending the Tuileries, Aug. 10, 1792; and among his statues in bronze are those of Schiller at Stuttgart and Gutenberg at Mentz. In 1838 he returned to Copenhagen in a frigate furnished him by the government, and was lodged in the royal palace. He died suddenly.
of disease of the heart, just after he had taken his seat in the theatre. He was engaged until within a few hours of his death upon a bust of Luther, which was left unfinished. He was a man of much modesty, generosity, and amiability. As a sculptor of bass relief he surpassed any of his contemporaries; and some of his smaller works in this department, as the “Day” and “Night,” modelled in 1815 at a single sitting, display a fertile vein of poetic imagination and executive refinement. In other works of the class he neglected the execution for the purpose of attaining vigor and strength. His entire collection of works of art, and the bulk of his large personal property, were bequeathed to the city of Copenhagen for establishing and supporting the celebrated museum containing his mausoleum and marble or plaster copies of all his works, of which Holst published 120 lithographs in his Musée Thorwaldsen (Copenhagen, 1951). Eugene Plon established in 1874 a Thorwaldsen museum at the Louvre.—See Thieler's various works on Thorwaldsen, including his life collated from his autobiography (German, Leipzig, 1852-6; English translation by the Rev. M. R. Barnard, London, 1865), and Eugene Plon's Thoroal- sden, a visio in arte (Paris, 1867; English translation by Mrs. Cashel Hoey, London, 1874, and by Miss I. M. Lyuster, Boston, 1874).

THOU, Jacques Auguste de (Lat. THUANUS), a French historian, born in Paris, Oct. 8, 1553, died May 7, 1617. He was the son of a first president of the parliament of Paris, studied law at home and in Italy, and was early engaged in diplomatic and judicial employments. In 1588 he was one of the deputies to the states general at Blois. He aided in effecting a recon- ciliation between Henry III. and Henry of Navarre, and went to Germany and Italy to procure money and troops for them. Henry IV. appointed him grand master of the royal library, and in 1594 président à mortier of the parliament of Paris. He was one of the framers of the edict of Nantes, and supported the rights of the Gallican church by preventing the adoption of several decrees of the council of Trent. On the death of Henry IV. he was appointed one of the directors of finance. His Historia sui Temporis (completed from his materials by Père Dupuy and Nicolas Rigault in 7 ed., 1620) embraces the period from 1549 to 1607, in 19 books. The only complete edition of his works is that of S. Buckley and T. Carte (7 vols. fol., London, 1733), including besides the above his autobiography, letters, and various essays, with an appendix by Rigault continuing the history to the death of Henry IV. A French translation appeared in 1744, in 16 vols. 4to, and a new edition of his autobiography in French, by Masson, in 1888. De Thou also left some Latin poems: Hieracosphion, sive de Re Ac- eptissimae Libri III. (4to, 1584); Poemata Sa- cera (12mo, 1590); and Posteriati, &c. (12mo, 1678).—See “Life of Thuanus, with some Ac- count of his Writings,” by the Rev. John Col- linson (London, 1867), and Discours sur la vie et les ouvrages de J. A. de Thou, by Philaret Chasles (Paris, 1824).—His son, François Au- guste, who succeeded him in the royal library, was a friend of Clng-Mar, and was executed with him, Sept. 12, 1642.

THOUARS. See Du Petit-Thouars.

THRACE, in ancient geography, originally that part of modern Turkey in Europe lying between the Danube, the Black sea, the sea of Marmora, the Grecian archipelago, the Struma, and a line, not well defined, connecting that river with the Danube. In later times that part of Thrace which lay between the rivers Strymon (now Struma) and Nestus (Kara-su) was annexed to Macedonia by Philip, and the country N. of the Hemus (Balkan) was made by the Romans a separate province under the name of Moesia. Thrace, in the narrowest sense, was bounded N. by the Hemus, E. by the Euxine, S. E. and S. by the Thracian Bosporus, the Propontis, the Hellespont, and the Ægean sea, and W. by the Nestus. Two off- shoots of the Hemus, the Rhodope (Despoto Dagh), E. of the Nestus, and a parallel range near the Euxine, traversed it in a S. E. di- rection. It was watered, besides the Nestus, by the Hebrus (Maritsa) and its affluents the Articus (Tundja), Agrianes (Erkench), and others. The principal towns were Apollonia and Salmydessus on the Euxine; Byzantium, (Constantinople) on the Bosporus; Selymbria and Perinthus or Heraelea (Ereklik) on the Propontis; Callipolis (Gallipoli) and Sestos on the Hellespont, in the Thracian Chersonesus (pen- insula of Gallipoli); Lysimachia, Ænos, Mc- sembra, Maronea, and Abdara, on the Æge- an; and Philippopolis, Hadrianopolis (Adria- nople), and Trajanopolis, on the Hebrus. The towns on the coast were all Greek settlements. The district between the Strymon and Nestus, called Macedonia Adjacta, contained Neapolis, Philippi, and Amphipolis. In the times of Herodotus and Thucydides, Thrace, in the wider sense, was peopled by numerous tribes, probably Goths and Scythians, as Gete, Treres, Odrysos, Triballi, Daci, and Moesi. At an early period they seem to have greatly influenced the culture of the Greeks, especially their mythology and religious rites. They are de- scribed as powerful, warlike, and cruel. They worshipped deities identified with Mars, Bac- chus, and Diana, and had an oracle of Bacchus on a lofty summit of Rhodope. Orpheus, Linus, Museus, and Eumolpus are said to have been Thracians. We find fragments of the Thracian race also in parts of Asia Minor and central Greece.—The Thracians are said to have been conquered by the Teutians and Mysians. They were subdued by the Persians under Darius, but recovered their freedom after the reverses of Xerxes. Their most pow- erful native rulers were Sitalecs, king of the Odrysos, who fell in battle against the Triballi in 424 B. C., and his nephew Senteus, after
THRALE joined government and delivered At the tyrants, Banished Alcibiades to submission, RUGIA, empire and R Thrasymenus, THREAD THREAD Thread the Rhodian fortress, restored the Athenian interest in Byzantium, secured several new alliances, and reduced Methymna and other towns in Lesbos. Afterward sailing south, he anchored in the Eurymedon, near Aspendus in Cilicia, when the inhabitants, exasperated by some act of his soldiers, killed him in the night. TRASYMENUS, or Trasimenus, Lake. See Pe- RUGIA, and HANNIBAL. THREAD WORM. See EntoZoa, vol. vi., p. 670. THREATENING LETTERS, sent to persons for the purpose of extorting money, have been said to constitute a misdemeanor or criminal offence at common law. Blackstone says that threatening by letter (even without demand) to kill any of the king's subjects or to fire their houses, &c., was made high treason by a statute of Henry VIII.; and though this is no longer the law, the offence is punishable severely under existing statutes. In many of the United States there are statutory provisions, punishing with great severity an attempt to extort money by means of a threatening letter. It may be said generally that a threat, to be indictable, must be such as might naturally overcome a man of ordinary firmness and sagacity; and the money demanded under the threat must be money to which the sender of the letter has no right. In England, it would seem to be an offence at law to post up, on a placard or otherwise, a threatening notice. THREE RIVERS (Fr. Trois Rivières), a city and port of entry of the province of Quebec, Canada, on the N. bank of the river St. Lawrence, at the mouth of the St. Maurice, 62 m. S. W. of the city of Quebec and 80 m. N. E. of Montreal; pop. in 1861, 6,058; in 1871, 7,570. It is connected by ferry with a branch of the Grand Trunk railway on the opposite bank of the St. Lawrence. The chief trade is in lumber, which is shipped in large quantities to South America, the West Indies, England, and the United States. The value of imports for the year ending June 30, 1874, was $82,097; of exports, $159,451. An additional element of prosperity is the manufacture of iron wares, for which the St. Maurice forges, 3 m. distant, are noted. The city contains two branch banks, a college, an English academy, an Ursuline convent and school, several other schools, a tri-weekly and a semi-weekly newspaper (both French), a Roman Catholic cathedral and parish church, and Episcopalian, Presbyterian, and Wesleyan Methodist churches. The streets are lighted with gas.—Three Rivers was founded in 1618. With the parish of the same name it forms an electoral district for parliamentary purposes, having an area of 174 sq. m. and 8,414 inhabitants in 1871. THRESHER. See SHARK, vol. xiv., p. 829. THRESHING MACHINE, a machine for threshing and separating grain from the straw. The threshing floor of the ancient was a flat surface of ground covered with clay rolled smooth and hard. Sheaves of grain were spread evenly on this floor, and cattle driven over it until the grain was beaten out by the constant trampling upon it. The Egyptians usually muzzled the ox while threshing, and the Greeks are said by Ælian to have had the filthy practice of besmearing the mouths of animals with dung to prevent their eating the grain. The flail, which is yet in common use by small farmers, is a very ancient invention. Planks or timbers stuck over with pieces of flint or hard wooden pegs were used to some extent, but answered no good purpose. Michael Menzies of Scotland is supposed to have been the first inventor of a machine for threshing, which was merely an adaptation of suitable mechanism to drive a large number of flails by water power. Though unsuccessful in practice, this machine attracted considerable attention. In 1758 a Stirlingshire farmer named Leckie invented a rotary machine which consisted of a set of cross arms attached to a horizontal shaft, and the whole enclosed in a cylindrical case. It proved tolerably efficient in threshing oats, but was not adapted to wheat, as it knocked off the entire head from the straw without separating the kernels. Mr. Leckie having demonstrated the superiority of...
a rotary motion for this purpose, it was an easy matter to remedy the defects of his machine and perfect the invention. In 1786 Andrew Meikle, a Scotchman, made an improvement on Leckie's machine by substituting a drum or cylinder with beaters attached to the circumference. He also applied rollers, connected by suitable mechanism to the driving gear, for feeding in the straw. When operated, the drum was set in rapid motion by water or other power; the sheaves of grain, unbound and placed between the rollers, were fed in; and the beaters, revolving with great velocity on the periphery of the drum, beat out the grain from the heads and partially separated it from the straw. A patent was procured in Great Britain in 1788, when Mr. Meikle constructed the first working machine, and added many new improvements, among which was the attachment of a fan mill, by which the grain was separated and cleaned from both straw and chaff. Though an invention of vast importance, saving annually millions of dollars in manual labor, and immensely increasing the product of grain throughout the civilized world, the simplicity of the threshing machine and the perfection of Meikle's inventions left little room for great modern improvements. Meikle's, with some modifications, was the first form of drum machine used in the United States; but although the beater drum is still used in Great Britain, it has long been replaced here by the spiked drum, which runs at a higher speed. This form of machine consists principally of a concave bed made of heavy plank lined with iron spikes arranged spirally, into which the drum, also armed with spirally disposed spikes, revolves. Such machines are capable of threshing 300 bushels of oats and over 100 of wheat in 10 hours. Most modern threshing machines have grain separators attached, by which the grain is winnowed by a revolving fan, and also elevators which are long endless aprons moved on rollers, by means of which the straw is taken up into a mow or on to a stack. Numerous machines of this kind are employed in the United States, especially in the Mississippi and Ohio region. In many places where the farms are not large, it is the practice to employ threshers who move their machines, which are on wheels like those of a wagon, from place to place.

One of these machines, patented by Peter Geiser, is represented in the engraving. M is the feeding board, and I the toothed drum, which throws the straw and threshed grain on to an inclined plane between I and B. Between B and C there is a rack, through which the grain falls, while the straw is moved forward to the elevator N by means of a reciprocating rake. The grain falls back on an inclined plane to E, thence down over the fluted rollers E and F, where, receiving the air blast from the revolving fan H, the chaff is blown away, the grain passing down into receptacles below. Lighter grains and seeds of weeds are blown further, beyond a screen, and are carried along with some good grain by an elevator, back to the thresher at I, by which means all the good grain is saved.

THROCKMORTON, a N. W. county of Texas, drained by the Brazos river and its affluent; area, 900 sq. m.; returned as having no population in 1870. The surface is mostly broken and hilly, suited to grazing. In the south, near the Clear fork of the Brazos, is some good farming land.

THROCKMORTON, Sir Nicholas, an English statesman, born in London about 1513, died there, Feb. 12, 1571. He was page to the duke of Richmond till 1556, was afterward sewer to Henry VIII., and headed a troop at the siege of Boulogne. Distinguished in the Scottish campaign under Somerset, he was knighted, received valuable manors, and sat in parliament as member for Northampton. He was present at the death of Edward VI. in 1553, and, though a Protestant and aware of the movement in favor of Lady Jane Grey, favored the accession of Mary. He was arrested in 1554 as an accomplice in Sir Thomas Wyatt's rebellion, conducted his own defence, and was acquitted, but remanded to the tower on the ground that the verdict was contrary to law. He was released in 1555, lived for a time in France, and in 1556 privately visited the princess Elizabeth at Hatfield, after whose accession he was made successively chief butler of England and chamberlain of the exchequer. As ambassador to France from 1559 to 1563, he favored the policy of Cecil, and intrigued to foment the civil religious war. He was imprisoned in 1569 for favoring a marriage between Mary queen of Scots and the duke of Norfolk, and never regained Elizabeth's confidence.

THROMBOSIS. See Brain, Diseases of the, vol. iii., p. 198.

THRUSH, the common name of a very large family of dentrostral birds, which contains some of the finest songsters in various parts of the world. The bill is of moderate length, rather stout, slightly convex and keeled above, with sharp and notched tip; at the base of the upper mandible on each side of the gape is a row of bristles much smaller than in the flycatchers; nostrils at the base of bill, partly protected by a membranous scale; wings tolerably long, broad, usually rounded at the end,
with the first quill very small; legs rather short and stout; tarsi compressed, covered in front by a single scale; the typical genus *turdus* (Linn.); tail moderate. The food consists of insects, worms, berries, and fruits, and sometimes mollusks; they move on the ground by hopping on both feet at once.—More than 100 species of the genus *turdus* are described, having the characters given above; they are found in all parts of the world, and are more or less migratory and shy; the nest is made of coarse grasses and mosses, usually lined with mud and soft plants, and is placed on bushes or trees; the eggs are five or six; the flesh is delicate. Several species have been already noticed under Blackbird, Fieldfare, and Robin. Among the American species is the wood thrush (*T. mustelinus*, Gmel.), 8 in. long and 13½ in. in alar extent; the form is stout, the tail nearly even, and the third and fourth quills the longest; the general color is rufous brown above, brightest on the head, and olivaceous on the tail; pure white below, with numerous blackish spots on breast and sides; legs yellow; bill brown, yellowish at base. It is found in the eastern United States to the Missouri river, and south to Guatemala. The notes are few, but powerful, clear, and mellow, rising and falling in gentle cadences; they are especially pleasing at sunset; the food consists of berries and small fruits, and insects; the flight is elevated. The eggs are uniform light blue; the young are easily raised from the egg, and they sing well in captivity. Several other species are described.—Of the European species, the largest is the missel thrush (*T. viscivorus*, Linn.), 11 in. long; it is light grayish brown above, the fore part of the head grayish and the rump shaded with ochre yellow; secondary coverts and tail feathers tipped with grayish white; a cream-colored band from bill over eyes; below yellowish white, each feather tipped with a black spot, largest and transversely oblong on breast, smaller and triangular on neck. It frequents woods and copses, in small straggling flocks, and is shy and vigilant; it feeds chiefly on berries, especially those of the mistletoe (whence its common name). The song of the male resembles that of the blackbird, and is heard as early as February, before the appearance of the leaves, and even during storms, whence its name of storm cock; it is very bold in spring. The eggs are four or five, 1½ by ¾ in., flesh-colored with irregular scattered spots of brownish red; two broods are generally raised in a season; it has been seen to carry off small birds to its nest to feed its young; the flesh is good. The song thrush, thrstile, or mavis (*T. muscius*, Linn.) is 9 in. long, yellowish brown above, tinged with red on the head; secondary coverts tipped with reddish yellow; fore part of neck and breast yellowish, each feather terminated by a triangular brownish black spot; lower wing coverts reddish yellow. It frequents lightly wooded regions and gardens, in the latter destroying snails, which it obtains by breaking the shell against a stone; it is one of the finest of European songsters, singing from early spring to autumn, in the morning and evening, from the top of a bush or tree. Its flesh, especially in the beginning of winter when the food consists of snails and worms, is very fat and juicy.—
The brown thrush or thrasher is placed by Baird in the subfamily mimína (with the cat bird and mocking bird), and genus *harpornychus* (Cab.). This bird (*H. rufulus*, Cab., or *T. rufulus*, Linn.) is 114 in. long and 13 in. in alar extent; brownish red above; below pale rufous white, thickly streaked with dark brown, and tinged anteriorly with reddish; two white bands on the wings; inner surface of wings and inner edge of primaries cinnamon; tail rufous. It is found over eastern North America to the Missouri, and to the high central plains; it is a constant resident in the southern states, and is almost as numerous as the robin; it migrates by day, singly, with a low and heavy flight. The song is prolonged, loud, varied, and melodious. The eggs are four to six, dull pale buff, with numerous brown dots; two broods are raised annually in the southern states; it breeds well in aviaries, and the young are raised like mocking birds, singing well and very actice in captivity. It is a bold and powerful bird, chasing cats, dogs, and foxes, not afraid of hawks and snakes, and savagely fighting with its rivals in breeding time; both sexes incubate; the food consists of insects, berries, and fruits of all kinds. The water thrush (*seirurus Noveboracensis*, Nutt.; *T. aquaticus*, Wils.) is placed by the most recent ornithologists in the family *sylveicola* or warblers; it is 6½ in. long and 9½ in. in alar extent; olive brown above with a green shade; beneath pale sulphur yellow, brightest on the abdomen; the other parts thickly streaked with olivaceous brown, and blackish on the breast. It is found throughout the eastern United States to the Missouri and south to Central America.

**THUANUS.** See ThOu, Jacques Auguste de.

**THUCYDIDES,** a Greek historian, born in Athens probably about 471 B.C., died about 400. He was the son of Olorus, and was probably connected with the family of Cimon. He tells us that he owned gold mines in Thrace, opposite Thasos. In 424 B.C. he was the commander of an Athenian squadron of seven ships, and charged with the general authority on the coast of Thrace; but as he failed to arrive in time to prevent the surrender of the important city of Amphipolis to the Spartan general Brasidas, he was condemned to exile, which continued 20 years. He spent much of this time in Thrace; but he must also have visited various parts of Greece, and it is certain from his own writings that he frequently visited the states under Lacedaemonian rule. He returned to Athens about the time the city was freed by Thrasybulus. The accounts of his death are uncertain. According to Pausanias, he was assassinated after his return; according to Plutarch, he was said to have been killed in Thrace, though his remains were carried to his native city. The work by which Thucydides is known is the history of the Peloponnesian war, a work equally distinguished by truthfulness, historical insight, excellence of narration, and mastery of arrangement of parts. The first edition was published by Al dus at Venice in 1502. Of the numerous later editions, the best are those of J. Bekker (3 vols., Berlin, 1821), Haack (2 vols. 8vo, Leipsic, 1820), Poppo (10 vols. 8vo, Leipsic, 1821-'38), Arnold (3 vols. 8vo, Oxford, 1880-'85), and Stahl's revised edition of Poppo (Leipsic, 1849-'75). There have been English versions by Nicolls (London, 1550), Hobbes, W. Smith (1759), Bloomfield (1829), Dale (1856), and Richard Crawley (1874).

**THUGS** (Hindi, *thugna*, to deceive), a sect of assassins in India, now exterminated by the British government. They roamed about the country in bands of from 30 to 100, and strangled to death such persons as they could decoy into their company. Their atrocious practices were not followed so much from impulses of plunder or malice as from religious motives. They were worshippers of the goddess Kali, who presided over impure love, sensual indulgence, and death. The members of the sect belonged to different Hindoo castes, and each had its functions. The bands were under a *junadar* or *sirdar*, who was the leader, and a *guru* or teacher. Its members were classified into spies, who were learners; strangers; entrappers, who were sometimes women; and grave diggers. They usually assumed the dress of merchants or pilgrims, and often craved the protection of those whom they intended to destroy. Their usual instrument of destruction was the handkerchief, with which by a dexterous movement they strangled their victims. The spies having informed the band of the route, habits, and circumstances of their intended victims, the members travelled in such lines as to be near one another, and the entrappers by artful management attracted them to a spot remote from dwellings, where the stranglers executed their office; and having stripped them of whatever they possessed, the grave diggers buried them, with such precautions as generally to prevent discovery. The plunder was divided, one third to the widows and orphans of the sect, one third to the goddess Kali, and the remainder to the partners in the assassination. After a murder the Thugs who had committed it united in a sort of sacrament, eating consecrated sugar. Their deities were carefully consulted before going on their expeditions, and unless the omens were favorable the Thug would not go. Neither women nor old men were victims. Europeans were never killed, as there would have been more danger of detection. There were also bands of Mohammmedan Thugs, of the sect of Moollances, and it is possible that at first the system of *thuggee* originated with Mohammmedan banditti, though it afterward became more a Hindoo than a Mohammmedan practice, and the words used are of Sanskrit origin. Thugs were found in all parts of India. Attempts were made to exterminate these bands of murderers in several of the native states, even prior to the present century; but their
connection as a wide-spread religious fraternity remained unknown till 1829, during the administration of Lord William Bentinck, who appointed Capt. (afterward Sir William) Sleeman to break up the organization. This was successfully accomplished by the arrest of every known Thug or relative of a Thug in India; 3,266 such persons were apprehended prior to 1837. They were colonized at Jubbulpore into a trade settlement, where technical instruction was afforded them and their children. Their descendants are still under government supervision there, and the practice of thuggee has become extinct.—In 1836 the government published, for judicial purposes, "Ramaseena, or a Vocabulary of the peculiar Language used by the Thugs," by Capt. Sleeman. See also "The Confessions of a Thug," by Meadows Taylor (London, 1858).

**THULE,** the name reported by the ancient navigator Pytheas, about the time of Alexander the Great, as that of the northernmost region of Europe. Strabo says that he gives no clue as to whether it is an island, or whether it is inhabited; and it is therefore probable that Pytheas did not visit Thule himself. Iceland is commonly supposed to be the land he referred to, as he says it was six days from the Orcades (Orkney islands); yet there are other reasons which favor the view that Mainland, the largest of the Shetland group, or Jutland, or Norway, is meant.

**THUN.** I. A walled town of Switzerland, in the canton of Bern, on the Aar, about 1 m. from Lake Thun, and 16 m. S. E. of Bern; pop. about 4,700. Among the public buildings are the old Kyburg castle, the cathedral, the federal military academy, and the modern Gothic castle of Schadau. It is a summer resort of tourists to the Bernese Alps. II. A lake, 10 m. long, 2 m. wide, and 1,896 ft. above the sea. It connects at the S. E. end with Lake Brienz by the Aar, which again emerges from the N. W. end of Lake Thun, and the water of the lake is carried into the lake through an artificial channel formed in 1714. The shores near the town of Thun are covered with fine villas and gardens. Near the S. W. shore are the two mountains Niesen and Stockhorn. A small steamer plies regularly.

**THUNBERG, Carl Peter,** a Swedish botanist, born in Jönköping, Nov. 11, 1743, died in Upsal, Aug. 8, 1828. He studied under Linnaeus at Upsal, became surgeon in a Dutch ship in 1771, passed three winters at the Cape of Good Hope, and between 1773 and 1779 resided principally in Java and Japan. He returned to Sweden in 1779, and was appointed in 1784 professor in the chair formerly occupied by Linnaeus, which he retained until his death. His works include *Flora Japonica,* &c. (Leipsie, 1784); a general account of his travels under the title of *Resa uti Europa, Africa, Asia* (4 vols., Upsal, 1788—91), which was translated into German, English, and French; *Prodromus Plantarum Capensium* (1794—1800); *Icones Plantarum Japonicarum* (1794—1805); *Flora Copensis* (1807—12); and nearly 100 academical dissertations.

**THUNDER.** See Lightning.

**THURINGIA,** a N. E. canton of Switzerland, bounded N. and N. E. by the Rhine and the lake of Constance, separating it from Schaffhausen, Baden, Wurttemberg, and Bavaria, S. E. and S. by the canton of St. Gall, and W. by Zürich; area, 882 sq. m.; pop. in 1870, 93,300, nearly all Germans, of whom 23,454 were Roman Catholics. The surface is comparatively level, but numerous hills traverse the country in different directions, the height of which nowhere exceeds 1,000 ft. above the lake of Constance. The principal river is the Thur, which flows N. W. and W. through Thurgau and Zürich to the Rhine. The climate in the southwest is severe, but elsewhere temperate. The soil is not very productive. Fruit is extensively grown, and good wine is produced. About one fifth of the surface is covered with forest. Linen and cotton goods, ribbons, lace, hosiery, and canvas are manufactured. Numerous schools are established throughout the canton. The only language spoken is the German. The executive power is vested in a council (kleiner Rath) of seven, who hold office for six years. The grand council or legislature consists of one member for every 220 citizens. It is presided over by two Landammanen, chosen annually, and sends five members to the national council. Capital, Frauenfeld.

**THURINGIA (Ger. Thüringen),** a central region of Germany, between the Hartz mountains on the north and the Thuringian Forest on the south, the river Saale on the east and the Werra on the west, the principal parts belonging to the Prussian province of Saxony, to Saxe-Coburg-Gotha, Weimar-Eisenach, Schwarzburg-Sondershausen, and Schwarzburg-Rudolstadt. The Thuringians were allies of Attila in the middle of the 5th century. Their country was afterward subdued by the Franks and Saxons. The Franks ruled it for some centuries through dukes and margraves. Under the Saxon emperors several Thuringian counts or landgraves obtained a kind of semi-independence. Louis the Jumper, son of Louis the Bearded, warred against the emperor Henry IV. in the latter part of the 11th century, and several of his successors added to the possessions of the house. One of them, Hermann (1190—1216), is chiefly known as a patron of minnesingers. A long war of Thuringian success was waged about the middle of the 13th century, the termination of which left the principal parts of the country in the possession of the margraves of Meissen. Thuringia was now ruled by the Saxon house of Wettin, until, after various changes, the Saxon dominions were divided in 1485 between Ernest and Albert, the sons of Frederick the Mild, when Thuringia fell to the Ernestine line. (See Saxony.)—The Thuringian Forest (Ger. Thüringerwald), which bounds
it S. W. and S., is a narrow and wooded mountain range, rising in some parts upward of 3,000 ft., and extending nearly 70 m., not including numerous northern offshoots toward the Hartz. In the southeast it approaches the Fliehtelgebirge, and in the southwest the Rhön, from which it is separated by the valley of the Upper Werra. The inhabitants are chiefly engaged in mining, grazing, and manufactures. The territory covered or traversed by the Thuringian Forest is included in the Prussian province of Saxony, Saxe-Weimar-Eisenach, Meiningen-Hildburghhausen, Saxe-Coburg-Gotha, Schwarzburg-Rudolstadt, Altenburg, and the Reuss principalities, all of which territories are called Thuringian in the wider sense.

**THURLOE, John,** an English statesman, born at Abbots Roding, Essex, in 1616, died in London, Feb. 21, 1668. He was called to the bar in 1647, and in 1652 became secretary to the council of state, and in 1658 secretary to the protector. In 1657 he was made a privy councillor, and in 1658 governor of the Charterhouse and chancellor of Glasgow university. While continuing to hold office under Richard Cromwell he was accused of offering his services to the promotion of Charles II., and was imprisoned in May and June, 1660. After his release he took no part in public affairs. His collection of state papers, with a number of private papers and letters, was edited, with a life of Thurlow, by Thomas Birch, D. D. (7 vols. fol., London, 1742.)

**THURLOW, Edward,** lord, an English statesman, born at Little Ashfield, near Stowmarket, Suffolk, in 1732, died in Brighton, Sept. 12, 1806. He was educated at Cambridge, was called to the bar in 1754, entered upon a lucrative practice, and was appointed king's counsel in 1761. In 1768 he was elected to parliament, in 1770 was appointed solicitor general, in 1771 attorney general, and in 1778, as a reward for his zealous advocacy of the government policy respecting America, he was made lord chancellor in Lord North's ministry, and raised to the peerage as Baron Thurlow. By command of the king he retained the office of lord chancellor in the Rockingham and Shelburne administrations, notwithstanding he was politically opposed to his condutors, and lost no opportunity to defeat their leading measures. This led to the withdrawal of Fox; and in the coalition ministry which succeeded, it was stipulated that Thurlow should not hold a seat. He still remained in confidential relations with the king, and on the accession of Pitt to power, in December, 1783, received again the great seal, which he held for more than eight years. He opposed certain measures of the cabinet, which led to his removal at the request of Pitt, whom he always disliked, and with the consent of the king. He was overbearing and passionate, a dictator rather than a debater in parliament, but an impressive and eloquent speaker.—His nephew and heir, EDWARD HOVELL-THURLOW, second

lord (1751-1859), published "Ariadne, a Poem in three Parts" (1814), "Carmen Britannicum" (1814), and several volumes of miscellaneous poems, including translations from Anacreon and Horace.

**THUR AND TAXIS.** See Post, vol. xiii., p. 748.

**THURSDAY,** the fifth day of the week, the *diea Jovis* of the Roman calendar, and sacred in the northern mythology to the thunderer Thor, from whom it is named. In German it is called *Donnerstag* (thunder day, originally Thunderer's day).

**THURSTON,** a S. W. county of Washington territory, bounded N. E. by the Nisqually river, and W. by the Coast range; area, 672 sq. m.; pop. in 1870, 2,246. Much of the surface is mountainous, but there are several rich valleys. An arm of Puget sound extends into the N. E. part, and it is drained by the Des Chutes river and other streams. The Pacific division of the Northern Pacific railroad passes through it. The chief productions in 1870 were 10,602 bushels of wheat, 1,778 of rye, 17,515 of oats, 18,375 of potatoes, 16,511 lbs. of wool, 40,425 of butter, and 3,013 tons of hay. There were 788 horses, 1,134 milch cows, 1,973 other cattle, 4,192 sheep, and 788 swine; 2 flour mills, 1 tannery, 1 currying establishment, and 3 saw mills. Capital, Olympia, which is also the capital of the territory.

**THVESTES.** See Arrasus.

**THYLLACINE, or Pouched Wolf,** a marsupial animal of the dasyurine family, and genus *Thylassinaceus* (Temminck) or *peracyon* (Gray), peculiar to Tasmania; both of the generic names indicate the possession of the pouch. In this genus the dentition is: incisors 2, the outer slightly the largest; canines 4-5, large, simply conical, the upper separated from the incisors by a deep concavity in which the apex of the lower is received when the jaws are closed, in this differing from carnivora proper, in which the lower canines pass outside of the upper jaw; premolars 4-5, separated from each other; molars 4-5, with a large central cusp, and two smaller, one in front and the other behind it. The humeras has the inner condyle perforated, the hind feet have no
ner toe, and the marsupial bones are absent, represented only by fibro-cartilage; the female has a distinct pouch, with four mamme. Only one species is described, the dog-headed thylacine (T. [P.] Harrisii, Temm.), about the size of a young wolf, or 32 ft. long, with a tail 20 in. additional, and a height at the shoulders of about 22 in.; the head is dog-shaped, with narrow and elongated muzzle; ears short, pointed, very broad at the base, and well covered with hair on both surfaces; eyes full and black, with a nictitating membrane; long black bristles on the upper lip, and a few on the cheeks and above the eyes; the claws stout, short, and brown, the bottoms of the feet with large, very rough pads. The fur is short and close, waved and slightly woolly; the general color is grayish brown, paler below, with 12 to 14 transverse black bands on the back, longest and widest posteriorly; pale around eyes, and edge of upper lip white; tail with short fur, with longer hairs at under side of apex; rusty red about the pouch; the legs are shorter in proportion than in the wolf, and the gait is semi-plantigrade. It is wild and shy, inhabiting the caverns and dismal glens of mountainous districts; inactive during the daytime, probably from imperfect vision, it preys at night upon the smaller marsupials; it is sometimes so large as to be a match for several dogs, and is one of the most formidable of Australasian quadrupeds; it is rare except in the most inaccessible regions. Among the fossil remains of the caves of Wellington valley, New South Wales, Prof. Owen has described parts of lower jaws of what he calls T. spelanus, differing from existing ones in their greater depth. In the secondary schists of Stonesfield has been discovered the genus thylacotherium (Owen), known by the lower jaw, which has six incisors, two moderate canines, six false and six true triangular molars; the T. Prevosti (Ouv.) was about the size of a rat. An allied genus from the same strata is phascolotherium (Broderip), somewhat larger.

THYME, low undershrubs or perennial herbs, of the genus thymus (Gr. θυμος, from θεμεν, to burn perfume, it having been used as incense), of the labiate or mint family. The wild or creeping thyme of northern Europe (T. serpyllum) is sparingly naturalized in the older states in old fields, and in some cases as a weed upon lawns; it is much branched and prostrate, forming low dense tufts a foot in diameter; its very small ovate leaves are fringed at the base with a few long hairs, and its purplish flowers are crowded in whorls at the ends of the branches. This is sometimes cultivated as an aromatic herb, but not so much so as the garden thyme (T. vulgaris), from southern Europe, which differs from the preceding in having a more erect and bushy habit, paler leaves, and flowers in shorter clusters; there are varieties of this, both the broad-leaved and narrow-leaved being known in kitchen gardens, and the variegated or golden thyme, which has each leaf distinctly marked with yellow, is a pleasing ornamental plant. Lemon thyme, much esteemed by some for its peculiar flavor, is T. citriodorus. The thyme in general use is T. vulgaris, the foliage of which is highly aromatic and much used for flavoring stuffing and other cooking; its properties are due to an essential oil, the oil of thyme, which is used as an external stimulant, in liniments, especially in veterinary medicine; it contains a liquid and a solid oil or camphor, which may be separated by fractional distillation.

THYMUS GLAND (Gr. θυμος), a double vascular or ductless gland, situated, in the human subject, in the upper part of the anterior medias-

Wild Thyme (Thymus serpyllum).

Transverse Section of an Injected Lobule of the Thymus of a Child, magnified 20 diameters. a, Membrane of the lobule. b, Membrane of the gland follicles. c, Cavity of the lobule from which the larger vessels branch out into the concavities, on the surface of which they terminate, occasionally forming loops.
TN. TIAHUAÑACO, or Tiawanaco. See TITICACA.

TIARA (Gr.), a species of high hat, anciently worn by many eastern nations. Those of kings and priests were encircled by a sort of crown, whence the term tiara has been applied to the triple crown worn by the popes, which in turn bears a striking resemblance to the Persian royal tiaras and to those of the Assyrian kings, represented on the slabs at Nineveh. It is uncertain when the popes assumed the tiara. It was called regnum, or emblem of royalty, to distinguish it from the mitre. Pope Innocent III., in his sermon on St. Sylvester, says that the bishop of Rome uses the mitre everywhere and at all times, because his episcopal jurisdiction is universal, whereas he only uses the regnum or tiara occasionally and in his own dominions.

The papal tiara was at first a conical cap, topped with a small round ball, and wreathed about the forehead with a crown of gold. It retained this shape...

TIBER

TIBERIAS. TIBERIIS, navigable

confluence its years granted purpose, till the beginning of the 16th century, where it assumed an oval shape, swelling out somewhat broad at top.

TIBALDI, Pellegrino, otherwise called Pellegrino Pellegrini, an Italian artist, born in Bologna in 1527, died in Milan about 1598. At 20 years of age he visited Rome, where he studied the works of Michel Angelo, and was employed by Cardinal Poggio to decorate his palace in Bologna. In 1586 he was invited by Philip II. to Spain, and during a residence there of nine years executed frescoes in the Escorial, besides many pictures. He was also an architect; his best architectural designs were the modern façade attached to the cathedral of Milan, and the Casa Professa, or house of the Jesuits, in Genoa.

TIBBOIS. See Tuahies.

TIBER (It. Tevere; anc. Tiberis), a river of Italy, rising in the Tuscan Apennines, 5 m. N. of Pieve San Stefano, and thence flowing generally S. S. E. and S. S. W., through the provinces of Arezzo and Perugia and between the latter and Viterbo, to Fiano, where it turns S. W., and passing through the province and city of Rome discharges into the Mediterranean near Ostia by two mouths, which enclose the Insula Sacra of the ancients. Its length is about 230 m., and its width at Rome and below from 300 to 500 ft. Its principal alluvial plains are the Chiascio, the Nera (anc. Nar), and the Teverone (Anio) from the left, and the Paglia from the right. In the upper part of its course, between Todi and the Passo del Forello, it is obstructed, by rapids and passes for some miles through a narrow gorge. It is navigable for vessels of 150 to 200 tons to Rome (13 m. from its mouth, and for boats to the confluence of the Nera, about 90 m. Rome and Perugia are the principal cities in its basin. From Perugia, above its confluence with the Chiascio, to its debouchure, its waters have a yellowish tinge, the result of the yellow clay through which it passes. An appropriation was granted at the end of 1875 by the Italian government for the preliminary measures relating to the improvement of the course of the Tiber. Various plans are proposed for that purpose, including one of vast scope advocated by Garibaldi.

TIBERIUS. See Genesaret.

TIBERIUS, an emperor of Rome, born Nov. 16, 42 B. C., died March 16, A. D. 37. His full name was Tiberius Claudius Nero Cesar. He was the eldest son of Claudius Tiberius Nero and Livia Drusilla. His father divorced his wife in order that she might be married to Augustus; and when he died, in 23 B. C., his funeral oration was pronounced before the rostra by his son, then only nine years old. Tiberius was educated by the emperor with princely care. In 29 he accompanied Augustus in his triumphal entry into Rome, and subsequently married Vipsania Agrippina, by whom he had a son named Drusus; but in 11 he was compelled by the policy of Augustus to divorce her, much against his will, and marry the beautiful but dissolute Julia, daughter of the emperor. In spite of her licentiousness he seems to have lived peaceably with her for a year, and had by her one child which did not live; and after that event the feelings of dislike between them gradually increased until they led to a virtual separation. As military tribune Tiberius made his first campaign in the Cantabrian war. In 20 he went to Asia Minor, restored Tigranes to the throne of Armenia, and compelled the Parthians to give up the eagles taken from Crassus; in 15 he and his brother Drusus carried on a war against the Alpine nations of Rhaetia, and the exploits of the two were celebrated by Horace. In 13 Tiberius became consul with P. Quintilius Varus; in 11 conducted the war against the revolted Dalmatians and the Pannonians; and in 9, when Drusus was fatally injured in Germany, he hastened from Pavia to the place where his brother was dying, and after his death conveyed the body to Rome, walking all the way before it on foot, and on arriving at that city pronounced over it a funeral oration in the forum. He returned to Germany, gained several victories, and crossed the Rhine; but in 7 he went back to Rome, celebrated his second triumph, and was made consul a second time. In 6 he obtained tribunician power for five years, but suddenly formed the resolution of retiring to Rhodes. According to Tacitus, this was to get away from the licentiousness of his wife; but other authorities say it was on account of the jealousy between himself and the grandsons of Augustus. At Rhodes he resided eight years, living in a very simple style. While he was absent his wife was banished (2 B. C.) to the island of Pandataria, and at the expiration of his tribunitian power Tiberius asked leave to return to Rome; but permission was not granted till A. D. 2, and then only on condition that he would take no part in public affairs. The death of the two older grandsons of Augustus virtually left Tiberius the succession to the throne, and in A. D. 4 he was adopted by Augustus. From this time to the death of the emperor he was constantly employed in military operations. He conquered all Illyricum, gained great victories over the Germans and the Dalmatians, and in 12 celebrated his fourth triumph. His military successes were all-important, as the loss of Varus and his legions in Germany had placed the empire in danger. In 14 he started for Illyricum to conduct the war in that quarter, when he was recalled by the death of Augustus to ascend the throne. One of the first acts of his reign was to put to death Agrippa Postumus, the only surviving grandson of Augustus, alleging that the execution was in accordance with the wishes of the late emperor. The first years of his
regn were marked by prudence and moderation. He rejected all flattery from the senate, placed in office the most worthy persons, and made efforts to relieve the scarcity of bread constantly recurring in Rome. Meanwhile a mutiny of the legions in Pannonia was only quelled by the energy of Drusus, the emperor's son, and the terror inspired by a solar eclipse. Under the influence of Sejanus, who had become his favorite, the natural severity of his temper began to degenerate into cruelty. The election of magistrates was taken from the popular assembly and transferred to the senate, which sat simply to register the decrees of the emperor. The charges of losa majestas, by which all persons suspected of impugning by word or deed the majesty of the emperor were tried, were prosecuted with great rigor. A secret organization of delatores, or spies, was formed, and their infernal machinations exposed the life, the fortune, and the honor of every Roman citizen to hourly danger. After the death of Germanicus (see Agrippa), the emperor surrendered himself more and more to the influence of Sejanus. By his advice the pretorian cohorts, stationed hitherto in various parts of the city, were assembled in one camp, in the vicinity of Rome. At the same time the power of the empire was thoroughly maintained in the provinces, and two revolts in 21, one on the Moselle headed by Julius Florus, and the other among the Eduli headed by Julius Sacrovir, were put down and their leaders forced to slay themselves to escape from the imperial troops. In 23 Sejanus caused the death of Drusus by poison. Whether Tiberius felt any sorrow or not, he certainly manifested none; and when the people of Tarsus sent him a message of condolence, he sneeringly sent back an answer of condolence on the death of their fellow citizen Hector. In 26 the emperor finally departed from Rome. He first went to Campania, and there issued an edict commanding the people not to molest his retirement, and in the following year went to the island of Caprea (Capri). The early part of his reign had been marked by a strict regard for external decency, and a stringent law had been passed against courtesans; but his last years were spent in the most infamous pleasures. Capreae became the haunt of disgusting debauchery, especially after the death of Livia Drusilla in 29, who had always exercised much influence over her son. In 30 he banished Agrippina, the widow of Germanicus, and afterward caused the assassination of two of her sons. Henceforth Sejanus had the full control of affairs of state. The employment of delatores gave him abundant means of getting rid of noxious individuals on false charges. Tiberius, who had been suspecting for some time the plots of his minister, managed to get rid of Sejanus in 31, and the favorite and all his family were destroyed. In the mean time the emperor became, in the words of Pliny, “the most wretched of men.” In the remarkable letter sent to the senate, in which Tacitus has preserved, he begins with a frank avowal of his misery. “What to write to you,” he says, “or how to write, I know not; and what not to write at this time, may all the gods and goddesses torment me more than I daily feel that I am suffering, if I do know.” About this time he went once more to Campania, and occasionally came as near Rome as his gardens on the Vatican. But his privacy was never disturbed; soldiers were placed so as to prevent any one from coming near him. He had been remarkable for beauty and majesty of person, but dissipation had covered his face with ugly blotches, and his body was bent nearly double. At Astura he was attacked by illness, and he reached Misenum to die in the villa of Lucullus. According to Tacitus, it was left to fate to determine his successor. On March 16 he had a fainting fit, and as he was thought dead, Caius Caligula, the son of Germanicus, was saluted as his successor; but the emperor suddenly recovering, a quantity of clothes was thrown over him and he was left alone. There is another account of his death. The people hailed the event with delight, and the cry of “Tiberius to the Tiber” was heard constantly in the streets of Rome. He however had a public burial. The chief authorities for his life are Suetonius, Dion Cassius, and above all Tacitus. He wrote a commentary of his own life, Greek poems, an ode on the death of L. Cæsar, and several epistles and orations, either to the senate or on occasion of funerals. The crucifixion of Christ took place during his reign.—See Tiberius’ Leben, Regierung und Charakter, by Adolf Stahr (Berlin, 1874).

TIBET. See THIBET.

TIBULLUS, Albini, a Roman poet, of the time of Augustus. He was of an equestrian family, and lived on his ancestral estate at Pedum near Rome. He went to Aquitania in 31 B. C. with his patron Messala, and when the latter had pacified that part of Gaul and set out to take command in the East, Tibullus accompanied him, but falling sick returned to Rome, and died young. Four books of elegies are attributed to him, but only the first two are undoubtedly his. Tibullus was a warm friend of Horace, who addressed two poems to him. The first edition of his works was printed, along with Catullus, Propertius, and the Silvae of Statius, at Venice in 1472. Two of the best late editions are those of Rossbach (Leipsic, 1866) and Müller (Leipsic, 1875). The elegies of Tibullus have been translated into English verse by Dr. Granger (1752), and a prose translation forms a volume of Bohn’s “Classical Library” (London, 1854).—See Seiler, De Tibulli Elegia (Halle, 1873).

TIBER. See TIVOLI.

TIC DOLOUREUX. See NEURALGIA.

TICHBORNE TRIAL, the most celebrated conspiracy case, and the first in which the impos-
tor assumed identity with a known person, in English legal records. Roger Charles Tichborne, born July 5, 1829, was, after his father, heir to the title and great estates of his uncle, Sir Edward, who added the name Doughty to Tichborne. After an education in France and at the Roman Catholic college of Stonyhurst, Roger entered the army in 1849. In 1852 he offered himself to his cousin Kate, daughter of Sir Edward; but her parents opposed the marriage, upon which he resigned his commission and went to sea. He arrived at Valparaíso June 19, 1858, and on April 20, 1854, sailed from Rio de Janeiro for New York in the ship Bella, which was lost at sea. Sir Edward died March 5, 1858, and was succeeded by his brother James, Roger's father, who died June 11, 1862. In the presumed loss at sea of Roger, he was succeeded by his second son Alfred, who died Feb. 22, 1866, and was succeeded by a posthumous son, born May 28, 1866. In 1865 Lady Tichborne, widow of Sir James, began to advertise in English and Australian newspapers for her son Roger, whom she believed to be alive. In 1866 a butcher in Wagga Wagga, Australia, supposed to be Arthur Orton, but then calling himself Thomas Castro, asserted that he was Roger Charles Tichborne, and had been saved from the wreck of the Bella. After some correspondence with Lady Tichborne, he sailed for London, arrived there Dec. 25, and in January, 1867, went to Paris, where Lady Tichborne accepted him as her son and supplied him with money. Nearly every other member of the family repudiated him as an impostor; but he found many adherents who assumed to recognize him as the long lost Roger, and went about England collecting witnesses and gathering information concerning the family, the estates, and incidents in Roger's life. In March, 1867, he filed a bill in chancery to restrain the trustees of the estates from setting up certain outstanding terms as an ab initio action by the family to recover the property. The commencement of the action was delayed nearly four years by the sending of commissions to South America and Australia, and by other causes. In the meantime Lady Tichborne died, March 12, 1868. The case had excited extraordinary attention. Public opinion was divided, though so many believed in the claimant that he was able to raise considerable money by the sale of bonds payable upon his coming into possession of the property. On May 11, 1871, the trial for the recovery of the Tichborne estates in Hampshire and Dorsetshire, valued at £24,000 a year, was begun in the court of common pleas. With two adjournments, it continued 103 days, till March 5, 1872, when the jury interposed, declaring themselves satisfied that the claimant was not Roger Charles Tichborne, and he was nonsuited. He was immediately ordered into custody to be tried for perjury, but was subsequently released on bail. The trial for perjury of Thomas Castro, otherwise Arthur Or- ton (as the indictment ran), was commenced in the court of queen's bench on April 23, 1873, and continued 188 days to Feb. 28, 1874, when he was found guilty and was sentenced to 14 years' penal servitude. He was sent to Millbank, and subsequently transferred to Dartmoor prison. The principal points in the two cases which led to the claimant's conviction were these: After assuming to be Tichborne, the claimant, though hard pressed for money, did not avail himself of balances and credits which Roger had with two Australian bankers. On arriving in London he immediately sought for the relatives of Arthur Orton, and subsequently sent to one of the Orton sisters photographs of himself, wife, and child as those of Arthur Orton and family. He was entirely ignorant of incidents connected with Roger's residence in France, and knew no French, which Roger spoke better than he did English. The handwritings of the two were wholly unlike. Roger was well educated, while the claimant was grossly illiterate. The physical differences between the two were even more marked. Roger was thin; his hair was straight; his ears adhered to the sides of his head. The claimant was enormously fat; he was an inch taller than Roger; his head was larger; his hair was inclined to curl; his ears were dependent and free, with large lobes; and it was clearly proved that one of Roger's arms was tattooed with his initials, while no such marks could be found on the claimant. The career of the claimant was also closely traced from the time when he left England to the time when he assumed to be Roger. The expense of the trials compelled the trustees to mortgage the Tichborne estates. See "Charge of the Lord Chief Justice in the Case of The Queen e. Castro", 2 vols. 8vo, London, 1875.

**Ticino** (Fr. and Ger. Tessin), a S. canton of Switzerland bordering on Vahis, Uri, Grisons, and Italy; area, 1,095 sq. m.; pop. in 1870, 119,619, nearly all Roman Catholics. The surface is mountainous, but the N. part is more elevated than the S., that frontier being formed by lofty summits of the Alps, including the central mass of the St. Gothard range; and a considerable portion of it belongs to the glacier region. The face of the country has a general slope toward the south, and lofty mountain ridges traverse it in that and a S. E. direction. With the exception of a small part of the north, the drainage belongs to the basin of the Po. The principal river is the Ticino (anc. Ticinus), which, rising in Mt. St. Gothard and receiving numerous tributaries, flows through Lago Maggiore, a small portion of which is within the boundary of the canton, to the Po near Pavía. There are several other lakes, including Lugano, Muzzano, and Origlio. In the elevated parts of the canton the chief business is cattle rearing and butter and cheese making. In the south there are on the lower slopes chestnut forests, and in the valleys vineyards, corn fields, and plantations of figs, almonds, oranges, citrons,
mulberries, and pomegranates. Game is abundant in the forests, and the streams and lakes are well stocked with fish. The manufactures are of no importance. The inhabitants belong to the Italian race, and speak that language. Only one village, Bosco, situated near the frontier of Valais, speaks German.—The Ticino was conquered from Italy by the Swiss in 1512, and, under the name of the Italian bailiwicks, was governed by deputies till 1815, when it was admitted as a member of the Swiss confederation. The government is vested in a council chosen by all citizens who have attained the age of 20 years. The property qualification of voters was abolished in 1803. The grand council meets alternately at Lugano, Locarno, and Bellinzona. The canton sends six members to the national council. The railway from Bellinzona to Locarno was opened Dec. 20, 1874.

**TICK,** the common name of several families of small arachnids infesting the skin of man and the lower animals. In addition to what has been given under *Eriozoa* and *Mites,* it may be stated that, from the young tick having only three pairs of legs instead of the four pairs of the adult spider and mites, some have maintained that the arachnids form an order of the class of insects, and not an independent class. The legs also in the young are very long and the head separate from the thorax, as in the insect. (See "American Naturalist," vol. III., 1869, pp. 564–575.)

**TICKELL, Thomas,** an English poet, born at Bridekirk, Cumberland, in 1656, died in Bath, April 28, 1740. He was educated at Queen's college, Oxford, and in 1710 was chosen fellow. He was a friend of Addison. During the negotiations for peace with France, Tickell published a poem entitled "The Prospect of Peace," which went through several editions. On the arrival of King George I. he wrote "The Royal Progress," printed in the "Spectator." His translation of the first book of the Iliad was brought out in opposition to that of Pope. Addison declared it the best version ever made, and it was suspected that he himself was the translator. Besides some minor poems, Tickell published a "Letter to Avice," written during the dispute on the Hanoverian succession, and an elegy on Addison, which was extravagantly praised by Johnson. Addison had employed Tickell in public affairs, and when in 1717 he was appointed secretary of state, he made him his under secretary. In 1725 Tickell became secretary to the lords justices of Ireland, in which office he died.

**TICKNOR, George,** an American author, born in Boston, Aug. 1, 1791, died there, Jan. 26, 1871. He graduated at Dartmouth college in 1807, studied law, and was admitted to the Boston bar in 1813, but never practised. From 1815 to 1829 he resided in Europe, and on his return became professor of the French and Spanish languages, literature, and belles-lettres in Harvard college. He resigned in 1835, and spent three years in Europe. In 1849 appeared his "History of Spanish Literature" (3 vols. 8vo, New York; 4th ed., edited by G. S. Hillard, 3 vols., Boston, 1871), which was translated into Spanish, German, and French (in part), and was accepted as an authority in Spain itself. Mr. Ticknor was one of the association of writers by whom the "Monthly Anthology" was conducted. His latest publication was the life of his friend W. H. Prescott (Boston, 1864).—See "Life of George Ticknor," by George S. Hillard (Boston, 1876).

**TICONDEROGA,** a town of Essex co., New York, enclosing the outlet of Lake George, 88 m. N. by E. of Albany; pop. in 1870, 2,590; in 1875, 3,401. It is at the junction of the Addison railroad, a branch of the Central Vermont, with the Champlain division of the Delaware and Hudson canal company's lines, and is the S. terminus of the Lake Champlain company's steamers. The portion of the town lying between Lakes George and Champlain is a lofty promontory, the terminus of a mountain ridge; Mt. Defiance at the extremity of the promontory is 750 ft. above the surface of Lake Champlain. The outlet of Lake George, 4 m. in length, has a fall in 2 m. of 220 ft.; and as the water never apparently varies in quantity, and is remarkably pure, it forms a very valuable water power. There is a vein of excellent graphite in the town, and about 25 tons of black lead are produced monthly by the "American Graphite Company," the only one in the United States. There are also extensive deposits of good iron ore, which is mined by the "Iron Company." Large quantities of lumber are manufactured, and there are an extensive sash and door factory, two foundries, two woollen mills, and a cotton factory of 20,000 spindles. The town has 15 schools, a weekly newspaper, and Baptist, Congregational, Episcopal, Methodist, and Roman Catholic churches. Nearly the entire business portion was destroyed by fire, March 31, 1875; it is now being rebuilt with fine brick buildings. The town is particularly remarkable for the prominent place its fortifications have held in American history. Early in 1755 the French, who had already occupied and fortified Crown Point, and caused a careful survey of Lake Champlain to be made, advanced to Ticonderoga and commenced a fortification there, which entirely commanded the passage of the lake. This fort they named Carillon (chime of bells), in allusion to the music of the waterfalls near it. It was afterward known as Fort Ticonderoga. Sir William Johnson was the commander of an English and colonial army the same year intended for the reduction of this fortress and Crown Point; but learning that the French had re-enforced it largely, he contented himself, after defeating Dieskan at Lake George, with fortifying Fort William Henry at the S. end of that lake. In 1757 Montcalm assembled a force of 9,000 men at Fort Carillon, and ascending Lake George attacked and reduced Fort Wil-
TIDES

R.M. Henry, Aug. 3. In the summer of 1758 Gen. Abercrombie took the command of an expedition for the reduction of Fort Carillon, crossed Lake George with 15,000 men, and on July 8 attempted to take the fort by storm, but was repulsed with a loss of 2,000 men. In 1759 Gen. Amherst at the head of 12,000 men invested Ticonderoga, and the French, not having a sufficient force to hold it, dismantled and abandoned it, July 30; and soon after Crown Point was also abandoned. The English government then greatly enlarged and strengthened the two fortresses. The fort and field works of Ticonderoga extended over an area of several miles. After the cession of Canada in 1763, the fort was allowed to fall into partial decay, and was held by a small force. Upon the receipt of the news of the battle of Lexington, Col. Ethan Allen surprised the fort, May 10, 1775, and captured the garrison of 50 men and the artillery and munitions of war in the fort. (See Allen, Ethan.) The centennial of this event was celebrated in the town on May 10, 1875. In 1776, after an engagement between the British and Americans, the latter were compelled to take refuge under the guns of Fort Ticonderoga. On June 80, 1777, Burgoyne invested the fort, and on July 4 erected a battery on Sugarloaf hill (now Mt. Defiance), which completely commanded it and compelled the garrison to evacuate it the next night, sending their stores and munitions to Skeneborough (now Whitehall), and escaping themselves into Vermont. In September of the same year Gen. Lincoln made an attack upon the works, took Mts. Hope and Defiance, released 100 American prisoners, and took 293 of the enemy, an armed sloop, several gun boats and 1,000 bateaux, but did not capture the fort. After the surrender of Burgoyne the fort was dismantled, and the garrison retreated down Lake Champlain; some of them were captured by Capt. Ebenezer Allen. In 1780 Gen. Haldeman with a company of British soldiers advanced to Ticonderoga and occupied it for some time; and from this point Major Carleton made a diversion against Forts Anne and George, in favor of Sir John Johnson. After the war the fort fell into ruins; portions of the walls are still standing.—There is a history of Ticonderoga by the Rev. Joseph Cook (Keeseville, N. Y., 1855).

**Tides**

Tides, the alternate rising and falling of the waters of the ocean, which is to be observed on all its coasts and estuaries. The rising is designated as the flood, and the highest elevation as high water; the falling is called the ebb, and the lowest depression low water. The duration of high and low water without apparent change of level is known as the stand, and the cessation of the ebb and flood streams or tidal currents is called slack water. The tides of each day occur somewhat later than those of the preceding day, the average retardation from day to day being about 50 minutes. The times of occurrence of high water bear a very close relation to the appearance of the moon in certain positions. Thus at New York high water occurs when the moon is about E. S. E.; at New Castle, on Delaware river, when the moon is nearly S.; at Baltimore when it is rising or setting. These are rude statements, but they are sufficiently accurate for many purposes, and they show at once the close connection between the time of high water and the time of the moon's transit of meridian. In fact, so completely is this recognized, that, in order to give the time of high water upon any day, it is usually thought sufficient to state the time of high water on the days of new moon and full moon (or "full and change") when the moon passes the meridian at 12 o'clock nearly. This time is called the establishment of the port. Then to find (roughly) the time of high water on any other day, it is only necessary to add the establishment to the time of the moon's meridian passage on that day. There will also be another high water on the same day, preceding or following that so found by 12th. Upon examination it will be found that the interval between the time of the moon's passage over the meridian and the time of high water varies sensibly with the moon's age. At new moon, full moon, first quarter, and third quarter (or rather on the day following each of these phases), the interval between the time of the moon's passage and the time of high water is nearly the same; but from new moon to first quarter, and from full moon to third quarter, the high water occurs earlier than would be inferred by using that same interval; and from first quarter to full moon, and from third quarter to new moon, it occurs later than the same interval would give it. The height at high water and the depression at low water are not always the same. On the days following new moon and full moon, high water is higher and low water lower than at any other time; these are called spring tides. On the days following the first and third quarters, high water is lower and low water higher than at any other time; these are called neap tides. Thus at New York the rise and fall (that is, the increase in elevation between high water and low water) is about 4 1/2 ft. at spring tides, and 3 1/2 ft. at neap tides. At Boston this variation is from 11 1/2 to 8 ft. There is a sensible difference in height between two successive high waters or low waters, one occurring before noon, the other after noon, and these differences are most perceptible when the moon is at her greatest declination N. or S., and disappear when she is near the equator. There are other variations of height depending on other circumstances. In a single tide the interval from high water to low water is greater than that from low water to high water; the difference between these intervals is sensibly greater at spring tides than at neap tides. The tidal current in

---

Note: The text contains several dates and times related to historical events and astronomical phenomena, such as the transit of the moon and high/low water occurrences. It also references specific locations like New York, New Castle, Baltimore, and Boston, and mentions the unusual tidal currents observed during different phases of the moon's cycle.
the bay runs upward for some time after high water, and after changing its direction continues to run downward for some time after low water, when it again changes its direction, and runs upward. If we further examine the state of the tide in different parts of the same river, or in a bay of great length as compared with its breadth, as for instance Chesapeake bay, we shall find that near the mouth there is very little difference between the interval from high to low water and that from low to high water; also that the current runs up the channel for a long time (sometimes approaching to three hours) after high water, and runs down the channel for as long a time after low water. In going up the bay we find that the high water occurs later and later, but the velocity with which the high water travels is so great as entirely to preclude the idea of explaining the tide by supposing the same mass of water to have been moved all the way up the bay. Thus, high water is 18 hours in travelling from Cape Henry to the head of Chesapeake bay, 190 m., moving with an average velocity of 15 m. an hour, while the greatest observed current is less than one mile an hour. High water takes place simultaneously near the head and the mouth of the bay, while it is low water at the same time near the middle. The interval from low water to high water diminishes as we go up the bay, as also the difference between the stand and slack water. At the entrance of the bay the ebb current begins three hours after the high water stand; in the vicinity of Annapolis it is but one hour, and at the head of the bay there is only half an hour between the high water stand and the commencement of the ebb current. Herodotus speaks of the tides in the Red sea. Plutarch says that Pythians of Massilia, who had observed them in Britain, ascribed them to the moon. Cesar, in his account of the invasion of Britain, refers to the nature of spring tides as well understood in connexion with the moon's age. Pliny explains the phenomena at some length, and ascribes them to the sun and moon dragging the waters along with them. Kepler in accounting for the tides was evidently aware of the principle of gravitation, but not of the law. Newton laid hold of this class of phenomena as the most incontestable proof of universal gravitation, and showed that according to its law just such periodic fluctuations in the fluid covering of the earth must take place as are actually exhibited by the tides of the ocean. If we conceive the earth to be wholly or in a great degree covered with water, and subject to the attraction of the sun, the force of which is inversely as the square of the distance, it will be obvious that while the whole earth will fall toward the sun with a velocity proportioned to the aggregate attraction upon its solid portions (which is the same as if all the matter were collected at its centre), the water nearest to the sun, being accelerated by a greater force, and being fluid, will approach the sun more rapidly than the solid core. It will thus run from all sides into a protuberance beyond the form of equilibrium of the earth's attraction and rotation, until the pressure of the elevated mass equals the difference in the attraction of the sun. Moreover, a similar protuberance will be formed on the side opposite to the sun, since the particles of water, being solicited by a less force than the solid core, will fall more slowly toward the sun, and as it were remain behind. Nor does the fact that, on the average, the earth does not lessen its distance from the sun, in the least invalidate the force of this reasoning; for the deviations from the tangential motion of the earth in its orbit are precisely those which the earth would move through if falling toward the sun unaffected by any other impulse. The same considerations hold in regard to the attraction of the moon upon the earth and the waters surrounding it; for although we are in the habit of considering the moon as simply revolving about the earth, it must be remembered that the attraction is mutual, that both bodies describe orbits about their common centre of gravity, and that while the moon obeys the attractive force of the earth, the latter equally follows that of the former, by which it is at every instant of time drawn from the path which it would pursue if that influence did not exist, by an amount precisely equal to the fall corresponding to the moon's attractive force. As a necessary consequence of the elevation of the water in the regions nearest to and most remote from the attracting body, there must be a corresponding depression below the mean level of the sea at points distant 90° from the vertices of the protuberances, or at the sides of the earth as seen from the sun or moon. If the latter bodies maintained a constant position with respect to the earth, the effect would therefore be to produce a distortion of figure in the ocean surface (assumed to cover the whole earth) having the form of a slightly elongated ellipsoid, the two vertices of which would be, the one precisely under, the other precisely opposite to the points at which the disturbing body is vertical. But this is not the case; for by the rotation of the earth and the motion of earth and moon in their orbits, the direction of the disturbing forces is constantly changing with respect to any point on the earth's surface. New points arrive at every instant under the zenith and nadir of either luminary, and thus waves are produced which follow them round the globe. The highest points of these waves will remain far behind the verticals of the disturbing bodies, because the inertia and friction of the water prevent the instantaneous change of form required, and because, although the elevating force is greatest under the vertical, it continues to act in the same direction for some hours after the passage of the luminary, with but little diminished force. This retardation, which would be
sensible under the simple supposition of an un-
interrupted ocean covering the earth's surface, be-
comes very considerable under the actual cir-
cumstances of the case.—The depth of the sea
varies so much, and the form of its basin, taken
as a whole, is so interrupted by the land, that
it may be doubted whether, were the action
of the sun and moon at once suspended, their
tide waves would perform even a single revo-
lution with any sort of regularity. Hence it
follows that the tides for the time being may
be considered as almost completely command-
ed by the then actual positions and proximities
of the sun and moon, the free oscillations of
the sea in its bed being quite subordinate to the
forced wave generating them. In consequence
(as is always the case in forced oscillations),
every periodicity in the action of the forcing
cause is propagated in the oscillations, and re-
cords itself in the recorded height of the tide
on every point of the coast, but at each point
at a greater or less interval from the culmina-
tion of the sun or moon, according to its local
position and the more or less circuitous course
taken by the tide wave to reach it, which spe-
cial observation can alone determine. This
interval is called the establishment of the
place. The close relation which the times of
high water bear to the times of the moon's
passage shows that the moon's influence in
raising the tides must be much greater than the
sun's. In fact, while the whole attraction of
the sun upon the earth far exceeds that of the
moon, yet, owing to the greater proximity of
the latter, the difference between its attraction
at the centre of the earth and at the nearest or
most remote points of its surface, which pro-
duces the tides, is about 2½ times as great as
the difference of the sun's attraction at the
same points.—There will be two complete lunar
tides in every lunar day of 24h. 50m., and also
two complete solar tides in each of the times
of the solstices and equinoxes. These are known
as the semi-diurnal tides, and constitute the principal fluctuations
of the sea level. When the sun and moon are
in conjunction or opposition, at the time of
new or full moon, the effects of both combine
to produce the spring tides, when high water
is higher and low water is lower than at mean
tides by the amount of the solar tide. At
quadriettes the high water of the sun will
combine with the low water of the moon to
produce a less fall, and the low water of the
sun with the high water of the moon to pro-
duce a less rise, than at mean tides; and we
have the neap tides, the range of which is less
than the mean range by the amount of the
solar tide. Thus, at New York, the rise and
fall at syzygies is 5'4 ft., at quadriette 3'4 ft.,
the former being the sun, the latter the differ-
ence of the lunar and solar tides; whence we
obtain for the effect of the moon 2'4 ft., and
for that of the sun 1 ft., or a ratio of 44 to
10. This proportion does not prove to be the
same in all parts of the world, and even varies
considerably in places not far distant from each
other. At Boston the heights are 11'8 and 8'5
ft., respectively, giving a proportion of 7 to 1.
On the Atlantic coast of the United States it
averages about 5 to 1, while on the E. side of
the Atlantic ocean, on the coasts of France and
England, it is in many parts 3 to 1. These
differences are to be ascribed to the fact that
the shore and harbor tides which we observe
have in every instance acquired a greater mag-
nitude than the ocean tides, and have been
modified in form by the varying slope of the
bottom and configuration of the shores. A
simple comparison of the range of spring and
neap tides will not serve, therefore, as a cor-
c correct measure of the relative effect of the sun
and moon, and hence for a determination of
the mass of the moon, which can only be de-
ferred from those data by a profound mathema-
tical analysis.—The next variation of the
tides to be considered is that dependent on the
moon's declination. Were the moon constant-
ly in the plane of the equator, the highest
points of the tide waves would also be in that
plane, and would consequently produce a series
of equal tides at any place either N. or S. of
the equator. But it is evident that when she
ascends to the north, the vortex of the tide
wave will tend to follow her, giving the high-
est point of one tide in the northern, and the
highest point of the opposite tide in the south-
ern hemisphere. Consequently, when the moon
has a northern declination, the tide at any
place in the northern hemisphere caused by her
upper transit will be higher than that caused
by the lower transit. This variation in the
heights has a period of one lunar day, and is
called the diurnal inequality; it reaches its
maximum when the moon is at its greatest
northern or southern declination, and disap-
ppears when it is on the equator, and conse-
quently has a half-monthly period. The va-
riation of the height mean solar day is as
1, the corresponding inequality in the times of high
water. The sun's declination affects the tides
in a similar manner, but the amount of the dis-
turbance is very small, and its period ex-
tends over half a year. Yet in long series of
observations its effect is well marked, both in
height and time. The diurnal inequality de-
pending on the moon's declination is on the
other hand quite sensible, and in many places
constitutes a prominent or even the chief fea-
ture of the tides, as on the Pacific coast of
North America and in the gulf of Mexico, to
the peculiarities of which we shall recur here-
after. If the tides arrive at the same place
by two different channels, and one of them
is retarded behind the other by six hours, in
consequence of travelling a longer route or in
shallower water, the semi-diurnal tides will be
destroyed by an interference of the waves, that
is, by the high water of one being superim-
posed on the low water of the other; the di-
urnal inequality, however, will not be de-
stroyed, but merely modified in height and
time, leaving a single tide in the lunar day
outstanding, which is always very small in amount. A further cause of variation in the height of the tides is the variation of the distances of the sun and moon, by reason of the ellipticity of their orbits. The efficacy of a heavenly body in raising tides is shown by theory to be inversely proportional to the cube of the distance. Hence the efficacy of the sun will fluctuate between the extremes 19 and 51, taking 50 for its mean value, and that of the moon between 43 and 9. Taking into account this cause of difference, the highest spring tide will be to the lowest neap as $50 + 21$ to $43 - 19$, or as 89 to 24, or 10 to 3; leaving out of consideration the local circumstances of access and depth, which greatly modify these proportions. In the North Atlantic the highest tides are observed a day and a half or two days after the syzygies. At New York, the high water which we observe about 8 o'clock in the evening on the days of full or change are those due to the meridian transit of the moon (and sun) on the preceding day, and the highest tide will not occur until the evening of the following day. At Boston this delay, which is called the retard, or age of the tide, is nearly 36 hours. It is the same at Brest, and the tide wave occupies 10 hours in travelling from Brest up the English channel and Thames to London, making the age of the tide at the latter place 46 hours. This delay, which even at the cape of Good Hope amounts to 14 hours, is still the subject of investigation, and is probably mainly due to friction. The interval between the moon's passage over the meridian of a place and the time of high water, which we have referred to as the establishment of the port, is also called the luni-tidal interval. This interval is constant for each place so far as the lunar tide wave is concerned; but as the actual high water depends upon the combination of the lunar and solar tides, it is subject to a variation which is known as the half-monthly inequality in time. On the day after the spring tides the top of the solar tide wave will be nearly an hour in advance of that of the lunar tide wave, and the two waves will combine to make high water earlier than the moon's alone would bring it; hence the luni-tidal interval is shorter. It will continue to shorten until the moon's transit is later by three hours than when the tide is greatest; it then increases again, passes its mean value when the moon has fallen behind six hours, attains its maximum when it is nine hours later, and again decreases until at the next spring tides it reaches its mean value. The mean of all the luni-tidal intervals for half a month at a port is called its mean or corrected establishment, to distinguish it from the vulgar establishment, which is the luni-tidal interval at full and change. The former is now generally used for finding the time of high water on any given day, and tables are constructed from observations at the principal ports for finding the correction for semi-monthly inequality due to the moon's age. Thus for New York the corrected establishment or mean luni-tidal interval is 5h. 13m., and its least and greatest values are 7h. 52 m. and 5h. 35m. On the Atlantic coast of the United States the range of this inequality is about three fourths of an hour; on the coasts of France and Great Britain it often exceeds an hour and a half. This difference of the half-monthly inequality in time at different places is analogous to the variation in the proportion of spring and neap tides above noticed, and is due to the same causes.—The motion of the water in the tide wave is totally unlike that in an ordinary surface wave, such as the wind produces. When a narrow wave of the latter kind, or a succession of such waves of equal breadths and heights, is formed in deep water, a light floating body, as a cork, revolves either in a vertical circle or an ellipse not very different from one, having the longer axis vertical. But in the tide wave the movement of each particle may be regarded as performed in an excessively elongated ellipse, the shorter axis of which is vertical. The breadth of the tide wave from crest to crest, supposing all the earth covered, would be half the earth's circumference, or 12,500 miles, in comparison with which the depth of the sea is insignificnt; and the slightest consideration suffices to show that, as all the water which goes to form the elevated portion must be brought from that depressed, this can only take place by a lateral approach of the vertical sections of the sea when the water is rising, and their recess from each other when falling (i.e., over a quadrant of the globe in either case, which is only another way of expressing an alternating backward and forward horizontal current at any given place), with this peculiarity, that these currents (the flow and ebb current) run most rapidly at the moments of high and low water; the instants of most rapid rise and fall being those of slack water or no current one way or the other. In fact, it is obvious that the surface must be rising most rapidly when the water is setting in equally both ways to, and sinking most rapidly when setting out equally both ways from the place; in neither of which cases can there be any current at the place. The tide wave differs also from a wind wave in another very remarkable point. It affects the whole depth of the ocean equally, from the bottom to the surface, while the wind waves, even in the most violent storms, agitate it to a very trifling depth; for the force which acts to produce the former is exerted equally in every portion of the vertical extent of the water, while those producing the latter are strictly confined to the surface. A tide wave of 4 ft. in total height (between high and low water), which is that of the tide at the atolls of the Indian ocean, advancing over a sea 30,000 ft. deep, implies in each particle an alternate advance and recess of 2,800 ft. in its total extent; but this movement, being
spread over six hours either way, is nowhere very rapid. Where a bay or indentation of the coast presents its opening favorably to the tide wave, and decreases in width from the entrance toward its head, the tides rise higher and higher from the mouth upward. This is due to the concentration of the wave by the approach of the shores, and to the gradual shoaling of the bottom by which a portion of the horizontal motion is transferred into vertical motion, the velocity of the wave being at the same time retarded. This effect is strikingly illustrated by a generalization of the heights of the tides on the Atlantic coast of the United States, developed from the tidal observations made in connection with the United States coast survey. That coast presents in its general outline three large bays: the great southern, from Cape Florida to Cape Hatteras; the great middle, from Cape Hatteras to Siasconset, Nantucket; and the great eastern, from Siasconset to Cape Sable. Referring to the tide table given below, we find at Cape Florida a mean height of 1·5 ft., and as we follow the coast to the northward a gradually increasing height, reaching 7 ft. at Savannah entrance, then decreasing again, with an exception easily explained, to Cape Hatteras, where it is 2 ft. In the middle bay, following the stations on the coast, and omitting those on the bays and sounds, we have a less regular increase to 4·8 ft. at Sandy Hook, and a decrease to 2·7 ft. at Menemsha light on Nantucket island. The configuration of the eastern bay is less regular, and the correspondence of heights requires closer examination. The recess of Massachusetts bay is well marked by the increase in height, reaching 10 ft. at Boston and Plymouth; but the most striking effect of the convergence of shores and shoaling is exhibited in the bay of Fundy. On a line across its mouth, at the Kennebec river as at Cape Sable, the mean height of tide is 8 ft., while at St. John's, N. B., it rises 19 ft., and at Sackville in Cumberland basin, at the head of the bay, 36 ft., attaining to 50 ft. and more at spring tides. When the wave leaves the open sea, its front slope and its rear slope are equal in length and similar in form. But as it advances into a narrow channel, bay, or river, its front slope becomes short and steep, and its rear slope becomes long and gentle. Hence arise the circumstances noticed in the early part of this article, and illustrated by reference to the Chesapeake bay. At the station near the sea the time occupied by the rise is equal to that occupied by the descent; but at a station more removed from the sea the rise occupies a shorter time than the descent. When the tide is very large compared with the depth of water, this inequality becomes very great; thus in the Severn river, at Newnham, above Bristol (England), the whole rise of 18 ft. takes place in an hour and a half, while the fall occupies 10 hours. As the wave advances over a shoaling bottom, a portion of the horizontal motion is transformed into vertical motion, by which the height of the wave is increased, the most rapid current approaches the greatest rise, and the transversal between the rise and slanting faces is diminished. This exaggeration of the height and current is particularly remarkable whenever the front of the advancing tide wave stretches across the mouth of an estuary with contracting borders, and extensive flats bordering the channel near low-water level; then it produces a bore, or sudden and violent wave of great height, which rushes forward with such impetuosity as to sweep everything before it. Such is the case at the head of the bay of Fundy; likewise in the Hoogly river, in the bay of Bengal; in the Dordogne, where it enters into the Garonne, on the coast of France; and in the Severn river, where at spring tides a bore of 9 ft. in height rushes up stream. In the river Amazon, at the equinoxes (when the equatorial tide is at its maximum), during three consecutive days bores of 12 or 15 ft. high rush up the river with each high water; so that along the course of the stream, up which for 200 m. from its mouth no fewer than eight tide waves are simultaneously advancing, as many as five bores are sometimes at once in progress.—It is easily seen that in the smaller seas, which have little or no communication with the ocean, as the Mediterranean, Black, and Caspian seas, and the North American lakes, the tides must be insensible, as the attraction of the moon is at all times very nearly the same for all parts of them. Near the W. end of the Mediterranean, as at Malaga, a small tide is observable, propagated from the Atlantic ocean through the straits of Gibraltar. Tides are also observable at Venice, but the observations have not been discussed so as to determine whether they arise from a small tide wave proper to the Mediterranean, magnified by travelling up the Adriatic sea, although insensible at its mouth, or whether they are variations due to the winds. Fluctuations of the sea surface, such as those of the northern European tides, and causing irregularities in the latter, are often produced by the winds, which in many places have a certain periodicity in their direction and force, as the land and sea breezes in the tropics. They come under consideration here only as complicating the study of the tidal phenomena.—The existing theories, while they suffice for the explanation of the observed facts, are inadequate to the prediction of the phenomena at places where they have not been observed. This arises not from any defect in the principles upon which the theory is based, but from the difficulty of investigating mathematically the motion of fluids, under all the various circumstances in which the waters of the sea and of rivers are found, and from our ignorance of the configuration of the bottom of the sea. The equatorial sea being broken up into three great basins, and open water existing only to the southward of the three great continents, the tides are complicated in
a singular way. In each of these basins the equatorial tide has to take a fresh start from the eastern side with every fresh upper and lower transit of the moon and sun, and is destroyed or confused by reflection on the western coast before the creation of a new wave; while in the open part of the southern ocean the tide wave circulates unimpeded, and spreads into the three oceans up which it runs as a free wave, from S. E. to N. W., overtaking in its progress and compounding with the partial equatorial tides or forced waves proper to either ocean. On approaching the shore, the waves are elevated and retarded by the slope of the bottom, and deflected or crowded together according to the varied configurations of the coasts. It is owing to these complications, together with our ignorance of the laws of friction among the particles of water, and between the water and the bottom, that our theories fail to inform us of the magnitude and time of the tides at any given place. But they determine the periodicity of their phases, and the relative part which each disturbing force bears to the whole, by which we are enabled, by the analysis of a sufficient series of exact observations at any place, to predict the phases of the tides at the same place for any future time, the knowledge of which is of immense importance to navigation. It is only since the beginning of the present century that the science of the tides has made any considerable progress in this direction. The theoretical investigations of Laplace, in the Mémoires de l'Académie, and his discussions of the tidal observations at Brest, opened the way. Lubbock and Prof. Whewell contributed largely by the elaborate discussions of large collections of tidal observations, published in the "Philosophical Transactions" of the royal society; and Prof. Airy, in his essay on "Tides and Waves" in the "Encyclopaedia Metropolitana," has greatly extended our theoretical conceptions of the subject. More recently still important investigations have been published by Prof. W. Thomson and Mr. W. Ferrel.—The tides on the coasts of the United States have been specially investigated by the late Prof. Bache as superintendent of the American coast survey. In connection with that work he organized an extensive system of exact observations, for the purpose of ascertaining the complicated laws which govern the tides. It will be readily understood that in order to separate the effects of the different causes which modify the phenomena, it is not sufficient to observe merely the heights and times of high and low water, but that a continuous record of the tides is necessary, as the inequalities are constantly shifting their place and magnitude. For this purpose a self-registering tide gauge is used, by which a continuous curve representing the successive changes in the height of water is traced on paper moved by clockwork, by a pencil acted on by the rising and falling of a float in a vertical box, to which the tide has free access. The time scale is such that every hour is represented by one inch, and is pricked into the paper by points on the cylinder which moves the paper forward. A continuous sheet, sufficient for the record of a whole month, is put on the tide gauge at one time. A complete description of this instrument will be found in the coast survey report for 1853. Prof. Bache gave in his annual reports on the progress of the coast survey, from 1851 forward, a series of papers on the tides, detailing the progress of discussion, and giving the results as they were from time to time developed. In these are considered the apparent anomalies in the tides in the gulf of Mexico, exhibiting at some places only one tide in 24 hours; the large inequalities in the tides on the Pacific coast; the general progress of the tide wave along our coasts and in the bays and rivers; the influence of the winds in particular localities; and the action of tidal currents on the bars and channels of our harbors. These last, which are still in progress, have resulted already in the annual publication of "Tide Tables," giving in advance the times and heights of high and low water at all the principal ports of the United States, for every day in the year. An elaborate discussion of the tides observed at Boston and New York during 19 years, a full lunar cycle, has been made by Mr. William Ferrel of the coast survey, and has resulted in representing the actual tides with unlooked-for precision, yielding moreover a value for the mass of the moon closely approaching that obtained by astronomical methods.—The tides on the coast of the United States, on the Atlantic, gulf of Mexico, and Pacific, are of three different classes. Those of the Atlantic are of the most ordinary type, ebbing and flowing twice in 24 hours, and having but small differences in height between the two successive high or low waters, one occurring before noon, the other after noon. Those of the Pacific coast also ebb and flow twice during 24 hours, but the morning and afternoon tides differ very considerably in height, so much so that at certain periods a rock which has 3½ ft. of water upon it at low tide may be awash (nearly bare) on the next succeeding low water. The intervals, too, between successive high and successive low waters may be very unequal. At San Francisco, for example, at a time when the moon has a large southern declination, the high water occurring about 12 hours after the moon's transit may mark 5 ft. on a tide staff; five hours afterward low water will mark 3½ ft.; and six hours after which the second high water will reach 7½ ft., and seven hours later the second low water will fall to zero. These inequalities depend upon the moon's declination, in the manner which we have explained; they disappear at the time of the moon's declination being nothing, and are greatest about the time of its being greatest. These tides exhibit the normal type, while those at New York and adjacent parts of the Atlantic coast do not exhibit the diurnal in-
equality. The explanation of this feature is probably to be found in the supposition that the tide wave which advances up into the Atlantic ocean from the continuous tide in the Southern ocean, arrives on our shores about 24 hours later than the direct tide wave which crosses the Atlantic from E. to W. In this way the diurnal inequality will be eliminated by the superposition of the two tides, the greater high water of the former coinciding with the lesser of the latter, and vice versa, leaving the semi-diurnal tides of equal height. The tide at Galveston, in the gulf of Mexico, furnishes a case of the elimination of the semi-diurnal tide, leaving only the diurnal inequality. It is to be presumed in this instance that the tides reaching Galveston through the straits of Florida and through the passage between Cuba and Yucatan differ by six hours in their periods, causing the low water of one to coincide with the high water of the other, thus sensibly destroying the semi-diurnal tides, except in so far as they are unequal. This leaves a small tide outstanding, having substantially the form of the diurnal inequality, and producing the appearance of the "single day tide," or one high and one low water in every 24 hours. This result is a fluctuation is well marked at tidelands when the moon's declination is considerable on either side of the equator, but disappears almost entirely when the moon is near the equator, since at such times the diurnal inequality disappears. Tides of this class have always a small range; in the gulf of Mexico they rarely exceed 2½ ft., and the average rise and fall is but 1½ ft. The tide gauges being in continuous operation, all other fluctuations of the ocean level, besides that produced by the tides, are likewise registered. The tide curves of the western coast are frequently found indented by fluctuations arising from earthquakes. A remarkable instance of this kind was furnished by the earthquake that destroyed the city of Shimoda, Japan, in December, 1854.

The time required for the transmission of the sea waves from Shimoda to San Francisco was 12h. 36m. The distance being 4,500 m., the transmission of the wave was at an average rate of 360 m. an hour. The theory of wave motion teaches us that this velocity will be attained by a free-moving wave in a depth of 1,440 fathoms, which may be taken as the average depth of the Pacific ocean in the region between Japan and California.

The crests of the waves occurred at intervals of about 23 minutes, corresponding to a length from crest to crest of 150 m. The height when the waves arrived at San Francisco was about 18 in. from hollow to crest. The great earthquake in Peru in August, 1868, was likewise recorded on the tide gauges at San Diego, San Francisco, and Astoria. The fluctuation of the ocean in this instance was very sensible to casual observation, and was noted in Australia, at the Sandwich islands, and at Kodiak, Alaska. The data obtained from these observations, combined with the result before mentioned, indicated that the average depth of the Pacific ocean is about 1,800 fathoms. Such waves originating with an impulse at one definite point, and propagated freely through the ocean in every direction with a velocity depending upon the square root of the depth of the sea, serve as good illustrations of the manner in which tides are propagated as free waves through sounds, bays, and rivers. The rate of motion for different depths is as follows: at 10 ft., 12.2 m. an hour; 60 ft., 30 m.; 100 ft., 38.7 m.; 1,000 ft., 122.9 m.; 6,000 ft., 2,995 m.

</table>

A study of the preceding tables, with the aid of a map, will develop many interesting facts with regard to the propagation of the tide wave and the effect of the configuration of the coasts on the time and height of the tides. It will be seen, for example, that high water occurs nearly at the same time at the head-
the Atlantic coast of the United States—at Cape Hatteras, Nantucket island, and Cape Sable—making an allowance for the difference in local time. If by a line on the map we connect these points at which high water occurs simultaneously, we may regard this line as representing the crest of a tide wave advancing upon the coast. We shall find high water to occur later and later as we go up into the bays and rivers; and by following up the progress of the waves, we may be enabled to draw lines representing the time of high water or the top of the wave for each successive hour. Such lines are called co-tidal lines, and have been traced for the coasts of the United States by Prof. Bache, for which we again refer to the coast survey reports. A chart of co-tidal lines for the British isles, by Prof. Whewell, will be found in Keith Johnston’s “Physical Atlas,” as well as a chart of co-tidal lines for the whole globe; but the latter must be looked upon as a rather adventurous generalization, in the absence of any positive knowledge of the tides in mid-ocean. The tides about the British isles present a very interesting study. The advancing high water passes up the main channel, occupying six hours from the Scilly isles to the mouth of the Thames, where it is met and reinforced by the high water 12 hours older, which has travelled around the isles to the northward and down the North sea. There is a point in the latter, about midway between Yarmouth and the Texel, where the co-tidal line of nine hours of the latter tide wave intersects that of three hours of the former, causing the interference of low water of the one with high water of the other tide, in consequence of which no change takes place in the sea level, as has been ascertained by actual observations over a shoal spot in that locality. No remarkable case of the meeting of two tides, which will be more particularly noticed below, occurs near Throg’s Neck at the W. end of Long Island sound. —The agency of tidal currents in producing changes in the entrances of bays and harbors is a subject of the first importance to commerce and navigation, which has received full attention in the prosecution of the American coast survey. As on the average the same amount of water moves inward and outward with the flood and ebb tides, we might readily suppose that the same amount of material is transported either way, and that no important change would take place in the configuration of the bottom. But the operation of the flood stream is very different from that of the ebb stream. We have as a general feature an interior basin of some extent communicating with the sea by a comparatively narrow passage. The flood stream, therefore, running with considerable velocity through this channel, will as it enters the basin spread out and become slow, depositing the sand and mud it is charged with, and making extensive flats or shoals opposite the entrance. The ebb stream runs slowly over the flats from all directions toward the opening, without removing much of the deposit, and gradually concentrates in definite narrow channels, which it scoops out, and the depth of which will depend in a great degree on the proportion of the area of the basin to the outlet, or, in other terms, on the difference of level which will be reached during the ebb between the basin and the ocean, which determines the greatest velocity and transporting power reached by the ebb stream. On the bars of most of the sand-barred harbors on our southern coast, the place and direction of the channel are frequently changed during violent storms, when the direction of the waves happens to be oblique to that of the channel; or when the sea runs directly upon the channel, the depth of water may be considerably diminished for the time being, by the sand rolled up by the waves. But in all these cases it is found that the normal depth is speedily restored by the scour of the ebb tide, which depends upon the unchanged factors of area and form of basin, height of tide, and character of the material forming the bar. To illustrate the important subject of tidal currents, we will examine the hydraulic system of New York harbor. Considering first the progress of the tide wave through Long Island sound from the eastward to its meeting with that entering New York bay at Sandy Hook, we see that about 7½ hours after the transit of the moon high water has advanced just within Block island with an elevation of 2 ft., and at the same time has just passed Sandy Hook with an elevation of 4½ ft. Traversing the sound westward with increasing heights, it reaches Sandy’s Point three hours later with a height of 7± ft. The observed time of transmission from the Race to Sandy’s Point is 2h. 1m., and the time computed from the depths according to the law developed by Airy is 2h. 14m.; a very good approximation when we consider the irregularities in the configuration of the sound, which could not be taken into account. Advancing still further, the height somewhat declines in consequence of the changes of direction in the channel and its shallowness. At Hell Gate this tide wave is met by that which had entered at Sandy Hook, and advanced more slowly owing to the narrowness and intricacies of the channel, especially in the East river. These two tides which meet and overlap each other at Hell Gate, differing in times and heights, cause contrasts of water elevations between the sound and harbor which call into existence the violent currents that traverse the East river. The conditions of the tidal circulation through Hell Gate are such that if there were a partition across it, the water would sometimes stand nearly 5 ft. higher, and at other times 5 ft. lower on the one side than on the other. In the actual case of the superposition or compounding of the two tides, the difference of level existing at any time is of course much less, but the difference of one foot is often
observed within the space of 100 ft. in the most contracted portion of Hell Gate off Hallett's Point. The entrance from Long Island sound is a natural depression or arm of the sea which is not changed by the forces now in operation. The tidal currents which flow through it do not change the channel, but are obliged to follow it in its tortuous course. The Sandy Hook entrance, on the contrary, is characterized by a cordon of sands extending from Sandy Hook to Coney island, intersected by channels, which are maintained against the action of the sea, which tends to fill them up, by the scour of the ebb tide from the tidal basin of New York harbor. The advance of Sandy Hook upon the main ship channel is among the notable and important instances of the effect of tidal currents; within a century it has increased a mile and a quarter. In the place where the beacon on the end of the Hook now stands there was 40 ft. of water 15 years before it was built. The cause of this growth is a remarkable northwardly current along both shores of the Hook, running both during the flood and the ebb tides with varying rates, and resulting from those tides directly and indirectly. The best water over the bar is about 2 m. Elev Hook light, in a direct line with the Swash channel; the greatest depth over it is 22 ft. at mean low water, and the same depth can now be carried through the Swash channel, which formerly was 3 ft. shallower, but has deepened since the cross section between the Hook and Flynns's knoll has been diminished by one third its area by the growth of the Hook. This relative change in the capacity of the channels has not affected the depth on the outer bar, which, according to the principles above laid down, is dependent mainly upon the area of the tidal basin within. The depth of 22 ft. at mean low water, which is now maintained at the entrance, through the sands constantly thrown up by the waves of the sea, may be considered as depending upon the following causes: 1. The narrowness of the sand basin between Sandy Hook and Staten island, including Baritan bay, which furnishes more than one half of the whole ebb scour; 2. what is called the Upper bay, including the Jersey flats and Newark bay; 3. the North river, perhaps as far as Dobbs Ferry, maintaining the head of the ebb current, although not directly taking part in the outflow; and 4. a portion of the sound tide, which flows in through Holl Gate. The proportion of the first three divisions in producing the depth of channel may be approximately estimated by a comparison of the areas and distances from the bar. In order to maintain the depth which we now have, it is important that the area of the tidal basin should not be encroached upon. In proportion as that is diminished the depth of the channels will decrease. The flats, just bare at low water, but covered at high tide, form as important a part as any other portion, for it is obvious that it is only the volume of water contained between the planes of low and high water, the "tide prism," that does the work in scouring the channels. The water on the flats is especially useful by retarding the outflow, thus allowing a greater difference of level to be reached between the basin and the ocean. The part which the fourth division in our classification of the basin of New York, that of the East river and Hell Gate passage, plays in the outflow of the ebb tide through the Sandy Hook channels, depends less upon the area involved than upon the difference in point of time and height of tide in Hell Gate already adverted to. The westerly current, usually called the ebb stream since it falls in with the ebb stream of New York harbor, taking place when the sound tide is highest, starts from a level 3½ ft. higher than the easterly, and thus a much larger amount of water flows out through the Sandy Hook channels than through the narrows at Throgs Neck. It is apparent, then, that this portion of the ebb stream, reinforcing the ebb stream of the harbor proper at the most favorable times, performs a most important part in maintaining the channels through the Sandy Hook bar.

TIECK. I. Ludwig, a German author, born in Berlin, May 31, 1773, died there, April 28, 1853. He completed his studies at Halle, and became known in 1795 as a writer of fantastic novels. His antagonism to the literary tendencies of the time was displayed in Peter Lebrecht (3 vols., 1796–9), and in Peter Lebrecht's Volksmärchen (3 vols., 1797), several of which, as Der gestiefelte Kater ("Puss in Boots"), Blaubart ("Bluebeard"), and Leben und Tod des kleinen Rothkämpchen ("Life and Death of Little Red Riding Hood"), combine the simplicity of the old legends with grotesque satire upon modern subjects. The classicists were the particular objects of his brilliant ratiUity, especially in his Herzengesprächen eines kunstliebenden Klosterbruders (1797), written in conjunction with Winkler. In the following year he published Fehl Sternbald's Wanderungen (2 vols., 1798), and in his comedies Die verkehrte Welt ("The topsy-turvy World") and Prinz Zerbino, oder die Reise nach dem guten Geschmaack ("Travels after Good Taste"). The Leben und Tod der Genoveva (1800) is esteemed his finest drama. Meantime he had married at Hamburg a niece of the composer Reichardt, had become associated with the Schlegels, Novalis, and Steffens at Jena, and with Herder at Weimar, and prepared an admirable translation of Don Quixote (4 vols., Berlin, 1798–1801). He published at Dresden in 1809, with A. W. von Schlegel, the Museumimanc. After examining at Rome the manuscripts of German medieval literature, he returned in 1806 to Munich, and for several years he was disabled by the gout. In 1817 he visited England to complete his studies of Shakespeare and the Elizabethan age. In 1819 he settled at Dresden. In 1820 he was invited by the king of Prussia to Berlin, where, as in Dresden, he exerted great influence on the
TIEDEMANN drama, and the “Antigone” of Sophocles was performed under his auspices. His works include Minnetländer aus dem schwäbischen Zeitalter (1808); Ulrichs von Lichtenstein Frauen- dientst (1815); the celebrated novels Dichterle- ben, Der Tod des Dichters, and the unfinished Aufbruch in den Cevennen (1826); Shakespeare’s Vorschule, a translation of plays which he re- garded as early works of Shakespeare, and Dramaturgische Blätter (2 vols., 1826). He also supervised his daughter Dorothea’s and aunt Baudeassin’s continuation of Schlegel’s translation of Shakespeare, and edited various poems. The latest edition of his poems is in 3 vols. (1841), and of his novels in 12 vols. (1853). Nearly complete editions of his works include 20 vols. (1828—42). Carlyle translated several of his tales in vol. i. of his “Specimens of German Romance”; a second edition of those tales, in another English version, appeared at London in 1860. Tieck’s biographer Köppe edited his posthumous writings (2 vols., Leipsic, 1855).—See Friesen’s Ludwig Tieck (2 vols., Berlin, 1871).

II. Christian Friedrich, a German sculptor, brother of the preceding, born in Ber- lin, Aug. 14, 1778, died there, May 14, 1851. He studied under Schadow and in Paris under David, and was employed at Weimar from 1801 to 1805, and subsequently in Italy till 1819, when he became a member of the academy at Berlin, cooperating with Schenkkel and Ranck in improving the art of sculpture. His works include many busts in the Walhalla, executed at Carrara by order of the crown prince and future king Louis of Bavaria; those of Goethe and other poets at Weimar; the statue of Neckar for Mme. de Staël; decorations of the royal theatre at Berlin and other public build- ings; and the statue of his brother at Dresden.

TIEDMAN. I. Dietrich, a German philoso- pher born at Bremen, died in Hanover, April 3, 1748, died in Marburg, Sept. 24, 1803. He studied at Göttingen, and taught ancient lan- guages at Cassel from 1776 to 1786, when he became professor of philosophy at Marburg. He combined the principles of Locke and Leib- nitz. His Untersuchungen über den Menschen (3 vols., Leipsic, 1777—98), Theodit (Frank- fort, 1794), Idealistische Briefe (Marburg, 1798), and Handbuch der Psychologie (edited by Wachler, Leipsic, 1804), are interesting on account of their investigations in psychology and on the subject of cognition. But his fame rests on his history of philosophy from Thales to Wolf in his Geist der speculativen Philosophie (6 vols., Marburg, 1791—71).

II. Friedrich, a German physiologist, son of the preceding, born in Cassel, Aug. 23, 1781, died in Munich, Jan. 22, 1861. He graduated in medicine at Marburg in 1804, and was professor of anatomy and zoology at Landshut from 1806 to 1816, and afterward at Heidelberg till 1849. His nu- merous works include Zoologie (3 vols., Lands- hut, 1808—10); Anatomie des Fischerezens (1809); Anatomie und Bildungsgeschichte des Gekirns (Nuremberg, 1816); and Die Physio-

TIER DE LUEGO logie des Menschen (Darmstadt, vols. i. and iii., 1850—36).

TIDGE, Christopher August, a German poet, born at Gardelegen, Prussia, Dec. 14, 1752, died in Dresden, March 8, 1841. He studied at Halle, and led a precarious life as a clerk in the civil service and as a private tutor and secretary till 1805, when he accompanied the countess Elisa von der Recke in her travels. Subsequently he resided with her at Dresden and Berlin; and at her death in 1833 she di- rected her establishment to be kept up for him without change. His most celebrated poem is Urania, on the immortality of the soul (Halle, 1801; 18th ed., Leipsic, 1862). He also pub- lished Elegien und vermischte Gedichte (Halle, 1803; 2d ed., 2 vols., 1814). His complete works are in 10 vols. (Leipsic, 1841). Falken- stein published Tidge’s Leben and poetischer Nachlass (4 vols., Leipsic, 1841), and Eberhard Blicke in T ridge’s und in Elisa’s Leben (Ber- lin, 1844). The Tidge charitable literary in- stitute at Dresden, originally founded for local purposes, has since 1860 extended its operations all over Germany.

TIENSIN, or Tientsin, or Tien-Sing, a town of China, in the province of Chihli, on level ground at the junction of the Pei-ho with the grand canal, about 65 m. S. E. of Peking; pop. dif- ferently estimated from 400,000 to 990,000. It is surrounded by a wall about 4 m. in cir- cuit, and entered by four gates. The prin- cipal streets lead from these gates to the centre of the town, and are broad and well paved. The houses are of unburned brick or mud, and have a mean appearance, though some of them are commodious and well furnished. The river is crossed by a bridge of boats, and large suburbs extend for a considerable distance along both banks. Tientsin derives its importance from being the terminus of the grand canal and the port of Peking, and is said to have been formerly a place of great wealth and extensive trade; but since the banks of the canal were broken by the inundation of the Hoang-ho the trade has de- clined greatly. Treaties were concluded here in 1858 between the Chinese government and the plenipotentiaries of England, France, Rus- sia, and the United States, by which it became one of the 13 ports open to foreign commerce. In 1873 the imports amounted to $27,002,314; exports, $12,240,602.

TIERRA DEL FUEGO (Sp., “Land of Fire”), a group of islands off the S. extremity of South America, between lat. 52° 40’ and 56° S., and lon. 68° 40’ and 75° W. It is separated from the mainland by the straits of Magellan, and has the Pacific ocean on the west and the At- lantic on the east, while the E. and W. limits of these seas are supposed to meet at Cape Horn, its S. extremity. The group comprises numerous small islands, of which Cape Horn is the most remarkable; the large island Tier- ra del Fuego proper, of very irregular shape and nearly 300 m. long E. and W.; the is-
lands of Navarin and Hoste to the south, separated from the last named by the Beagle channel; and Dawson, Clarence, and Desolation islands to the west. All these islands are deeply indented. They are mountainous, and many of the peaks are more than 5,000 ft. high, while the highest, Mt. Sarmiento, is about 9,000 ft. The limit of perpetual snow is about 4,000 ft. The soil is generally a swampy peaty, and to the height of 1,500 ft. is covered with forests of beech. The geological formation is principally clay slate, greenstone, and granite. The climate is one of the worst in the world; storms, sudden gusts of wind, rain, snow, and mist constantly succeed each other. The gigantic seaweed macrocystis pyriforma is common on the coasts, and in the straits, and affords shelter for innumerable shell fish, without which the natives would find it extremely difficult to subsist. Deer, guanacos, foxes, sea otters, mice, bats, and a few other animals are found, and birds, particularly sea fowl, are numerous. The natives are of the same race as the Patagonians, but smaller, and those of the S. E. portion of the group are short, ill made, and ill looking. Their clothing consists entirely of guanaco or seal skin. Their huts, generally built close to the shore in some sheltered spot, are conical, made of branches or small trees stuck in the earth, 7 or 8 ft. in diameter and 4 or 5 ft. in height, with a small hole for a door.

—Tierra del Fuego was discovered by Magalhaens in 1520, and received its name from the numerous fires seen during the night along the shore. (See Magellan, Straits of.)

TIE RS ÉTAT. See States General.

TIFFIN, a city and the county seat of Seneca co., Ohio, on the Sandusky river, 77 m. N. by W. of Columbus; pop. in 1870, 5,648. It is an important railroad centre, four lines intersecting here, viz.: the Cincinnati, Sandusky, and Cleveland; Toledo, Tiffin, and Eastern; Mansfield, Coldwater, and Lake Michigan; and Baltimore, Pittsburgh, and Chicago. There are important manufacories, including one of agricultural implements, one of woolens, one of steam engines, &c., two of shoes, two of sash, doors, and blinds, one of wagon hounds, one of furniture, one of stoves, and one of carriages. The city contains a national bank, a savings bank, five public schools, one daily and four weekly (one German) newspapers, and 11 churches. It is the seat of Heidelberg college and theological seminary, founded by the German Reformed church in 1850. The college has classical and scientific courses. In 1874-5 there were 10 instructors (2 theological) and 221 students (13 theological, 165 collegiate, and 166 preparatory); the libraries contained 5,000 volumes.

TIFLIS. 1. A government of Asiatic Russia, in Transcaucasia, comprising the central part of the former kingdom of Georgia; area, 15,614 sq. m.; pop. in 1871, 606,584. (See Georgia.) 2. A city, capital of the government, and formerly of Georgia, on the river Kur, 1,100 ft. above the level of the Black sea, in lat. 41° 41' N., lon. 44° 50' E.; pop. estimated at 60,000, composed of Russians, Georgians, Armenians, Persians, Jews, Germans, and French. It occupies a long stretch of uneven ground on both sides of the Kur, and is almost surrounded by an amphitheatre of brown barren hills. It is a mixture of Asiatic and European architecture. The modern quarter is laid out in broad streets and open squares, and contains the grand-ducal palace, the theatre, public buildings, and residences of the authorities. The old part of the town has narrow unpaved lanes and alleys, mud or sun-baked brick houses with flat roofs and few windows, and vaulted bazaars, and in it is concentrated all the life and business of Tiflis. The town is the headquarters of an army of 150,000 men, employed in frontier duty, in surveillance of the tribes, and to a great extent in making roads. Tiflis is celebrated for its warm baths. The mineral springs are chiefly at the S. end of the city, and the temperature of the hottest is 115° and that of the coldest 75°. These waters are said to be very beneficial in cutaneous disorders and rheumatic complaints. The climate is exceedingly hot, and bilious diseases prevail. The manufactures consist of carpets, shawls, &c.; and a considerable trade is carried on with Persia. A railway, following the upper course of the Kur and the lower of the Rion or Phasis, connects Tiflis with Poti on the Black sea.—Tiflis.
TIGER

was founded in the 6th century by a monarch named Vakhtang, who conquered the territory lying between the Black and Caspian seas, and was the capital of the nominally independent kingdom of Georgia, though devastated by Genghis Khan, and frequently in the possession of the Turks or Persians. Aga Mohammed Khan, shah of Persia, destroyed it in 1795, and reduced a large portion of the inhabitants to slavery. The last king of Georgia ceded it to Russia in 1801, since which its population has more than doubled. An insurrection broke out on June 27, 1865, but was soon suppressed.

TIGER (Felis tigris, Linn.), one of the largest, strongest, and most active of the cat family, peculiar to Asia. It is usually about 8 ft. long and between 3 and 4 ft. high, but occasionally is considerably larger; the ground color is bright orange yellow, the face, throat, and under parts nearly white, and all elegantly striped with transverse black bands and bars; nearly cleared the thickly settled districts of these animals, against which the native traps and weapons (spears and poisoned arrows) are comparatively powerless. The tiger makes no noise comparable to the roar of the lion, but rather a loud grunting sound. It may be tamed when taken young, but its temper cannot be depended on; it breeds in captivity, though less frequently than the lion; hybrids between the Asiatic lion and tigress have been born in menageries, but have not reached maturity; their color is brighter and the bands better marked than in young lions or tigers of unmixed race. Pliny says the first tiger known in Rome was a tame one belonging to the emperor Augustus.—See Capt. Shakespeare's "Wild Sports of India" (London and Boston, 1860), and "The Royal Tiger of Bengal, His Life and Death," by J. Fayrer, M.D. (London, 1875).—The so-called American tiger is the jaguar (F. onca, Linn.).

TIGER BEETLE. See BEETLE.

TIGER CAT, a name commonly applied to several small species of felinae in America, Asia, and Africa, especially to those ornamented by bands and bars. Among the American species, the ocelot has been described under that title, and under the same the margay (Felis tigrina, Linn.). The F. eyra (Desm.) is called tiger cat; it is about the size of the house cat, but with longer neck, body, and tail; it is uniform brownish red, with under jaw and nose spot white, paler below; like the ocelot, it comes from Guiana and as far north as Mexico and Texas. The F. yagua-rundi (Desm.) is larger, with a much longer body; it is grizzled brownish gray without spots; hairs ringed and tipped with black; the young more rufous; it extends from Paraguay to Texas. Both of these cats frequent woods and thickets, feeding on small mammals and birds, and are excellent climbers. The chati (F. mitis) of South America is also sometimes called tiger cat. (See CHAT.)—There are several tiger cats in Asia, of which the largest and handsomest is the rimau-dahan (F. macro-

cells, Temm.). It is about 3 ft. long, with a tail of 2½ ft. more, and 16 in. high at the shoulders; the head comparatively small, ears

TIGER CAT

it is less high but longer and more slender than the lion, with rounder head and more cat-like form; the colors are brightest in the adult male, the young being grayish with obscure dusky bands; it has no mane. It lies in ambush at early dawn by the sides of springs and rivers for animals as they come to drink; it is able to leap a great distance upon its prey, carrying off a buffalo with apparent ease, a powerful man being as nothing in its jaws; its motions are exceedingly supple and graceful; it passes the day for the most part in a shady covert, gorged and sleepy from the morning meal. Its north and south geographical range is extensive, from northern China to the Malay peninsula, but it is most abundant in the vast jungles lining the banks of the great rivers of Hindostan. In many parts of Bengal it is the terror and scourge of villages prowling around the outskirts, and attacking cattle in the fold and on the road, though the natives protect them in part by noisy drums by day and torches by night; men and women frequently fall victims. The English rifle has
short and rounded, body cylindrical, limbs very robust, tail very full and long, and fur thick and soft; it is ashy or brownish gray, with irregular spots and bands of velvety blackness arranged longitudinally and unbroken along the back; border of mouth black, and feet gray. It is a native of Sumatra, and lives much on trees, hence called tree tiger; the food consists of birds and the smaller deer; it is not very common, and not dangerous.—The animal commonly called tiger cat by the furriers has been described under Serval. Other tiger cats are F. minutus and F. Diardi, both inhabiting the islands of the Malay archipelago, and F. Nepalensis, inhabiting the Himalaya mountains.

TIGER FLOWER, a species of tigrilus, both names referring (from Lat. tigris, a tiger) to the spotted flowers. It is a Mexican genus of bulb-bearing plants, belonging to the iris family; the long sword-like leaves are much plaited, and the stems, about 2 ft. high, produce a succession of large and very showy but ephemeral flowers. The flowers, 5 or 6 in. across, have three very large outer divisions with a concave base, and together form a cup; the three inner divisions are smaller and fiddle-shaped. The species in cultivation are T. pavonia, having rich scarlet flowers variegated with bright yellow and spotted with black, and T. conciliforma, orange and yellow with black spot; there are garden varieties of both, differing in the depth of color and markings. Their cultivation is very simple; the bulbs are planted in any good garden soil after cold rains are over, and taken up at the first frosts, dried, and kept until spring where mice cannot destroy them.

TIGER MOTH. See Motl.

TIGHE, Mary (Blackford), an Irish author- ess, born in Dublin in 1773, died at Woodstock, Kilkenny co., March 24, 1810. She married in 1793 her cousin, Henry Tighe, of county Wicklow, a member of the Irish parliament, and in 1805 printed for private circulation her "Psyche," a poem founded on the story of Cupid and Psyche as related in the "Golden Ass" of Apuleius. It reached a fifth edition in 1810. She died of consumption after several years of suffering. In 1811 appeared a complete edition of her poetical works, containing many devotional pieces.

TIGLATH-PILESER. See Assyria.

TIGRAN THE GREAT, a king of Armenia, ascended the throne about 350 B.C., died about 55. He was a descendant of Artaxerxes, the reputed founder of the Armenian monarchy, and by wars during the early part of his reign united all Armenia under his rule, and conquered in addition several provinces. He also acquired by his war with Parthia two important provinces, which comprised the whole of northern Mesopotamia and the tract east of the Middle Tigris, including Assyria proper and Arbelitis; and by some unknown means he obtained possession also of Media Atropatene. In 88 he was invited into Syria by the inhabitants, who were wearied with the continual strife between the princes of the house of the Seleucidae, and he established himself as king over Cilicia, Syria, and most of Phoenicia, residing at Nisibis. About 80 he made the strongly fortified city of Tigranocerta, between the Tigris and Lake Van, his capital. His support of Mithridates of Pontus, his father-in-law, involved him in a war with the Romans. Lucullus gained several victories over them, and captured Tigranocerta. Pompey, his successor, made an alliance with Phraeses III. of Parthia, who engaged Tigranes in war on his own frontier, while Pompey marched into Pontus. The occasion for it was offered by the eldest son of Tigranes, of the same name, who had engaged in a conspiracy against the life of his father, and being discovered had fled to Phraeses, who readily embraced his cause and marched an army into Armenia. Tigranes fled, Artaxata was invested, and the Parthian monarch withdrew, leaving the young Tigranes as many troops as he thought necessary to press the siege to a successful issue. When Phraeses was gone, Tigranes returned, defeated his son, and drove him out of his kingdom. But soon afterward he was forced to submit to Pompey, who in the mean time had defeated Mithridates also. (See MITHRIDATES.) Tigranes went to the camp of Pompey, and placed himself as a supplicant at the feet of that general. Pompey would not accept the diadem which he offered him, and treated him in a friendly manner, placing him on the throne of Armenia proper. At first Pompey destined the province of Gordyene for the younger Tigranes, but that prince offending him, he made it over to Ariobarzanes of Cappadocia. As the province gave rise to disputes between Tigranes and Phraates, Pompey sent Ahranes to drive the Parthians out of it, and gave it to the Armenians. In 64 Tigranes was again at war with the king of Parthia, but the differences between them were composed by the intervention of Pompey.

TIGRÉ, a state of Abyssinia, between lat. 12° and 16° N., and lon. 37° 25' and 40° E. It is an elevated plain, which forms the basis of
several mountain ranges and lofty groups, and is drained in the north by the Mareb and in the south by the Tacazze. The plateau itself varies from 3,500 to 9,000 ft. in elevation, and is deeply indented by the ravines which form the beds of the principal rivers. The Tacazze is second only to the Bahr el-Azrek in size among the rivers of Abyssinia. Tigré is divided into many petty chieftaincies or districts; the principal towns are Antalo, formerly the capital, Axum, and Adowa, the present capital. Adowa, the largest town, is the entrepot of trade on the great caravan route between Masisowah and Gondar, and has considerable manufactures.—Tigré was for many years an independent kingdom, but in 1855 was conquered by Theodore, king of Abyssinia, who made it a province of his empire. (See Abyssinia.)

Tigris, the second river of western Asia, rises in N. W. Kurdistan, S. of Goljik lake, flows S. S. E. to Diarbekir, thence S. E. to Mosul, and thence S. by E. to its junction with the Euphrates at Korna, where the two form the Shat el-Arab. At its source it is less than 10 m. from the Murad or E. branch of the Euphrates; at Mosul it is about 150 m. distant from the sister stream; near Bagdad it is within 20 m. of it, but near Surat the distance has increased to 100 m. Its total course is estimated at 1,150 m., and its width from Mosul to Bagdad, a distance of about 220 m. in a straight line, averages 200 yards; its current in March flows 4 m. an hour. The greatest height is attained in the latter part of May, and it resumes its usual level by the middle of June. It is navigable in the flood time between Diarbekir and Mosul for rafts; below Mosul it is navigable for steamers at all seasons. The Tigris is swifter and in the latter part of its course deeper than the Euphrates, and its volume is generally greater. It has been calculated that the quantity of water discharged every second by the Tigris at Bagdad is 164,103 cubic feet. In its upper course it receives from the mountains W. of Lake Van the Bitlis-tchai or Eastern Tigris, which surpasses it in volume of water. From the Zagros mountains it receives streamlets which often swell into large rivers. The principal of these are the Upper Zab, the Lower Zab, the Adhem, and the Diyalah. The western affluents are insignificant. The course of the branch streams constantly varies, and some of the tributaries are left dry within a few years of the time that they have been navigable. While the low banks of the Euphrates often cause that river to leave its channel, the Tigris, which runs in a deep bed, seldom varies. (See Euphrates.)—In antiquity the Tigris was the great river of Assyria, and the eastern boundary of Mesopotamia, and on its banks flourished the cities of Nineveh, Seleucia, and Ctesiphon. The name Tigris is supposed to be derived from the old Persian tigrā, arrow; its Aramaic name was Digla or Diglāth, and the Hebrew Hiddékēl.

TILBURG, a town of the Netherlands, in the province of North Brabant, on the Ley, 14 m. E. S. E. of Breda; pop. in 1873, 24,345. It has a Protestant and several Catholic churches, and a royal castle. The king owns most of the real estate. It is the principal seat of the Dutch manufactories of wool.

TILDEN, Samuel Jones, an American lawyer, born in New Lebanon, Columbia co., N. Y., Feb. 9, 1814. He entered Yale college in 1833, but completed his course at the university of New York, and was admitted to the bar. He was a member of the state constitutional convention of 1846, and also of assembly, and did much to shape the canal policy of the state. In 1855 he was defeated as democratic candidate for the office of attorney general of the state. In 1866 he was chosen chairman of the state democratic committee, and in 1867 was a member of the constitutional convention. In 1869–70 he was active in the organization of the bar association. In 1870–71 he was prominent in detecting important frauds in the government of New York city, and in 1872 was a member of assembly. In November, 1874, he was elected governor of New York by 50,317 majority. He has been counsel in many important cases, prominent among which are the Flagg contested election for the comptrollership of New York city in 1855; the Burdell heirs against Mrs. Cunningham in 1857; the Cumberland coal case in 1858; and the Delaware and Hudson canal company against the Pennsylvania coal company in 1868.

TILE, a plate of baked clay, flat, curved, or hollow, used for covering the floors, roofs, or walls of buildings, and for drains and other purposes. The Assyrians employed them as tablets, writing upon them with a style before baking them. (See Cuneiform Inscriptions.) The Egyptians used tiles for the same purposes, but wrote upon them with ink. They also used tiles for roofing, usually in the form of part of a cylinder, one row being laid with the concave side and the next with the convex side upward, the edge being received in the concavity of its fellow. The Greeks used large flat roofing tiles, sometimes having flanges, with semi-cylindrical ones laid over their lines of junction. The flat tiles were sometimes stamped with brief inscriptions, and the others were ornamented with painted devices. They also used tiles in the construction of tombs and the cliffs of baths, and for drains. The Romans used them still more generally, and their name tegulae (from tegere, to cover) came to be applied to bricks, which were much more used than tiles. The real distinction between them is the greater fineness of the tile. The roofing tiles were, like those of the Greeks, large and flat, having flanges rising a little more than two inches above the surface, the junction of the flanges being covered by the arched tile or imbrez. It was customary to stamp the tiles with inscriptions designating the pottery, the manufacturer, the name of
the estate which supplied the clay, the name of the reigning emperor or of the consulship, and other matters. Thus they have often served as records of important historical events. The tiles used by the Romans for covering interior walls were large thin squares of terra cotta, generally ornamented on one side with incised devices. The tesselated pavements were formed of small cubical tiles called tesselae (the diminutive of tesserae, from the Gr. τέσσαρες, four, having reference to their form). Some of these tesselae were not more than one fourth of an inch square, and they were laid to form mosaics. The Romans, like the more ancient nations, made use of large flat tiles in the construction of their graves, and also for grave-stones with inscriptions.—At the international exhibition at Vienna in 1873 there was a rich assemblage of decorative tiles of several countries, many of the specimens being from Great Britain, where the art is now practised in great perfection. Among the latter were Roman tiles and tesselae from mosaic pavements recently excavated at Chichester. There were also glass-decorated tiles (see ENCAUSTIC) from Egypt and Assyria, and Saracenic tiles from Spain; also antique tiles from India and from the mosques of Samarcand of the 14th and 15th centuries. In the Indian tiles, brought by Dr. Leitner from Lahore, and taken from old monuments, the colors retained their original vividness. The manufacture in Great Britain dates from medieval times, doubtless due to imitation of the Roman pottery, and may be divided into two periods. The most ancient tiles were probably made between 1290 and 1580, and those of the second period during the prevalence of the perpendicular style of building. Numerous kilns have been found in the Malvern hills, and it is supposed that Tewkesbury abbey and Worcester and Gloucester cathedrals were furnished by them with tiles. The manufacture is said to have continued in Worcestershire to about 1640. Some of the earliest specimens of tiles in the British museum are from the ruined churches in Norfolk. The designs upon the tiles at that time were chiefly sacred symbols and inscriptions, heraldic devices, and monograms. The material is ordinary coarse red clay, the designs being formed of a lighter-colored clay contained in incisions in the body, and afterward covered with a glazing.—The manufacture of tiles in Holland commenced at a very early period, and in the 18th century large quantities were exported to England for fireplaces. They were also brought to America in the 17th and 18th centuries for fireplaces, hearths, and roofs. Many of them were highly ornamented with various designs. The discovery of transferring designs by printing from paper to earthenware about 1752 created numerous imitations in England, and the demand in that country was in a great measure supplied by home-printed tiles.—What are called dry tiles are made in Great Britain by Prosser's method. The material is dried and reduced to powder in a mill, when it is placed on slabs of plaster of Paris slightly moistened. It is then passed through fine sieves and subjected to intense pressure in steel boxes, from which the tiles are taken to a hot room and dried for a week or two and then ornamented, glazed, and fired. Drain tiles may be made of ordinary brick clay by various simple machines, moved either by power or hand, usually the latter, as the process is very simple. They are all made upon the principle of forcing the prepared clay through a cylindrical or semi-cylindrical tube over a mandrel. Some of them work the material after it has been passed through a pug mill, while others consist of a pug mill and tile machine combined. The uncombined machines cost from $100 to $200, and are capable of turning out by man power from 200 to 300 two-inch tiles per hour, or with one horse about 5,000 large tiles per day. The subsoil where drainage is desirable often contains clay of a suitable quality for their manufacture, and the machines are then taken out upon or near the fields to be drained. (See DRAINAGE, and "Farm Drainage," by Henry F. French, New York, 1865.)

TILLAMOOK, a N. W. county of Oregon, bordering on the Pacific ocean, bounded E. by the Coast mountains, and watered by several streams; area, 1,400 sq. m.; pop. in 1870, 408. Tillamook bay affords a good harbor. The coast and rivers abound in fish. The greater portion of the surface is covered with gigantic forests of spruce; there are some small and fertile valleys and hills that afford pasturage. Coal and iron are found. The chief productions in 1870 were 2,399 bushels of wheat, 2,719 of oats, 9,340 of potatoes, 29,840 lbs. of butter, and 764 tons of hay. The value of live stock was $24,585. Capital, Tillamook.

TILLANDSIA, a genus of endogenous plants of the Bromeliaceæ or pineapple family, the characters of which are given under PINEAPPLE. It was named in honor of Prof. Tillands, a Swedish botanist. The species are numerous in tropical and extra-tropical America, and are mostly epiphytes, with their foliage covered with scurvy scales; some South American species have very handsome white, blue, pink, or purple flowers, and are cultivated as stove plants, either on blocks of wood, in the manner of some orchids, or in baskets or pots of moss. There are eight species in the United States, most of which are confined to Florida, and from growing upon the trunks and branches of trees they are popularly called air plants. The largest Florida species is T. utriculara, with a large tuft of leaves about 2 ft. long, which are narrow and recurved at the apex, but are much dilated and convoluted at the base to form a cup which contains a considerable quantity of water. (See Pitcher PLANTS.) Other species have this peculiarity, there being one in Brazil, the water held in the cups of which is the only locality for an aquatic spe-
TILLANDSIA

TILLOTSON

eties of utricaria or bladderwort. The flowers of T. utriculata are pale blue, on much branched stems longer than the leaves. Others have very narrow leaves, and are only a few inches high. The most important species, unlike the rest, has slender, thread-like, pendent stems; this is T. usnoidea, so called from its resemblance in manner of growth to usnea, a genus of long pendulous lichens, and is popularly known as long moss, and also as black or Spanish moss; its northern limit is the Dismal swamp in Virginia, and it is found all through the southern states to Texas, and in South America to Chili, as well as in the West Indies. Its much branching stems, 2 ft. or more long, bear recurved leaves 2 to 3 in. long, which are scarcely broader than the stems, and like those are greenish gray; each internode or space in the stem between two leaves is twisted to form a loose spiral of about two turns; the flowers, produced at the ends of short branches, are about a fourth of an inch across, and have three bright yellowish green petals; the pod, about an inch long, contains numerous slender seeds, with a long hairy tuft. This epiphyte, draping the trees and swinging in the wind, frequently forms a characteristic feature of the southern landscape, though where very abundant its effect, on account of its sombre color, is not altogether pleasing; recently considerable quantities in the living state have been sold in northern cities for the decoration of rooms; it will flourish in an ordinary greenhouse if hung up in any convenient place. The central portion, or the woody part of the stem, is scarcely larger than a horse hair, which it much resembles also in toughness and elasticity; it is dark brown or black even in the fresh plant. This material is used where it grows for various purposes, and is an article of commerce. The rude method of preparing the moss is to place it in shallow water until the outer covering becomes loosened; after it is thoroughly dried, it is beaten until nothing is left but the horse-hair-like central portion; of late years the process has been much facilitated by the use of steam; the moss is placed in large tight vats, steamed, and dried, and afterward beaten by machinery, the product being superior to that prepared in the slow way. In the southern states it is twisted into ropes, and woven into horse collars, saddle blankets, and mats of various kinds, and is a common filling for beds; northern upholsterers use it by itself or with hair for stuffing chairs, sofas, and mattresses.

TILLEMONT, Louis Sébastien le Nain de, a French historian, born in Paris, Nov. 30, 1687, died Jan. 10, 1698. He was educated at Port Royal, and at the episcopal seminary of Beauvais, became a subdeacon in 1672, and a priest in 1676. In 1677 he went to reside with the recluses at Port Royal; and in 1679 he retired to his estate of Tillemont, between Vincennes and Montreuil. His principal works are: Mémoires pour servir à l'Histoire ecclesiastique des six premiers siècles (16 vols. 4to, 1693–1712), and Histoire des empereurs et des autres princes qui ont régné durant les six premiers siècles de l'Église (6 vols. 4to, 1690–1738). His Vie de St. Louis was first published by the French historical society (6 vols. 8vo, 1847–51).

TILLODONIA, a new order of eocene mammals, described by Prof. O. C. Marsh in 1875, apparently combining characters of the plantigrade carnivora, ungulates, and rodents. The typical genus tillotherium in its skeleton comes nearest to the bears, but has a dentition partly ungulate and partly rodent.

TILLOTSON, John, an English prelate, born at Sowerby, near Halifax, in 1630, died in London, Nov. 22, 1694. His father was a strict Calvinist. At an early age Tillotson became a student at Cambridge, where he was made a fellow in 1651, and remained till 1657, when he became tutor in the family of Prideaux, Cromwell's attorney general. Chillingworth's writings having converted him from Puritanism, at 30 years of age he took orders in the English church, and was successively curate of Cheshunt, rector of Keddington, and preacher at Lincolns Inn in London. He opposed the proclamation of Charles II. for liberty of conscience, which made him unpopular at court, preached earnestly against popery, and advocated the exclusion of the duke of York. He was the leading member of the commission of 20 divines appointed in 1689 to examine and revise the liturgy. On the accession of William III. he became dean of St. Paul's, and in 1691 archbishop of Canterbury. His marriage with a niece of Cromwell brought him into intimate connection with Wilkins, bishop of Chester, whose posthumous works he edited. His life was written by Dr. Thomas Birch (5vo, London, 1752). He published "The Rule of Faith" (1666) and several volumes of sermons. For the copyright of his manuscript sermons his widow received 2,500 guineas; and many collective editions afterward appeared in 14
TILLY, Johann Tserclaes, count, a German soldier, born in the castle of Tilly, Brabant, in February, 1559, died in Ingolstadt, April 20 (O. S.), 1632. He was educated at a college of Jesuits, first served in the Spanish army in the Netherlands, and in Hungary distinguished himself against the Turks. In 1610 Duke Maximilian of Bavaria appointed him field marshal. On the opening of the thirty years' war he was placed at the head of the army of the Catholic league, and contributed to the victory of Prague, Nov. 8, 1620; in 1621 he drove Count Mansfeld, the staunchest supporter of the Protestant cause, from Bohemia and the Upper Palatinate; in 1622 defeated the margrave of Baden at Wimpfen on the Neckar, and Christian of Brunswick at Höchstädt; and in 1623 routed the latter once more at Stadtilt. When Christian IV. of Denmark joined the German Protestants, he信号 defeated him at Lutter in August, 1626. He next besieged Nordheim, which he took after a hard struggle, crossed the Elbe, and coöperated with Wallenstein in conquering the continental part of Denmark. In 1630 he succeeded Wallenstein as chief commander of the imperial armies. On May 10, 1631, he carried Magdeburg by storm, and allowed his soldiers to burn most of the town and massacre about 25,000 persons. But in the same year (Sept. 7) he was utterly defeated by Gustavus Adolphus at Breitenfeld, near Leipsic, and vainly tried to recover his prestige. He was mortally wounded in an engagement with Gustavus at the river Lech near Rain, April 5, 1632. He declined the title of count of the empire and the principality of Kalenberg, was a devoted Catholic, and boasted of his temperance and chastity. —See Klopp's Tilly im dreissigjährigen Kriege (2 vols., Stutt- gart, 1861).

TILSIT, a town of the kingdom and province of Prussia, at the junction of the Tils and the Niemen (Memel), which is here spanned by a long bridge, 60 m. N. E. of Königsberg; pop. in 1871, 20,286. The town proper consists of two long streets, and has many fine new buildings, manufactories of paper, machinery, iron, sugar, and leather, and an active trade in grain. After Napoleon's victory at Friedland, he met here for the first time the emperor Alexander (June 26, 1807) on a raft in the middle of the Niemen, and the Tilsit treaty of peace, by which Prussia lost half her possessions, was concluded early in July. (See Bonaparte, vol. iii., p. 42.)

TILTON, Theodore, an American author, born in New York, Oct. 2, 1835. He studied at the New York free academy, and in 1856 became a writer for the "Independent," of which he was editor for many years. In 1871 he became editor of the Brooklyn "Union," and in 1872 founded the "Golden Age," which he edited till 1874. In that year he sued the Rev. Henry Ward Beecher on a charge of seducing his wife, but the trial, lasting six months, resulted in a disagreement of the jury. He is also a public lecturer, and has published "The American Board and Slavery" (1860); a "Memorial of Mrs. Browning," prefixed to an edition of her last poems (1862); "The Fly" (1865); "Golden-Haired Gertrude" (1866); "The Two Hungry Kittens" (1865); "The King's Ring" (1866); "The True Church" (1867); "The Sexton's Tale, and Other Poems" (1867); "Sanctum Sanctorum, or Proof-sheets from an Editor's Table" (1871); "Tempest-Tossed," a novel (1875); and several pamphlets, including a life of Victoria C. Woodhull.

TIMBER. See Wood.

TIMBS, John, an English author, born in London, Aug. 17, 1801, died there in March, 1875. In 1821 he became amanuensis to Sir Richard Phillips, publisher of the "Monthly Magazine," to which he contributed. "A Picturesque Promenade round Dorking" (1822). In 1835-36 he published anonymously a selection of ethical passages, under the title "Laconi- cies." From 1827 to 1838 he was editor of the "Mirror," one of the earliest popular low-priced weeklies. He edited the "Literary World" in 1838-40, and was one of the editors of the "Illustrated London News" from 1842 to 1858. He compiled "The Arcana of Science and Art" (11 vols., 1828-38); "Knowledge for the People" (4 vols., 1851-2); "Year Book of Facts in Science and Art" (81 vols., 1859-69); and "The Illustrated Year Book" (2 vols., 1850-51). Among his other publications are: "Things not generally Known" (7 vols., 1856-67); "School Days of Eminent Men" (1858); "Stories of Inventors" (1859); "Lives of Wits and Humorists" (2 vols., 1862); "English Eccentrics and Eccentricities" (2 vols., 1866); "Nooks and Corners of English Life" (1866); "Wonderful Inventions" (1867); "Notable Things of our Own Time" (1868); "Ancestral Stories and Traditions" (1869); "Abbeys, Castles, and Ancient Halls of England and Wales" (2 vols., 1870); "Necabbia" (1872); and numerous other works.

TIMBUCTOO, a town of central Africa, on the borders of the Sahara, about 9 m. from the river Niger, about lat. 17° 40' N., lon. 3° W.; pop. about 18,000, greatly increased during the season of trade, from November to January. It is nearly triangular and about 3 m. in circuit. It was formerly surrounded by a clay wall, but this was destroyed in 1826. The houses are closely packed together, and mostly built of clay and stone; some of them are two stories high, and show considerable taste in their decoration. The port of Timbuctoo is at Kabara on the Niger, which has a vast artificial basin, but is accessible for only four or five months in the year, the stream at other times being too shallow for navigation. The most valuable traffic is by caravans, for which
TIMOLEON

Timbuctoo is the central station of northern Africa. Gold dust is the great article of trade, but many native products and foreign manufactures are also found here. The merchants of Timbuctoo are generally only agents of those of Mogadiscio, Timmeco, Fez, and other places in northern Africa; and this, with the incessant conflicts of race and religion, prevents the accumulation of wealth. The inhabitants are a mixed population of indigenous negroes, Tauriks, Bambarras, Mandingos, Arabs, and Foolahs, the governing race. The city dates from the 12th century, but it was long known in Europe only by reports of native travellers, until it was first reached by Major Laing in 1826, and hurriedly visited by Cuillié in 1828. In 1838-4 Dr. Barth resided there nearly a year.

TIMOLEON, a Corinthian general, liberator of Syracuse, born about 395 B.C., died in 337. He was early noted for his patriotism and courage, and in his hatred of tyranny he brought about the assassination of his brother Timophaes, who had usurped power in Corinth. Seized by remorse, he lived for nearly 20 years in utter seclusion. In 344 he took command of an expedition sent out by the Corinthians in aid of the Syracusans. After gaining a victory over Hicetas, tyrant of Leontini, who had formed an alliance with the Carthaginians against Dionysius the Younger, he obtained the support of several Sicilian cities. He marched to Syracuse, and took possession of the island of Ortygia, surrendered to him by Dionysius, who sailed for Corinth. Timoleon retired to Adranum, while Neon, in command of Ortygia, attacked the blockading force of the Carthaginians. These soon began to distrust Hicetas, and suddenly sailed away with their whole fleet and all their troops. Timoleon came at the head of 4,000 men, and took the portion of Syracuse held by Hicetas without the loss of a single man. He gave the inhabitants a democratic constitution, ordered the fortifications to be demolished, and erected courts of justice on their site. In a short time more than 60,000 immigrants and exiles repopulated the deserted town. But in 339 the Carthaginians landed at Lilybaeum an army of 80,000 men led by Hadsrural and Hamilcar. The inhabitants were panic-struck, and with difficulty Timoleon collected 12,000 men and set out for the western portion of the island, where he attacked the enemy just as they were crossing the Cremisius, and, aided by a storm, completely routed them. He soon after overthrew Hicetas and Mamecus, tyrant of Catana, and proceeded in his work of de-throning tyrants until none was left throughout Grecian Sicily. Timoleon declined the supreme power and withdrew again from public life, residing with his family in Syracuse, in a house voted to him by the inhabitants. Toward the close of his life he became totally blind. When he died, the Syracusan people voted to honor him for all future time with festival matches in music, races, and gymnastics. His life was written by Cornelius Nepos and Plutarch.

TIMOR, called THE MIANTHROPE, an Athenian who lived in the latter part of the 5th century B.C. In consequence of disappointments in friends, he secluded himself, and admitted no one to his society except Aleibiades. He is said to have died from a broken limb which he refused to have set. He is the subject of Shakespeare's "Timon of Athens."

TIMOR, an island of the Indian archipelago, between Flores and Timor-Laut, extending N. and S. nearly 800 m., with a general breadth of about 50 m.; area, about 11,500 sq. m.; pop. about 200,000. It lies between lat. 9° 30' and 11° 40' N., and lon. 129° 20' and 127° 10' E. The native chiefs on the W. and S. coasts acknowledge the supremacy of the Dutch, who have their principal settlement at Kupang or Coepang; while those in the E. and N. parts pay tribute to the Portuguese, who have established themselves at Dilli. The coasts are but slightly indented, but the harbors of Kupang and Dilli are safe and commodious. The shores are lined in many places by rocks and sand banks; and several islets intervene between Timor and the island of Flores to the west and Timor-Laut to the east, which are respectively distant about 100 and 250 m. The island is traversed throughout its length by a mountain chain, which attains a height in the north of about 6,000 ft. There are no active volcanoes, nor are there any igneous rocks of recent origin; but Timor peak, near the centre of the island, is a volcanic cone which has been quiescent since 1638. Numerous offsets extend from the main range to the coasts on both sides, so that the surface is almost entirely occupied by mountains separated by narrow valleys, though there are considerable tracts of level ground. The rivers are short mountain torrents; many of them become dry in summer, and the water is unwholesome. The mountains are generally bare and rocky, and there are no forests in the proper sense of the word. The indigenous vegetation is described by Wallace as poor and monotonous. It consists largely of eucalypti, acacias, and sandal wood, with grass scanty on the uplands, and coarse but luxuriant in the moister districts. Rice grows abundantly in the lowlands, and wheat and coffee thrive on the higher slopes and plains. Gold, copper, and iron have been found in small quantities. The animals on the N. W. side of the central range of mountains resemble those on the western islands of the archipelago, but those on the opposite side are strongly allied to the fauna of Australia, which is about 360 m. distant. Besides 15 species of bats, but two are met with in Timor; these are the common Indo-Malayan monkey, a civet cat, a tiger cat, a species of deer, a wild pig, a shrew mouse, and an opossum. There are 118 species of birds. The common domestic animals of Europe have all been introduced. Fish are plentiful on the coasts;
TIMOTHEUS

pearl-oysters are found in some places, and a
kind of coral much prized by the Japanese is
procured on the reefs. The people are of low
stature, with very dark complexions and bushy
hair, and resemble the Papuan type of man-
kind. The women weave cloth, and the only
manufactures which the men engage in are the
construction of canoes, and ornaments for their
horses. A considerable trade is carried on,
principally from Kupang, and is chiefly in the
hands of the Chinese.—Timor was visited by
Dampier in 1609. The region about Dili has
been occupied by the Portuguese about 300
years, but the settlement is miserably governed,
poorly cultivated, and without roads. The
Dutch colony is little better. The natives
throughout the island are peaceably disposed
toward Europeans, but belligerent among them-
selves, and practically independent.

TIMOTHEUS, an Athenian general, died in
Chalæis in 354 B. C. He was the son of the
general Conon and a pupil of Isocrates. He
was made a general in 378, and in 375 de-
feated a Spartan fleet near Alyzia. In con-
sequence of his failure to come promptly to
the relief of Corecyra, thereby endangering the
loss of the island, he had to lay down his gen-
eralship and answer the charges brought against
him. Though acquitted, he went in 372 to
Asia, and entered the service of the king of
Persia; but he returned to Athens and was
sent on an expedition in support of Ariobar-
zanes, satrap of Phrygia. Seizing a favora-
ble opportunity, he took possession of Samos
for the Athenians, and secured for them a par-
tial control of the Hellespont and the occupa-
tion of a large surrounding territory. Timo-
theus was then appointed to a command in-
cluding Macedonia, Thrace, and the Chersonese.
With the aid of Macedonia he reduced Torone,
Potidæa, Pydna, Methone, and various other
cities belonging to the Olybthian confederacy,
but was unsuccessful in the attack upon Amphip-
olis. In 363-362 he proceeded against Cotys,
king of Thrace, and to the defence of the Ate-
nean possessions in the Chersonese, in which
he is said to have been successful; but for
some reason not now known he retired from
his command. In 358 the cities of Eubœa sent
messages to Athens entreating aid against the
Thebans, who had despatched a large force
into the island. Through the energy of Timo-
theus, within five days an Athenian fleet and
army under his command were in Eubœa, and
in the course of 30 days the Thebans were
forced to evacuate the island under capitula-
tion. In 356, the second year of the social
war, Chares, Ipícrates and his son Menestheus,
and Timotheus were appointed to the joint
command of an Athenian fleet. In 354 Chares
accused his colleagues of having been the direct
cause of his defeat at Chios, and Timotheus and
Ipícrates were recalled and accused of treason.
Ipícrates was acquitted, but Timotheus was
found guilty and fined 100 talents. He retired
to Chalæis in Eubœa, where he died in the same
year. His son Conon was permitted to com-
promise the fine by paying 10 talents for re-
pairing the walls of the city.

TIMOTHY (Gr. Τιμόθεος, "he who honors
God"), a disciple of Paul, and his companion
in travel and in preaching. He was a native
of Derbe or Lystra in Lycaonia, and the son
of a Greek and a Jewess. To prevent the
cavils of the Jews, Paul circumcised him.
He was set apart to the office of the ministry by
the laying on of the hands of Paul and the
presbytery. He journeyed through Macedonia
and Achaia, and was afterward sent by Paul to
Ephesus, whence he accompanied the apostle
to Jerusalem, and probably to Rome. In the
epistles of Paul written during his captivity
at Rome, Timothy is mentioned as being with
the apostle. Tradition says that Timothy was
the first bishop of Ephesus, and was martyred
under Domitian.

TIMOTHY, Epistles to, two canonical books
of the New Testament, addressed, according to
ecclesiastical tradition, by the apostle Paul
to his disciple Timothy. They are mentioned
by Tertullian, Clement of Alexandria, and Ori-
gen. Schleiermacher attacked the authenti-
city of the first epistle, and after him the au-
thenticity of either the first or both epistles
has been doubted by Baur, Reuss (arch-
bishop of Upsal), Meyer, De Wette, Ewald,
and others; against whom it has been defended
by Thiersch, Wieseler, Reuss, Huther, Bleek,
and others. The defenders of their authenticity
are not agreed as to the times when the epis-
tles were written. Most of them suppose the
first to have been written about the year 65.
The second, according to the same writers, was
written during the captivity of Paul at Rome,
and while he was in expectation of martyrdom.
It gives instructions on Christian steadfast-
ness and fidelity (ch. i.), exhorts Timothy to
constancy (ch. ii.); warns him against false
teachers, invites him to come to Rome, and
gives information of many of the companions
of Paul (ch. iii. and iv.). The two epistles to
Timothy, together with the one to Titus, are
comprised under the name pastoral epistles.
Among the recent commentaries on them are
those of Wiesinger (1850), Ellicott (London,
3d ed., 1864), Huther (3d ed., 1866), and Oster-
zee in Lange's Bibelwerk (2d ed., 1864; En-
lish translation by Washburne and Harwood,
New York, 1868).

TIMOTHY GRASS, an agricultural grass
(Phleum pratense), which takes this name
from Timothy Hansen, who cultivated it ex-
tensively in Maryland, and brought it into no-
tice. In some parts of the country it is called
Herb's grass, a name which leads to confusion,
as the red-top (Agrostis vulgaris) is called
Herb's grass in Pennsylvania and some other
states; in England it is known as cat's-tail. The
genus Phleum has its one-flowered spikelets in
dense spikes; its structure is illustrated un-
der Grasses. A native species, P. alpinum, is
found on the higher mountains, but P. pra-
Tess is supposed to have been introduced from Europe, where it is found from the Mediterranean to the arctic regions. It was first cultivated for hay in this country, and the seeds were taken to England as a novelty about 100 years ago; but it is much less esteemed there than with us. In the north it is a perennial, with a rather coarse stem, which in dry soils thickens at the base and becomes bulbous; its average height is 2 to 3 ft., but it sometimes grows to 5 or even 7 ft. It forms the great bulk of the hay crop of the country, and is sown to the neglect of other grasses which are much better suited to some soils. Analysis shows, in 100 parts of timothy hay, 97 of albuminoids, 48.8 of carbohydrates, 3 of fat, and 22.7 of crude fibre.

TIMOUR, or Tamerlane (a corruption of Timour Lenk, i.e., Timour the Lame), an Asiatic conqueror, born at Sebz, a suburb of Kesh, about 40 m. S. E. of Samarqand, April 9, 1336, died at Otrar on the Jaxartes, Feb. 18, 1405. He was the son of the chief of the Turkish tribe of Berlas, which inhabited Kesh, and claimed to be on his mother's side a direct descendant of Genghis Khan. In 1361 he became chief of his tribe, and supported the cause of Hussein, khan of northern Khorasan; and after driving out the Calkmucks of the khan of Kashgar he married Hussein's sister. With him he had frequent contentions, and after the death of his wife in 1385 a war broke out between them, which ended in the defeat and death of Hussein, and the taking of Balkh, his capital, in 1389, after a siege of three years. Soon after a general Mongol assembly was held, and Timour was proclaimed khan of Jaga-tai (Transoxiana), Samarqand being chosen as his residence. He now aspired to the dominion of all the countries once under the power of Genghis Khan, and attacked the neighboring princes in detail. The khan of the Getes, ruling the country between the Jaxartes and the Irtish, was forced to render homage, and in 1379 the khan of Khiva was conquered. He then undertook the reduction of Khorasan (1380), and received the submission of a part of it, but was met with a fierce resistance by Gilyath ed-Din Pir Ali, whose capital was Herat. His efforts were all in vain, and the taking of his capital by storm led to the conquest of the remainder of the country. All Khorasan was now in Timour's power; but the town of Sebsevar revolted and was stormed, and thousands of its inhabitants were subjected to a cruel death. Timour now aspired to the conquest of the world. All Persia was soon in his power; the country between the Tigris and the Euphrates, from the sources to the mouths of those rivers, submitted to his authority; and the Christian princes of Georgia also became his tributaries. An invasion of Timour's territory by Tokhtamanish, whom he himself had established in the Mongol empire of the north, led to the conquest of Kiptchak. The new chief of his conqueror of the East into the provinces of Russia, he threatened Moscow, marched to the south, and sacked and burned Azov, at the mouth of the Don. In 1398 he crossed the Indus at the passage of Attok, and, after a long march, in which he massacred 100,000 captives, stood before Delhi, which soon capitulated. He penetrated still further into the country, but was recalled by the news of insurrections in Georgia and adjoining parts, and of the designs of Bajazet, sultan of Turkey. His first care was to crush the rebellion in Georgia, and as the Mongol and Ottoman conquests now bordered upon one another, a collision was soon rendered certain. Timour overran Syria, then a dependency of Egypt, and then stormed the revolted city of Bagdad, July 9, 1401, leaving in the public places of the town a pile of 90,000 slaughtered human beings. At last the two great armies of the sultan and the Mongol conqueror met on July 20, 1402, on the plains of Angora, and the former was totally defeated and captured. (See BAZAZT.) Timour's dominions now covered all Asia from the Irtish and Volga to the Persian gulf, and from the Ganges to Damascus and the archipelago. He made Solyman, a son of Bajazet, ruler of European Turkey, and his brother Musa of Turkey in Asia. The sultan of Egypt also became his vassal. He now retired to Samarqand (July, 1404), and spent two months in festivities, but did not long remain idle. He had planned an invasion of China, from which the house of Genghis had recently been expelled, and previous to his return from his Ottoman conquests had sent an army beyond the Jaxartes to prepare the way for his own advance. At the head of 200,000 veteran troops he began his march, crossed the Jaxartes on the ice, and had gone 300 miles from his capital when he died. His army was disbanded, and the invasion of China was given up. He died after a reign of 35 years, all of which was spent in military operations, and left 36 sons and grandsons and 17 grand-daughters. A large proportion of his conquests, especially in the northern and western parts of Asia, were lost immediately by his successors. The glory of his race was revived in his descendant Baber, the conqueror of India.—The great authority for the life of Tamerlane is the Persian history of Sheref ed-Din Ali, to whom the journals of his secretaries were intrusted, and whose work has been translated into French by Petis de la Croix,
under the title of *Histoire du Timur-Beï, con- nu sous le nom du grand Tamerlan* (4 vols. 12mo, Paris, 1729). The writings attributed to Timour have been preserved in Persian, and are of questionable authenticity. The work on the "Institutions" of his government, with an English translation and a valuable index, was published at Oxford in 1783 (4to) by Maj- or Davy and White, the professor of Arabic, and has also been translated from the Persian into French by Langlé. The autobiographical and "Commentaries" of Timour have been trans- lated from a manuscript of Major Davy by Major Stewart, and published by the oriental translation committee of London. These only contain his life from his birth to his 41st year, no version having as yet appeared of the re- maining portions. See also the translation of the narrative of Clavijo, envoy of Henry III. of Castile to Timour, by C. R. Markham (Hak- luyt society, 1890), and Lamartine, *Les grands hommes de l'Orient* (Paris, 1895).

TIMROD, Henry, an American poet, born in Charleston, S. C., Dec. 6, 1822, died in COLUM- bia, Oct. 6, 1897. He was educated at the university of Georgia, but took no degree, and studied law. During the first years of the civil war he wrote martial lyrics, and early in 1863 joined the confederate army of the west as correspondent of the Charleston "Mercury." In January, 1864, he became editor of the Columbia "South Carolinian," which was discontinued in February, 1865, and revived in Charleston in 1866. He was for a time as- sistant secretary to Gov. Orr. He published "Poems" (Boston, 1860; enlarged ed. with a memoir by Paul H. Hayne, New York, 1873).

TIMQUANS, a tribe of Indians in Florida, belonging to the Choctaw family, formerly oc- cupying the coast above St. Augustine. The Franciscans established missions among them in 1592, and though these were checked by the massacre of several of the missionaries by the heathen party in 1597, they were revived and continued till the destruction of the mis- sions and mission Indians by Carolina and Georgia in the border wars. Several works for the use of the Timqua missions and a grammar, chiefly by Father Francis Pareja, a Mexican, were printed in the 17th century; and petitions signed by the chiefs in 1868 show that they had all been educated to some ex- tent. Near the close of the century Dick- enson found the missions in a thriving condition and acting as post houses on the route to the English colonies.

TIN (Ger. Zinn; Fr. étain), an almost sil- very white, highly lustrous, non-elastic metal; chemical symbol, Sn (Lat. stannum, tin); equiva- lent, 116; sp. gr. 7.39. It is softer than gold and harder than lead; malleable at ordinary temperatures into thin laminae (tin foil); so ductile at 215° F. that it can be drawn into fine, very flexible wire, which however breaks under a weight of less than one ton per square inch of section; so brittle at 392° F. as to be broken by a blow or fall; not appreciably af- fected in density by hammering; fusible at 442° F.; burns in air at high temperature, with white light; volatile at very high temperature; comparatively indifferent to air or moisture at ordinary temperatures; a good conductor of heat and electricity. Melted tin has a strong tendency to crystallize on cooling; and the surface of cast tin, when etched with dilute acid, shows its crystalline texture in figures analogous to the tracery of frost on window panes (motif métallique). The free crystals are monometric, or, when obtained by the electric current, quadratic prisms, showing di- morphism of the metal. A bar of tin cracks- when bent (the tin cry, cri d'étain, Zinng- schrei), and under rapidly repeated flexures the bent place grows hotter than the hand can bear. Both noise and heat are due to the friction of the interior crystal faces upon each other. The handling of tin communic- ates a peculiar odor to the skin. There are three oxides of tin: the stannous, SnO, stann- neso-stannic, SnO₂, and stannic, SnO₃. A certain obscure modification of the last, the hydrate of which is insoluble in nitric or mu- ratic acid, is called metastannic oxide. The stannic and metastannic oxides form salts with alcalies, earths, and metallic oxides. Muratic acid dissolves tin as stannous chloride, SnCl, which is used by dyers and in laboratories as a reducing agent, by virtue of its strong affinity for oxygen and chlorine. Dilute sulphuric acid scarcely attacks tin; heating with con- centrated sulphuric acid transforms it to stannous sulphate, setting free sulphurous acid; very dilute nitric acid dissolves it cold, with- out any escape of gas, ammonia being formed simultaneously with the stannous nitrate and held as nitrate of ammonia in the solution. Concentrated nitric acid attacks tin violently, forming the insoluble metastannic oxide, which is the "putty powder" used in enamelling and in polishing plate. *Aqua regia* dissolves tin as stannic chloride, SnCl₂. Alkalies cause oxidation of tin, forming stannic acid, which unites with the alkaline bases. Thus tin be- ing heated in concentrated caustic soda solu- tion, hydroxys is set free, and sodic stannate is formed. This is extensively used as a mor- dant, the basis of the "tin-prepared liquor" of dyers and calico printers. Sulphuretted hydrogen does not attack massive tin at ordi- nary temperatures. There are three sulphides of tin, of which the stannous or protosulphide may be obtained by heating sulphur and tin together; the second, sesquisulphide, by heat- ing the first with additional sulphur; and the third, bisulphide, by a similar process. In the last case, the high temperature, which would otherwise decompose the bisulphide, must be kept down by adding to the ingredients volatile substances (mercury, sal ammoniac), which in escaping will absorb heat. This sulphide, thus produced, presents delicate golden or brownish yellow scales, and is used as a bronze powder.
TIN (mosaic gold, the aurum muriunum or monai-
cum of the alchemists). A mixture of stannous
and stannic chloride, added to gold chloride in
solution, precipitates a purple powder, sup-
posed to be stannic oxide, colored by metallic
gold in fine particles, or a mixture or combi-
nation of the oxides of gold and tin. It is
known as the purple of Cassius, and is used
for coloring porcelain and glass, with which
it is incorporated by fusion. The amalgam of
tin and its alloys with lead and other metals
is employed in the arts. (See Amalgam,
BRITANNIA METAL, BRONZE, MIRROR, PEWTER,
and SPECULUM.)—History. Tin ore, being a
heavy mineral, not altered by ordinary mete-
oric agencies, may occur in alluvial and diluvial
deposits, like gold and precious stones; and
being also, when pure, easily reduced by smelt-
ing, its treatment might naturally become
known to nations of great antiquity. It is
often said that the Hebrews, Egyptians, and
Greeks employed this metal; but so far as the
question turns upon the Hebrew bedil (Ezek.
xxvii. 13; Numb. xxxi. 22; Is. 1. 25, &c.) and
the Greek κασαιτρος, which have been trans-
lated as tin, this seems doubtful. Tin was
certainly often confounded with lead, being
called by the Romans plumbum candidum.
Even the stannum of Pliny was not tin; and
not until the 4th century does stannum definite-
lly bear this meaning. (See Kopf’s Geschichte
der Chemie.) But bronze vessels found at
Thebes are said to be in part composed of tin,
which Wilkinson suggests the Egyptians may
have obtained from Spain or India long before
the Phœnicians voyaged in the Atlantic. The
latter people brought κασαιτρος from the Oas-
siterides, supposed to have been the Scily
islands, off the coast of Britain. This may
have been brought to the Scily islands from Cornwall, or else it is presumed, the Phœnici-
ans pretended to visit these islands, and
gave them a deceptive name, in order to
mislead the Romans and conceal their real
trade on the Cornish coast. (See “Transac-
tions of the Geological Society of Cornwall,”
vols. iii. and iv.) Spain also is believed to
have furnished tin to the Phœnicians. In the
middle ages Cornish tin was used for church
bells, and later for bronze cannon. The an-
cient Mexicans obtained tin from the mines of
Teco, and with it made bronze for very hard
cutting tools; and they used small T-shaped
parts of it as money. Cortés had bronze cannon made with the tin of Teco.—Distribu-
tion. Native metallic tin is one of the rarest of
minerals. It has been reported from Sibe-
ria, Bolivia (doubtful), and Pennsylvanina. (See
Genth’s recent volume on the mineralogy of
that state.) There is a native sulphide (stann-
nine, tin pyrites), but the only ore com-
mercially utilized is the stannic oxide, called
tinstone or stannite, SnO₂; sp. gr. 6.94; crys-
talline form, tetragonal pyramids; percentage
of tin, 78-98; crystals yellowish and translu-
cent when pure, but usually dark brown, al-
most black, from admixture of ferric and man-
ganic oxide. This occurs in veins, beds, and
Stockwerke, or in secondary (alluvial and di-
luvial) deposits. In the former case, it is
found in quartzose crystalline rocks (granite,
gneiss, porphyry, mica and hornblende schists,
quartz-porphyry, &c.), associated with arseni-
cal pyrites, iron and copper pyrites, bismuth,
zcinc blende, wolfram, molybdenite, specular
iron, &c., and with such earthy minerals as
feldspar, tourmaline, chlorite, topaz, apatite,
fluor spar, and scheelite. The leading locali-
ties where such deposits have been worked
are Cornwall and the Saxon and Bohemian
Erzgebirge. Tin veins also occur in Brittany,
Finland, Spain, Mexico, Bolivia, and New
South Wales. The placer deposits are illus-
trated at the islands of Banca and Billiton in
the Malay peninsula, and at some other points
in the East Indies. The tin placers of Aus-
tralia have also furnished of late large quanti-
ties of tin ore; and such deposits (stream tin)
occur subordinately in Cornwall, Brittany,
Spain, and elsewhere. A remarkable deposit
of tin ore in a dike of trachyte is said to exist
in Durango, Mexico. Stannite occurs with
cryolite in Greenland. Tin ore in veins, dikes,
or beds of dark porphyry is found in San
Bernardino county, southern California; spe-
cimens are said to have been found in Idaho,
in the bed of a stream; and several localities
in the Appalachian regions are known to min-
eralogists as furnishing the ore in occasional
crystals or in thin veins. Chesterfield and
Goshen, Mass., and Lyme and Jackson, N. H.,
are localities of stannite; and tin has been de-
tected in the magnetic iron ore of the highlands
of New York and New Jersey, and in some
of the auriferous ores of Virginia. The tin-
ore deposits of Missouri, the object of a con-
siderable speculative excitement a few years
ago, seem to consist in the replacement to a
minute extent, in certain crystalline schists,
of titanic by stannic acid, the two being iso-
morphous. The relative importance of the
chief tin-producing regions is shown by the
following estimates of production in tons:

The amount credited to Great Britain includes
the tin produced in that country from import-
ded Australian ores. The product of Bolivia or
Upper Peru, known as Peruvian tin, was esti-
mated in 1868 by English authorities at 1,500
tons; but it is probably much less at present,
since no account is taken of it in the trade
reports. Saxony and Bohemia produce an in-
significant quantity, not more than 200 or 300
tons in all; and Spain yields still less.—In the
tin mines of Cornwall the ore occurs in small
TIN

strata, veins, or masses ("tin floors"); in congeries of small veins; in large veins; and disseminated in alluvial deposits. The congeries or networks of small veins (Stockwerke of the Germans) occur in granite and "elvan" (feldspathic porphyry). The large metalliferous veins are grouped in three districts: the S. W. part of Cornwall, beyond Truro; the neighborhood of St. Austell; and the neighborhood of Dartmouth, in Devonshire. The first is the richest and best explored. The tin veins belong to different systems, having nearly the same general course, but differing in dip. It was formerly thought that tin occurred in the upper portions of the lodes only, and the appearance of copper pyrites in depth was considered to be a sign that the tin ore had been "cut out"; but more recently tin ore has been found at great depths and below the copper. Thus the Dolcoath mine was worked first as a tin mine for a very long period; then as a copper mine for half a century; and finally again, at still greater depth, and with considerable profit, as a tin mine. Alluvial tin ore occurs as stream deposits on the hillsides and in the valleys, and fattened for centuries the whole of the Cornish tin. The largest works of this kind are around St. Just and St. Austell. Many of the Cornish mines have been unprofitable since 1872, on account of the great fall in prices resulting from the influx of Australian ore and metal. The mines in the East Indies might perhaps have brought about this revolution still earlier, since they were capable of producing tin very cheaply; but the supply from that source was limited at the will of the governmental authorities, so as to divide the market with Cornwall, on terms which left some profit to the Cornish mines. One authority estimates the product in 1868 at 7,200 tons for Great Britain, and 7,500 tons for southern Asia and India. According to a recent writer (Berg- und Hüttenmännische Zeitung, 1875), the total product of tin in the world about 1870 was something over 11,000 tons annually, of which 6,000 tons came from Cornwall and 4,000 tons from Asia. (This estimate for Asia is apparently too low.) But since that time, and especially since 1872, a very extraordinary development of tin mining in Australia has revolutionized the market.

The Australian tin-ore deposits thus far known occur in the region of the Cordilleras, in Victoria, New South Wales, and Queensland. In Victoria the older outcropping rocks are predominantly Silurian, and tin ore is found in small quantity in alluvial deposits, but hitherto not in veins. In New South Wales and Queensland there is a greater quantity and variety of exposed rock formations, and among them granites, porphyries, and metamorphic schists, with which the tin ore is associated. In a portion of New South Wales it appears connected with more recent eruptive rocks. The alternations of rain and drought in the seasons are a serious inconvenience to alluvial mining, which suffers also, like the placer mining of gold in Australia and the United States, from occasional excessively dry years. The existence of tin ore in this region was made known by the Rev. W. B. Clarke, colonial geologist, in 1845; in 1869 a shepherd brought to market a considerable quantity which he had obtained by washing, without knowing its value; a population of 10,000 miners was attracted to the district, and a feverish speculation raged until near the end of 1871, followed by disastrous reaction and a gradual renewal of industry in a more reasonable way. Up to the end of 1871 the production had been about 2,000 tons of tin. The present export in metal and in ore (sent to England for reduction) is said to exceed 7,000 tons of tin; the number of workmen is between 2,000 and 3,000. Veins are abundant, but the entire product is at present derived from alluvial mines. These occur in five principal districts, interspersed with scattered minor districts, the aggregate area being about 1,000 sq. m., the greater part of which lies south of the boundary between Queensland and New South Wales. The placers usually lie along present or former water-courses, and present at the surface granitic sand and pebbles, with underlying gravel, and at the bottom, resting upon the bed rock, a layer of clay, gravel, and boulders, in which occur tin ore, wolfram, tourmaline, quartz, and occasionally sapphire and ruby. Sometimes the series is repeated, giving two layers of stanniferous gravel, of which the lowest rests upon the rock, a phenomenon familiar to placer miners for gold; and the methods of working are similar to those of the latter. The total depth of the deposit is rarely less than 4 or more than 20 ft. The labor employed is partly Chinese; the average cost of the ore, delivered at the nearest harbor, is perhaps £40 a ton, though rich mines, favorably located, can deliver it at £30. Some furnaces have been erected near the mines to smelt the ore; but wood, the only fuel available there, though cheap at present, is likely to be rapidly exhausted. Two large establishments, at Sydney and Brisbane, have successfully smelted the Australian tin ores with coal in reverberatory furnaces. The metal, however, even after refining, contains but 99 per cent. of tin, on account of the wolfram invariably present in the ore. For this reason Australian ore is disliked by the smelters of Cornwall, and Australian tin always commands a somewhat lower price than Banca or Cornish metal. New and extensive discoveries of tin ore have been recently reported in south of the island of Banca, in the Dutch East Indies, occurs as stream tin and also in veins in granite. The Dutch government at present works the alluvial deposits only. These consist of 9 to 30 ft. in depth of loam, red and blue clay, coarse and fine sand, and tin ore. The tin-bearing layer is from 3 to 22 in. thick, in some cases even more. The mines are worked de-
ring the dry season of eight months, the rainy season being devoted to smelting the ore. The workings are open pits. The ore, when the material is conveyed away to be washed, water being collected by means of dams and reservoirs. After the washing the ore is calcined, leached in water (to remove sulphates of iron and copper), smelted in shaft furnaces with charcoal, drawn into a purifying receptacle, and poled. The resulting tin is the best in the market. The government furnishes engineers, superintendents, and furnaces; all the rest is supplied by the workmen (Chinese), who receive about $5.09 for each 100 lbs. of cast tin. The "Straits" tin comes from the British settlement of Malacca, and from various points on the Malay peninsula and the islands between it and Java. Drought and troubles with the Malays have temporarily reduced the supply from this source. Its quality varies according to the locality of the mines and the skill of the metallurgical treatment; but it is usually less pure than Banca tin.

-Metallurgy of Tin. The tin ore found in drift or alluvium is usually purer than that in veins, because the arsenides, sulphides, and metallic salts are decomposed and carried away by the action of water. The veinstuff as mined is usually rock or gangue containing disseminated ore (sometimes as little as 4 of 1 per cent. of tin), and requires a careful preliminary concentration, the difficulty of which is enhanced by the presence of heavy minerals (wolfram, bismuth, &c.), which must be removed to secure a pure metal as the result of smelting. Connected with the mechanical concentration there is usually a calcination, to convert heavy sulphides into oxides, which can be more easily washed away. The apparatus of concentration comprises launders, plane tables, biddles, percussion tables, jigs, &c. (See Metallurgy.) The theory of the reduction of tin ore is simple. The stannic oxide must be reduced to stannous oxide by the oxygen of the air, iron, or carbon at high temperature, and reduced to metallic form in fusion, while the earths and metallic oxides accompanying it must be collected in the slag. In practice the operation is embarrassed by several difficulties. One of these arises from the high temperature necessary for the reduction of the stannic oxide, at which temperature other metallic oxides, which should pass into the slag, are also partially reduced and enter the metallic bath, or cause "salamanders" or "scaffolds" by chilling in the furnace. Hence the necessity of removing lead, copper, antimony, arsenic, zinc, iron, tungsten, molybdenum, &c., as far as practicable, before smelting. There is also danger that the stannic oxide, which plays the part of an acid toward many bases, and of a base toward acids, may pass partly into the slag as ferrous or calcic stannate, or stannic silicate. The oxidability and volatility of tin are also sources of loss, to avoid which the shaft furnace is so constructed as to remove the metal, once reduced, as soon as practicable from the influence of the heat and blast. The earthy ingredients of the ore, in which usually silica predominates, tend to form "stiff" (not easily fusible) slags; and, rather than add fluxes to counteract this evil, at the cost of an increase of the amount of zinc carried into the slag, it is common to smelt with little or no extra flux, producing a scarcely fused slag, in which more tin is mechanically caught and retained than is chemically combined with silica or the bases. This slag may be remelted or treated by mechanical concentration, to extract the tin which it contains, in fine metallic grains. Wolfram, which cannot be completely washed out, either with or without preliminary roasting, and which if present in the smelting charge goes partly into the slag and partly as tungsten into the metallic tin, is sometimes removed by a preliminary smelting of the ore with soda carbonate or sulphate (Glauber's salt), by which a soluble tungstic acid is formed, which can be leached out. Muratic acid will leach out from roasted tin ore the chlorides of iron, copper, and bismuth. The melting of the concentrated and purified tin ore may take place in a reverberatory or in a cupola furnace. The former is advantageous in size, where coal is cheap and good. It loses less tin by oxidation than the shaft furnace, in which the blast acts more or less on the tin, and it requires less fuel for the production of a given amount of tin. Zirkel says the reverberatory consumes for each part of tin produced 14 part of coal and loses 5 per cent. of tin, while the shaft furnace consumes 3 parts of coal and loses 15 per cent. of tin. But when the ore is impure, the reverberatory furnishes an inferior tin. The greater product is due to the better opportunity afforded for the grains of tin to settle from the slag into the bath, which in the shaft furnace must be quickly removed to prevent oxidation from the blast. But this oxidizing blast, on the other hand, removes more completely arsenic, bismuth, &c. The principal ingredients added in the reverberatory are reducing agents (carbon), and sometimes, to counteract predominant silica in the ore, small quantities of slacked lime and fluor spar. This furnace is used in England, and also in Australia. In the cupola furnace, which is employed on the continent of Europe and in the Indies, the additions, aside from the fuel, are chiefly stanniferous slags and residues from the same process, which serve to prevent the fine dressed ore from packing too closely in the furnace to permit the passage of the blast. The cupola furnaces are made comparatively small in section, and contracted near the tuyeres, in order to secure the necessary temperature; and to prevent the reduction of iron oxides, they are made low (in Saxony, 1.88 to 2.82 metres; in Banca, 1.26 to 2.82 metres). The hearth slopes at the bottom from the rear wall toward the breast, and the fused material, flowing down this slope, passes con-
tin

The size of the lower part of the shaft furnace is shown in the accompanying section, in which

a is the rough masonry of granite or gneiss; b, the inner wall, of granite; c, the front wall; d, the hearth; e, the tuyere; f, the "eye"; g, or opening in the breast, through which the molten material escapes; i, the fore hearth, built with granite, k, clay, and clay powder.

The arrangement for removing the slag from i, and the chambers for saving dust and fumes, placed above the furnace, are not shown in the diagram. The dimensions of the furnace here shown are, in metres: height, 2.48; width at top 0.90, at bottom, front, 0.58; rear, 0.48; depth from front to rear wall at top 0.62, at bottom 0.48; inclination of hearth, 26°; size of "eye," 0.10 high by 0.28 at top and 0.5 at bottom; depth of fore hearth 0.38, of crucible 0.14; diameter of each, 0.5. The product of the shaft or reverberatory furnace contains more or less of the impurities of the ore. Of iron there are at least traces in all sorts of tin; 0.5 per cent. injures the silvery color and lustre, and 1 per cent. diminishes perceptibly the softness and smoothness. Of copper, 1 to 1.5 per cent. makes tin harder and less malleable; and as the proportion is increased, the metal becomes more brittle and suffers a change in lustre. Of antimony and bismuth, 0.5 per cent., without affecting the lustre, causes a brittle, crystalline structure. Of lead, 1 per cent. injures color and lustre, and softens the tin. Arsenic to the amount of 0.5 per cent. affects color and lustre; over 1 per cent. of it renders the tin lighter, and gives it a spotted, dull, or darkened appearance. Wolfram and molybdenum in considerable proportions diminish rather the fusibility than the strength or lustre; zinc renders the metal harder, more brittle, and whiter; sulphur makes it "short," tin oxide reduces its brilliancy; quicksilver, contained in several varieties of East Indian tin, renders it crumbly, and hinders its union with other metals. The refining of crude tin is conducted in England as follows: The blocks of tin are set on the hearth of a reverberatory, and liquated at low temperature, by which process a purer tin is obtained in a kettle, while an alloy consisting mainly of less fusible metals (iron, wolfram, copper, &c.) remains on the hearth. The liquid tin in the kettle is further purified by "poling," that is, green wood or damp coal is submerged in it, causing by the generation of gases a violent ebullition, which continually changes the surface of the bath exposed to the air, and promotes the oxidation of the foreign substances. These are skimmed off, and the bath is allowed to settle, when there is a further deposit of heavy metals (iron, copper, &c.) on the bottom. After settling, the tin is drawn off in three portions, the upper layer being refined block tin, the middle common tin, and the lowest an impure alloy which is again liquated. Block tin is cast in moulds of marble. The purest metal (containing only 0.01 per cent. of iron) is called grain tin, and is produced by heating the best block tin until it is brittle, and dropping it from a considerable height upon flat stones. The German process of refining consists in pouring the melted crude tin from a certain height upon an inclined cast-iron plate, coated with loam and covered with a layer of glowing coal about 0.25 metre thick. The less fusible impurities remain among the coals, and the purified tin flows along the plate, to be collected in a sump of cast iron filled with coal. The operation is performed repeatedly; the coals are subsequently beaten, to remove adhering grains of tin, and the residue is returned to the smelting furnace. Care must be taken to cast tin at the right temperature. If too hot, it becomes iridescent and "red short," if too cold, it assumes a dull appearance, becomes "cold short," and loses ductility. The proper moment for casting is shown by a mirror-like clearness of the surface of the bath. A special refining of tin in the humid way consists in dissolving the granulated metal in muriatic acid, and precipitation by zinc. The zinc solution is subsequently decomposed with milk of lime, and the precipitate manufactured by heating into zinc white. The following analyses are from Kerl's Metallhüttenkunde (Leipsic, 1876):

Uses of Tin. Tin foil is used for coating the backs of mirrors, wrapping articles requiring to be kept from the air, lining boxes, covering Leyden flasks, &c. The latter uses require less copper in the composition, and the material is sometimes called stanniol. Of the following four analyses by Stötzel, the first two are of foil for large mirrors, the third for small mirrors, and the fourth for wrappers and linings:

Tin foil is prepared by rolling cast tin into plates, and beating and doubling as with gold foil, though by a simpler process. (See Gold-beating). Tin foil consisting of a surface of tin, with an interior of lead or tin-lead alloy, is prepared by placing a plate of lead or alloy in a mould slightly larger, casting tin around it, and rolling and hammering. Tin-lined lead pipe for plumbers' use is made by setting a core of block tin in the centre of a mass of melted lead, so that the more fusible tin is melted, but does not mix with the remainder of the bath, and then proceeding as in the ordinary manufacture of lead pipe. (See Lead, vol. x, p. 262.) Tin plating is performed either by covering the metallic articles to be plated with melted tin, or by humid processes. The former method is chiefly confined to copper, iron, and zinc. Copper may be heated, cleaned with sal ammoniac, sprinkled with resin, to prevent oxidation, and then plated by pouring melted tin upon it, and spreading the tin with tow, a high temperature being maintained. The plating of sheet iron, to form so-called "tin plate" or sheet tin, for domestic utensils, &c., is conducted as follows: The thin sheets of iron are cleaned by immersion in dilute sulphuric acid and subsequent rubbing with sand and water and washing, after which they are annealed by exposure to cherry heat for 12 hours in cast-iron boxes, tightly closed and luted. Imperfect or seriously oxidized plates are rejected. The accepted ones, which are purplish from a thin external film of oxide, are polished by being passed cold through rolls, then subjected to a second and less prolonged annealing, then sorted and cleansed again, and finally taken to the tinning apparatus. After cleansing they will quickly rust on exposure to air, but may be kept indefinitely without injury if immersed in pure water. The tinning apparatus comprises a series of long rectangular pots or tanks, with a fire under each. These tanks contain the liquid baths into which the plates are to be plunged. The operation comprises a series of immersions: first into melted grease, in which the plates are left till all moisture has evaporated; then successively into several baths of tin, each of which is purer than the preceding, so that the sheets acquire a coating first of alloy and finally of pure tin; then into melted grease again, in which the superfluous tin runs off, while the liquid grease prevents a too rapid cooling and consequent cracking of the surface. As the tin in the final tin bath becomes fouled by alloyed iron, it is removed to the preceding tin bath, and from this in turn to the first bath. After the final greasing bath (tallow and palm oil), which anneals the plates, the edging of tin which usually forms around them is removed by dipping into melted cast iron, which melts it, so that a quick blow on the plate causes it to drop off. The plates are at last rubbed with bran and then with sheepskin to remove grease and dirt, sorted, packed in boxes, and marked to indicate size and quality. The sheet iron for tin plates is rolled from the best charcoal or coke bar. Terne plates have, instead of tin, a coating of tin-lead alloy, containing from one third to two thirds lead. Iron may be coated with zinc first, and then very readily tinned by dipping into the fused metal, since tin and zinc unite with ease. Sheet zinc is tinned in the same way, but should not be left in the bath so long as to become alloyed with tin beyond the surface. Lead and its alloys may be tinned in like manner. The process above given for tinning iron is not applicable to cast iron, unless it has been de carbonized on the surface by heating in iron oxide, after the manner of the "annealing" practised in the manufacture of malleable castings. The humid methods of plating tin upon various metals are numerous. Pins, which are made of brass wire, and other objects of brass or copper, are dipped into an aqueous solution, containing 1 part argal, 2 parts alum, and 2 parts salt, in which tin has been dissolved, or to which stannous chloride has been added. In this liquid they remain unaffected until brought into contact with metallic tin, whereby an electro-chemical action is caused, and all the objects connected directly or through one another with the metallic tin are immediately coated with tin reduced and precipitated from the solution. Boiling brass or copper objects, in contact with tin filings, in a solution of stannic oxide in caustic potash, is also an excellent way. Iron objects (nails, hooks and eyes, &c.) may be tinned, after suitable cleansing, in a bath of argal and stannous chloride, with the addition of zinc filings; or the bath may be composed of equal parts of the tin salt and common salt, dissolved in water, or of 1 part tin salt, ½ part sal ammoniac, and 1 part common salt, dissolved in 2 parts nitric and 4 parts muriatic acid, diluted with water. In the latter liquid most metallic objects may be tinned by sufficiently prolonged immersion, copper or iron being kept in contact with a zinc wire during the process. Zinc is most easily tinned. For galvano-tinning a weak battery may be employed, and a solution of stannic chloride in caustic potash. But the use of the battery in this and similar opera-
TINAMOU

TINAMOU, a name applied to the *tinamidae*, a family of gallinaceous birds peculiar to South America. The bill is moderate, rather straight, flattened, the base covered by a membrane, and the tip suddenly hooked; wings short and concave; tail short or wanting; tarsi rather long, scaled in front, and without spurs; toes long, with stout blunt claws, the hind one sometimes wanting. They live in the fields on the borders of woods, are low and heavy fliers, but rapid runners, and feed on grains, fruits, and insects; they lay about a dozen eggs, on the ground in tufts of grass, and the young when hatched soon disperse; when pursued they endeavor to hide in the bushes, and are often caught by a noose on the end of a stick; their flesh is exceedingly good; they vary from 6 to 18 in. in length, and are usually of a reddish or gray brown. In the genus *tinamus* (Lath.; *crypturus*, Illig.), the bill is shorter than the head, the upper mandible the longer, and the nostrils in the middle; first quill short, fourth and fifth longest; hind toe small and elevated. The great tinamou (*T. Brasilienis*, Lath.) is about 15 in. long, of a deep olive color, slightly and narrowly banded with black, with crown red and secondaries red and black; pale reddish ash below; it is found in Guiana and Brazil, resembling in size, habits, colors, and quality of flesh the partridges of the old world; though gentle and timid, it is said not to be capable of domestication. The males have a trembling plaintive whistle to warn of danger or attract the females; they live in couples during breeding time, at other seasons in small flocks. The nest is made on the ground in a slight hollow, covered with dry grasses; they lay twice a year; the young follow the parent as soon as hatched. Other genera are *rhynchosaurus* (Spix), with the species *R. rufescens* (Wagl.) or rufescent tinamou, inhabiting the borders of lakes and the swampy thickets of Paraguay in small troops; and *tinamotis* (Vig.), with three or four species, found in high desert places, some distance from fresh water.

TINCTURE, a solution of a vegetable, animal, or in some cases mineral substance in alcohol, dilute alcohol, or ether. As tinctures present the active principles of many drugs in a small bulk, and are little liable to change, they are largely used in medicine. They are made by maceration or displacement. The former process consists in soaking the drug for a time which varies greatly in different cases. Displacement or percolation is largely employed in the preparation of fluid extracts as well as of tinctures, and consists in allowing the fluid employed to filter slowly through the powdered drug, the lower layer of fluid, containing a large portion of the soluble constituents, being constantly drawn off and its place supplied by fresh strata from above. This process is in most cases much more rapid than maceration. Tincture of iodine and tincture of the chloride of iron demand no maceration, as iodine dissolves rapidly in alcohol or ether, while the iron preparation is a mere mixture of a solution with alcohol.

TINDAL, Matthew, an English author, born at Beer-Ferris, Devonshire, about 1637, died in London, Aug. 18, 1733. He was educated at Oxford, took the degree of bachelor in 1656, and was elected to a fellowship at All Souls, which he retained throughout life. He was created LL.D. in 1685, and soon after became a Roman Catholic, but returned to the church of England just before the revolution of 1688. After the revolution, of which he was a zealous partisan, he became an advocate, sat as judge in the court of delegates, and received a pension from the crown of £200. In 1706 he published "The Rights of the Christian Church asserted, against the Romish and all other Priest&mdash;those who claim an independent Power over it," in opposition to high church principles. This excited a long controversy, during which he published two defences, which he reprinted in 1709, with essays on obedience and the law of nations, the liberty of the press, and the rights of mankind in matters of religion. In 1710 he attacked the party of Dr. Sacheverell in a pamphlet entitled "New High Church turned Old Presbyterian;" but the house of commons on one day condemned Sacheverell's sermons, and on the next ordered Tindal's "Rights of the Christian Church" and the second edition of his "Defences" to be burned. His most important work is "Christianity as old as the Creation, or the Gospel a Republi- cation of the Religion of Nature" (1730), in which he expressly denies that Christianity contains any truth which the human reason might not have discovered for itself. Waterland, James Foster, Conybeare, Leland, Chapman, and others wrote replies to it. He left a second volume of this, only the preface to which has been published.
TINNE, the northern branch of the great Athabascan family of American Indians, being the most northerly of all except the Esquimaux. They live north of lat. 55°, and extend from central Alaska to Hudson bay. They embrace several large divisions, differing in language: 1, the Chipewyans or Pointed Skins, called Montagnais by the French, including the plain, the Caribou River, the Caribou, and the Knives; 2, the Beaver Indians, on the west, the Mauvais, and Sareces; 3, the Dog Ribs, Slaves, Hares, Naunaes, Red Knives, Sheep, Brushwood, and Rocky Mountain Indians, all E. of the Rocky mountains; 4, the Tuculi or Carriers, including the Sicanees in British Columbia; 5, the Kutchin Dukedh or Lowenex; 6, the Kenai, including the Atunas in Alaska. They are generally mild, timid, and honest, live on fish or reindeer and other animals, more frequently snared than hunted, and do not attempt to cultivate the ground. They are tall and slim, with a full face, dark complexions, piercing eyes, and have more beard than other Indians. Their weapons and implements are generally rude, made of bone or stone; but some tribes make excellent water-tight vessels of roots. Their jkuanoe or medicine men have great influence. The Chipewyans leave the dead unburied, but the Tucullies burn them. The estimates of their numbers vary; those east of the Rocky mountains are estimated by Archbishop Taché at 15,000. Catholic and Protestant missions have been established among them in various parts.

TINNE, Alexandrine Petronella Francina, a Dutch traveller, born at the Hague, Oct. 17, 1835, murdered in Fezzan, Africa, Aug. 1, 1869. Her father was an English merchant, her mother the baroness Van Steengracht-Capellen of Holland. She was rich, travelled in Europe and the East, settled in 1861 in Cairo, and in 1862 set out from Khartoom with a steamboat, transport vessels, beasts of burden, and a large retinue, to visit the White Nile. Her state made the natives believe her the daughter of a sultan. In 1863 she explored the Bahal el-Ghazal, the W. arm of the White Nile, in company with Baron von Hungen and Dr. Steudner, the latter of whom, together with Miss Tinné's mother, and many others, died from exposure. The expedition, which was absent 14 months, determined astronomically the position of Lake Meshera, one of the feeders of the Ghazal. The flora of the region has since been illustrated in Kotschy's Planta Tinni- nae, partly from her drawings and descriptions. In 1869 she set out from Tripoli for Bornoo, with 70 camels and 50 attendants, of whom the only Europeans were two Dutch sailors. From Moorzook she turned aside to visit the country of the Tuariks, and while on the way to Ghar was murdered by her attendants.

TINTOCERAS, or Titanotherium, a fossil mammal of the order Eremotheria, discovered by Prof. O. C. Marsh in the eocene of Wyoming territory, in 1870. It was as large as an elephant, and had many characters of the proboscids, with three separate pairs of horns, and large recurved canines like the walrus; it also had characters of both the perissodactyl and artiodactyl ungulates. These animals have been named eobasileus and lozolophodon by Prof. Cope, and uintatherium by Prof. Leidy, ("American Naturalist," vol. viii., 1872.)

TINTORIETO, M. T., a Venetian painter, whose real name was GIOACCHINO RIVIERI, born in Venice in 1512, died there in 1594. He was the son of a dyer, whence he received his popular name. He studied for a short time under Titian, and subsequently began a rigorous course of self-instruction, inscribing over his studio: "Il disegno di Michel Angelo et colorito di Tiziano ("The drawing of Michel Angelo and the coloring of Titian"). He did not however content himself with following them, but aspired to become the founder of a school, which should supply whatever was deficient in their styles. He soon rose into great reputation among the Venetians, and of his best period his quickness of invention and the facility and rapidity of his execution were unequalled perhaps by any painter; but his impetuosity made his performances remarkably unequal. His portraits are his most uniformly excellent works, and his landscapes are distinguished for imaginative suggestiveness. But his reputation rests mainly upon his great historical pictures in Venice. His masterpieces are the two immense compositions representing St. Mark rescuing a tortured slave from the hands of the heathen, and the "Crucifixion," both painted in his best period. The doge's palace is rich in his works, and contains, among other remarkable pieces, a representation of paradise 844 ft. long and 54 ft. high, painted, like almost everything he produced, in oil. In the latter part of his life he degenerated into a coarse style, of which his "Last Judgment" and "Worshipping of the Golden Calf," in the church of Sta. Maria dell' Orto, are examples. In the maturity of his powers he wrought so fast and at so low a price, that few of the contemporary painters of Venice could get employment. Many of his works were bestowed gratuitously upon convents, and for others he got barely enough to pay for the materials.

TIOGA. 1. A S. county of New York, bordering on Pennsylvania, and intersected by the North branch of the Susquehanna river and several railroads; area, 480 sq. m.; pop. in 1875, 31,744. The surface is very hilly and the soil generally fertile. The chief productions in 1870 were 108,955 bushels of wheat, 229,385 of Indian corn, 622,379 of oats, 167,674 of buckwheat, 398,770 of potatoes, 79,482 lbs. of wool, 1,907,767 of butter, and 65,078 tons of hay. There were 6,402 horses, 16,424 milch cows, 9,393 other cattle, 19,688 sheep, and 6,190 swine; 8 manufactories of agricultural implements, 8 of boots and shoes,
TIPTAH

17 of carriages and wagons, 1 of machinery, 1 of pianos, 1 of printing paper, 11 flour mills, 3 tanneries, 35 saw mills, and 9 planing mills. Capital, Owego. II. A N. county of Pennsylvania, bordering on New York and drained by the Tioga river and its affluents; area, about 1,100 sq. m.; pop. in 1870, 35,097. The surface is hilly and heavily timbered, and the soil better adapted to grazing than tillage. Iron ore is found, and bituminous coal is abundant, of which large quantities are transported to Buffalo by the Corning, Cowanesque, and Antrim, and Tioga railroads. The chief productions in 1870 were 163,719 bushels of wheat, 236,313 of Indian corn, 504,684 of oats, 116,263 of buckwheat, 282,618 of potatoes, 89,788 lbs. of wool, 145,209 of maple sugar, 1,574,825 of butter, 65,589 of cheese, and 82,572 tons of hay. There were 6,165 horses, 16,017 milk cows, 15,149 other cattle, 32,729 sheep, and 8,351 swine; 3 manufactories of agricultural implements, 25 of carriages and wagons, 7 of cheese, 12 of furniture, 2 of glassware, 1 of woollens, 10 flour mills, 13 tanneries, and 46 saw mills. Capital, Wellsborough.

TIPIAH, a N. county of Mississippi, bordering on Tennessee, drained by the Hatchie and Tallahatchie rivers and Tippah creek; area, about 500 sq. m.; pop. in 1870, 20,727, of whom 5,091 were colored. The surface is undulating, and the soil fertile. The chief productions in 1870 were 37,429 bushels of wheat, 59,988 of Indian corn, 15,255 of oats, 49,125 of sweet potatoes, 15,457 lbs. of wool, 188,459 of butter, and 6,307 bales of cotton. There were 8,116 horses, 2,010 mules and asses, 13,761 cattle, 9,942 sheep, 32,629 swine, and 9 saw mills. Capital, Ripley.

TIPPECANO, a river of Indiana, which rises in a lake of the same name in Kosciusko co., and flows generally S. W. into the Wabash river 9 m. above Lafayette, Tippecanoe co. Its length is about 200 m. It is famous for the battle fought on its banks, Nov. 7, 1811, in which the Americans under Gen. Harrison defeated the Indians under Tecumseh's brother.

TIPPECANO, a W. county of Indiana, intersected by the Wabash river, drained by the Tippecanoe river and several creeks, and intersected by the Wabash and Erie canal and several railroads; area, 500 sq. m.; pop. in 1870, 33,515. The surface is generally level, and the soil a rich black loam. The chief productions in 1870 were 552,677 bushels of wheat, 909,367 of Indian corn, 177,578 of oats, 94,516 of potatoes, 54,265 lbs. of wool, 207,971 of butter, and 16,654 tons of hay. There were 9,095 horses, 5,886 milch cows, 12,695 other cattle, 16,910 sheep, and 27,205 swine; 4 manufactories of agricultural implements, 6 of boots and shoes, 25 of carriages and wagons, 5 of machinery, 1 of paper, 1 of vegetable oil, 3 of woollens, 14 flour mills, 3 breweries, 1 distillery, 1 planing mill, 6 saw mills, and 1 beef-packmg and 3 pork-packmg establishments. Capital, Lafayette.

TIPTAH

TIPOO SULTAN, or Tipoo Sahib, the last independent sovereign of Mysore, born in 1749, killed at Seringapatam, May 4, 1799. He was the son of Hyder Ali, and was first known by the appellation of Feth Ali Khan. He distinguished himself in the war against the English, and succeeded his father, Dec. 7, 1782. He at once gave a new impulse to the war, took Bednore and other cities, and concluded a peace, March 11, 1784, on advantageous terms. He then assumed the titles of sultan and padishah, and subdued the Nairs of Malabar, carrying off from that province, it is said, 70,000 Christians, and forcing 100,000 Hindoos to become Mohammedans. Under a flimsy pretext, in December, 1789, he broke the treaty with the English by invading the territory of their ally, the rajah of Travancore. The English in turn invaded Mysore, took several of his strongholds, were joined by the Mahrattas and the subahdar of the Deccan, and, under Cornwallis and Abercrombie, besieged him at Seringapatam, his capital. In March, 1799, Tipoo was forced to conclude peace, agreeing to pay within a year 33,000,000 rupees, to give up to the allies nearly half of his dominions, and to deliver two of his sons as hostages. The earl of Mornington (afterward Marquis Wellesley), then governor general of India, subsequently discovered that he was engaged in intrigues with the French and making preparations for war, and in February, 1799, on his refusal to desist from arming his subjects, gave orders for the invasion of Mysore. Gen. Stuart and Harris defeated the Mysoreans in two encounters, at Sidasir and Malaveli; and the sultan himself was obliged to take refuge in Seringapatam, at the storming of which by Gen. Baird he was killed.

TIPTON. I. A W. county of Tennessee, bordering on the Mississippi river, and bounded N. by the Hatchie; area, 370 sq. m.; pop. in 1870, 14,884, of whom 6,891 were colored. It
has a level surface and fertile soil. Its S. E. corner is intersected by the Louisville and Nashville and Great Southern railroad. The chief productions in 1870 were 30,870 bushels of wheat, 448,771 of Indian corn, 18,681 of oats, 12,104 of Irish and 18,380 of sweet potatoes, 74,777 lbs. of butter, and 10,052 bales of cotton. There were 1,879 horses, 1,851 mules and asses, 2,784 milk cows, 4,315 other cattle, 4,675 sheep, and 20,240 swine. Capital, Covington. II. A central county of Indiana, drained by Cicero creek and other streams; area, 250 sq. m.; pop. in 1870, 11,583. The surface is level and the soil fertile. It is intersected by the Indianapolis, Peru, and Chicago, and the Pittsburgh, Cincinnati, and St. Louis railroads. The chief productions in 1870 were 149,822 bushels of wheat, 357,835 of Indiana corn, 21,487 of oats, 25,413 of potatoes, 30,648 lbs. of wool, 179,905 of butter, and 4,892 tons of hay. There were 2,967 horses, 2,059 milk cows, 3,691 other cattle, 10,762 sheep, and 11,835 swine; 1 flour mill, 14 saw mills, and 1 woollen factory. Capital, Tipton.

TIRABOSCHI, Girolamo, an Italian author, born in Bergamo, Dec. 28, 1731, died in Modena, June 3, 1794. He was educated in the Jesuit college of Monza, became a Jesuit, and about 1766 was appointed professor of rhetoric in the university of Milan. In 1770 he was made librarian of the duke of Modena. His "Storia della letteratura italiana" (13 vols., Modena, 1772–83; best ed., 16 vols., Milan, 1822–6) extends from the earliest times to the end of the 17th century. Tiraboschi was also the author of many other literary, historical, and biographical works.

TIRESSA, a Greek soothsayer, born in Thebes, the son of Eueres and Charicio, and fabled to have lived through nine generations of men, but blind from his seventh year. His loss of sight was ascribed by one account to the fact that he disclosed to mortals what they should not know; by another, to his having seen Minerva bathed in the waters of a spring which blinded him by sprinkling water upon him. In compensation, she gave him a staff by which he could guide his steps as safely as by sight, and ability to understand the voices of birds and thus know futurity. His oracle was at Orchomenus.

TIRYNS, one of the oldest cities of Greece, in Argolis, the site of which is 2 m. N. of Nauplia. The name is supposed to be an ancient form of τίρυς, a tower or castle. It was founded by Pratus, and said to have been surrounded with walls by the Cyclopes. These walls are the finest existing specimens of the military architecture of the heroic age of Greece. The ruins at present occupy the lowest hill of several which rise out of the plain, and the entire circuit of the walls enclosing the citadel is still preserved to some extent, being from 20 to 25 ft. wide and 350 yards in circumference. On the E. side of the hill are two towers, and the S. E. part of the wall has a remarkable covered gallery 36 ft. long and 5 ft. broad. In 468 B. C. Tiryns was entirely destroyed by the Argives.

TISCHENDORF, Lobegott (Latinized Äxner, or Eus) Friedrich Constantin von, a German Biblical paleographer, born at Lengenfeld in the Voigtdom, Saxony, Jan. 18, 1815, died in Leipzig, Dec. 7, 1874. From 1834 to 1838 he studied philology and theology at Leipzig, where he published two prize essays: "Doctrina Pauli Apostoli de Vi Mortis Christi satisfactoria" (1837), and "Disputatio de Christo Pane Vite" (1839), and a volume of poems entitled Maimeroppen (1838). He was for a year and a half a private teacher in the neighborhood of Leipz, at which time he wrote his "Her junges Mystiker," a novel, published under the pseudonym of Dr. Fritz. Devoting himself thereafter to textual criticism, he returned to Leipsic, wrote an essay on Matt. xix. 16, and a severe criticism of the published texts of the New Testament, with special reference to the edition of Schoel, and in 1841 published his own edition of the Greek Testament, embodying the various readings of the textus receptus. The years 1841–4 were in great part spent by him in visiting the various libraries of Europe for the purpose of collating, copying, and publishing the most important New Testament manuscripts. In their possession, 1844, 1853, and 1859 he made journeys through the East, visiting numerous libraries and monasteries of Asia Minor, Palestine, the Sinaiic peninsula, and Egypt. He published accounts of two of these journeys, Reise in den Orient (Leipsic, 1845–6), and Aus dem heiligen Lande (1862). With the exception of the last journey, which he made under the auspices of the emperor of Russia, he received pecuniary assistance for his travels from the Saxon government. In 1842, while at Paris, he prepared an edition of the New Testament intended for the use of Catholos, giving the Latin Vulgate and a Greek text, rendered as far as possible conformable to it, in parallel columns. He published also in the same year a Greek text differing very little from his earlier Leipsic edition. In 1843 appeared the New Testament portion of his publication of the Ephraem palimpsest of the 5th century. Two years later, when the remainder of this edition was
published, he was made professor extraordinary in Leipzig. The principal result of his first oriental journey, in 1844, was the discovery of 49 leaves of a Septuagint manuscript of the 4th century, then called Codex Fredericus Augustanus, but subsequently discovered to form part of the Codex Sinaiticus. The fragment was published in 1846 in lithographed facsimile. The same year also appeared the Monumenta Sacra Inedita, containing the manuscripts F, L, N, W, Y, and Œ of the Gospels, and B of the Apocalypse. In 1847 he issued a portion of a manuscript of the old Latin version of the Gospels, and the Wiener Jahrbücher brought out serially during the following years his edition of the old Latin Codex Bobbiensis. In 1849 Tischendorf published a second edition of his Leipsic Greek Testament of 1841, fully revised according to all the material so far collected, and in 1850 the same text with marginal readings of the textus receptus, a correct reprint of the Vatican edition of the Septuagint with marginal readings of the Ephraem and Alexandrine manuscripts, and the New Testament according to the Codex Amiatinus, probably the oldest manuscript of the Latin Vulgate. In 1851 he obtained the prize offered by the society of the Hague for the defence of the Christian religion, with a dissertation entitled De Evangeliorum Apocryphorum Origine et Usu, and published his Acta Apostolorum Apocrypha, and a Synopsis Evangelica, a Greek harmony with the principal readings, and advocating the tripaschal theory. In 1852 he published a Graeco-Latin manuscript of the Pauline epistles of the 6th century; in 1853 the Evangelia Apocrypha; and in 1854 a Novum Testamentum Trilinguut, being the Greek text of 1849 revised, a critical edition of the Latin Vulgate, and Luther's German translation substantially after the edition of 1545, but corrected from other editions published in Luther's lifetime. The prolongation of varied addenda accompanying this work render it one of Tischendorf's most valuable publications. In his Aneudota Sacra et Profana (1855) he gives an account of the manner in which he secured the numerous manuscripts, describing also their general character. The larger part of the manuscripts which he obtained were deposited in the library of the university of Leipzig, while others were sold to the British museum, and the Bodleian library. In 1855 he began a new collection of Monumenta Sacra Inedita, in nine volumes, of which he completed seven, and a seventh and larger critical edition of his Greek Testament of 1849 (2 vols., 1859). In 1856 he added to his Septuagint of 1850 the Codex Chisianus version of the book of Daniel. In 1859 he was made ordinary professor of theology and Biblical paleography, which chair was founded expressly for him. His third oriental journey, made in this year, resulted in the discovery at the convent of St. Catharine, near Mt. Sinai, of the famous Codex Sinaiticus.

(See Manuscript.) He gave the first account of it in his Notitia Codicis Sinaitici (1860), and a more popular one in a pamphlet entitled Die Sinaitische, ihre Entdeckung, Herausgabe und Erweiterung (1871). The Sinaitic manuscript was printed in facsimile type (4 vols. fol., St. Petersburg, 1869). Tischendorf received from the Russian government 100 copies, with permission to sell them at about $200 each. In 1863 was published an abridged edition of it, containing only the New Testament, Barnabas, and a portion of the Shepherd of Hermas, and giving the manuscript line for line, but in ordinary type. Tischendorf prepared in 1864 another edition of his Synopsis Evangelien, in which he adopted a large number of readings from the Codex Sinaiticus. His Novum Testamentum Graece ex Sinaitico Codice (1865) presented also the variations of the textus receptus and Vatican manuscript, and has a more elaborate introduction than the edition of 1863, for which however it does not form a complete substitute as a manual for critical purposes. In the same year appeared his Wann wurden unsere Evangelien verfasst? which met with an enormous sale, though in many respects sharply criticized by eminent Biblical paleographers. In 1866 Tischendorf published Apocalypses Apocrypha, and added to a new edition of the treatise on the date of the Gospels a severe criticism of the arguments which had been brought out against his theories; and in this form the pamphlet was rapidly translated into nearly all modern languages. In Appendix Codicum celeberrimorum, Sinaitici, Vaticani, Alexandrini (1867), giving fragments of the Codex Sinaiticus found in the binding of some manuscripts, and an edition of the Alexandrine epistles of Clement of Rome, he expressed his opinion that one of the scribes of the Sinaitic manuscript wrote also the New Testament of the Vatican manuscript. The Novum Testamentum Vaticanum, a corrected edition of the one by Cardinal Mai, published by Tischendorf about the same time, was two years later supplemented by him with an Appendix Novi Testamenti Vaticani, which furnished also the Vatican text of the Apocalypse and corrected the errors of the main edition. His subsequent publications are all signed Constantin von Tischendorf, instead of Constantin Tischendorf, Alexander II., having conferred upon him the rank of a hereditary noble. With the assistance of B. Harris Cowper, he published in 1869, as the thousandth volume of the Tauchnitz collection of British authors, the authorized English version of the New Testament, with readings from the Sinaitic, Vatican, and Alexandrine manuscripts. In 1870 he brought out a corrected edition of the Novum Testamentum Graece ex Sinaitico Codice of 1866, and published a pamphlet, entitled Responsa ad Calumniae Romanas, in defence of his Novum Testamentum Vaticanum. The next year appeared a third edition of the Synopsis Evangelica; in
which several of the readings adopted for the second edition are omitted. In 1872 he completed the important eighth larger critical edition of his Greek Testament, which for fulness and accuracy excels all that preceded it. He published also the first of the two parts of an abridged edition of this valuable work; the second part was not completed at the time of his death. The minor editions of Tauchnitz and Brockhaus (1879) are corrected by this critical edition. In 1873 Tschendorf completed Theodor Heyse's edition of the Latin Vulgate, and in 1874 he published in conjunction with Baer and Delitzsch a Liber Psalmorum Hebraicus et Latinus ab Hieronymo ex Hebræo conversus. Shortly before his death appeared his 22d edition of the New Testament.

TISHOMINGO, a N. E. county of Mississippi, bordering on Tennessee and Alabama, bounded N. E. by the Tennessee river, and drained by the affluents of the Tennessee and Tombigbee rivers; area, about 550 sq. m.; pop. in 1870, 7,350, of whom 741 were colored. The surface of the soil is fertile. It is traversed by the Memphis and Charleston railroad. The chief productions in 1870 were 4,919 bushels of wheat, 188,836 of Indian corn, 15,575 of sweet potatoes, 1,397 bales of cotton, 3,999 lbs. of tobacco, 6,597 of wool, and 462 of butter. There were 1,171 horses, 2,091 milch cows, 7,140 other cattle, 4,547 sheep, and 9,183 swine; 1 cotton factory, 2 planing mills, and 5 saw mills. Capital, Iuka.

TISSAPHERNES, a Persian general, assassinated in Colossae, Phrygia, in 395 B. C. In 414 Darius Nothus appointed him satrap of Lower Asia, S. of the Aradymyttian bay, in place of Pissuthnes, then in revolt. He was ordered by the king to collect from the Hellenic cities within his jurisdiction the tribute in arrears for half a century, and also to slay or imprison Amorges, the son of Pissuthnes, who had rebelled and made an alliance with the Athenians. Tissaphernes obtained the aid of the Spartans through the influence of Alcibiades, who desired to support the Chians in their revolt against the Athenians. Throughout the ensuing contest, comprising the closing scenes of the Peloponnesian war, Tissaphernes acted treacherously to his allies. (See Alcibiades, and Greek, vol. viii., p. 194.) In 407 Cyrus the Younger was appointed viceroy of the maritime region of Asia Minor. Hostility soon sprang up between him and Tissaphernes, who accused him, after the death of Darius, of aspiring to the throne of his brother Artaxerxes II. Tissaphernes, being one of the four generals who commanded the Persian army at Cunaxa, gained possession of the persons of the five generals commanding the Greek mercenaries of Cyrus, and put four of them to death. During the famous retreat of the 10,000 under Xenophon he continually harassed them as far as the Carduclian mountains. For his services he was made governor of the provinces formerly ruled by Cyrus, and as such he carried on war with the Spartans. Complaints against him constantly arrived at the Persian court, and Tithraustes was sent to put him to death. Tissaphernes was surprised in the bath and slain, and his head sent to Artaxerxes.

TISSOT, Simon André, a Swiss physician, born at Grancy, in the canton of Vaud, March 20, 1728, died in Lausanne, June 15, 1797. He studied at Geneva and Montpellier, settled at Lausanne about 1750, acquired great eminence as an practitioner, and became professor in the university. In 1780 he accepted the professorship of clinical medicine at Pavia, and in 1783 returned to Switzerland. His most important works are: Historia Epidemiae Lausaniensis Anni 1755 (Lausanne, 1758; French, 1759); L'Onanisme (Latin and French, 1760; latest ed., revised and enlarged by M. A. Petit, Lyons, 1856); Aide au peuple sur la santé (1761; 12th ed., 1799); and De la santé des gens de lettres, suivi de l'essai sur maladies des gens du monde (1768-70; new ed., revised by Bertrand de Saint-Germain, Paris, 1856). His complete works have been edited by Hake, with a biography and annotations (11 vols., Paris, 1800-13).

TITANIUM, a metal first detected in 1789 by Gregor in titanic iron, and found by Klaproth in 1794 in rutile, and named by him from the Titans. Dr. Wollaston in 1822 recognized it in the form of minute copper-colored cubical crystals found in the slags of the iron-smelting furnaces at Merthyr Tydfil in South Wales, and these, often met with since that time in iron slags, were formerly regarded as pure titanium, but are now understood to be compounds of the metal with nitrogen and cyanogen. Berzelius was the first to separate this metal in a state of purity. He decomposed a mixture of the fluorides of titanium and potassium by means of metallic potassium, and obtained the metal in a grayish powder. M. Sainte-Claire Deville obtained it in forms resembling specular iron ore, crystallized in prisms with a square base. Its chemical equivalent is 50; symbol, Ti. Three oxides of the metal are known, TiO, Ti2O3, and TiO2; the last of which, titanic anhydrite, is the only one of interest. It occurs as a mineral in three forms: as rutile and anatase, which both crystallize in the diamond system, though with different angles, and as brookite, crystallizing in the triclinic system. Rutile is generally a reddish brown mineral, sometimes yellowish or black, harder than feldspar, and of specific gravity 4.18 to 4.25. It occurs in many parts of Europe and America, the richest localities in the United States being in Chester and Lancaster cos., Pa. In Vermont and New Hampshire, as also in Brazil and Switzerland, it is found in long needles enclosed in masses of transparent quartz, making very curious and beautiful specimens, which are often used in jewelry. Anatase and brookite are comparatively rare minerals. In combination with oxide of iron, titanic acid forms the compound ilmenite or
TITANS

In Greek mythology, the sons and daughters of Uranus and Gea were Titans. They included Oceanus, Cetus, Crisus, Hyperion, Iapetus, Theia, Rheia, Themis, Mnemosyne, Phoebe, and Tethys. According to the most generally received account, Uranus feared his offspring, and as fast as they were born threw them into Tartarus. Gea endeavored to persuade them to free her and themselves from this oppressive treatment. Cronus, armed with a sickle made by his mother, unmanned his father, and thus secured liberty and power for himself and his brothers. Marrying his sister Rhea, he begot three sons and three daughters, but, having been told that he would be destroyed by one of his own children, swallowed them as soon as they were born. Rhea concealed Zeus (Jupiter), the youngest, in a cave in Crete, giving to Cronus instead a stone wrapped in swaddling clothes. When Zeus had grown up, he was enabled by stratagem to make his father vomit up the stone and the five children he had swallowed. Supplied by the Cyclops with thunder and lightning, and aided by the Centaurs, Zeus carried on a war against the Titans for ten years, and at length triumphed. The Titans, with the exception of Oceanus, were confined for ever in a subterranean dungeon, where they were guarded by the Centaurs. The name of Titans was also given to their descendants.

TITE, Sir William, an English architect, born in London in 1802, died in Torquay, April 20, 1873. He studied under Laing, and early superintended the restoration of the church of St. Dunstan-in-the-East. He built the famous gothic Irvingite church in London, and several line railway stations in France and England. His most celebrated work is the church in Westminster. He was president of the institute of British architects from 1862 to 1864, a member of parliament for Bath from 1855 till his death, and was knighted in 1869. He was a high financial authority, and presided for some time over the London and Westminster Bank and the Bank of Egypt.

TITHE (Ang. Sax, tenth), a tax of one tenth of the increase of crops, stock, and avail of personal industry, formerly and still in some countries levied for the support of the officers of religion, religious worship, or the assistance of the poor. This tax seems to have been of patriarchal origin (Gen. xiv. 29), and existed in many of the nations of antiquity. Under the Jewish theocracy the tenth part of the increase of the property of the Jews was accorded to the Levites, as a substitute for the landed inheritance which they forfeited by their consecration to the temple worship, and also as a compensation for their services. Other tithes were also prescribed for the sacrifices of the temple, and at particular periods for the poor. The early Christian church adopted voluntarily the custom of consecrating to religious purposes a tenth of the income, it being admitted that first fruits and tithes were not of divine precept in the new law, but held that the obligation of supporting the ministers of religion is of divine origin. It does not appear that the payment of tithes was ever enjoined as obligatory by the Greek or other eastern churches. The first known canonical enactment made for that purpose in the Latin church was a statute of the second council of Tours in 567, and this collection was enforced under pain of excommunication by the second council of Macon in 585. In France, Charlemagne established them by decree in the 8th century. In England the first law in relation to them is believed to have been that of Offa, king of Mercia, who brought the civil power to the aid of the clergy in collecting their tithes. This was subsequently extended over the whole of England by Ethelwulf. In the 9th century they were also made obligatory in Scotland, and not long after in Ireland. At first they were paid to whatever church the payer chose, but the decretal of Pope Innocent III directed their payment to the parsons of the respective parishes in which they arose. By the ecclesiastical law tithes were divided into three kinds: "predial," or such as arose immediately from the ground, like grain of all kinds, fruits, herbs, grasses, hops, wood, &c.; "mixed," natural products, but nurtured, and preserved in part by the care of man, such as wool, milk, pigs, butter, cheese, &; and "personal," as of manual occupations, trades, fisheries, &c. The first two kinds were payable in gross, but of the third class only the tenth part of the clear gains and profits was due. In France, Charlemagne divided the tithes into four parts, one to maintain the edifice of the church, another to support the poor, a third to maintain the bishop, and a fourth the parochial clergy. By the original law in England, all lands except those of the crown and of the church itself were tithable; but at the rever-
nation many of the forfeited church lands when sold were specially exempted, and some were also exempted by composition and some by prescription. These partial exemptions only made the burden more galling to those who were compelled to pay; and as the tithes were a tax for the support of the clergy of the established church, it was particularly annoying to dissenters, and has been for two centuries a constant subject of complaint. Until the reign of William IV. the payment of tithes might be extended in kind, but by the act of 6 and 7 William IV., c. 71, and subsequent acts, tithes have been converted into a rent charge payable in money, but varying annually according to the average price of corn for the preceding seven years. In Ireland they had been compounded at three fourths their former estimated value previous to the disestablishment act of 1869, which abolished tithes, and created a common fund for the support of the Protestant Episcopal church and clergy. In France tithes were abolished at the revolution, and this example was followed afterward by the other continental states. In the Canadian province of Quebec tithes are still collected by the Roman Catholic clergy, in virtue of the old French law still in force there. In the United States tithes are only exacted by the Mormon hierarchy, and among them the system is modelled on that of the Jewish theocracy.

**TITIAN (Tiziano Vecellio), an Italian painter, born near Pieve di Cadore, Friuli, in 1477, died in Venice, Aug. 27, 1576.** He is said to have made his first attempts at coloring in his early childhood with juices expressed from flowers. In his ninth year he was placed under Sebastiano Zucchi, a Venetian painter and worshiper in mosaic, and subsequently studied under Bellini. He also came probably under the influence of Albert Dürer, who visited Venice in 1494 and again in 1507, but was indebted chiefly to his intimate friend and fellow student Giorgione for the ideas of art and color which long governed him. At Giorgione's death in 1511 the styles of the two artists were so similar that it was difficult to distinguish their productions, and Titian readily completed the unfinished works of his friend. Perceiving that breadth of form produced breadth of color, he endeavored to see nature in a more ample light, and, instead of copying or imitating her tones, to generalize and elevate them in accordance with his original conceptions. The result was a free and serene beauty of form and expression, and a representation of life realizing what Kügler calls "the glorification of earthly existence, and the liberation of art from the bonds of ecclesiastical dogma." Left at the age of 34 without a rival, Titian entered upon a career which for the uniform excellence of its productions, for celebrity and duration, has perhaps no parallel in the history of painting. Commissions from the wealthy Venetian nobility afforded him abundant employment. In 1514 he visited the court of Duke Alfonso I. of Ferrara, for whom he painted the "Arrival of Bacchus in the Island of Naxos" and "A Sacrifice to the Goddess of Fertility," which are at Madrid, and the "Bacchus and Ariadne," in the British national gallery, which presents an epitome of all the characteristic beauties of Titian in composition, color, and form. At Ferrara he also painted portraits of Lucrezia Borgia and of Ariosto. He was again at Venice from 1516 to 1520, and in 1525 went to Bologna to paint the portraits of the emperor Charles V. and Pope Clement VII., and to Mantua, where he executed for the duke a series of the twelve Caesars. At 65 he retained the vigor and freshness of youth, while the magic charm of his color and the cheerful serenity of his style seemed to mellow with time. In 1543-5 he revisited Bologna and Ferrara, and painted the emperor Charles V. for the third or fourth time, and Pope Paul III. After passing some time in the employment of the duke of Urbino, he went to Rome, where he produced a masterpiece in his picture of the old pope with his grandsons. Cardinal Farnese and Duke Ottavio Farnese. While engaged upon a picture of Jupiter and Danae, he was visited by Michel Angelo, who, after expressing admiration for his coloring, observed that if he had been early grounded in the principles of drawing, he would rank as the first painter in the world. In 1548 he was summoned by Charles V. to Augsburg, and received from him the title of count palatine of the empire and a pension. After the abdication of Charles he continued in great favor with his son Philip II. of Spain, for whom he painted important works; but his pension was thenceforth constantly in arrears, and he was frequently obliged to petition the Spanish officials for the sums due him for pictures. The remainder of Titian's life was passed principally in Venice. His "Martyrdom of St. Lawrence," in the Jesuits' church in Venice, painted when he was 81, is one of his largest and grandest compositions; and at least one of his celebrated Magdalenas, that in the Escurial, was executed even later. At 90 years of age sorrow rather than time began to affect him, and, notwithstanding he clung resolutely to his art for consolation, the vigor and beauty of his style became impaired. In his 97th year he received Henry III. of France, who passed through Venice on his way from Poland, with magnificent hospitality; and two years later, while yet occupied with his art, he fell a victim to the plague. His latest work was a dead Christ with the Virgin and attendant saints, now in the academy of Venice. By a special exception in his favor he was buried in the church of Santa Maria di Frari.—The works of Titian comprise sacred and profane history, mythological subjects, portraits, and landscapes; the last named being generally treated in connection with other subjects, though not always in subordination to them. Many of the pictures pas-
The text is a mixture of random words and phrases, making it difficult to understand. It appears to be a page from a book, possibly containing historical or cultural information. Due to the randomness of the text, it is not possible to accurately transcribe the content into a coherent paragraph. Some words such as "Titicaca," "Titlark," "Titjens," and "Titlians" are recognizable, suggesting that the text might be discussing historical or cultural topics associated with these terms. However, without a clearer and more legible version of the text, it is not possible to provide a meaningful translation or summary.
The species are numerous, inhabiting most parts of the world and in every variety of region, some being migratory, others permanent residents. The nest is made upon the ground, of dry grass and stalks, lined with finer plants and hair; the eggs are four to six. The American titlark (A. Ludovicanaus, Lich.) is 6½ in. long and 11 in. in alar extent; olive brown above, each feather darkest in the middle; beneath yellowish brown, the sides of the neck spotted longitudinally with dark brown; around eyes and superciliary stripes yellowish; central tail feathers like back, the others blackish brown, the external one mostly white and a white spot at the end of the second; primaries edged with whitish, and the other quills with pale brownish; bill and feet black. It is very generally distributed over North America, extending to the Pacific and to Greenland, and is accidental in Europe. The flight is exceedingly easy and graceful; it occurs in flocks of tens or hundreds running fast on the ground. It is found in the fields, on the prairies, along rivers, and on the sea shore; the notes are clear and sharp tweets, the last much prolonged; it breeds as far N. as Labrador, both sexes incubating, and sitting so closely as almost to allow themselves to be trodden upon before flying; the eggs are six, ½ by ⅓ in., reddish brown, with darker dots and lines at the larger end. The Missouri titlark (Neocorys Spraguei, Selater), 5⅞ in. long and 9½ in. in extent of wings, in song and habits comes the nearest of American birds to the European skylark.—Among the European species, the most extensively distributed is the meadow titlark or pipit (A. pratensis, Bechst.), also called titling; it is 6½ in. long and 9¼ in. in alar extent, olive-brown above, spotted with dusky; brownish white below, tinged anteriorly with red; neck, sides, and fore part of breast with oblong brownish black spots. It is of slender and elegant form, generally distributed over Europe, a permanent resident in Great Britain, and most abundant in meadows; it sings from the middle of April to the end of July, and rears two broods in a season; its notes are remarkably fine, the bird uttering them perched, seated, or flying, in the last case beginning at a considerable height, hovering a little while, and descending warbling to the ground. It is in the nest of this species that the cuckoo generally places its eggs.

**TITMOUSE**, the popular name of the *parina*, a subfamily of the warblers, found in all parts of the world except South America. The bill is short, strong, rather conical and straight, with the tip entire; nostrils generally concealed by the frontal plumes; wings moderate and pointed, with the first three quills graduated; tail more or less long, rounded and even; tarsi long, slender, and scaled in front; inner toe shortest; claws strong and curved.—In the typical genus *parus* (Linn.) the bill is somewhat curved, not very stout; the head is not crested; the fourth and fifth quills are equal and longest; the crown and throat generally black. There are more than 50 species described in North America, Europe, Asia, and Africa, small, sprightly, and bold birds, and many of them with beautiful colors. They sometimes do considerable damage in orchards by picking open the buds in search of insects. The nests are made in the forks of bushes and trees, of moss, grasses, and wool, lined with hair and feathers; many of the best known species deposit their eggs in holes of decayed trees, left by the woodpeckers or made by themselves; the eggs are six to twelve.—The largest of the well known American species is the tufted titmouse (*lophophanes bicolor*, Bonap.), 6½ in. long and about 10 in. in alar extent; the crown has a conspicuous crest, the bill is conical with the upper and lower outlines convex, wings graduated with the first quill very short, and the tail moderately long and rounded. The color above is ashy black; frontal band black; under parts uniform whitish, sides brownish chestnut; sides of head nearly white, and bill black. It is found throughout eastern North America to the Missouri, appearing in the middle states about May 1, in the summer inhabiting the forests, in flocks or families of eight or ten, in company with the nuthatch.
TITMOUSE

and downy woodpecker; the note is a kind of pleasing whistle; the eggs are six or eight, white with a few red spots at the larger end, and are laid in holes of decayed trees.—In the genus *parus* (Linn.) belongs the black-capped titmouse or chickadee (*P. atricapillus*, Linn.). (See Blackcap.) The largest of the European species is the great titmouse or tit (*P. major*, Linn.), called also oxeye and blackcap in England, and *la charbonniere* in France; it is less than 6 in. long, with the head, fore part of neck, transverse band on sides, and longitudinal one on breast and abdomen, black; cheeks white, back yellowish green, and breast and sides yellow; wings and tail grayish. Its usual note is a loud cheep followed by a harsh chatter, in the spring resembling the filing of a saw and heard to a great distance; it imitates the notes of other birds, and in its habits

TITUS

like a snake or angry kitten, and severely biting the hand brought near the nest.—The hanging tit (*parus pendulinus* Koch), 4½ in. long, is reddish gray above, with wings and tail blackish, and lower parts rosy white; it is found in eastern and northern Europe, and constructs very artistically a nest woven of the fibres of bark and the cotton of the seeds of willows, fastened to a reed or thin branch and surrounded by closely tangled bushes, which protect it from the wind and hide it from view.

TITUS, a N. E. county of Texas, bounded N. by Sulphur fork of Red river, S. by Big Cypress bayou, and intersected by White Oak bayou; area, 940 sq. m.; pop. in 1870, 11,839, of whom 2,816 were colored. The surface is generally level and the soil fertile. The county is well timbered, and contains iron ore. The chief productions in 1870 were 382,029 bushels of Indian corn, 5,632 of oats, 48,348 of sweet potatoes, and 7,039 bales of cotton. There were 3,457 horses, 4,697 milch cows, 10,784 other cattle, 3,798 sheep, 28,711 swine, and 7 saw mills. Capital, Mount Pleasant.

TITIUS (Titius Flavus Sabinus Vespasianus), a Roman emperor, born Dec. 30, A.D. 40, died near Reate in the Sabine country, Sept. 13, 81. He was the son of Vespasian, and was educated in the imperial household with Britannicus, the son of Claudius, who was poisoned by Nero. While still young he served as military tribune in Britain and Germany, and subsequently became questor. During the Jewish war he commanded a legion under his father, and captured Tarichea, Gannula, and other places. When Vespasian, proclaimed emperor by his army, went to Rome, he left Titius to end the Jewish war, which he accomplished in September, 70, by the capture of Jerusalem and the massacre and dispersion of its inhabitants. Subsequently he returned to Rome by the order of his father, carrying with him Berenice, the daughter of Herod Agrippa, with whom he had fallen in love (see Berenice), and by his prompt obedience proved that the rumors which charged him with aiming at the throne were unfounded. For their common success in the Jewish war he had with his father the honor of a triumph, and the arch of Titus then erected is still standing. (See Rome, vol. xiv, p. 412.) During the remaining years of the reign of Vespasian he was employed in discharging the highest functions of state. He drew up the imperial edicts, and was permitted to write letters in the emperor's name. He ascended the throne in 79, and soon dispelled the impression, produced by some features of his earlier conduct, that he would be another Nero. The people called him amor et delicia gentis humanae, and Suetonius records that he exclaimed, *Amici, diem perdidi*, whenever a day passed without his being able to do a service to a friend or petitioner. His reign was marked by a succession of terrible calamities, the injuries inflicted by which he made earnest efforts to repair. In 79 the
TITUS

TITUSVILLE, a city of Crawford co., Pennsylvania, on Oil creek, 85 m. N. by E. of Pittsburgh, and 40 m. S. S. E. of Erie; pop. in 1870, 8,639; in 1875, about 10,000. It is in the midst of a fine dairy region, and is surrounded by hills. The streets are broad, straight, and well paved; the dwellings are of wood and brick, and are surrounded by gardens; the business blocks are of brick. It is well drained, lighted with gas, and has Holly water works. It communicates with Buffalo, Erie, Pittsburgh, and other points by means of the Dunkirk, Alleghany Valley, and Pittsburgh, the Oil Creek and Alleghany River, and the Union and Titusville railroads. Titusville is the chief place in the oil region, and owes its prosperity to the petroleum wells in the vicinity. It had only 300 inhabitants in 1859, when the production was commenced. It contains seven oil refineries, refining 6,000 barrels of crude petroleum daily; three oil-barrel factories, besides a number of cooper shops, together producing 3,000 barrels a day; four iron works and founderies, manufacturing steam engines and boilers, stop-cocks and pipe fittings, and oil-well tools, and also doing brass casting and finishing; two sulphuric acid factories, two flourishing mills, two lager-beer breweries, four banks, a high school, four ward schools, two Roman Catholic schools, two daily and weekly newspapers, and 12 churches.

TIVOLI (anc. Tibur), a town of Italy, in the province and 18 m. E. N. E. of the city of Rome, on the Teverone (anc. Anio) and on the slope of Mt. Ripoli; pop. about 6,000. It is remarkable for magnificent scenery and for its antiquities, which include villas, bridges, and the temples of the Sibyl and of Vesta. The celebrated falls of the Anio were best seen from the grottoes of Neptune and the Sirens till 1826, when the artificial wall over which they flowed was destroyed by an inundation. The course of the river was then diverted by cutting two long tunnels through the rock of Mt. Catillo, finished in 1834; the new falls thus formed are exceedingly picturesque, as well as the numerous small cascades in the W. part of the town.—The ancient Tibur, probably a Sicilian city, was one of the early rivals of Rome. As a member of the Latin league, it was, after a protracted struggle, taken in 338 B. C., and deprived of a part of its territory. Remaining nominally independent, it became a resort of Roman exiles. It was famed for the worship of Hercules in one of the most beautiful temples of the period, and for its associations with illustrious Romans who had villas here during the republic and the early days of the empire. The domain of Hadrian, S. of Tibur, extended over 8 m., and included many public buildings besides a magnificent palace. In the middle ages the town again became important. Pius II. built the castle in its present form near the gate Santa Croce.

TLAXCALA, or Tlacala (Aztec, “land of bread”), a state and city of the republic of Mexico. The state is bounded W. by the state of Mexico, and on all other sides by that of Puebla; area, 1,498 sq. m.; pop. in 1871, 121,605. In area it is the smallest of the Mexican states, not including the federal district. It received its name from its great fertility in maize. The city, capital of the state, is between two mountains on an upper branch of the river Mescala, 20 m. N. of the city of Puebla, and 70 m. E. by S. of Mexico; pop. about 5,000. It has a cathedral, state house, bishop’s palace, and the oldest Franciscan convent in Mexico.—The Techichiemoes founded the Tlaxcalan republic, which successfully resisted all
efforts of surrounding tribes and even of the Mexican monarchy for its subjugation. In 1319 the Tlaxcalans resisted the march of Cortes, but, after being defeated in four battles, they submitted as vassals to Spain, but refused to abjure their religion. (See Corres.) The city is said to have numbered at the time of the invasion about 20,000 families, and Sept. 18, the day of Cortes's entrance, is still celebrated there.

Tlemcen, a town of Algeria, in the province and 68 m. S. W. of the city of Oran; pop. in 1872, 18,722, including 3,000 French. It is the strongest Algerian fortress on the Moroccan border, and one of the most picturesque places of the country. It has about 30 mosques, the most magnificent being that of Sid Ibrahim. Trade and industry are active, and increasing in consequence of improved communications. It was originally called Jiddah, and for several centuries was, with occasional interruptions, the capital of an independent kingdom, with a population estimated at more than 100,000. Many vestiges of its former splendor remain. (See Histoire des rois de Tlemcen, from the Arabic, by the abbé Bargas, Paris, 1852.) In the 16th century it fell under the domination of the Turks, who allotted it to the day of Algiers. The inhabitants having revolted in 1670, the place was burned. The French, after a brief occupation, restored it in 1837 by treaty to Abd-el-Kader, and they did not recover possession until after partly destroying the town in 1842, since which time they have greatly strengthened the fortifications.

Toad, the common name of a well known family of anourous or tailless batrachians, the general character and anatomy of which have been described under Amphibia and Frogs. The bufonidae, which comprise the common toads, have a well developed tongue, jaws rather sharp at the edge but without teeth, thick and heavy body, and skin more or less covered with glandular warts which secrete an acrid fluid; the hind legs are but little longer than the anterior. According to Agassiz, the toads should rank higher than the frogs, from their more terrestrial habits; the embryonic web, which still unites the fingers of the frog, disappears in the toad, and the cutaneous glands of the skin do not exist in frogs. Toads, like frogs, absorb moisture by the skin, which is cast at intervals, coming off in lateral halves which are swallowed by the animal at a gulp; the skin feels hard to the touch, and, according to Mr. Rainey ("Microscopic Journal," 1855), contains a layer of earthy matter under the dermis effervescent with acids, considered by him the analogue of what becomes a continuous hard dermal skeleton in the testudinata. Like frogs, they have also a large sac resembling a bladder, often found filled with pure water, in no way connected with the kidneys, but formed of the allantois, serving as a reservoir of water and aiding in respiration, its walls being highly vascular. The acrid fluid of the skin may be pressed out from two eminences like split beans just behind the head; it comes forth in a jet, and will make the eyes smart severely if it touches them. The hyoid bone being absent, the root of the tongue is attached anteriorly in the concavity formed by the branches of the lower jaw, the free extremity pointing backward when at rest; it is capable of protrusion in a reversed position so rapidly that the eye cannot follow it. They are not only inoffensive, but of great service to man in destroying noxious insects and larvae; they usually lie hid during the day, but come out at dusk in woods, fields, and gardens, in search of food, and are not unfrequently found in cellars and dark places about houses; their metamorphoses are of the same character as those described under Frogs; they live out of the water except during the breeding season in March or April; during winter they remain torpid in holes and crevices, under stones, stumps, &c.; they lay a great number of eggs united into long strings, enclosed in a gelatinous substance, generally two, which the male draws out with his hind feet. The species are less numerous than in the terrestrial and tree frogs; they are found in both hemispheres, but unequally distributed, being most abundant in America, and least so in Europe, which has not a single species peculiar to it, both the common toad and the natterjack occurring also in Africa and Asia; they are more abundant in Asia than in Africa, and only one is described in Australia; Duménil and Biron recognize only 35 species of bufonidae.—In the genus Bufo (Laur.) the tongue is oblong, free posteriorly; anterior limbs four-toed and free, the posterior five-toed and semi-palmated; the tuberosity behind each eye, above the tympanum, porous and cushion-shaped; head obtuse in front, the upper jaw descending directly downward so that the intermaxillaries do not project in front of the cranium. The common European toad or padlock (B. vulgaris, Laur.), le crapaud of the French, is 3 to 3½ in. long, of a lurid brown—
ish gray, with reddish brown tubercles and a blackish stripe externally or along the glands on the sides of the head; the iris red or golden; the body thick and much inflated. It feeds on insects and worms of all kinds, but will touch only a living and a moving prey; it remains unconscious, with its eyes fixed on its intended victim till it comes within reach of its tongue, which is darted out with extreme rapidity and accuracy; when it seizes a worm, it pushes it into the mouth with the fore feet till all disappears, and the animal is swallowed whole. Its motions are by a kind of crawl; when alarmed it stops and swells out the body, and sometimes makes short and awkward leaps. The eggs are in a double series, 3 or 4 ft. long and two lines thick, and are laid in the spring two or three weeks later than those of the frog, the young being fully developed by the last of summer; they are smaller and blacker in all their stages than the young of the frog. Small toads of this and the common North American species are often found in places, such as gardens and cellars, where they could neither have had access to water nor have been introduced from without, and therefore could not have gone through the usual stages of tadpole existence; the gills must have disappeared shortly after birth, if they ever existed; they appear to have the power of prematurely assuming the functional conditions of terrestrial animals when circumstances demand it; a similar rapid metamorphosis is observed as a rule in the Surinam toad mentioned below. (See "Annals and Magazine of Natural History," vol. xi., London, 1853.) The toad has been regarded as venomous in almost all countries and ages, its saliva, bite, and cutaneous and watery secretion being supposed to be poisonous and more or less maleficient; the acrid exudation from the skin is sufficient to produce a painful irritation on a tender skin or a wounded mucous membrane; though it will make a dog quickly drop a toad from its mouth, it has no effect when introduced into the circulation; it not only serves thus for the protection of the animal, but is probably partly excrementitious, and assists the lungs in clearing the blood of carbon. The toad has been known to live 35 or 40 years, and it is thought to attain a considerably greater age; it has been so far domesticated as to come and feed from the hand, and seems capable of attachment to man. From their well known fondness for insects, toads make excellent traps for the entomologist, who may thus procure rare and otherwise unattainable beetles and nocturnal species, which they can be made to disgorge without difficulty; gardeners often put them into hot-houses to destroy ants and other insects and larvae. In respect to reptiles, the toad can live a considerable time without food and with a very small supply of air; but the alleged instances of their being found imbedded in solid stone or the heart of a tree, with no possible communication with the external world, have no doubt arisen from errors of observation. Dr. Buckland's experiments in 1825, in connection with the so-called antidiluvian toads, show that these animals cannot usually survive a long time, not even a year, deprived of air and food. (See "Curiosities of Natural History," by his son Francis T. Buckland, 1st series, London, 1859, pp. 74-86.) —The other European species is the natterjack, or niphetic or green toad (B. calamita, Laur.); it is less than 3 in. long, of a light yellowish brown color clouded with dull olive, and with a bright yellow stripe along the middle of the back; under parts yellowish with black spots, and the legs with black bands; iris yellowish green; it is less timid, and the eyes more prominent; the hind legs are shorter and the toes less palmed, indicating more terrestrial habits; it is less common, more active, and frequents drier places; it is found throughout Europe, and in Asia and N. Africa. —The common American toad (B. Americana, Le Conte) is 2 1/2 to 3 in. long, with short, thick, and bloated warty body; anterior limbs large, posterior short with a spade-like process at root of first toe, described as a rudimentary sixth toe by some writers; the jaws entire, and the eyes large and brilliant. It has a longitudinal line of dirty white from the occiput to the vent, on each side several spots of various colors, size, and shape, and a row of black and whitish ones extending to the hind legs; lower parts granulated and dirty yellowish white; anterior limbs dusky above with small white spots, the posterior ashy with blotches and bands of black. The head is smaller than in the European toad, the body less bloated, and the movements more active. In the breeding season toads and frogs do not generally assemble in the same pond; this species has been found on sandy shores overgrown with beach grass and in salt marshes; it is met with from Maine and Canada to the Mississippi valley; its note is a prolonged trill, continued by day and night.—There are several toad-like batrachians, generally arranged by modern herpetologists in the frog family. One of these, the accoucheur toad (B. obstetricans, Laur.; genus alytes, Wagler), is common in the vicinity of Paris, France, and in S. Germany; the males not only assist the females in the exclusion of the eggs (which are yellow), but afterward attach them to their hind legs by small pedicles; the young are developed under ground in the femoral region until they reach the tadpole state, when the males enter the water and the young escape.—The family pipida constitute the group of phrynoGLOSSES, so named from having no tongue, as distinguished from the planeroglosses, in which this organ exists; the head is triangular, and the small eyes are low and near the mouth; the body is broad and thick, the hind legs very powerful and large, and the toes united by a complete and full web. The family contains only two genera, pipa (Laur.) and dactylethra
TOAD FISH

(Cuv.), each with a single species. In *pips* there are no teeth, and the last joint of the slender anterior toes is divided into four parts. In *dautelephius* the upper jaw has small pointed teeth, the tongue is at the back of the mouth, and some of the hind toes have (alone among batrachians) hoof-like claws; the anterior legs are small and slender; the *D. Capensis* (Cuv.)

is found at the Cape of Good Hope and on the Mozambique coast. The Surinam toad (*P. Americana*, Laur.) has a remarkable and anomalous mode of reproduction; the eggs do not escape into the water, but are received by the male, who deposits them on the back of the female and there impregnates them (some authors say that impregnation takes place before the deposition of the eggs on the back of the female); the skin becomes thickened between them, rises, and partly invests each egg in a sac or pouch, covered by a thin operculum of dried gelatinous matter, probably a portion of that which originally surrounded the egg; the young go through the usual changes in the dorsal pouches, and emerge perfect toads; the yolk is large; the external branchiae disappear at a very early period; the tail is fully formed in the embryo, but is absorbed before it leaves the egg; the embryo at this stage is larger than the original egg, so that it must have absorbed something from the pouch of the parent. This animal is commonly found in the dark corners of houses in Guiana, and, though very large and exceedingly disgusting in appearance, is said to be eaten by the natives.

TOAD FISH, a spiny-rayed fish of the *lophius* family, and genus *batrachus* (Bloch), so named from its large head, wide gape, usually naked skin, and disgusting appearance; it is also called frog fish and oyster fish. The head is flattened and wider than the body; teeth conical, small and crowded on the intermaxillaries, larger on the lower jaw, palate, and vomer; operculum small and spiny; head, lips, and cheeks provided with numerous fleshy appendages; lower jaw the longer; first dorsal short, with three spinous rays almost concealed in the skin; second dorsal and anal low, soft, and long; ventrals under the throat, narrow, with three rays; pectorals on short arms of five carpal bones; fourth branchial arch without gills; body generally scaleless; no pyloric canes; air bladder deeply forked anteriorly, attached to the vertebrae by slender ligaments, and muscular on the sides. They hide in the sand and mud of salt water, and occur in both hemispheres, preying on fish. There are more than a dozen species, of which one of the best known is the grunting toad fish (*B. grunniens*, Bleck), found in the seas of the East Indies; the skin is naked, smooth, soft and spongy; the head and jaws with numerous cutaneous appendages; the color is brownish above, mottled with darker, below white, fins white with brown bands; it is 8 to 15 in. long, and is said to be eaten at Bombay; it received its specific name from its making a grunting noise like a pig, from the expulsion of air by the muscular air bladder through the mouth.—The common American toad fish (*B. tau*, De Kay) is much like the East Indian, with half a dozen more rays in the second dorsal and anal, stronger teeth, more prominent dorsal spines, and rather darker colors; it is 8 in. to a foot long, light brown, marbled with black, and the fins with black lines; the body is covered with a copious viscid secretion; the mouth very large, and the chin and cheeks with numerous fleshy appendages. It is found from Maine to the gulf of Mexico and the West Indies, on the New England coast usually in ponds and lagoons connected with the sea, in muddy shoal water, or under eel grass and stones. The disgusting appearance of this fish, its slimy body, goggle eyes, and immense mouth, have generally prevented the use of its flesh as food, though it is said to be delicate, palatable, and wholesome; it is a savage biter, and capable of inflicting severe wounds. Other species are found in the Indian and African seas, and some larger ones with soft scales on the Brazilian coast.

TOBACCO, the plant and the dried and prepared leaves of *Nicotiana tabacum* and other species of *Nicotiana*, a genus of the *solanaceae* or nightshade family. (See SOLANUM.) The name of the genus commemorates that of Jean Nicot, a French ambassador to Portugal, who in 1560 sent the seeds from Lisbon to France, as those of a highly valuable medicinal plant which was then known throughout Portugal, having been introduced in 1526. The botanical specific name, and the common name, come
from *tobago* or *tabaco*, the native term in Santo Domingo for the tube or pipe through which the smoke of the burning leaves was inhaled. The native Brazilian name for the plant was *petum* (now used as a generic name for the related *petunia*), which the Portuguese introduced into Europe, and it is occasionally met with in old works. The genus *Nicotiana* is mostly American, containing about 60 species, mainly herbs, with leaves, stems, &c., covered with viscid hairs; calyx tubular-bell-shaped and five-lobed; corolla funnel-shaped, with a five-lobed limb; stamens five, inserted on and included by the corolla; ovary two-celled, ripening into a two-celled capsule, surrounded by the persistent calyx, and opening by two or several valves for the escape of the numerous, very small, kidney-shaped, roughened seeds. The species most generally cultivated is *N. tabacum*, a stately plant, 3 to 6 ft. high, with ample, oblong-lance-shaped leaves, which are mostly decurrent upon the stem, and decrease in size toward the summit of the plant; the flowers are in a large terminal panicle, the rose-purple corolla about 2 in. long, with a somewhat inflated throat and short lobes. This species was extensively cultivated by the natives before America was visited by Europeans, and has not been detected in a truly wild state. *N. rustica*, according to Humboldt, was largely cultivated by the ancient Mexicans, as it was by the more northern aborigines; it is occasionally found as a weed as far north as New York state, and occurs in various other parts of the country as a relic of its cultivation by the Indians; though a native of tropical America, it is more hardy than the common species; it was early introduced into cultivation in Europe, and has become naturalized in the southern parts of that continent. It has ovate, petioled leaves, and dull greenish yellow flowers, which are much smaller than those of *N. tabacum*. As its leaves in drying retain much of their color, it is sometimes called green tobacco, and being earlier and more hardy, it is better suited to northern localities than the common species; it comes to maturity in Canada, and is cultivated in northern Germany, Sweden, and Russia, and various eastern countries; the Turkish, Hungarian, and Latakia tobaccos are of this species. Chinese tobacco is accredited to *N. Chinenisa*, and that of Shriraz to *N. Persica*, species of doubtful origin and identity. *N. repanda* is said to be raised in Cuba for the manufacture of a particular brand of cigars. The tobacco formerly cultivated by the Indians of Missouri and further west was, according to Nuttall, *N. quadriradicrafta*, a low, much branched plant, with short, lanceolate, sessile leaves, and nearly white flowers, opening only at sunset; its native country is unknown.—Tobacco is largely produced in China, Japan, Persia, and other parts of the East, in some of which the plant has become so thoroughly naturalized that an eastern origin has been sometimes claimed for it; but Alphons de Candolle, after a thorough study of the subject, finds no satisfactory evidence that its uses and culture were anywhere known before the discovery of America.—In speaking of the cultivation and uses of tobacco, the common species, *N. tabacum*, is intended, unless otherwise mentioned. Like some other plants of the family, as the potato and tomato, tobacco readily adapts itself to new conditions, and it becomes to a certain extent acclimated. The influences of climate and soil upon the development of plants are strikingly illustrated in tobacco as cultivated in the United States; it is grown from near the borders of Canada to the gulf of Mexico, and almost from ocean to ocean, and several states produce a leaf of such well-marked characteristics that a good judge can at once tell the locality of its growth. The valley of the Connecticut produces a leaf which is large, thin, and remarkably fine and silky, and which, though deficient in flavor, is so superior for wrappers, or the outer covering of cigars, that it is even sent to Cuba for that use. In the attempts to improve the flavor of the tobacco of the Connecticut valley, seeds from Cuba and other localities have been tried there; but it is found that in a very few seasons the tobacco, from whatever source the seeds are obtained, becomes similar to that which has long been raised there; it has also been found that when Connecticut valley seeds are sown in other localities the plants in two or three generations give a product almost precisely like that peculiar to the locality.—The first European cultivation of tobacco took place in Portugal, in the early part of the 16th century; it was raised in France in 1572, a box full of powdered leaves having been sent to Catharine de Medici, who acquired a taste for it, and the plant was for a time called herbe de la reine. The culture rapidly extended to other parts of Europe and to Asia,
in some cases being checked by severe laws or made useful as a source of revenue. Its production in England, by a law of 1660, was restricted to a very small quantity for medicinal purposes, and the prohibition still remains in force. The earliest settlers in Virginia engaged in the cultivation of tobacco, as it was a salable commodity in England; but as early as 1619, when the colony only numbered 551 persons, a provision was made by law against neglect of food crops in its favor.—In the cultivation of tobacco the first step is to sow the seeds in a seed bed; the success of the crop greatly depends upon the management of this. A spot with a warm exposure and well sheltered is selected, a temporary fence being sometimes put up to protect it from the winds, and as soon as the soil is thawed the bed is highly manured and spaded or ploughed. It is very common to put upon the bed a covering of brush, burn it, and make the ashes into the soil; this burning destroys all the seeds of weeds near the surface, and leaves the soil in good condition. The seeds of tobacco are so exceedingly minute that it is said an ordinary thimbleful, if each germinated, would produce more than enough plants for an acre; but, as is usually the case with very small seeds, a large proportion of them will be covered too deeply and fail. The surface of the bed being raked fine, the seed is carefully mixed with several quarts of lime, ashes, sand, or other material to aid in its distribution, and sown with the greatest care broadcast, and the surface well rolled. After sowing, the bed receives the closest attention; watering when needed, applying liquid manure, covering with mats or straw on cool nights, and when the plants are well up killing destructive insects and weeding, are among the labors needed to insure success. When the plants are about 4 in. high they are ready to be transplanted; the field is previously prepared, and can hardly be made too rich; stable manure and a great number of artificial fertilizers are applied to this most exhausting crop; the land is marked out in rows 3 ft. apart one way and 2 ft. the other for small varieties, which will give 7,000 plants to the acre, while for larger kinds the rows are 3 ft. one way and 4 ft. the other, allowing 4,200 plants to the acre. Transplanting is done in cloudy weather, the plants being set at the intersection of the rows; they soon become established, and during their growth receive the most thorough cultivation. When the leaves are as large as one's hand, the tobacco needs "worming." Various insects attack it, but the most destructive is the large "green worm," the larva of a sphinx; the common tobacco worm in western states is sphinx Carolina, but S. quinque-maculata, commonly found on the potato and tomato, feeds upon tobacco in the eastern states; both are large, night-flying moths, with five inches spread of wing and a long coiled proboscis; in their larval state they eat voraciously and grow rapidly, forming when full grown a caterpillar 3 in. long, as large as one's finger, and having an ornamental horn (not a sting) at its tail end. These will ruin the leaves in a short time; the whole farm force is frequently needed to "worm" the tobacco, and it must be guarded from these attacks during its whole growth; the worms are killed by pinching them between the thumb and finger. When the plants and the worms are small, a flock of young turkeys may be employed, but later in the season there is no substitute for hand picking. Some have killed the parent insects by placing sirup poisoned with arsenic in the large tubular flowers of the common thornapple or Jamestown weed (datura stramonium) and placing these about the field. "Priming" is the name given to the breaking off of such leaves as touch the ground and become broken and soiled; this is not practised by the planters, some preferring to cure all the leaves and put the poor ones by themselves. "Topping" is the stopping of the upward growth of the plant by breaking off the upper end of the stem, in order that the nourishment which would otherwise go to the production of flowers and seed may be diverted to the greater development of the lower leaves; some top when the first blossom buds show, and others leave a given number of leaves, 10 to 16, as experience has proved most profitable. The upward growth of the plant being checked by topping, branches soon appear in the axils of the leaves; these are called suckers, and the operation of removing them is "suckering," which is done as soon as those on the upper part of the plant are large enough to get hold of, and the laborious work must be kept up as long as any suckers appear. The maturity of the crop is judged by the color and the feel of the leaf; over-ripeness is more injurious than its opposite. Cutting is sometimes done as soon as the dew is off in the morning, and the tobacco housed as soon as wilted; others cut in the afternoon, and house the next morning. A hatchet or a knife like a corn knife is used, the stalk being severed close to the ground with one blow, and laid down, where it remains long enough to wilt so that it may be handled without breaking the leaves, but not so long as to be sun-burned. Where it is an important crop, large buildings (tobacco houses) are erected expressly for it; these are so arranged that the ventilation is under perfect control; there are several ventilators in the roof, and each alternate board of the upper side is hung on hinges, and so arranged that all may be opened or closed at once; the best houses are provided with a stove. The methods of hanging tobacco to dry vary greatly; the old way is to hang the plants upon poles, which are supported at each end by timbers arranged for the purpose; the plants are tied to the poles with a strong twine; they hang tops downward, and are placed upon alternate sides of the pole and such distances
apart that the leaves will not touch. A very common way of hanging is on laths; these are 4 ft. long, 1½ in. wide, and ½ in. thick; an iron spear about 8 in. long, with a socket to fit upon the lath, is placed upon one end, and by its means the tobacco is strung upon the lath, the spear passing through the stalk near its larger end; this work is done in the field, and the laths with their load are hung upon rails in the barn. Besides these methods of hanging there are several patented contrivances intended to facilitate the work and at the same time keep the plants far enough apart. During the drying close attention must be paid to ventilation; as the leaves dry they must not be broken by the wind; if hung too close, the tobacco will "pole burn;" if it does not dry quickly enough, the green leaves may freeze and be spoiled; fire heat is often used, which improves the color, but is objected to by some as injuring the flavor; it ordinarily takes about 12 weeks to cure. When quite cured, the tobacco is stripped; the house is opened in a damp time, and when the leaves have absorbed so much moisture from the air that they will not break, the tobacco is taken from the poles and put in piles, where it will remain plant for a week. In stripping, the leaves are at the same time assorted, four qualities being usually made. The first stripper takes a stalk and picks off all the defective leaves near the base, and throws it to the next; the second stripper removes all of the next quality, and so on; the leaves are kept even and smooth, and when the stripper gets enough for a "hand," which is 3 or 4 oz., he binds them together into a bunch by means of another leaf. Up to this stage the tobacco is simply the dried leaves, without the aroma and other qualities for which it is esteemed; these are developed only after it has undergone a fermentation or is "conditioned," to effect which the leaves are "bulked." The merchants who purchase the tobacco frequently prefer to "condition" it in their own warehouses; when this is the case, the hands are simply baled for transportation. "Bulking" consists in stacking the tobacco in a compact heap, the buts of the hands laid outward, the leaves being carefully smoothed as they are placed down; in a rude way the bulk is made on a platform of boards raised above the ground sufficiently to allow of a circulation of air beneath; when the pile is 3 or 4 ft. high, planks and weights are placed upon it, and it is covered if need be with blankets. In this state it remains until the color, flavor, and other qualities are properly developed, which requires from four to six weeks. Bulking being the finishing process, the quality of the crop depends upon its proper management, and it requires frequent attention. Tobacco is sent to market in boxes containing about 400 lbs., or in casks holding 1,500 to 1,500 lbs.; in packing in casks the butts of the hands are laid toward the outside and trodden down by the bare feet of the packer; when about 100 lbs. are thus packed, pressure by means of a screw or a powerful lever is applied, after which more tobacco is placed in, pressed again, and so on till the cask is full.—The yield of marketable tobacco to the acre depends upon numerous contingencies; but the average is not far from 600 lbs., while some growers harvest 1,000 lbs. annually, and this is exceeded in particular cases. Tobacco growers are very careful in the matter of seed; the tendency of the plant to vary has already been noticed, and it is the custom of some growers to save a large supply of seed from a desirable crop, as when well kept it remains good for six to ten years.—The various kinds of foreign tobacco are known by the names of the countries producing them, or the ports whence they are shipped, such as Havana, Ori- noco, Turkey, Latakia, Shiraz, &c; that grown in this country bears the name of the state or some particular locality, while the product of the Connecticut valley and some other localities bears the unmeaning name of "seed leaf." Virginia tobacco is one of the strongest kinds, not fitted for cigars, but is made into various shapes for pipes, and for chewing, and used for snuff; Maryland is paler and weaker, and used for pipes; Kentucky is intermediate between the two, and in this as with the Missouri there is much variety; the Florida is now becoming known as a fine tobacco, and used for cigars; the best of the northern kinds for making cigar wrappers is the Connecticut, and those from New York, Ohio, and other northern states are valued in proportion as they approach this in texture, as for this use strength or flavor is not required; the body of the cigar being made of Havana, a leaf that has an attractive color and silky feel is sought for. (See CIGAR.) The Turkish and other kinds from the East are only used cut fine for pipes, or granulated for cigarettes. Manila tobacco is imported only in the form of peculiar conical cigars called cheroots. Very fine tobacco is produced in Paraguay, and small quantities have been imported.—In whatever manner the tobacco may be manufactured (except for snuff), the first step is to "strip" it. The hands, being moistened to prevent breaking, are untied, and the strong midrib of the leaf is removed; this work is done by women and children; the upper surfaces of the leaf are folded together lengthwise, and the midrib dexterously separated by a pull; the "stems," as the midribs are called, are used in the poorer kinds of cut tobacco and snuff, but are nearly
a waste product, being sold at low rates for making sheep dip to destroy ticks on those animals, and for fumigating greenhouses to destroy insects. Some tobacco is sold which seems to be of the leaf merely stripped, made into a roll, and subjected to moderate pressure, without any foreign substance, and some of the cut tobacco is of this kind; but the greater part of that made up into cakes, heads, planks, or pigs, as the parcels are variously called, as well as that which is cut for both smoking and chewing, is prepared by various processes to meet the taste of the consumers; molasses, liquorice paste, a decoction of figs, and glycine are used to impart a sweet taste, give color, and prevent rapid drying; common salt and other salts are used for flavoring, and nitrate of potash or soda is sometimes added to increase the combustibility; anise and other aromatics are added for their flavor, and smoking tobaccos have their odor increased, if not improved, by the use of cascarilla bark, and laterly *latris odoratissima*, the leaves of which are largely collected in Florida and sold as "wild vanilla" or deer's-tongue (see *Vanilla*); these contain a great deal of coumarine, the aromatic principle of the Tonqua bean, a seed employed for scenting snuff. These additions, except those for odor, are made in the form of a liquid technically termed "liquor" or "sauce," in which the leaves are steeped. To make cut tobacco, the leaves are made up into large cakes, which are cut into shreds or filaments by the action of machines similar in principle to straw-cutters. In this condition the tobacco is put up in a great variety of packages, which are marked with fanciful names. The dark-colored leaves, made still darker by the liquorizing process, produce the coarse variety called shag, and the better sorts are converted by spinning processes into cords variously folded or twisted, and distinguished by different names. The term "negro head" is applied to coarse rolls of tobacco weighing 6 or 8 lbs. each. The variety known as "pig-tail" is also spun; the cord, but little larger than a pipe stem, is often braided, and then oiled and packed closely in kgs. In the United States a great deal of tobacco, intended chiefly for home consumption, after being cut up, is made into flat cakes, which are moistened with molasses and powerfully compressed; these cakes are about 5 in. long and 1½ in. wide, and when closely packed in the strong oak boxes in which they are sent to market, they form a compact mass, from which the cakes are torn out only by the application of considerable force; this, known as plug or Cavendish tobacco, is in common use for chewing, and is smoked in pipes by those who are fond of tobacco of the strongest flavor. Snuffs vary greatly in quality, the poorer kinds being made from the "stems," or midribs of the leaves, separated in preparing tobacco for other purposes; in the finer kinds these are rejected, the blade or better portion of the leaf only being used; and in interme-

diate qualities both parts are ground up together, and the refuse or dust from the cutting machines is used. There are two principal classes of snuffs, the dry and the moist. The dry snuffs are prepared from tobacco which has been exposed to a high temperature before grinding, and they differ in quality according to the proportion of stem they contain; they are usually very finely powdered, of a light yellowish brown color, and from their excessive dryness are very diffusible in the air, and need careful handling; lime is said to be sometimes mixed with these snuffs, to increase their dryness, and those so treated have an injurious effect upon the membranes of the nose. The Scotch or yellow snuff is the commonest of this class; this is usually packed in bladders; yellow oehro is often added to improve the color and as a cheap adulteration to increase the weight. The names of some of the brands indicate the method of preparation, such as "high-dried" and "high toast." The Irish and Welsh snuffs belong in this class; one of the most celebrated Irish brands is Lundy Foot, taking its name from the original makers, Lundy, Foot and co. The moist snuffs present a greater number of varieties. They are prepared by grinding the tobacco while moist, and are subjected to various manipulations. The finely divided tobacco is moistened, usually with a solution of salt, and placed in a heap to ferment; the extent to which this fermentation is carried, the fineness of the subsequent grinding, the addition of perfumes, and the admixture of other substances to increase the pungency or to maintain its moist condition, all vary in producing the different commercial varieties. Carbonate of potash, in the form of pearlash, readily attracts moisture from the atmosphere, and is sometimes added to keep the snuff damp. Salt is added to all moist snuffs, and is not regarded as an adulteration, as it is considered necessary to prevent mould. Various essential oils are used to perfume particular brands, a most common being those of bergamot and rose; powdered orris root and rosewood are both used for this purpose. The color of the snuff is due to the extent to which it is fermented. The leading brands of moist snuffs are rappes (Fr. *raper*, to rasp) of various kinds (coarser-grained than other varieties), prince's mixture, maccoboy (Fr. *maconde*), Dutch carotteet, Grand Cairo, &c. Snuff is much more largely consumed in Great Britain and France than in the United States. In Scotland the rappee snuff is generally preferred, the so-called Scotch snuff being used chiefly by women of the lower classes. —The first analysis of tobacco was made by Vauquelin in 1809, who detected a volatile acid principle, which was not isolated till 1828, by Posselt and Reimann, as a colorless oily liquid, which was called nicotine or nicotia, and is the constituent upon which the active properties of the plant chiefly depend. (See *Nicotia*.) The proportion of this alkaloid
in the dried leaves varies from less than 2 per cent. in Havana to nearly 8 per cent. in tobacco produced in the department of Lot in France. The occurrence of nicotia in tobacco smoke is asserted by some chemists, while others have failed to detect it. Another constituent is tobacco camphor, or nicotianine, a concrete volatile oil which appears on the surface of the distillate as minute crystals when the leaves are distilled with water; very discrepant accounts are given of its sensible properties, which have not been sufficiently studied. Besides these the leaves contain a bitter extractive matter, gum, malate of lime, chlorophyll, albuminoids, malic acid, woody fibre, and various salts. The amount of ash is very large, varying from 16 to 27 per cent. Wolff found in 1,000 parts of air-dried leaves 197.5 of ash, composed as follows: potash, 54.1; soda, 7.3; magnesia, 20.7; lime, 73.1; phosphoric acid, 71; sulphuric acid, 7.7; silica, 19.9; chlorine, 8.8. The leaves contain from 2.1 to 4.4 per cent. of nitrogen, partly in the form of nitrates; this, with the large content of potash and phosphoric acid, shows the heavy draft made by the crop upon the fertility of the soil, which can only be maintained by the most liberal manuring. By dry or destructive distillation at a red heat, an empyreumatic oil is obtained, of about the color and consistency of molasses, with acrid taste, and precisely the odor of an old pipe; this is powerfully poisonous; under the name of oil of tobacco it is used in ointments for skin diseases. This oil has been detected in tobacco smoke together with nicotianine (as some assert), nicotia, salts of ammonium, hydrocyanic acid, sulphuretted hydrogen, several volatile fatty acids, phenol, creosote, and numerous basic substances of the picolinic series. It appears therefore that the physiological effects of smoking cannot be directly deduced from, although closely allied to, those of tobacco administered by the mouth or otherwise.—The admixture of some of the materials used in the processes of manufacturing tobacco cannot be properly called adulterations, as they are added to suit the tastes of consumers. Water, necessary to bring the leaf into proper form, may be sometimes fraudulently used to increase the weight, and those who keep the unmanufactured tobacco in store are careful that it shall not lose in this respect; the other additions, of various saccharine and saline matters, have already been mentioned. In England, where tobacco bears a high price, there is a temptation to add other materials, and, especially in cut tobaccos, various vegetable substances have been detected; dock, rhubarb, coltsfoot, and other leaves, malt sprouts, and peat are among the most important; but the use of these is not frequent, as detection in the adulteration of tobacco, and even their possession by a tobacconist, are punished by a fine of £200. The microscope serves for the detection of these adulterations, the structure of the true leaf being quite distinct from that of any likely to be mixed with it. The various salts, such as nitrates to increase the combustibility, and others to modify the flavor or to increase the weight, are detected by chemical tests. Snuff is more liable to adulteration than any other form of tobacco; common salt is a very frequent addition; ocheres and other earthy matters, pearlash to absorb moisture, oxide of lead, and various other foreign substances, including powdered glass (supposed to be accidental), have been detected.—The medicinal effects of tobacco upon the system are very marked, whether it is taken internally or applied externally. In small quantities, taken by either of the methods in which it is commonly used, as smoking, chewing, or snuffing the pulzerized dry leaf, it acts as a sedative narcotic, in larger quantities, or with those unaccustomed to it, it causes giddiness, faintness, nausea, vomiting, and purging, with great debility; as the nausea continues with severe retching, the skin becomes cold and clammy, the muscles relaxed, the pulse feeble, and fainting and sometimes convulsions ensue, terminating in death. Its power of causing relaxation of the muscular system is great, and has been taken advantage of in surgical treatment, as by Dr. Physick in a case of obstinate and long continued dislocation of the jaw, the desired effect being produced by smoking, to which the patient was unaccustomed. An infusion or the smoke of tobacco has been introduced into the rectum to facilitate the reduction of a hernia or intestinal obstruction; but it is now entirely superseded for these purposes by the more effectual and less dangerous ether or chloroform. Its physiological action is nearly opposed to that of strychnia, to which it has been used as an antidote. It is also applied in the form of infusions and cataplasms to relieve various spasmodic affections, and its use generally in medicine is in external applications, the heat of which occasions almost wholly preventing its exhibition internally. It is recommended in articular gout, rheumatism, and neuralgia; and the toothache is often relieved by smoking a cigar. The application of the infusion, or even of the leaves, or of powdered tobacco, to surfaces deprived of the cuticle, has sometimes been attended with fatal effects; these have even followed the inhalation of the smoke. The powerfully nauseating effects of tobacco suggest its use as an emetic, but it is rarely resorted to for this purpose. Entirely different opinions have been entertained by the most respectable medical authorities as to the effects of tobacco upon the system, whether beneficial or hurtful, as it is commonly used; and even since its early introduction many have earnestly condemned it for its supposed universally injurious qualities. Its use nevertheless has been constantly increasing, and multitudes among all nations depend upon it daily, suffering extremely if deprived of it for a time. Attempts have been made to show that the use
OF TOBACCO

TOBACCO

of tobacco lessens mental vigor, but it would be very easy to produce abundant instances to prove that its action in this direction can be but slight. Its use, however, is specially to be avoided by persons who have not reached their full bodily development. Medical authorities are able to trace pretty clearly to its extreme use certain forms of pharyngitis, dyspepsia, palpitation of the heart, and so-called nervousness. A form of blindness known as tobacco amaurosis is recognized by oculists; this is sometimes, but not usually, attended by actual atrophy of the optic nerve, and is generally very amenable to treatment. In Spain and Spanish American countries women smoke as well as men, while in England and North America the use of tobacco by women, except in the form of snuff, is very rare, and the use of snuff by women is becoming less frequent. The use of snuff for "dipping" appears to be peculiar to the southern states; it avoids the unpleasant effects of snuffing, and has been largely practised in secret as well as openly; it is done with a small brush, which is first wetted, then dipped in snuff, and applied to the gums; it is thought to brighten the eyes and improve the complexion of the young, but the older soon abandon it for the pipe. — The general estimate of the crop of leaf tobacco in 1875 is: Virginia, 65,000 hhds.; Maryland, 35,000; Ohio, 15,000; Kentucky and Tennessee, 100,000; Illinois and Indiana, 30,000; Missouri, 30,000; total, 275,000 hhds. In January, 1876, the average values of leaf tobacco per hhd. were: Kentucky, $150; Virginia, $120; Indiana, $60; Ohio, $60; at which rates the total value of the estimated crop of 1875 would be $29,400,000. The annual consumption in the United States is estimated at 60,000 to 75,000 hhds. of seed-leaf tobacco the stock on hand on Jan. 1, 1875, was 180,000 cases; exported during the year, 35,000 cases; consumption, 70,000 cases; packed in hogsheads and for cutting purposes, 10,000 cases; total, 115,000 cases; leaving stock on hand Jan. 1, 1876, 65,000 cases, to which must be added the estimated crop of 1875, as follows:

Manufactured tobacco was exported as follows: to Great Britain, 2,866,560 lbs.; Germany, 86,718 lbs.; West Indies, 754,855 lbs.; South America, 1,190,155 lbs.; Australia, 1,246,262 lbs.; and in less quantities to Belgium, Holland, Portugal, the Mediterranean, Africa, the British North American provinces, China, and India. The receipts of Cuban tobacco in the United States in 1875 were 82,819 bales. — See Joübert, Nouveau traité du fabricant de tabac (Paris, 1844); Hassall, "Adulterations detected in Food and Medicine" (London, 1857; new and enlarged ed., 1876); H. P. Prescott, "Tobacco and its Adulterations" (London, 1858); "The Uses and Abuses of Tobacco," by John Lizar, professor of surgery (Edinburgh; reprinted, Philadelphia, 1850); Fairholt, "Tobacco, its History and Associations" (London, 1859; new ed., 1876); "Tobacco Culture, by Fourteen Experienced Cultivators" (New York, 1803); and "Tobacco," by John Dunning, in the "British Manufacturing Industries" (1876).

TOBACCO PIPE. See PIPES, TOBACCO.

TOBAGO, an island of the Windward group of the British West Indies, the N. point of which is in lat. 11° 25' N., long. 60° 32' W., 32 m. long; area, 120 sq. m.; pop. in 1871, 17,054. It is a mass of rocks which rises abruptly on the N. E. side and descends toward the S. W., the most elevated part of which is about 900 ft. above the sea. There are several good harbors on the N. side for vessels of 150 tons, and a few on the S. side. The valleys are well watered by numerous streams. The productions are sugar, molasses, and rum. The value of imports in 1874 was £43,743; of exports, £45,280. It has a lieutenant governor, subordinate to the governor of the Windward islands, a privy council, a legislative council of 7 members, and a house of assembly of 16 members, elected by the parishes. The capital is Scarborough, on the S. coast. — Tobago was discovered by Columbus in 1498, and was ceded by France to Great Britain in 1763.

TOBIT, a book of the Old Testament in the Roman Catholic canon, but regarded as apocryphal by Jews and Protestants. It contains the history of Tobit or Tobias, a pious Jew of the tribe of Naphtali, living in exile at Nineveh. Being purveyor to the court of King Shalmaneser, he became wealthy; but under
Sennecherib lost his position and his property, because he had buried Jews who had been executed. Having returned to Nineveh after the death of Sennecherib, he became blind; but he was cured by the application to his eyes of the gall of a fish which his son Tobias had brought home from a journey undertaken by the angel Raphael. The Greek text of the Septuagint, which some writers believe to be the original, and the Latin translation of Jerome, which he claims to have made from a Chaldaic text, differ considerably. The author is supposed to have been a Jew of Palestine, who, according to Ewald, most probably wrote in the far East about 350 B.C. Among the best commentaries are those of Fritzsche (Leipsic, 1853), Sengelmann (Hamburg, 1859), and Reusch (Freiburg, 1857).

TOBOLSK. I. A government of Russia, in western Siberia, extending from the Arctic Ocean to the Central Asian provinces of Alma-Ata and Semipalatinsk, separated on the west by the Ural mountains from European Russia, and bounded E. by Jeniseisk and Tomsk; area, 531,964 sq. m.; pop. in 1870, 1,086,848. It is traversed by the Obi and its principal tributaries, and contains extensive lakes. Timber abounds in the south. Its great mineral resources are not yet properly explored. The land on the banks of some of the rivers yields much grain. Fish and game, including fur-bearing animals, are especially plentiful. The transit trade with China is considerable. II. A city, capital of the government, on the right bank of the Irtish, at the confluence of the Tobol, nearly 1,000 m. E. N. E. of Moscow; pop. in 1867, 20,330. It contains a cathedral and many other churches, several mosques, an episcopal palace, an arsenal, a theatre, and a gymnasium. Inside the citadel is a workhouse for Siberian exiles of the lower classes. The manufactures are unimportant.

TOCANTINS, a river of Brazil, formed by the Almas and Maranháo, which rise in the province of Goyaz and unite in lat. 14° S., lon. 49° 15' W. After a course of about 1,000 m., in a general northerly direction, it falls into the Rio Pará, about 80 m. S. W. of the city of the same name. The Aguaray, Paranãm, Great Somno, Tucuhanas, and Theseas are its affluents. The tide ascends about 300 m., and at its mouth the Tocantins is 8 m. wide.

TOCQUEVILLE, Alexis Charles Henri Clérel de, a French author, born in Paris, July 29, 1805, died in Cannes, April 16, 1859. He studied law, was appointed a judge in Versailles in 1826, was promoted in 1830, and in 1831 was sent with Gustave de Beaumont on a mission to the United States, to examine the penitentiary system. The report of their observations was published under the title Du système pénitentiaire des États-Unis (2 vols., 1832; translated into English by Francis Lieber, 2 vols., Philadelphia, 1833). De Toqueville investigated at the same time the political and social institutions of the country, and wrote his celebrated philosophical work De la démocratie aux États-Unis (2 vols. 8vo, Paris, 1835), which received the Montyon prize, and procured his admission to the academy (1844). He was elected in 1839 to the chamber of deputies, and became the leader of a moderate wing of the opposition. As a member of the constituent assembly in 1848, he opposed socialistic doctrines and ultra-democratic measures. After attending the diplomatic conferences in Brussels upon Italian affairs, he became minister of foreign affairs, June 2, 1849. He strongly supported the French expedition to Rome, but, dissatisfied with Louis Napoleon in other respects, he resigned at the end of October. On Dec. 2, 1851, he protested against the coup d'état, and was imprisoned, but released after a few days, when he retired to private life. In 1856 he published L'ancien régime et la révolution (8vo; translated by J. Bonner, 12mo, New York, 1856). His Études et correspondance inédites have been published with a biographical notice by G. de Beaumont (2 vols. 8vo, 1860; English translation, 2 vols. 8vo, London and Boston, 1861). His complete works are in 9 vols. (Paris, 1860–65). His "Democracy in America" was translated into English by Henry Reeve, with a preface and notes by John C. Spencer (8vo, New York, 1839; new ed., London, 1875; abridged ed., "American Institutions and their Influence," with notes, 16mo, New York, 1856); and Reeve's translation has been edited by Prof. F. Bowen (2 vols. 8vo, Cambridge, 1863).—See "Correspondence and Conversations of Alexis de Toqueville with Nassau William Senior," edited by M. C. M. Simpson (2 vols., London, 1872).

TODD, James, an English soldier, born in 1782, died in London, Nov. 17, 1835. He went to India in 1800 as a cadet in the East India company's service, and attained the rank of lieutenant-colonel. After the Mahratta war, he was engaged to survey Rajpoota, of which a topographical map was finished in 1815. He was political agent of Mewar and other Rajput states from 1817 to 1823. He wrote "Annals and Antiquities of Rajasthan" (2 vols. 4to, London, 1829–33), and "Travels in Western India" (4to, 1839).

TODD. I. A S.W. county of Kentucky, bordering on Tennessee, and drained by Pond river and several large creeks; area, 350 sq. m.; pop. in 1870, 12,612, of whom 4,860 were colored. The surface is generally hilly and the soil fertile. It is intersected by the Louisville and Nashville and Great Southern and the St. Louis and Southeastern railroads. The chief productions in 1870 were 178,887 bushels of wheat, 445,275 of Indian corn, 57,375 of oats, 13,490 of sweet potatoes, 2,620,193 lbs. of tobacco, 18,925 of wool, 65,260 of butter, and 1,683 tons of hay. There were 2,965 horses, 1,759 milch and asses, 2,000 milk cows, 2,423 other cattle, 7,300 sheep, and 18,870 swine. Capital, Elkton. II. A central county of Minnesota,
watered by Long Prairie and Partridge rivers and other streams; area, 960 sq. m.; pop. in 1870, 2,036. The surface is generally level, interspersed with numerous small lakes, and the soil is productive. The Northern Pacific railroad passes through the N. part. The chief productions in 1870 were 13,907 bushels of wheat, 18,013 of oats, 13,736 of potatoes, 25,688 lbs. of butter, and 3,339 tons of hay. There were 74 horses, 337 milch cows, and 613 other cattle. Capital, Long Prairie.

III. A S. E. county of Dakota, bordering on Nebraska, and lying between the Missouri and Niobrara rivers; area, about 550 sq. m.; pop. in 1870, 837. The river bottoms are very fertile; the uplands consist of prairies. Capital, Fort Randall.

TODD, Henry John, an English clergyman, born in 1783, died at Settrington, Yorkshire, Dec. 24, 1849. He was educated at Oxford, and was vicar of Milton near Canterbury, rector of Allhallows, London, keeper of the manuscripts at Lambeth palace (1809), rector of Settrington (1820), prebendary of York (1830), and archdeacon of Cleveland (1832). His publications comprise "Illustrations of the Lives and Writings of Geoffrey Chaucer and John Gower" (8vo, 1810); an edition of Johnson's "Dictionary," with corrections and additions (4 vols. 4to, 1814); "Memoirs of the Life and Writings of Brian Walton" (2 vols. 8vo, 1821); "A Letter to the Archbishop of Canterbury concerning the Authorship of Ion Basilius" (8vo, 1825); "Some Account of the Life and Writings of John Milton" (8vo, 1826); and a life of Archbishop Cranmer (2 vols. 8vo, 1831).

TODD, James Hethororne, an Irish antiquary, born in Dublin, April 23, 1805, died near there, June 28, 1869. He graduated at Trinity college, became a fellow there in 1831, and was regius professor of Hebrew in the university of Dublin. He was also treasurer and precentor of St. Patrick's cathedral, president of the royal Irish academy, and one of the founders of the Irish mathematical society. He edited several rare Irish manuscripts and tracts, including "The Wars of the Danes in Ireland," and published "Historical Tables and Medallions" (1828); "Discourses on the Prophecies relating to Antichrist" (1840); "Historical Memoirs of the Successors of St. Patrick and Archbishops of Armagh" (2 vols. 8vo, 1861); and "St. Patrick, Apostle of Ireland" (1863). He collected a library of manuscripts, which after his death brought extraordinary prices.

TODD, John, an American clergyman, born in Rutland, Vt., Oct. 9, 1800, died in Pittsfield, Mass., Aug. 24, 1873. He graduated at Yale college in 1822, spent four years at the Andover theological seminary, and was ordained to the ministry in the Congregational church at Grotton in 1827. In 1833 he was settled over the Edwards church at Northampton, in 1836 was called to the pastorate of the first Congregational church in Philadelphia, and from 1842 to 1872 was pastor of the first Congregational church in Pittsfield, Mass. He was one of the founders of Mount Holyoke female seminary, and for several years was president of the trustees of the young ladies' institute of Pittsfield. In 1840 he received the degree of D. D. from Williams college. His principal works, most of which have passed through many editions both in the United States and England, and several translated into other languages, are: "Lectures to Children" (2 vols. 16mo, Northampton, 1834; 2d series, 1835); "Student's Manual" (12mo, 1835); "Index Reorum," prepared for noting books read (4to, 1835); "Truth Made Simple" (18mo, 1839); "Great Cities, their Moral Influence" (18mo, 1841); "Lost Sister of Wyoming" (18mo, 1841); "The Young Man" (18mo, 1843); "Simple Sketches" (2 vols. 16mo, Pittsfield, 1845); "Pastor's Daughter" (24mo, 1844); "Stories on the Shorter Catechism" (2 vols. 18mo, Northampton, 1850-51); "Summer Gleanings" (12mo, 1852); "The Daughter at School" (12mo, 1854); "The Angel of the Iceberg, and other Stories" (18mo, 1859); "Future Punishment" (32mo, New York, 1863); "Mountain Gems" (4 vols. 16mo, Boston, 1864); "Nuts for Boys to Crack" (16mo, New York, 1866; 8vo, 1868); "Polished Diamonds" (16mo, Boston, 1868); "Serpents in the Dove's Nest" (18mo, 1867); "Woman's Rights" (18mo, New York, 1868); "The Water Dove and other Gems" (18mo, Edinburgh, 1868); "Mountain Flowers" (16mo, Northampton, 1869); "Sunset Land, or the Great Pacific Slope" (Boston, 1869); and "Old-Fashioned Lives" (1870). Several collective editions of his works were published from 1853 to 1868.—See "John Todd, the Story of his Life, told mainly by Himself, compiled and edited by Rev. John E. Todd" (16mo, New York, 1876).

TODD, Robert Bentley, a British physiological, born in Dublin in 1809, died in London, Jan. 30, 1869. He was educated in Trinity college, Dublin, went to London in 1831, became professor of physiology and anatomy in King's college in 1837, and was also professor of clinical medicine in King's college hospital. He had great reputation as a practitioner, and published "Cyclopedia of Anatomy and Physiology" (4 vols. 8vo); "The Physiological Anatomy and Physiology of Man" (2 vols. 8vo), in conjunction with Dr. Bowman; "Anatomy of the Brain, Spinal Cord," &c.; "Lectures on Paralysis and Brain Diseases," and "Treatise on Gout and Rheumatism."

TODDY TREE. See PALM, vol. xiii., p. 18.

TODLEHNER, Isaac, an English mathematician, born in Rye in 1820. He graduated at Cambridge in 1848, and became mathematical lecturer at St. John's college. He has published a series of works on higher mathematics for college instruction, which enjoy great favor in England. The most important of his works on the philosophy and history of mathematics are the "History of the Progress of the Calculus of Variations during the 19th Century."
TODLEBEN

TODLEBEN, Franz Edourd, a Russian military engineer, born in Mita, Courland, May 20, 1818. He was educated at the school of engineers in St. Petersburg, and after being employed in that department he served in the Caucasus against Shamil from 1849 to 1851, and against the Turks on the Danube in 1855-6. He displayed great genius in the defence of Sebastopol, and was wounded, June 20, 1855. Subsequently he was employed in strengthening Nikolayev and Cronstadt. In 1860 he became chief of engineering in the war office, with the rank of general, and he is at the same time the adjunct of the grand duke Nicholas in the general direction of this service. His history of the defence of Sebastopol (St. Petersburg, 1864) has been translated into several languages, and reviewed in a volume by William Howard Russell (London, 1864).

TOFANA. See AQUA TOFANA.

TOGIRL BEL. See Szlagor.

TOKAT, or Torat, a town of Asiatic Turkey, in the vilayet and 55 m. N. N. W. of the city of Sivas, on the Yeshil Irmak (the ancient Iris); pop. estimated variously from 45,000 to 150,000. It has high limestone hills on three sides, and is commanded by two peaks which are almost perpendicular and consist of crystalline marble. The houses are of mud or unburned bricks, but the town has a large and handsome Armenian church and several mosques. The manufactures consist chiefly of copper articles and hardware, woollen, linen, silk, cotton goods, and carpets; and there are dyeing and book-printing establishments. The inhabitants are chiefly Turks.

TOKAY (Hun. Tokaj), a town of Hungary, in the county of Zemplén, at the junction of the rivers Bodrog and Theiss, 117 m. E. N. E. of Pest; pop. in 1870, 5,012. Several important fairs are held here annually. Tokay is celebrated for the wine produced in its vicinity. (See HUNGARY, WINES OF.)

TOKIO (formerly Yedo), a city and the capital of Japan, in the E. part of the main island, at the head of the bay of Yedo, on the Sumidagawa, in lat. 35° 40' N., lon. 139° 40' E.; pop. in 1873, 779,361, including a garrison of 7,140 and 400 foreigners. The city is a combination of compactly built and densely inhabited districts, with intervening gardens and groves devoted to civil and religious uses, the whole covering nearly 60 sq. m., the area of the built up portion being about 28 sq. m., while one eighth of the whole is occupied by moats and canals. The centre of the city is the citadel, surrounded by stone walls and a moat, outside of which a second wall encloses about 3 sq. m. A third system of walls and moats encloses about 5 sq. m., formerly occupied by the residences of the daimios, but now covered with government buildings, colleges, schools, arsenals, barracks, foundries, steam mills, and factories. Outside, in the business and more densely populated portion, are miles of brick and stone buildings in the European style of architecture, and the shops are filled with foreign wares. The streets are wide, regular, and clean. The city is abundantly supplied with water brought in wooden aqueducts from the Tonegawa, 9 m. distant, and a part of it is lighted with gas. For police purposes it is divided into a principal and 95 smaller districts, with stations connected by telegraph and a uniformed force of 3,500 men. At the N. and S. ends of the city are the cemeteries, filled with tombs and temples. There are 741 Shinto shrines, 2,179 Buddhist temples, and 4 Christian churches. The imperial university has in its different faculties nearly 100 foreign instructors. The language, normal, and elementary schools are attended by more than 60,000 pupils. There are several banks, and more than a dozen daily newspapers printed with metal type on improved presses, and native capital has established cotton, woollen, and paper mills driven by steam, while sewing, knitting, and other manual machines are very common. Hundreds of horse vehicles and over 20,000 jin-riki-sha (man-power carriages) make the streets lively. Places of amusement abound; actors, wrestlers, story tellers, and female minstrels are numerous. Foreign dress and manner of living have been largely adopted, and the place presents most of the characteristics of a modern European or American city. It is connected by telegraph with Nagasaki, Hakodadi, and other cities. There is a railway to Yokohama, 18 m. distant, and a line has been surveyed to Kiaoto, 295 m. The shallow bay permits only small junks and small steamboats to reach the city, and the foreign trade is limited.—Yedo was laid out in 1591, when the walls of the present stronghold were built, and it soon became the military centre of the empire. In 1656 and 1854 earthquakes occasioned an immense loss of life and property; and there have been many very destructive conflagrations, owing to the former combustible style of building and inefficient police. In 1861 the British and French legations were established here, but were soon driven away, and were not re-established till 1865. It 1862 it ceased to be the compulsory residence of the daimios. In 1868 it became the residence of the mikado, and the name was changed to Tokio ("eastern capital"). On Jan. 1, 1869, the port was formally opened to foreign trade and residence. In the summer of 1871 the entire power of the empire was centred here.

TÖKÖLYI, or Tököl, Imre. See HUNGARY, vol. ix., p. 58.

TOLAND, John, a British author, born near Lounderry, Ireland, in 1669 or 1670, died at Putney, near London, March 11, 1732. He studied three years at the University of Glas-
TOLEDO

gow, received the degree of M. A. at the university of Edinburgh in 1690, studied two years for the ministry at Leyden, and finally became a conspicuous free thinker at Oxford. He went to Dublin in 1697, where the Irish churchman ordered the common hangman to burn his "Christianity not Mysterious" (London, 1696), and returning to London published "An Apology for Mr. Toland" (1697). He visited the courts of Hanover and Berlin, apparently as a political agent, and held a theological discussion with Beausobre. On returning to England, he professed himself in 1702 "a true Christian" and "a good churchman," but in 1705 declared himself a pantheist. He wrote political pamphlets for the earl of Oxford (Harley), by whom he was sent again in 1707 to Germany and Holland, as a political spy. Returning after three years, he was supported by Harley till a quarrel separated them. His other publications include "The Militia Reformed, or an Easy Scheme of Furnishing England with a constant Land Force" (1698); a "Life of Milton" (1698); editions of Lord Holles's "Memoirs" and of Harrington's "Works;" "Anglia Libera" (1701), a treatise on the succession of the crown of England; and "Nazarenus, or Jewish Gentleman, or Mahometan Christianity, containing the History of the Ancient Gospel of Barnabas, and the Modern Gospel of the Mahometans, attributed to the same Apostle, this last Gospel being now first made known among Christians," &c., which involved him in controversies. His posthumous works were published with a biography by Des Maizeaux (2 vols., 1726; new ed., 1747).

TOLEDO. I. A central province of Spain, in New Castile, bordering on Ávila, Madrid, Cuenea, Ciudad Real, and Caceres; area, 6,586 sq. m.; pop. in 1870, 342,272. The surface is generally mountainous, and there are elevated plains near the centre. The Tagus flows W. through the middle of the province. The Jigue la and its affluents flow toward the Guadiana. Gold, silver, lead, iron, copper, quicksilver, tin, cinnabar, alum, bismuth, coal, graphite, and ochre are found. The soil is generally poor, but in the centre and toward the south the quality improves. Grain, flax, fruit, vegetables, wine, oil, and silk are produced. But very few sheep, cattle, or horses are reared. II. A city (anc. Toletum), capital of the province, on the Tagus, 42 m. S. S. W. of Madrid; pop. about 18,000. It stands on a rocky height, around which the river in horseshoe shape flows in a deep and narrow channel, crossed by two stone bridges 100 ft. in height, one of which, built by the Moors, consists of a single arch. The town is incircled by two walls, originally Roman, but repaired and extended by Goth, Moors, and Spaniards, and entered by nine gates. The streets are steep, crooked, and narrow. The houses are generally in the Moorish style, from two to four stories high, with the apartments arranged round a court. The cathedral, in pure Gothic and with a lofty spire, founded in 1258 and completed in 1492, is one of the finest in Spain. The palace of the archbishop (who is the primate of Spain) formerly contained a rich collection of books and manuscripts, now added to the provincial library, which has 10,000 volumes. The foundling hospital of Santa Cruz, a fine piece of architecture, was founded by Cardinal Mendoza in 1494. The dilapidated walls of the ancient Alcázar are still standing. The university was suppressed in 1845; a seminary for theological students has been founded to supply its place; and there is a military school, a female college, school of fine arts, and other public schools. The principal manufactures are woolen and silk goods, oil, leather, and the celebrated Toledo blades, made in the royal sword manufactory two miles from the town. There is also a royal foundery outside the walls. According to an ancient but improbable tradition, Toledo was founded by Jewish colonists in the 6th century B.C. It was taken by the Romans in 192 B.C., and by the Goths in A.D. 467, who made it the capital of their kingdom a century later. It was captured by the Moors in 714, and wrested from them by Alfonso VI. of Castile and Leon after a terrible siege in 1085, when it became the capital of Castile, and at one time had a population of 200,000. It afterward suffered many
sieges, and the removal of the court to Madrid in 1550 led to its decline. It was occupied by the French from 1808 to 1813.

TOLEDO, a city and the capital of Lucas co., Ohio, port of entry of the district of Miami, on the Maumee river, 5 m. from its mouth in Maumee bay and 8 m. from the W. extremity of Lake Erie, 92 m. W. of Cleveland, 92 m. S. S. W. of Detroit, Mich.; pop. in 1850, 3,829; in 1860, 13,768; in 1870, 31,584, of whom 11,099 were foreigners, including 5,841 Germans and 3,031 Irish; in 1875, estimated at 50,000. It comprises an area of 21·5 sq. m., of which 9·65 sq. m. were annexed in 1874; 6·2 sq. m. are on the E. side of the river and 15·8 sq. m. on the W. side. It has a fine harbor, and is well laid out, having wide streets that give an easy ascent from the harbor to the table land on which most of the houses are built. It has large and handsome public buildings, several small parks, street railroads, and water works recently erected. The number of miles of improved streets at the beginning of 1875 was 35·06; of sewers, 26·94; of water pipe, 41·62. Toledo communicates by the Miami and Erie canal with Cincinnati and Evansville, Ind., and has extensive railroad connections. The lines centring here are the Lake Shore and Michigan Southern, Toledo, Wabash, and Western, Dayton and Michigan, Detroit and Toledo, Flint and Père Marquette, Canada Southern, Columbus and Toledo, Toledo and Maumee, Toledo and Sylvan, and Toledo, Tiffin, and Eastern. All these railroads concentrate at an immense union depot. The chief items of receipt and shipment are grain and flour. There are 10 grain elevators, with a storage capacity of 4,017,000 bushels, and capacity to receive and ship 780,000 bushels daily. The aggregate deliveries of grain, including flour, for 14 years have been as follows:

The receipts in 1874 were 730,768 barrels of flour, 10,107,382 bushels of wheat, 17,031,996 of Indian corn, 6,400,247 of oats, 14,105 of rye, and 190,224 of barley. The shipments were 579,366 barrels of flour, 3,342,069 bushels of wheat, 16,581,345 of Indian corn, 6,391,372 of oats, 13,896 of rye, and 24,050 of barley. Other important items of receipt are provisions, livestock, whiskey, iron, tobacco, hides, cotton, wool, and lumber. In 1874 there were manufactured in the city 287,000 barrels of flour, 10,000,000 laths, and 30,000,000 ft. of lumber. The value of imports from Canada during the year ending June 30, 1874, was $79,018; of exports to Canada, $1,856,825; number of entrances, 302 of 69,517 tons; clearances, 286 of 71,889 tons; entrances in the coastwise trade, 1,962 of 441,593 tons; clearances, 1,918 of 425,951 tons; number of vessels belonging in the district, 170, with an aggregate tonnage of 13,946. The manufactories of Toledo include 5 flouring mills, 5 lumber mills, 6 iron foundries, a blast furnace, 5 breweries, 7 brick yards, 14 planing mills, 4 ship yards, 5 tanning and currying establishments, 2 manufactories of cars, 1 of car wheels, several of carriages and wagons, 2 of chairs, 1 of edge tools, 2 of files, 4 of lime, 1 of mowers and reapers, 3 of potash, 1 of refrigerators, 2 of coffee and spice mills, 3 of staves, 1 of stove, 3 of tobacco, 2 of wire goods, 1 of wooden ware, and 2 of boots and shoes. There are six banks, with an aggregate capital of $1,900,000; three savings banks and several savings and loan associations, three fire and marine insurance companies, and one life insurance company.—The city is divided into eight wards, and is governed by a mayor, eight aldermen, and 16 councilmen. The principal charitable institutions are the city hospital, house of refuge and correction, home for friendless women, and three orphan asylums. There are 20 ward school houses and a high school building, with 122 teachers and about 7,500 pupils enrolled in 1874—'5, and 10 denominational and private schools. The public library contains 8,000 volumes. Three daily (one German), two tri-weekly, one semi-weekly, and six weekly (one German) newspapers, and six monthly periodicals are published. There are 45 churches, viz.: 3 Baptist, 1 Christian, 3 Congregational, 4 Episcopal, 2 Evangelical Association (German), 2 Evangelical Lutheran (German), 1 Evangelical Reformed (German), 2 Jewish, 3 Lutheran (German), 8 Methodist (2 German), 4 Presbyterian (1 German), 8 Roman Catholic (2 French and 2 German), 1 seamen's berth, 1 Swedishborgian, 1 Unitarian, and 1 United Brethren.—Toledo was settled in 1832, and incorporated in 1836.

TOLLAND, a N. E. county of Connecticut, bordering on Massachusetts, drained by the Willimantic and Hop rivers; area, 440 sq. m.; pop. in 1870, 22,000. In the W. part the surface is nearly level and the soil fertile, but in the E. part it is very hilly and the soil inferior. It is intersected by the Hartford, Providence, and Fishkill, and Rockville branch, and the New London Northern railroads. The chief productions in 1870 were 15,860 bushels of rye, 101,721 of Indian corn, 76,574 of oats, 17,123 of buckwheat, 159,406 of potatoes, 531,399 lbs. of tobacco, 21,580 of wool, 986,768 of butter, 50,671 of cheese, and 40,820 tons of hay. There were 2,401 horses, 6,452 milk cows, 3,436 working oxen, 6,244 other cattle, 7,902 sheep, and 3,851 swine; 1 manufactory of leather belting and hose, 3 of boots and shoes, 5 of boxes, 12 of carriages and wagons, 23 of potatoes, 2 of hosiery, 3 of iron castings, 8 of machinery, 9 of shoddy, 14 of silk goods,
TOLLENS, a Dutch poet, was born in Rotterdam, Sept. 24, 1780, died in Ryswick, Oct. 21, 1856. He was intended for trade, but in 1800 began publishing poetry, and finally became one of the most celebrated national bards. His masterpieces include a narrative poem on Barentz's expedition to Nova Zembla (new ed., 1844), dramatic works, and patriotic lyrics, especially the Wappenkredt (1815). His Gesammelte dichtwerken comprises 8 vols. (Leeuwarden, 1855–7).

TOLNA, a S. W. county of Hungary, bordering on the counties of Veszprézm, Stuhlweisenburg, Pesth, Baranya, and Somogy; area, 1,407 sq. m.; pop. in 1870, 220,740. It is watered by the Danube, which forms its E. frontier, and by the Sárvíz and Kapos. The soil is generally fertile, except the sandy E. portion. Corn, tobacco, flax, wine, and fruit are produced, and cattle, pigs, sheep, and horses abound. Capital, Szegszárd.

TOLSTOI, a Russian family, celebrated since the 17th century. Among its best known members at the present day are Count Alexis Tolstoi (born Sept. 5, 1817, died Oct. 10, 1875), a poet, novelist, and dramatist, author of three historical tragedies forming a trilogy, "Death of Ivan the Terrible," "Czar Feodor," and "Czar Boris," and Count Leo Tolstoi, whose novel of Anna Karenina (1875–8) has given him a great reputation.

TOLTECS, or Tulauecas, a nation of Mexico, who according to Mexican annals appeared in Anahuac in the beginning of the 7th century, led in their wanderings from another continent or country by Tanub. They founded the kingdom of Tula, and were the first civilized and civilized race. As they increased, capital arose at Colhuacan, Otompam, and Tollan. The Chichimecas, a nation of different origin, entered the country about a century later, and these were followed in time by seven Nahualet tribes, of the same race as the Toltecs, the Mexicans being the last. Before this the Toltec monarchy, rent by civil wars between the clergy and nobles, had fallen in the 11th century; famine and pestilence desolated the country, and many of the survivors emigrated to Guatemala. The rest of the Toltecs were incorporated by the Chichimecas, to whom they imparted their civilization. The emigrants founded in Guatemala a new empire, and the Quichés claimed descent from them, though the names of the later Quiché monarchs show another language than the Toltec. It is usual to refer all that is grand or surprising in Mexico and adjoining parts to the Toltecs; but tradition ascribes to them definitely the use of hieroglyphics, astronomical knowledge and the division of time, agriculture, weaving, stone cutting, and architecture.

TOLLENS, Hendrik Corneliszoon, a Dutch poet, born in Rotterdam, Sept. 24, 1780, died in Ryswick, Oct. 21, 1856. He was intended for trade, but in 1800 began publishing poetry, and finally became one of the most celebrated national bards. His masterpieces include a narrative poem on Barentz's expedition to Nova Zembla (new ed., 1844), dramatic works, and patriotic lyrics, especially the Wappenkredt (1815). His Gesammelte dichtwerken comprises 8 vols. (Leeuwarden, 1855–7).

TOLICA, a city of the republic, capital of the state, and 30 m. W. S. W. of the city of Mexi-

TOMATO, a plant of the Solanaceae or nightshade family, cultivated for its fruit. It is a native of tropical or sub-tropical America, and its name, given in the earlier works as tumati and tomati, is of Indian origin. The plant was originally placed in the genus lycopersicum, which Linnaeus reduced to solanum; but later botanists, thinking that the difference in the antlers, which are united at the tips and open by a longitudinal slit, and not by a pore at the apex as in solanum, was a sufficient distinction, restored the genus, and called the tomato lycopersicum esculentum; while some still adhere to the view of Linnaeus, and class the plant as solanum lycopersicum. The older English writers call the fruit love apple; in France pomme d'amour, and in Italy pomi d'amore, are still in use, perpetuating the old notion that their use as food had an influence upon the passions. Peru is regarded as its native country, but it has not been found there or elsewhere in a truly wild state, and it had probably been long in cultivation before the advent of the Europeans. The tomato has weak stems about 4 ft. long, and when left to itself forms a much branched trailing or prostrate plant. Its leaves are irregularly pinnate, with the larger leaflets themselves cut or divided; both stem and leaves are clothed with soft viscid hairs, which exude a strong-smelling, rather fetid, and somewhat resinous sub-

stance, which stains the hands and clothing when the plants are handled. It has been lately said that an infusion of tomato leaves is effective in destroying plant lice. The flower stalks, or peduncles, are extra-axillary and bear...
racemose clusters of yellow flowers, which, with the exception in the anthers already noted, have a similar structure to those of the solanums. (See SOLANUM.) The fruit is normally a two- or three-celled berry, but in the cultivated plant there are usually numerous cells; the fruit, especially in the larger specimens, often has a very complicated structure, resulting from the union of two or more flowers; their pistils being fused together present at maturity a curiously abnormal fruit, in which all traces of the original structure are lost. The cultivated tomatoes present a great variety in form, color, and size, and it is not known whether they are from several species or are different forms of one very variable species. The plant is remarkably plastic, and by selecting seeds from fruit with desirable peculiarities, it is very easy to establish a strain or variety. When tomatoes were first cultivated in our gardens there was but one variety; this had a

distinct varieties is the "Feejee," which has a large rose or pinkish red fruit; there are several yellow varieties and one nearly white large one, and there are both yellow and red of smaller sorts named according to the shape and size of the fruit, such as the pear, plum, and cherry tomatoes; the currant tomato, which has berries scarcely larger than a large currant, in long racemes, and delicate foliage, is very ornamental, and apparently a distinct species, probably L. cerasiforme. The upright or tree tomato originated in France; its main stem is thick, and its few branches so short and strong that it carries its weight of large fruit without support; but it is not very productive. Less than half a century ago the tomato was almost unknown to northern gardens, or cultivated in them only as a curiosity, but at present it is one of the most popular of vegetables. As the fruit will color and ripen when picked green, it can be transported to great distances, if properly packed in small crates with abundant openings for ventilation; the first tomatoes in the northern markets come from Bermuda, appearing in February, followed successively by contributions from Florida, Georgia, &c., before the fruit from the gardens near by is ripe. At the north the seeds are sown in hot-beds, the young plants set out in other hot-beds, and finally transplanted to tall frames, where they may be protected at night until the weather is warm enough to set them in the open ground. Light, well manured soils are better than heavy ones for this crop; in field culture the plants soon fall over with the weight of fruit and are allowed to lie upon the ground, but in private gardens they are supported by a frame or trellis, or tacked up to a fence or the side of a building; by proper pruning and removing the excess of young fruit, the size and quality of that allowed to ripen is greatly improved.—The tomato is used in a great variety of ways, being eaten raw as a salad, stewed, baked, broiled, and as an ingredient of soups, stews, and sauces; it is also used to make a popular catsup, and is pickled and preserved in various ways.—The strawberry tomato is described under Physalis.

TOMBIGBEE, Tombigby, or Tombeekbee, a river of Mississippi and Alabama, which rises in Tishomingo co. in the N. E. extremity of the former state. It first flows S. to Columbus, then S. E. to Demopolis, Ala., where it receives the Black Warrior on the left, and then generally S., with many and sudden windings, to its junction with the Alabama, about 45 m. from Mobile, where the united stream takes the name of Mobile river, and falls into Mobile Bay about 30 m. from the Gulf of Mexico. Its length is estimated at 450 m., and it is navigable for large steamboats to Columbus, 366 m. from the mouth of Mobile river.

TOM GREEN, a S. W. county of Texas, formed in 1874; area, about 14,000 sq. m. It is bounded S. W. by the Pecos river and N. W. by New Mexico. In the east it is intersect-
ed by the head streams of the Colorado river. This county, with Crockett, formed in 1875, has absorbed what was formerly known as Bexar district or territory. Capital, Ben Ficklin.

**TOMLINE, George**, an English prelate, eldest son of George Pretyman, born in Bury St. Edmunds, Oct. 9, 1750, died in Winchester, Nov. 14, 1837. He was educated at Cambridge, and in 1779 became tutor to William Pitt, who made him his private secretary on becoming chancellor of the exchequer in 1782, and his secretary when he became first lord of the treasury. Pretyman remained with Pitt till 1787, when he was made bishop of Lincoln and dean of St. Paul's. In 1820 he was transferred to the see of Winchester. In 1868 he received by will an estate from Marmaduke Tomline, and assumed that name. He published "The Elements of Christian Theology" (2 vols. 8vo, 1799), which has passed through numerous editions; "A Refutation of Calvinism" (1811); and "Memoirs of William Pitt" (3 vols. 8vo, 1821), "which," Macaulay says, "enjoys the distinction of being the worst biographical work of its size in the world."

**TOMMASI, Nicolo**, an Italian author, born in Sebenico, Dalmatia, about 1808, died in Florence, May 1, 1874. He resided several years in Florence, wrote for the patriotic Antologia, went as an exile to France in 1833, and in 1838 settled in Venice. He was arrested with Manin in January, 1848, but were released in March by the people, and in August Tommasi became minister of religion and education in the revolutionary government, and vainly attempted to procure French intervention in favor of the republic. After the restoration of Austrian rule in August, 1849, he was banished from Venice, resided in Cornu and Turin, and in 1865 finally returned to Florence. His works include Nuovo dizionario dei sinonimi della lingua italiana (Florence, 1832; 5th ed., 2 vols., Milan, 1867); Canti popolari (2 vols., Venice, 1843); Studi critici (2 vols., 1849); Lettere di Passuale de' Paoli, with Paoli's biography and a history of the war for Corsican independence (Florence, 1846); Nuovi studi su Dante (Turin, 1865); and Poesie (1872).

**TOMMI IWAKURA**, a Japanese statesman, born in Kioto about 1825. He is a kuge or court noble of the Murakami branch of the Minamoto family, and was a leader as well as the instrument of the conspiracy which effectuated the Kioto coup d'état of Jan. 3, 1868, overthrowing the shogunate, and establishing a government in which his class held the chief offices. (See JAPAN, vol. ix., p. 546.) In August, 1871, he was made minister of foreign affairs, and was active in the abolition of the feudal system and the retirement of the ex-emíos to private life. In December he left Japan as chief of the embassy which visited the United States and the principal capitals of Europe. On his return in September, 1873, he was made junior prime minister, which office he now holds (1876). He was active in averting the threatened war with Corea in 1873. He has been especially distinguished for his advocacy of the introduction of the forms and improvements of western civilization, and he sent his sons to the United States to be educated. On the night of Jan. 14, 1874, while he was in his carriage near the mikado's palace, an attempt was made to assassinate him, but he escaped with several severe wounds.

**TOMPKINS, Daniel D.**, an American statesman, born at Scarsdale, Westchester co., N.Y., June 21, 1774, died on Staten island, June 11, 1825. He graduated at Columbia college in 1795, was admitted to the bar in New York in 1797, and in 1801 was a member of the legislature, and of the convention for revising the state constitution. In 1804 he was elected to congress from the city of New York, but resigned to become one of the associate justices of the supreme court of the state. From 1807 to 1817 he was governor of New York, and he was conspicuous for his support of the national government during the war of 1812. In 1812 he prorogued the legislature for ten months, to prevent the establishment of the bank of America in the city of New York. This measure gave him temporary popularity, but did not defeat the charter of the bank, which was passed in 1813. In a special message to the legislature, Jan. 28, 1817, he recommended the abolition of slavery in the state of New York; and an act for that purpose was accordingly passed, to take effect July 4, 1827. In 1816 he was elected vice president of the United States, and in 1817 resigned the governorship on assuming that office, to which he was re-elected in 1820, retiring March 4, 1825.

**TOMSK.** A government of western Siberia, bordering on Tobolsk, Yeniseisk, China, and the Central Asian provinces of Semipolatinsk and Akmolinsk, from which it is partly separ-
rated by the Irish; area, 329,027 sq. m.; pop. in 1870, 883,756. The Altai mountains extend along the S. part. The river Obi rises in the south, flows N., and receives numerous tributaries, the chief of which are the Tchunish, Tom, Tebulim, and Ket. There are several lakes. Gold, silver, copper, lead, and iron are extensively worked in the south. The N. part is barren, but toward the south the pastures become luxuriant, and abundant crops are raised; but cattle constitute the principal wealth.

Tobolsk, capital of the government on the right bank of the Tom, 620 m. E. S. E. of Tobolsk; pop. in 1867, 24,481. It consists of an upper town inhabited by the wealthy classes, chiefly Russians, and a lower town, by Tartars and Bokharians. It has many fine private and public buildings. In 1875 provisions were made for a Siberian university here. The chief trade is in grain, leather, and furs. Situated on the great road leading to the Chinese border, it is next to Irkutsk the most prosperous town of Siberia. It was founded about 1610.

TON, or TON, a denomination of weight, equal to 30 cwt. or 2,240 lbs., and also (usually with the second orthography) a liquid measure of 232 gallons; also applied to dry measures and solid measures of various capacities in different countries. In common use, the ton weight is often rated at 2,000 lbs., when it is termed the "short ton;" but by act of congress, when not specified to the contrary, the ton is to be understood as 2,240 lbs. In Maryland the ordinary ton is 2,000 lbs., the usual coal ton 2,240 lbs., and the miner's ton, according to which he is paid, is 2,470 lbs., the allowance being for waste. The shipping ton of France was by the old standard 2,158.43 lbs., and the metric ton is 2,004.6 lbs.; the shipping ton of England is 2,032.2 lbs.; of Portugal, 1,735.3 lbs. The measurement ton for shipping is in the United States 40 cubic ft. In England the ton for wine is 252 gallons.

TONE, Theobald Wolfe, an Irish revolutionist, born in Dublin, June 20, 1763, died in prison there, Nov. 19, 1798. He graduated at Trinity college, Dublin, and was called to the bar in London in 1789. In defence of the whig club he published "A Review of the Last Session of Parliament" in pamphlet form, and on the appearance of a rupture with Spain wrote a pamphlet to prove that Ireland as an independent nation was not bound by a declaration of war. Subsequently he sought to effect a union against the government between the Catholics of Ireland and the dissenters, and in 1791 addressed to the latter "An Argument on behalf of the Catholics of Ireland." The same year he assisted in founding the first club of "United Irishmen" at Belfast, and others in other parts of Ireland. He became secretary and agent of the Catholic committee in 1792, and was subsequently implicated in the proceedings of Jackson, sent from France to sound the sentiments of the Irish. He was allowed to retire from the country, and in 1795 came to the United States. Letters asserting that Ireland was ripe for a revolt induced him to sail for France in January, 1796, to gain the aid of the directory; and owing in large measure to his exertions, that government determined to fit out a powerful expedition under the command of Hoche. In July Tone received his commission as chef de brigade, and was also made an adjutant general to Hoche, whom he accompanied in December in the armies destined for Hungary. The fleet was scattered by storms, and the French government would not undertake another expedition. In 1797 Tone was attached to Moreau's army; and in September, 1798, he accompanied a petty squadron destined for Ireland, which was intercepted and defeated by an English squadron. After fighting desperately, Tone was captured, carried to Dublin, tried by court martial, and sentenced to be hanged on Nov. 12. He died, however by his own hand, having cut his throat with a penknife on the 11th. After his death appeared "The Life of Theobald Wolfe Tone, written by himself," with his "Political Writings," ed. by his son, William Theobald Wolfe Tone (including "An Account of his own Campaigns under Napoleon," 2 vols. 8vo, Washington, 1826; abridged, London, 1827, 1837, and 1847).—His son was an officer in the French army, and after the fall of Napoleon in that of the United States; and he was also the author of L'Etat civil et politique de l'Italie sous la domination des Goths (Paris, 1813), and "School of Cavalry" (Georgetown, D. C., 1833).

TONGATABOO. See FRIENDLY ISLANDS.

TONGUE, in the animal system, the organ, situated on the median line, at the commencement of the alimentary canal, ministering to the senses of touch and taste. Taking the tongue of man as an example, the organ is attached at its base to the movable hyoid arch of bones, and suspended and kept in place by muscles from the base of the skull, lower jaw, and hyoid bone; it is essentially composed of muscular fibres, which move freely its various portions; it is covered by sensitive mucous membrane, containing numerous mucous glands and follicles; fibrous, areolar, and fatty tissues enter into its structure, which is freely supplied with blood vessels and nerves. The size bears no relation to the height of the individual, but is proportioned to the capacity of the angular arch; it is, therefore, smaller in women than in men. From the base to the epiglottis extends a fold serving to limit the movements of the latter organ, and from the sides of the base to the soft palate two folds on each side, the pillars of the fauces, between which are the tonsils; under the anterior free extremity is the frenum, which connects it with the lower jaw, a fibrous and mucous lamina or figament, sometimes so short congenitally as to prevent the free movements of the tongue and to require an operation for its division. There
TONGUE

is a more or less distinct longitudinal furrow on the median line, from which extend outward and forward numerous other lines whose angle of union points backward; the posterior third is smooth and without compound papillae, exhibiting a few simple ones and the nodular eminences of the numerous muciporous glands; in front of this is a V-shaped ridge, the angle directed backward, formed by two converging lines of button-like eminences, the circumvallate papillae; in front of these, and occupying the anterior two thirds of the organ, are the fungiform and conical or villiform papillae, the former spheroidal and scattered, the latter very numerous. The osseous support of the tongue is the U-shaped or hyoid bone, consisting of a base or median body, two greater and two lesser cornua, and placed in the neck between the lower jaw and the thyroid cartilage; it is the homologue of a very complex apparatus in the lower vertebrates. The muscles constitute the chief bulk of the tongue; they are arranged in a complicated manner, so as to support each other, rendering the movements of the organ exceedingly varied and extensive; they are attached to the submucous fibrous tissue, which is firm and thick on the superior surface. The mucous membrane is invested with a delicate scaly epithelium, the superficial layer of which readily and constantly falls off. The papillae are much like those of the skin, most being compound organs, in their nervous and vascular supply. The circumvallate papillae are 6 to 10 in number, and sometimes ½ in. in diameter; the fungiform are ½ – 3/16 in. in diameter, and vary greatly in number, perhaps accounting for the well known diversity in the acuteness of the sense of taste in different individuals; the filiform are the most numerous, closely set like the pile of velvet, covering the anterior two thirds of the tongue, and the seat of what is called the fur; their epithelium frequently breaks up into hair-like processes, having their imbrications directed backward, which mark a physiological distinction between the circumvallate and fungiform papillae and the filiform and conical ones. The conical papillae are generally regarded as tactile, the fungiform and circumvallate as gustatory (acutely tactile), and the filiform as the homologues of the recurved spines of the tongue of the cats, and as principally concerned in regulating the movements of the food in order to bring it within the reach of the muscles of deglutition. The principal arteries of the tongue are the lingual branches of the external carotid; the sensory nerves are the lingual branch of the fifth pair or trigeminal, and the glossopharyngeal, distributed respectively to the anterior and posterior portions, and the motor nerve is the hypoglossal; for their functions see TASTE. The tongue in fishes is rudimentary, and not endowed with any great sensibility or motor power; in reptiles it varies greatly in length, size, and movability, being in some immovable or short and thick, in some remarkable for slenderness and length (as serpents), and in others for protractility (as in the chameleon and frog); in them it is usually an organ of prehension and not of sensation. The tongue in birds is also prehensile and not gustatory, and generally provided at the base with numerous spines directed backward to prevent the return of food; though itself incapable of elongation, it may be remarkably protruded by the action of the muscles attached to the very long and moveable hyoid bones. In some mammals, as the giraffe and ant-eater, it is capable of great elongation, and is an important organ of prehension; the recurved spines of the cats have been referred to, and constitute efficient instruments for cleaning flesh from bones and for combing their fur. In man the tongue keeps the food during mastication within the range of the teeth, collects it from all parts of the mouth preparatory to swallowing it, and is also concerned in the commencement of deglutition; and it is a principal organ of articulate speech. It is liable to inflammation, enlargement, atrophy, ulcerations, tumors, and malignant diseases. The fur in disease depends on a sodden and opaque condition of the epithelium of the filiform and conical papillae, arising from an alteration of the mucus and saliva of the mouth, the bright red color of the fungiform papillae presenting a striking contrast; the amount, color, and arrangement of the fur are symptomatic of various morbid changes in the system, of interest to the physician, though there is great variety within the

FIG. 2.—A. Fungiform Papilla, showing the secondary papillae on its surface, and at a its epithelium covering them over. (Magnified 25 diameters.) B. The capillary loops of the simple papillae of A, injected: a, artery; v, vein. The groove around the base of some of the fungiform papillae is represented, as well as the capillary loops (c, c) of some neighboring simple papillae. (Magnified 18 diameters.)
TONQUA BEAN

limits of health. The papillary surface is healed and repaired with great readiness and perfection.

TONQUA BEAN (also written Tonquin, Tonga, and Tonka), an Asiatic name applied to a South American product, the seeds of dipterix odorata, a tree belonging to the leguminosae or pulse family. The genus dipterix (Gr. διπτερος, double, and περασσων, a wing) comprises about eight species, all large trees of the forests of Brazil, Guiana, and neighboring countries, and belongs to a tribe of the family of which there are no representatives in northern localities; the trees have pinnate leaves and large panicles of flowers, which are succeeded by (what is very unusual in the family) a pod containing only a single seed. The Tonqua bean tree grows 60 to 90 ft. high, with a trunk sometimes 3 ft. in diameter; the indehiscent pods, about 2 in. long, are almond-shaped and very thick; the single seed is over an inch long, shaped somewhat like a large kidney bean; it has a wrinkled skin, which is shiny black. The odor, which is remarkably strong, resembles that of the meillot or sweet clover and the sweet-scented vernal grass (anthozanthum), and is due to the same principle, coumarine, a concrete crystallizable, volatile, neutral substance, with the composition C₁₄H₁₁O₄, very soluble in alcohol and ether, and somewhat soluble in boiling water, from which it crystallizes on cooling; the beans are often frosted with crystals of this, which show very distinctly on their black surface. Formerly the beans were much used to scent snuff, and they are often called "snuff beans," a few of them being placed in a jar with the snuff, or a single one kept in the snuff box; they were also formerly used in smoking tobacco, but a much cheaper substitute is found in the "wild vanilla" (liatris odoratissima) of Florida. (See VANILLA.) The odor of the bean bears some resemblance to that of the true vanilla, and much of the extract of vanilla sold for flavoring ice cream and articles of confectionery is adulterated with it, and in some of the cheaper flavoring extracts it is entirely substituted for that costly material; any one with a nice sense of smell can readily detect the least admixture. The wood of the Tonqua bean tree is remarkably close-grained, hard, and heavy, and, though redder, much resembles lignumvitae, and in some parts of South America it is called by that name; it is valued for fine cabinet work. Another species, D. eboensis, is the eboe tree, the fruit of which is without odor; its timber is hard and valuable.

TONQUA. See ANAM.

TONQUIN, Gulf of, an arm of the China sea, having the Anamese province of Tonquin on the west, the Chinese province of Quang-tung on the north and east, and the island of Hainan on the southeast; length, nearly 300 m.; average width, 150 m. The Sangkol or Tonquin river flows into it. It has numerous islands. The typhoons are very violent in the gulf.

TONSILS, or ANYGALA, two glandular organs, of an almond shape, with the larger end upward, situated on each side of the fauces, between the anterior and posterior pillars of the soft palate, and easily brought into view by opening the mouth. They are composed of a collection of mucous follicles, which open through 12 or 15 orifices on the inner side of each tonsil. These follicles are lined with a continuation of the mucous membrane of the pharynx, and have a structure similar to that of Peyer's glands in the small intestine. They secrete mucus which goes to make up the mixed mass of saliva, or to lubricate the fauces during the act of deglutition, the pressure of the food and the constriction of the pharynx forcing the contents from the organs. They are supplied with blood from the facial, inferior pharyngeal, and internal maxillary arteries, and with nerves from the fifth and glossopharyngeal. The veins terminate in the tonsillar plexus on the outer side of the tonsil. These organs vary in size in different individuals, being notably larger in persons of scrofulous constitution. They are liable to acute inflammation, involving great enlargement and suppuration; an affection called tonsillitis or eynanche tonsillaris, and popularly quinsy.

TONSTALL. See TONSTALL.

TONTINE, a kind of life annuity originated by Lorenzo Tonti, a Neapolitan, who published his scheme and introduced it into France about the middle of the 17th century. The subscribers or their representatives were divided into 10 classes, and an annuity was apportioned to each class according to their age, the survivors deriving an increased annuity as their associates died, and the last survivor receiving the entire annuity of the class till the close of his life. The first association of this kind, called the "Royal Tontine," was founded under the administration of Cardinal Mazarin in 1653. The total sum paid in was 1,025,000 francs, in 10 classes of 102,500 francs each. The subscription was 300 francs, and every subscriber received the interest of his investment until the death of some member of the association increased the dividend to the rest, and after the death of the last subscriber it reverted to the state. This project was not successful, nor were two more subsequently proposed by Tonti. In 1689 Louis XIV. authorized another of 1,400,000 francs divided into 14 classes, according to age, from children of 5 years to
TONTY

adults of 70. In 1726 the last survivor of the 13th and 14th classes was the widow of a poor surgeon who had invested 300 francs in two tontines, and who enjoyed at her death, at the age of 96, an income of 78,500 francs. Tontines were again resorted to by the French government in 1735 and 1754; but in 1763 they were interdicted as a measure of finance. In 1791 a tontine called the caisse Lafarge, on a more extended scale, was established under private management; but by a gross blunder or fraud, the interest promised was impossible, and the subscribers, whose united contributions amounted to 60,000,000 francs, never received even simple interest, and the entire capital was lost in the disasters of the time. In England tontines have been occasionally resorted to as a measure of finance, the last opened being in 1789, and a few private ones have been established. In 1871 the Alexander park company in London proposed to organize an institution similar to the South Kensington museum by means of a tontine to cease June 30, 1886; but the scheme proved unsuccessful, and was abandoned in 1872. In the United States there have been private annuities of this kind. The New York tontine association was organized in 1790, with 208 shares valued at $250 each. The tontine coffee house was built in Wall street, and about 1850 the property was leased for business purposes. The lease was to expire and the property to revert to the owners of the shares depending upon the last seven surviving lives. This contingency occurred in 1870, but proceedings for winding up the affairs of the association and the partition of the property are still pending (1876). Buildings have been erected in some other cities on the same plan.

TONTY, Henry de, an Italian explorer, died at Fort Louis, Mobile, in September, 1704. The son of Lorenzo Tonti, inventor of the tontine system of association, he entered the French army as a cadet, served in the navy, and lost a hand. He came to Canada with La Salle in 1683. Near the present site of Peoria on the Illinois river he assisted in building a fort in 1683, which La Salle left in his command. He attempted a white settlement in Arkansas. In 1685 he brought a force of western Indians to join in attacking the Senecas. Twice he went to meet La Salle at the mouth of the Mississippi, but without finding him. He descended a third time to meet Iberville, and remained in the gulf region. His memoir of La Salle's voyage, published in Marry's Relations et mémoires, has been translated into English under the title "Account of M. de La Salle's last Expedition and Discoveries in North America." (21mo, London, 1698; 8vo, New York, 1814; in French's "Historical Collections of Louisiana," vol. i., 1846).

TOOELL, a W. county of Utah, bordering on Nevada, and bounded N. E. by Great Salt lake; area, 8,820 sq. m.; pop. in 1870, 2,177. The greater portion is a barren desert. The hilly portions contain some valuable arable and grazing land, and mines of gold, silver, copper, and lead. In the W. part are large fertile valleys and several mining districts. The chief productions in 1870 were 28,483 bushels of wheat, 2,505 of Indian corn, 2,840 of oats, 1,630 of barley, 9,484 of potatoes, 8,497 lbs. of wool, and 973 tons of hay. There were 511 horses, 2,041 cattle, 4,929 sheep, and 121 swine; 1 flour mill, and 5 saw mills. Capital, Tooole.

TOOKE, John Horne, an English politician, born in Westminster, June 26, 1739, died at Wimbledon, March 18, 1812. He was the son of John Horne, a poulterer, who was educated at Cambridge, became an usher in a school at Blackheath, took orders, and obtained a curacy in Kent. He was ordained priest in 1760, and for three years officiated in the chapelry of New Brentford. He then went to France as travelling tutor to the son of Elwes the miser. In 1765 he wrote a pamphlet in favor of Wilkes and his cause; and on a second visit to the continent he formed at Paris an intimate acquaintance with that politician. On his return in 1767 he took an active interest in political matters, especially in securing the election of Wilkes from Middlesex. In 1769 he was one of the founders of the society for supporting the bill of rights; but its financial affairs involved him in a quarrel with Wilkes, and for this he was attacked by Junius, but defended himself with success. In 1771 he received his degree of M. A. from the university of Cambridge. In 1772, designing to study law, he formally resigned his living. He rendered great assistance in resisting an enclosure bill which would have reduced the value of some property of his friend William Tooke of Purley, who in return made him his heir; but, though in 1782 he changed his name to Tooke, he never received more than £8,000 from the property. He bitterly opposed the American war, and advertised for a subscription for the widows and orphans of the Americans "murdered" by the king's troops at Lexington and at Concord." The ministry prosecuted him for libel, and he was tried at Guildhall in July, 1777. He conducted his own defence, but was condemned to one year's imprisonment and a fine of £200. While confined he published his celebrated "Letter to Mr. Dunning," critically explaining the case of The King v. Lawley, which had been used as a precedent against him on his trial. He declared himself "the victim of two pretensions and a conjunction," which parties he calls "the abject instruments of his civil extinction." After his release in 1779, he applied for admission to the bar, but was rejected on the ground of being a clergyman. He published in 1780, in conjunction with Dr. Price, a pamphlet entitled "Facts," severely reflecting upon Lord North and his prosecution of the American war. In 1786 appeared the first part of his "Enea superba, or the Diversions of Purley," the object of which
was to prove that all parts of speech could be resolved into nouns and verbs, and that all words were at first applied to sensible objects. The second part appeared in 1805 (new ed. by Richard Taylor, with additions from the copy prepared by the author for republication, and his letter to John Dunning, 2 vols. 8vo, 1829; with additional notes by Richard Taylor, 8vo, 1860). In 1876 he published “A Letter to the Prince of Wales” in regard to his supposed marriage with a Roman Catholic. In 1786 appeared his pamphlet “Two Pair of Portraits,” in which he drew a contrast between the two Pitts and the two Foxes. In 1794 he was tried for high treason, with Hardy, Thelwall, and others, mainly on the ground of his participation in the action of the “Constitutional Society,” and was acquitted, being eloquently defended by Erskine. In 1801 he was returned to the house of commons by Lord Camelford for the borough of Old Sarum, and he retained his seat till the dissolution in 1802; but the decision of that parliament that no one in priest’s orders could be a member disqualified him from sitting again. The latter years of his life were spent at Woburn. He was never married, but left several illegitimate children.—See Memoirs of John Horne Tooke, interspersed with Original Documents,” by A. Stephens (2 vols. 8vo, 1813), and “Memoirs of John Horne Tooke, Esq., together with his Valuable Speeches and Writings,” &c., by John A. Graham (New York, 1828).

TOOKE. I. William, an English clergyman, born Jan. 18, 1744, died in London, Nov. 17, 1820. In 1771 he became minister of the English church at Cronstadt, and in 1774 chaplain to the factory of the Russian company at St. Petersburgh, where he remained till 1792. His most important works are: “Russia, or a Complete Historical Account of all the Nations which compose the Russian Empire” (4 vols. 8vo, 1780-83; French translation, Paris, 1801); “Life of Catharine II., Empress of Russia,” an enlarged translation from the French. (3 vols., 1797-1800; new ed., 1810); “A View of the Russian Empire during the Reign of Catharine II. and to the Close of the Eighteenth Century” (3 vols., 1799); and “History of Russia, A. D. 862-1762” (2 vols., 1800-6). II. Thomas, an English political economist, son of the preceding, born in St. Petersburgh in 1774, died in London, Feb. 26, 1853. In 1838 he published “A History of Prices and of the State of the Circulation from 1720 to 1807, preceded by a brief Sketch of the State of the Corn Trade in the last two Centuries” (2 vols. 8vo). Four additional volumes bring the work down to 1856.

TOOMBS, Robert, an American politician, born in Washington, Wilkes co., Ga., July 2, 1810. He graduated at Union college, Schenectady, in 1828, studied law at the university of Virginia, and commenced practice in his native place. In 1836 he served under Gen. Scott as captain of volunteers in the Creek war. In 1837 he was elected to the state legislature, and with the exception of 1841 continued a member till 1845. He was a member of congress from 1845 to 1853, when he was elected a member of the United States senate, and was reelected for the term ending March 4, 1855. He was a prominent member of the extreme southern party, and after the election of President Lincoln was one of the most active in persuading Georgia to secede. The state of Georgia having passed its secession ordinance on Jan. 19, 1861, Mr. Toombs withdrew from the senate on the 29th, and on March 14 he was expelled. He was a member of the confederate congress which met at Montgomery, Ala., was subsequently for a short time secretary of state of the Confederate States, and also served as a brigadier general in the confederate army.

TOOKISTAN. See TURKISTAN.

TOPAZ, a precious stone, a silico-fluoride of alumina, consisting, in 100 parts, of alumina 48 to 58, silica 34 to 39, and fluorine 15 to 18.5. Its specific gravity is 3.4 to 3.65; its hardness is 8, or between that of quartz and sapphire. It is usually colorless, but is sometimes blue, green, or red. The yellow Brazilian topaz when heated becomes reddish, while the Saxon wine-colored topaz loses its color entirely. Topaz is pyro-electric; it crystallizes in the triclinic or rhombic system, the prism generally having dissimilar extremities. When heated in the blowpipe flame it becomes covered with small blisters, while a coarse variety called physalite (Gr. ψῆπαλις, to blow) swells up when heated. Its principal localities are: the Ural and Altai mountains, Kamchatka, Villa Rica in Brazil (of a deep yellow color), Altenberg in Saxony, and the Mourne mountains in Ireland; in the United States, at Trumbull and Middletown, Conn., and at Crowder’s mountain, N. C. Physalite is found in Norway and Sweden in very large crystals; one weighed 60 lbs. The topaz is not very highly valued as a gem, though fine specimens sometimes bring very good prices. Tavernier speaks of one belonging to the Great Mogul weighing 157 carats, which was valued at 181,000 rupees. The principal supply is from Brazil, which furnishes about 40 lbs. annually. The white and rose-red are the most valuable. The former are called by the Portuguese pingas d’água (drops of water), and when cut resemble the diamond in brilliancy. The oriental topaz is the yellow variety of transparent corundum, and belongs to the family of sapphires. (See SAPPHIRE.) A yellow variety of quartz is sometimes called false topaz.

TOPEKA, a city and the capital of Kansas, county seat of Shawnee co., situated on both banks of the Kansas river, here spanned by a fine iron bridge, 45 m. S. W. of Leavenworth and 300 m. W. of St. Louis; pop. in 1860, 759; in 1870, 5,790; in 1875, 7,272. The streets are wide and regularly laid out. The city is remarkably well built. The state house is a magnificent building. A site has been
purchased by the United States government for a public building, and a state asylum for the insane is in course of construction about 2 m. W. of the state house. The surrounding country is very fertile and contains deposits of coal. The trade of Topeka is large and rapidly increasing. The Atchison, Topeka, and Santa Fé and the Kansas Pacific railroads afford communication with the east and with Colorado and Texas. The river furnishes good water power. The chief manufacturing establishments are three flouring mills, a rolling mill, a foundry and machine shop, two breweries, a broom factory, and several manufactories of carriages and wagons, and harness and saddlery. There are two national banks, two state banks, two loan and trust companies, and three building and savings associations. The public schools have accommodations for 2,000 pupils, and comprise a high school and seven schools of inferior grades. Other prom-

inent institutions of learning are Washburn college (Congregational), for both sexes; an Episcopal theological seminary; and the colleges of the sisters of Bethany (Episcopal) and sisters of charity (Roman Catholic), for females. The Topeka library association has about 2,000 volumes. Three daily and four weekly newspapers are published. There are 23 religious societies, viz.: 3 Baptist, 1 Christian, 3 Congregational, 1 Episcopal, 1 Jewish, 2 Lutheran (1 Swedish), 4 Methodist (1 German), 3 Presbyterian, 1 Roman Catholic, 1 Spiritualist, 1 Unitarian, 1 United Brethren, and 1 Universalist. Topeka was laid out in 1854, incorporated as a city in 1857, and made the state capital in 1861.

TÖPFER, Rudolphe, a Swiss novelist, born in Geneva, Feb. 17, 1799, died there, June 8, 1846. He began life as a landscape and genre painter, and subsequently became professor of aesthetics at the academy of Geneva. His works in-clude Le prodigieuse (Geneva, 1839; English translation, "The Parsonage," London, 1848); La bibliothèque de mon oncle (1843); Rose et Gertrude (1845); Nouvelles génévoises (Paris, 1845); and Collection des histoires en entampe (6 vols., French and German, Geneva, 1846).

TOPHET, a spot in a fertile valley S. E. of ancient Jerusalem, called the valley (ge) of Hinnom, or of the children of Hinnom, and hence Gehenna in the New Testament, and watered by the brook Kidron. It was the place where the idolatrous Jews passed their children through the fire to Molech. At a later period it was used as a spot to throw the garbage of the streets, the carcases of beasts, and the dead bodies of men to whom burial had been refused; and as a fire was kept constantly burning to consume all that was brought, the word was used metaphorically for hell.

TOPLADY, Augustus Montague, an English clergyman, born in Farnham, Surrey, Nov. 4, 1740, died in London, Aug. 11, 1778. He was educated at Westminster school and Trinity college, Dublin, took orders, and obtained the living of Broad Hembury in Devonshire. In 1775 he removed to London and preached in a chapel in Leicester square. For several years he edited the "Gospel Magazine." His fame rests principally upon his controversial writings against the Methodists, and a few hymns. He was the great champion of Calvinism in the church of England. An edition of his works was issued in 1794 (6 vols., Svo; last ed., with "Life," 1 vol. 8vo, 1869).

TÖPLITZ. See Teplitz.

TORENO, José María Queypo de Llano Ruiz de Saravias, count of, a Spanish statesman, born in Oviedo, Nov. 26, 1786, died in Paris, Sept. 16, 1843. In the rising of the Spaniards against the French in 1808 he was sent to England to negotiate for assistance, was afterward repeatedly a cabinet minister, and died in exile. He published Historia del levantamiento, guerra y revolución de España (5 vols., Madrid, 1825-7; best ed., 4 vols. 8vo, 1848).

TORFÉUS, or Tormod, the Latin name of Thormod Torfason, an Icelandic scholar, born in Engö in 1636, died near Copenhagen in 1719. Frederick III. of Denmark in 1660 made him interpreter of Icelandic manuscripts, of which he made a collection in Iceland. In 1667 he was appointed keeper of the royal collection of antiquities, and in 1688 royal historiographer. Of his works, in which first appeared the northern sagas on the discovery of
TORGAU, a town of Prussia, in the province of Saxony, on the left bank of the Elbe, 26 m. S. E. of Wittenberg; pop. in 1871, 10,867. The principal public building is the Hartenfels palace, containing a church consecrated by Luther, whose wife, Katharina von Bora, died here. It has manufactories of linen and woolen goods and a brass foundry. The elector of Saxony and the landgrave of Hesse concluded here a league for the defence of the reformation, March, 1526. In 1576 a conference of Protestant theologians, assembled by the elector Augustus, elaborated here the "Book of Torgau," which formed the basis of the Concordia Formula. The town was nearly destroyed in the thirty years' war. In the seven years' war Frederick the Great here defeated the Austrians under Daun, Nov. 3, 1759. Napoleon was the original builder (1810) of the buildings surrounding fortifications. Torgau was surrendered to the Germans in January, 1814, after a siege of several months, during which more than 25,000 French soldiers died of typhus fever.

TORLONIA, Alessandro, prince of Civitella Cesi, Musignano, Canino, and Farnese, marquis of Roma Vecchia and Torrita, an Italian capitalist, born in Rome, June 1, 1800. He is the youngest and most enterprising son of Giovanni Torlonia (born in Siena in 1754, died in Rome, Feb. 25, 1829), who was originally a small shopkeeper, and became a banker of great wealth and influence, and duke of Bracciano. Alessandro increased his patrimony by taking long leases of the salt and tobacco monopolies in the Papal and Neapolitan states, and by other profitable transactions. He became the principal holder of real estate in the city and province of Rome, filled his palace and villa with fine works of art, and rendered many important services to the pope. He has made extensive excavations, and his collection of antiquities is said to rank next to that of the Vatican. The most remarkable of his public enterprises is the draining of Lake Fuiano.

TORNA, a N. county of Hungary, bordering on the counties of Zips, Abauj, Borsod, and Gomor; area, 239 sq. m.; pop. in 1870, 23,126, chiefly Magyars and Roman Catholics. It is watered by the Bodva, which receives the Torna. The soil is mostly rocky and sterile; the principal products are hemp and wine. About three sevenths of the area is wooded. Capital, Torna.

TORNADO. See Hurricane.

TORNEA (Swed. Torneå). I. A river of Europe, having its source in Lake Tornéa-Trask in Sweden, and falling into the gulf of Bothnia after a course of about 240 m. It forms part of the boundary between Sweden and Russia.

II. A town of Finland, Russia, in the Grand Duchy of Ulenborg, at the mouth of the Tornéa river; lat. 65° 50' N., lon. 24° 14' E.; pop. about 700. It has a considerable trade in timber, fish, furs, reindeer skins, tar, &c. Many travellers visit Tornéa to see the midnight sun, visible here from the church steeple in the latter part of June. Most of them proceed to Mt. Avakaska, about 40 m. N., which offers a more advantageous view. Observations for determining the figure of the earth were made at Tornéa by Maupertuis in 1736-7, and by Prof. Svanberg of Upsal in 1801-3.

TORONTAL, a S. county of Hungary, bordering on the counties of Csongrâd, Csanâdal, Temes, and Bács, and on Slavonia; area, 2,650 sq. m.; pop. in 1870, 413,010, chiefly Magyars and Roumans. It is watered by the Maros, Theiss, Beâga, and Temes. The climate is unhealthy, but the soil is very fertile. The chief products are wheat, maize, melons, flax, rice, tobacco, and wine. Many sheep and horses are raised. Capital, Nagy-Beeskerek.

TORONTO, a city, port of entry, and the capital of Ontario, Canada, county seat of York co., on the N. shores of Lake Ontario, 310 m. S. W. of Montreal and 36 m. N. E. of Hamilton; lat. 43° 39' N., lon. 79° 21' W.; pop. in 1861, 44,821; in 1871, 56,092. The bay S. of the city is formed by an island, and is about 3 m. long and 2 m. wide. The river Don, which falls into the bay on the east, is not navigable. The site of the city rises gradually from the water and extends back about 2/4 m., connecting on the north with the villages of Yorkville and Seaton, and on the east with Leslieville, all of which, except in name, form part of the city. The corporation limits include more than 5,000 acres. The Queen's park, in the centre of the N. part of the city, contains over 35 acres; the jail farm is to be converted into a park in the east; and a few miles W. of the present corporation limits, on Humber bay, 300 acres has been secured for a park. The streets intersect at right angles. The buildings in the chief business streets are of brick, white or red, or of cut stone; and whole streets of fine residences of white brick have been built up within a few years, while other streets are occupied chiefly with wooden structures. Among the public buildings are Toronto university and University college building, the finest in the province, erected in 1859 at a cost of about $800,000; the government house, the official residence of the governor of Ontario; the custom house and the post office; the Grand opera house and the Royal opera house, each capable of seating over 1,500 persons; the central prison, which cost nearly $500,000; the city hall and St. Lawrence hall; Trinity college, a church of England institution; Knox's college, a Free church theological institution, just completed at a cost of about $80,000; the college of technology; the normal school buildings; the legislative buildings, in which also are some of the executive departments; the new central public school for University college; and Osgoode hall, the seat of the principal law and equity courts of the province and the headquarters.
of the benchers of the law society. There are 78 churches, the principal of which are St. James’s cathedral, commenced in 1852, and recently completed by the erection of a spire 316 ft. high, at a cost of about $220,000; St. Michael’s cathedral, Roman Catholic; the Metropolitan church, Methodist, costing $100,000; St. Andrew’s, church of Scotland, $80,000; and the Baptist church. The two principal markets are the St. Lawrence and the St. Andrew’s, the latter just completed.—Toronto has railroad communication with the United States and with the principal points of the provinces of Ontario and Quebec by means of the Grand Trunk, the Great Western, the Northern, the Toronto, Grey, and Bruce, and the Toronto and Nipissing lines. The imports for the year ending June 30, 1874, were $14,716,824, and for the next year $14,436,091. The official returns of exports show in each of these years less than $1,900,000, but they are imperfect. The customs revenue collected in the first of these years was $1,907,997 60, and in the last $1,293,644 34. The value of manufactures according to the census of 1871 was $13,686,093, the chief items being furniture, boots and shoes, rail cars, ale, and whiskey. There are five banks having their headquarters in the city, and branches of five Quebec and Montreal banks. Besides the Toronto savings bank, the assistant receiver general’s office, a branch of the Dominion treasury department, receives money on loan at interest; and there are numerous loan societies.—The city is divided into eight wards, each of which annually elects four aldermen, who are vested with legislative and executive powers, and can act as magistrates if possessed of a legal property qualification.

University of Toronto.

mayor is annually elected by a vote of the rate payers. The assessed value of the real and personal property (not counting stocks in public companies) in 1873 was $44,765,000; in 1874, $43,462,512; in 1875, about $46,000,000. The taxes in 1874 yielded $608,475. The funded debt is about $5,000,000; and at the close of 1874 there was $258,293 to the credit of the sinking fund. The city has a fire alarm telegraph, a paid fire department, and street railways. The water works, which the corporation recently acquired from a private individual, are undergoing improvement and extension, at a cost that will exceed $2,000,000. The water is taken from the lake, and the sand of the island, across which it passes, is made to act as a filtering basin; the filtered water then passes across the bay in sunken pipes, and is pumped up to a reservoir on a height N. of the city. Among the charitable institutions are the asylum for the insane, supported by grants of the provincial legislature, and accommodating about 700 patients; the city hospital, the resources of which, arising from an endowment of public lands, are supplemented by an annual legislative grant; a boys’ home and a girls’ home, for unprotected children; a newsboys’ home; a home for female servants out of employment; a house of industry; a Protestant orphan asylum; and the house of providence, belonging to the Catholics, and mainly supported by them. There are a number of common schools, supported at a cost of about $40,000 a year, besides Roman Catholic separate schools. St. Michael’s college (Roman Catholic) has not, like Trinity college, university powers. There are no strictly public libraries, but several semi-public ones, including the legislative library; the library in the normal school, intended for the council of public instruction;
TORPEDO

The site of Toronto was selected by Governor Simcoe in 1794 as the seat of the provincial government; and here the capital of Upper Canada remained till 1841, when Upper and Lower Canada (now Ontario and Quebec) formed a legislative union. From 1849 to 1858 Toronto was alternately with Quebec the seat of the united government; and in 1867, when the confederation was formed, it became the permanent capital of the province of Ontario. It was taken by the Americans in 1813, and the legislative buildings and archives were burned. It was known as York till 1834, when it was incorporated as a city.

TORPEDO, the generic and popular name of the electric rays or skates of the family torpedinidae. They were called vágos by the Greeks and torped by the Latins; the Germans call them Krampfisch, the French torpille, and the English cramp fish and numb fish. The body is smooth and rounded; the tail short and thick, cylindrical at the end and keeled on the sides; teeth conical, sharp, and crowded; ventral fins immediately behind the pectorals, dorsals generally two and on the tail, and the caudal subtriangular. The electrical apparatus, which has given the name to the family, is arranged in two masses, one on each side of the skull, between this and the base of the pectorals; it is composed of a multitude of perpendicular gelatinous columns or hexagonal prisms, separated by membranous partitions containing a fluid, freely supplied with blood, and receiving very numerous nervous filaments from the par vagum and triracial nerves. There are about 20 species, arranged in seven genera, in the seas of all parts of the world; the best known are the species of the Mediterranean and the W. coast of Europe, and of the Atlantic coast of North America, all belonging to the genus torpedo (Dum.), in which the mouth is crescentic, the teeth not extending outward beyond the margin of the lips, and spiracles distant from the eyes, with a circular fringe around the opening. The common torpedo of the Mediterranean (T. marmorata, Rud.; T. Galeaenii, Bonap,) is sometimes of a uniform brown, but generally mottled or spotted with darker; it rarely attains greater dimensions than 4 by 2½ ft., or a weight of more than 50 lbs. The spotted torpedo of the same sea (T. ocellata, Rud.; T. narke, Risso) is yellowish red, with one to five large, rounded, grayish blue spots, surrounded by a brownish circle, with a few whitish dots, and grayish white below. One (or both) of these species occurs on the W. coast of Europe as far as Great Britain, and also, it is said, in the Persian gulf and Indian ocean; they feed on small fish, keeping on the mud or sand at the bottom; their flesh is eaten along the Mediterranean. Their electrical apparatus is analogous to the galvanic pile; John Hunter counted 1,200 columns in a very large fish, about 150 plates to the inch.—The American torpedo (T. occidentalis, Storer) attains a length of about 4½ ft. and a width of 3 ft.; it is dark brown above with a few black dots, and white beneath; eyes very small, and spiracles directed outward and a little forward. In one specimen Prof. J. Wyman estimated the number of plates at between 250,000 and 300,000, about 1,200 prisms in each battery, each 1 to 2 in. in height, and containing about 100 plates to the inch; the interval between the plates was filled with an albuminous fluid, 90 per cent. water, containing common salt in solution; the ganglia from which the par vagum nerves arise are larger than the brain itself, indicating the great nervous power supplied to the battery.—See Electro fishes, and Lepus sur les phénomènes physiques des corps vivants, by C. Matteuccei (Paris, 1847).

TORPEDO, a machine for destroying hostile shipping, pontoon bridges, &c., through the agency of subaqueous explosions; that is, a military mine used under water. The germ of the device is to be found in floating powder vessels, which were first used at the siege of Antwerp in 1585, and received their latest application in the attempt upon Fort Fisher, N. C., during the late civil war. David Bushnell, a captain of engineers in the American revolutionary army, made the first practical application of the idea to ordinary warfare. He devised a submarine boat to carry a torpedo, charged with 150 lbs. of gunpowder, to be attached by a wood screw to the bottom of an enemy's vessel, and fired by a clockwork fuse. The first actual trial of the invention was made in 1776, when the boat, under the guidance of Sergeant Ezra Lee, was placed under the bottom of the Eagle, an English ship of war carrying the flag of Lord Howe, lying at anchor in New York harbor. But the sergeant found it impracticable to attach the torpedo, which was cut adrift, and soon exploded. In 1777 Capt. Bushnell directed a drifting percussion
torpedo against the frigate Cerberus, lying off New London, and it destroyed a schooner moored alongside. Similar torpedoes were set adrift on the Delaware, but did no harm. (See Bushnell, David.) Twenty years later Robert Fulton made vigorous attempts to bring the new weapon into notice, under the name of "torpedo," then first applied by him. Unsuccessful in France, he went to England in 1804, and in 1805 was authorized to make an attempt to destroy the French fleet at Bonlogne, which proved unsuccessful. In the same year he blew up the brig Dorothea, assigned to him for experimental trial, in the harbor of Deal. This was accomplished by two drifting torpedoes, which, connected by a rope, fouled the hawser; and one of them, charged with 170 lbs. of powder, exploding by clockwork under her bottom, utterly destroyed her. Notwithstanding this triumph, motives of policy, resulting from their sovereignty of the sea, caused Fulton and his new weapon to be rejected by the English government; and he returned to America to encounter ultimately a like repulse, although in 1807 he repeated his experiment successfully in the harbor of New York.

Fulton's system included four classes of torpedoes: buoyant mines, held in place by anchors, and provided with a mechanical device by which explosion ensued when they were struck by a vessel; line torpedoes, of the kind used in the destruction of the Dorothea; harpoon torpedoes, to be attached to the enemy's vessel by a harpoon shot from a gun, and then to explode by clockwork; and lastly "blockship" torpedoes, to be carried on spars projecting from a peculiar kind of vessel, and exploded by contact with the enemy. Just before the close of the war of 1812 preparations were made for an extended use of torpedoes in the defence of our harbors. Col. Samuel Colt first practically applied electricity to the ignition of torpedoes. After experimenting for 14 years, and blowing up several vessels at anchor, he finally, on April 13, 1843, destroyed a brig under full sail on the Potomac, operating by electricity from a station in Alexandria, 5 m. distant. He elaborated a complete system of buoyant submarine mines, which were to be planted in groups quincunxially in the channel to be defended. To connect them with the shore he devised one of the very first insulated cables ever attempted, which was connected with a platinum wire fuse imbedded in a priming of gunpowder. He proposed to arrange a reflector to throw the image of the ship upon a map of the mines at the operator's station. This project, bearing the date of 1838, was discovered among Colt's papers after his death. Although much progress was made in submarine blasting, and an elaborate system of electrical submarine mines was prepared by Capt. Hennepart of the French engineers, no opportunity offered for the further use of torpedoes until the Anglo-French war with Russia. In 1855 a new kind of contact mine, devised by Jacobi, was planted off Cronstadt and at Sebastopol; explosions occurred under the frigates Merino and Free fry, but did no serious damage. The Jacobi fuse consisted of a little bottle of sulphuric acid bedded in a mixture of potassium chlorate and sugar. This bottle being broken by the shock, an explosion ensued, which communicated with the charge and ignited the mine. Had not this engineer employed too small charges of powder (8 or 9 lbs.), his success would probably have been more marked. His system included electrical mines as well as mechanical. The destruction of the docks at Sevastopol was effected by the French engineers through the agency of submarine explosions, and the attention of all nations was thus again called to the subject. The result appeared in the defence of Venice in 1859 by Col. Von Ebner of the Austrian engineers, who originated a system more complete than any which had preceded it. During the civil war in the United States, when the confederates had no fleet, the southern ports and rivers were much exposed to attack, and this method of defence was largely used. The first torpedoes in position were discovered in Mud river, near Fort Pulaski, in February, 1862; they belonged to the simple contact class, and occasioned no damage. In October, 1862, the service was formally legalized by the confederate congress, and a torpedo bureau was soon established at Richmond. A special corps of officers and men was raised and trained for submarine warfare; inventions multiplied, and agents were sent to Europe to provide material and get the latest ideas. The southern waters soon became so dangerous as to interfere seriously with naval operations. The first vessel actually blown up by the new machines was an ironclad, the Cairo, which was totally destroyed on Yazoo river in December, 1862. During the remainder of the war seven United States ironclads, eleven wooden war vessels, and six army transports were destroyed by torpedoes, and many others were temporarily disabled. The confederates lost a fine ironclad, the Albemarle (see Plymouth, N. C.), two steamers in Charleston harbor, and a flag-of-truce boat on James river, in the same manner, the last three accidentally by their own torpedoes. This great destruction chiefly occurred in the last two years of the war. In the Schleswig-Holstein war of 1864, Denmark resorted to ingenious stationary submarine mines, and one of the invading vessels was destroyed. Paraguay employed torpedoes in defending its river coast against Brazil and her allies in 1865-6. By this time the ironclad Rio de Janeiro was destroyed and the Tama- dare disabled, although the engineers were crippled by the want of supplies. During the Franco-German war of 1870-71 the coasts of the Baltic and North seas were effectively protected against the French fleet by torpedoes; and various attempts were made to defend the French rivers in a similar manner.—The recent
changes in naval architecture, which have produced iron-clad vessels capable of enduring for a few minutes the heaviest fire of modern artillery, have rendered it necessary to devise means of striking the remaining vulnerable points, viz., the deck and the bottom. The former can be attacked advantageously in many localities only by the vertical fire of mortars; the latter can be most effectively assailed by the torpedo. The chief nations have accordingly established special schools for investigating the subject of submarine warfare, and all possible secrecy is thrown around these studies. In the United States, Great Britain, and other countries a distinction is made between the defensive and offensive branches. The American school for defensive torpedoes is at Willet's Point, New York harbor. The general principles which must govern this service are well established. The most vulnerable points of maritime nations are now their great seaboard cities; hence it is of primary importance to protect the seaports. The invention of the screw propeller and of iron armor has enabled fleets to steam rapidly past the forts, under cover of night or fog, and anchor securely in positions where their fire can either destroy the city or compel the payment of an enormous ransom. The great problem of coastal defense is, therefore, to devise an effective obstruction of the channel, which, while allowing the free passage of friendly vessels, shall bar the way to an enemy. This is supplied by defensive torpedoes planted and operated from the forts. If by their aid the enemy can be detained 100 hours under the fire of the forts, when without it he could pass in one hour, the number of the guns is virtually multiplied by 100. For these reasons military engineers are giving the closest possible study to defensive torpedoes, or submarine mines as they are often called. While the details of our system of submarine mines are not public, yet certain features have been announced. In a deep casemate of the fort, secure from the fire of the enemy, are placed electrical batteries, operating apparatus, testing galvanometers, &c., under the charge of a thoroughly trained engineer sergeant. A telegraph wire keeps him in constant communication with his officer, who is posted at some commanding point, where the whole channel lies like a map before him. Radiating from the casemate, in submarine galleries, the torpedo cables extend to the channel, where they terminate in multiple groups of mines so arranged as to be perfectly flanked by the guns of the work. The details of these mines are not public, but an idea of their general construction can probably be formed from fig. 1, which represents the Austrian type. It consists of an anchor, a; a buoyant case, b, containing the charge, fuse, and circuit-closing apparatus; and the electric cable, d, extending to the operating room on shore. These groups are so placed, in successive lines and outlying mines, as to render it impossible for a vessel to pass without moving over some of them. Thickly rising, but never exposed to view, are numerous buoys, each containing a simple electrical apparatus, which instantly reports to the sergeant the locality of any vessel touching them. If friendly, the ship passes in safety; but if an enemy, a single motion of the sergeant makes every mine an automatic agent of destruction, ready to deal a tremendous blow at the precise instant when it will be most effective. As the buoys may be slightly in rear of the mines, all attempts to protect the vessel by outrigging frames or nets are futile. Any boat attempting to grapple the torpedoes by night will be overwhelmed by a fire of grape or case shot from the fort, fired automatically by electricity, without the agency of the soldiers sleeping quietly by the guns. The mines are as effective a year after they are planted as when first laid; and if a single cable be injured or a single charge be wet, the fact is automatically reported, and within five minutes after the injury has occurred its existence and nature are known in the fort. A mine can be fired without the aid of the buoys. For secondary channels, the use of which could be sacrificed for a time, less elaborate kinds of torpedoes are provided, not unlike those employed by the confederates in the late war. These mines, once planted, are dangerous alike to friend and foe, as they explode on contact with any vessel. The electric light is employed to aid the forts in arresting operations attempted on the mines, when constant currents exist, as in rivers, use can sometimes be made of double drifting torpedoes, so arranged as to foul with the connecting rope the hawser of vessels at anchor. On the torpedoes being brought alongside by the force of the current, the same agency, acting on a simple piece of mechanism, soon releases a hammer and causes an explosion.—Offensive torpedoes are employed in the battles of vessels with vessels, and require technical naval skill. They are various in principle, and are receiving the careful study of many naval officers of all nations. The American school for offensive torpedoes is at Newport, R. I. The principal types of this class are the following: spar torpedoes, automatic fish torpedoes, otter or Harvey torpedoes, submarine rockets, and submarine boats. Besides these, there is a mixed class, that of fish torpedoes, which may be directed and controlled through the agency of electricity. These last may be either offensive or defensive. The spar torpedo has given occasion for some of the most brilliant naval
exploits on record, such as that of Lieut. Cush- 
ing in the destruction of the Albemarle. Fig. 2 represents the Wood and Lay apparatus used by him. A reserve torpedo, a, is shown on its spar b. The port torpedo c is about to ex-plode. It has been detached from its spar d by a pull on a rope, and is rising by its own buoyancy to be fired at the proper moment by the halyard e. Since the civil war boats espe-

![Fig. 2.—Wood and Lay Torpedo.](image)

cially fitted for this kind of attack have been devised by many nations, but the same kind of torpedo may be used from any vessel possess- ing the requisite speed. The automatic fish torpedo, of which the Luppis Whitehead is most widely known, consists of a small cigar-shaped boat a, fig. 3, carrying a contact tor- pedo in the bow, and containing an engine driven by some powerful agent, like com- pressed air, which, acting on the propeller b, gives it an effective range of about 300 yards. It is started usually from a large vessel, but sometimes from a launch or boat, and passing under water strikes and destroys the object of attack. Usually a directing tube is employed, but for simplicity the engraving shows a device sometimes used in experiments. The otter or Harvey torpedo is emphatically a sailor's wea-

![Fig. 3.—Luppis Whitehead Torpedo.](image)

pon, requiring high nautical skill for its use. It consists of a thin vertical copper torpedo case, enclosed in wood, a, fig. 4, and so attached to a tow rope b, leading from a reel on deck through a leading block on the yardarm, as to diverge from the quarter of a fast vessel, whose duty it is to move rapidly past the enemy. The course is so directed as to bring the torpedo in contact and explode its charge under his bot- tom. This is accomplished by skilfully caus-

![Fig. 4.—Harvey Torpedo.](image)

ing the case to dive at the proper moment, by the slackening of the tow rope, and then, by suddenly checking the latter, making the tor- pedo rise and explode by contact, either through the agency of a contact fuse acted upon by the levers c, or by electricity. The cork buoys d, d are used to give the requisite flotation. Official trials in England have shown that when properly handled this is a most effec-
tive weapon, and one which admits of use on the high seas as well as in harbors. Submarine rockets, in connection with sub-
marine guns, are now receiving much atten-
tion. The design is to render it possible to attack the enemy under his armor by a movable torpedo, in a manner analogous to the ordinary fire of artillery in air. Experiments lead to the belief that this project will ultimately be successful, for the short ranges usual in the combats of armor-plated ships. Submarine torpedo boats have been an object of study since the days of Bushnell; and, under the name of Davids, they played a conspicuous part during the civil war, in which the Housatonic was sunk off Charleston by a night attack of this de-
scription. The French plongeur is a more elaborate type of the same class. The general idea is to form a water-tight vessel, propelled by compressed air, which can be navigated under water to the enemy, there to deliver a blow through the agency of a contact torpedo. As success, and even failure, has heretofore often involved the lives of the crew, the pro-
ject is not now regarded with much favor. Indeed, it may be said to be superseded by fish torpedoes controlled by electricity, which may be made equally effective without endan-
gering the operators. This device consists essentially of an ordinary fish torpedo, which carries a coil of insulated wire to be paid out as it proceeds. One end of the wire remains with the operator, who can thus at will send a current of electricity, positive or negative, through certain electro-magnets in the fish,
causing a motion of the armatures in either of two directions. This enables him by ingenious devices to control valves which apply the motive power as desired, and thus start, stop, and steer the boat. The idea was first patented by Lieut. Col. Ballard, R. E., but it has been independently elaborated by Mr. Lay, by Mr. H. J. Smith of this country, and by Col. Scheilha in Russia. A modification of the idea has been made by Professor Ericsson, who places his motive power (compressed air) with the operator, and supplies it to the fish through a flexible tube, thus enabling him to control both its speed and direction. The tube is drawn after the fish as it advances. This kind of torpedo seems to be especially fitted for use on shipboard, where the engines may be made to supply the compressed air, and where, by advancing upon the enemy, a short range can usually be secured.

TORQUATUS, Titus Manlius Imperiosus, a hero of Roman story, of the 4th century B.C. He was brought up in privacy in the country, on a farm near Palestrina. M. Pompeius charged his father, who was hated by the people for his haughtiness, with being a tyrannical parent. The young Manlius compelled Pompeius to withdraw his accusation; and this act of filial devotion so pleased the Romans that he was made the same year military tribune. In the Gallic invasion of 361 he slew in single combat a gigantic enemy on the bridge over the Anio upon the Salarian road, and took from his neck the chain (torques) and put it around his own; from which circumstance he was called Torquatus. In 333, though he had not yet held the consulship, he was made dictator in order to carry on the war against the Cœrites and their allies, and in 334 was again made dictator for the purpose of holding the comitia. He was consul in 347, 344, and 340. In 340 his colleague was P. Decius Mus, and the two were appointed to carry on the war against the Latin league. While they were in the plain of Capua an order was issued forbidding all single encounters with the enemy; but Titus Manlius, the son of Torquatus, fought with Mattius Geminus of Tusculum, and slew him. Returning to the camp, he laid the spoils at his father's feet; but Torquatus assembled the soldiers in the prætorium, and in their presence his son was beheaded. The young men of Rome from that time regarded Torquatus with abhorrence. In this campaign a great victory was gained over the Latins at the foot of Mt. Vesuvius, and Torquatus returned to Rome in triumph. According to the Fasti, he was dictator again in 320, but the dates of his life vary in different authors.

TORQUAY, a town of England, in Devonshire, on a peninsula on the N. E. side of Tor bay, 167 m. W. S. W. of London; pop., in 1871, 21,637. It has two principal streets lined with substantial houses of limestone, with several fine churches, a town hall, theatre, numerous schools, assembly and reading rooms, a museum's institute, and a public garden. Earthware, yellow ochre, cider, and fish are exported. It has grown up within 50 years from a fishing village, and owes its progress mainly to its fine climate, making it a desirable health resort. Tor bay is a large and well protected harbor. William of Orange landed here in 1688. In the vicinity are the ruins of Torquay abbey, founded in 1196. About a mile from the town is Rome's hole, or cavern, in which have been found bones of the elephant, rhinoceros, bear, hyena, and other animals now extinct in England. It has been penetrated to the depth of 600 ft., and scientific explorations are still in progress.

TORQUEMADA (Lat. Terrecremata), Juan de, a Spanish theologian, born at Valladolid in 1388, died in Rome, Sept. 26, 1468. He became a Dominican friar in 1403, accompanied his superior to the council of Constance in 1417, graduated in the university of Paris in 1424, taught theology there, and was successively chosen prior of the Dominican convent of Valladolid and Toledo. In 1431 he was appointed by Pope Eugenius IV. "master of the sacred palace," and his own theologian at the council of Basel. He there contributed to the solemn condemnation of the doctrines of Wycliffe and Huss, and maintained that the doctrine of the immaculate conception was divinely revealed. In 1439 he attended the council of Florence as papal commissary, and was foremost in drawing up the "articles of union" between the Greek and Latin churches, receiving on this occasion from the pope the title of "defender of the faith." He was made a cardinal on Dec. 18 of that year. In 1440 he attended in the pope's name at the national council of Bourges, where he succeeded in keeping the French prelates on the side of Eugenius IV. He became bishop of Palestrina in 1455, and of Sabina in 1464. His most important works are: Meditationes Joannis de Turrercremata positae et de pius mandato in Ecclesia Ambitu Sancta Mariae de Minerva (fol., Rome, 1467, with 34 engravings on wood); Expositio brevia et utilis super toto Psalterio (4to, Rome, 1470; fol., Augsburg, 1472, with many subsequent editions); Questiones Spiritualis Convisii divinæ deliciæ preferentes super Evangelii (fol., Rome, 1477; Nuremberg, 1479); Commentarii in Decretum Gratiani (6 vols. fol., Lyons, 1519; Venice, 1578; 3 vols., Rome, 1726). Many of his works have not been published.

TORQUEMADA, Tomas de, the first Spanish inquisitor general, born at Torquemada about 1420, died in Ávila, Sept. 16, 1498. He became a Dominican and prior of the monastery of the Holy Cross in Segovia, and in 1483 was made inquisitor general for Spain by Ferdinand and Isabella, in which post he was confirmed by the pope on Oct. 17. From him the Inquisition received its thorough organization. Tribunals were established at Seville, Cordova, Jaen, and Ciudad Real (later transferred to
TORRES VEDRAS

Toledo), and a code was promulgated by which the Spanish inquisition was afterward governed. Jews and Moors were expelled under his control, and he so multiplied *autos de fe* that Alexander VI. intervened and gave him four colleagues to moderate his zeal.

**TORRES VEDRAS**; a town of Portugal, 23 m. N. N. W. of Lisbon, on the left bank of the Sazandro; popul. about 4,200. Part of its ancient walls and an old fortress still remain. In the vicinity are an aqueduct with Gothic arches and the noted convent of Varratojo. It has four churches, two hospitals, a Latin school, and a considerable trade in wine. It gave its name to the defensive lines erected by Wellington in 1810 on a range of heights in its neighborhood, which took nearly a year for their completion, and set the army of Massena at defiance.

**TORREY, John**, an American botanist and chemist, born in New York, Aug. 15, 1796, died there, March 10, 1875. He graduated at the New York College of physicians and surgeons in 1818. While a student there he was one of the founders of the New York lyceum of natural history, of which he was for many years president. In 1824 he became professor of chemistry, mineralogy, and geology at West Point, and in 1827 was called to the chair of chemistry in the college of physicians and surgeons, which he held till 1854. He was also at the same time professor of chemistry in the college of New Jersey; and in 1856 he was appointed botanist of the geological survey of the state of New York. In 1854 he became United States assayer at New York, which office he held until his decease. Though better known as a botanist, he was a profound chemist, and was the frequent confidential adviser of the government, especially in matters relating to coinage and currency. Dr. Torrey's first publication was "Catalogue of Plants growing spontaneously within Thirty Miles of the City of New York" (Albany, 1819). In 1824 he published the first volume of the "Flora of the Northern and Middle States." This was not continued, but in 1826 he gave in a "Compendium," in a condensed form, the materials he had accumulated. In 1838 he began the publication, in connection with Prof. Asa Gray, of the "Flora of North America," which appeared at intervals till 1843, when it was discontinued on account of the vast amount of new material brought to light by exploration. From 1822 to 1858 he prepared the botanical reports, some of them in connection with Dr. Gray, of most of the United States exploring expeditions. Among his other publications are "Cyperaceae of North America" (1836), and "Flora of the State of New York," in the series of reports of the natural history survey of the state (2 vols. 4to, 1843-'4). He was also the author of numerous botanical, chemical, and mineralogical papers in the "Smithsonian Contributions" and other scientific publications. His herbarium, the result of 40 years' collection, and his botanical library, one of the most valuable in the country, were transferred to Columbia college some years before his death.

**TORREYA**, a genus of evergreen coniferous trees, named by Arnott in honor of Dr. John Torrey, from specimens collected in Florida by the late Mr. Croom. It belongs to the yew tribe of conifers, in which the fruit does not form a proper cone, but becomes a sort of fleshy fruit or drupe. The Florida species, *T. taxifolia*, is confined to a rather limited locality near Aspalaga, on the Apalachicola river, in middle Florida; it is 20 to 40 ft. high, with a trunk 6 to 18 in. through, and has much the general aspect of the common hemlock spruce (*abies Canadensis*). There was formerly a considerable forest of Torreyas, but all the trees not growing in inaccessible ravines have been used for lumber and steamboat fuel. The leaves, mostly in two rows, are about 1½ in. long, thick, rigid, sharp-pointed, and rather light green; the flowers are dioecious, the fertile ones bearing a drupe about the size and shape of a small olive, consisting of a hard nut surrounded by a thin pulp. The wood, which is very durable, gives off when sawed or burned a strong terebinthinate and somewhat unpleasant odor, on which account it was called in Florida "stinking cedar." The tree has proved hardy in the latitude of New York.—Not long after the discovery of the original species, Siebold and Zuccarini described *T. nucefera*, discovered in northern Japan, but cultivated in all parts of that country, where the oil obtained from its seeds is used for culinary purposes. Another species, discovered by Fortune in the mountains of northern China, and described as *T. grandis*, is a large fine tree, possibly not belonging to this genus. Among the wonderful stories told about California in the early days of its present era was the discovery of the nutmeg tree growing wild in the mountains, and the tree was mentioned as *myristica Californi-"
ca; materials were sent to Dr. Torrey, who found it to be a new species of the genus bearing his name, and he described it as T. Californica. It grows from 140 to 50 ft. high, and has a smooth bark, and leaves from 2 to 2½ in. long; the nut bears much similarity in size and shape to the nutmeg, and the ruminated albumen shown when it is cut adds to a resemblance that is not borne out by the taste, which is that of turpentine. Another species is mentioned as having been found in the Bogotá Andes, though little is known about it. The Torreyas flourish well in England, but trees of other than the Florida species have not been sufficiently tested to know how they will succeed in our Atlantic states.

TORRICELLI, Evangelista, an Italian mathematician, born in Faenza, Oct. 15, 1608, died in Florence, Oct. 25, 1647. He received a mathematical education in a Jesuit school at Faenza, which he completed at Rome. Some tracts written by him upon the dialogues of Galileo excited the latter's attention, and he invited Torricelli to Florence, who soon became his successor in the academy as professor of mathematics. His greatest discovery is that of the barometer. (See BAROMETER.) He published Opera Geometrica (4to, Florence, 1644).

TORSION BALANCE. See BALANCE.

TORSK, or Tusk. See CECUM. Torstenson, a count of Ortempa, a Swedish general in the thirty years' war, born at Torstena, Aug. 17, 1608, died in Stockholm in April, 1651. In 1618 he became a page at the court of Gustavus Adolphus, and as captain of the king's body guard accompanied him to Germany in 1630, where he directed the artillery. In 1632 he contributed materially to the passage of the Lech, but was captured during the assault on Wallenstein's headquarters near Nuremberg. He was carried to Ingolstadt, and the severity of his imprisonment made him an invalid for life. On his exchange and release he was placed at the head of an army corps, and in 1633 he invaded Saxony and captured Landsberg. In 1635 he operated against the Poles in Prussia, and subsequently marched to the relief of Baner, and was with him in the campaign of 1636-7. In 1641 he was made field marshal and succeeded Baner as generalissimo of the Swedish armies in Germany. With a reinforcement of 8,000 men he joined the confederates in the duchy of Lüneburg, marched through the territories of Brandenburg into Silesia, stormed Glogau, and in May, 1642, gained a great victory at Schweidnitz over Franz Albrecht of Saxe-Lauenburg. He then pushed into Moravia and reduced several cities, but retreated to Saxony before sufficient forces had been sent and laid siege to Leipzig. Here he was attacked on Oct. 23 (N. S., Nov. 2) by the archduke Leopold, on the plain of Breitenfeld, and the conflict resulted in the signal defeat of the imperialists. Torstenson, again assuming the offensive, reduced all Saxony, invaded Moravia, and laid the country under contribution as far as the Danube. In the mean time Denmark had entered into a secret alliance with the emperor; and Torstenson, marching with wonderful celerity from Moravia, and with little harm, soon conquered the Danish peninsula, with the exception of Glückstadt and Krempe. After an abortive attempt on the part of Gallas to check his return to Germany, Torstenson advanced into Bohemia, and on Feb. 24, 1645, gained the battle of Jankau, which secured the submission of Moravia; and, obtaining the control of the Danube, he took even the fortifications which covered the head of the bridge at Vienna. Deserted here by his allies, he retreated into Bohemia, and in 1646 his infirmities obliged him to give up the command to Wrangel. In 1647 he was made a count.

TORT (Lat. tortus, from tortuere, to twist), in law, a private or civil wrong or injury, in contradistinction from a crime against the public or the state, but not technically including breaches of contract or other agreements. Torts are injuries or infringements of the civil rights that belong to individuals considered merely as individuals, while crimes are wrongs which affect the community and so invade and violate the rights of society. The distinction between private injuries and public wrongs seems to be much dependent on the constitution and positive laws of civil society. So long as the harm done by an offender is limited to the single individual against whom it was directed, the offender commits only a private injury or a tort; but if the act, though immediately concerning an individual, disturbs the public order or safety and welfare, then the positive law interposes and elevates the hitherto private offence to the degree of a crime or of a misdemeanor. In some cases the injury may be both public and private, or at once a tort and a crime or misdemeanor. For example, the commission of a battery subjects the aggressor to a public prosecution as a disturber of the peace, while the party beaten may have his separate civil action for damages. Libel and nuisance are other examples of this twofold character. As wrongs are privations or infringements of rights, so torts, being private wrongs, are infringements of private rights, or the rights of individuals. These rights respect either the person or the property. In the former class is included the right of personal security, in respect as well to the body as to the health and the reputation, and the violations of this right in one or other of these respects bear the names battery, assault, nuisance, slander, libel, and malicious prosecution. In this class is included also the right of personal liberty, which is violated by false imprisonment. Rights of property, real or personal, may be infringed by trespasses in various degrees by waste, conversion, and fraud, and the more incorporeal of these rights by nuisance and by infringement of patents and copyrights and rights in trade marks. These several names of torts have been applied by
TORT

long usage of the law to prescribed and well
determined offences. But besides these there
are many torts not specifically designated or
classed, because they do not affect well defined
classes of rights, but vary with the peculiar
circumstances of every case.—When one al-
eges that a tort has been committed against
him, he must show at all events that he has
been wronged. The mere fact that the act
complained of has injured the plaintiff, does
not entitle him to claim indemnity unless the
act was also a breach of a legal obligation be-
tween the parties, resting either on their ex-
press agreement, or on the general policy and
rules of the law. If, for example, my neigh-
bor builds a wall just before windows of mine,
to which it is conceded I have no prescriptive
right as ancient lights; or if in a street oc-
cupied by private and costly dwellings my
neighbor chooses to use his house for a shop,
or convert it to other uses offensive to me and
yet constituting no nuisance; in neither case
have I ground for action, however consider-
able the actual injury or damage may be to me.
The reason is, that I have not been wronged;
it is a case of what the law calls damnum ab-
que injuria, damage but no wrong; no legal
right of mine has been violated. But every
legal wrong imports damage in the very nature
of it; and if no other damage is established,
the party is entitled to nominal damage. To
use Sir John Holt’s quaint and familiar illus-
tration: “If a man give another a cuff on the
ear, though it cost him nothing, nay, not so much
as a little dinchylon, yet he shall have his action.”
It is on this principle that, without proving any
actual damage, one who has a right of way may
maintain an action against an intruder, or one
whose lands are flowed against him who con-
structs a dam so as to set back the water. So
a voter can sustain suit against the authorities
for refusing his ballot, even though his can-
didate was elected. These are cases of legal
wrongs, infringement of legal rights; and even
if no actual damage be proved, the injury or
damage is the presumption of the law. To
this class also belong those cases of torts in
which the legal wrong consists in the doing of
a mischievous act which is only likely to prove
injurious to others, or even in the doing of a
legal act in such a careless or negligent man-
ner that injury may probably result; for care-
lessness of the rights of others is in itself
morally wrong, and by the construction of law
is legally wrong when injury results from it.—
The commonest form of a tortious intrusion
upon real property is called trespass, or are
clausum frigeti, or for breaking and entering
upon the plaintiff’s close. A higher offence
against a person, in respect to his property,
than mere encroachment on his possession, is
that which consists in a usurpation of the
property itself. An injury of this nature is
most likely to happen in respect to personal
property, and one of the most frequent actions
for torts of this nature is that of trover. One
may be further injured in his rights of prop-
erty by the effect of threats, mistake, or fraud.
In the last respect, for example, an action lies
when one knowingly utters a falsehood to the
plaintiff with the design to deprive him of a
benefit and to acquire it to himself, and damage
naturally results from the plaintiff’s belief.
But it is not always necessary to show that
the defendant intended to defraud the plaintiff
particularly. Thus one who makes a false rec-
ommendation of another, representing him to
be solvent and trustworthy, and with the pur-
pose of obtaining credit for him, is liable to
any one who gives credit to the report and
thereby suffers injury. The tort of nuisance
consists in injury to the more natural rights
of individuals, and the tort of infringement of
patent and copyrights and rights to trade marks
violates rights created and assured by the posi-
tive law.—In our examination of torts we have
thus far considered persons only in their natu-
ral capacity. It is obvious that new rights
arise and new wrongs become possible when
the individual is clothed with an artificial
character; when, for example, he becomes a
sheriff, a magistrate, or other public officer.
The new functions with which he is invested
give him capacity for doing official wrongs;
and these, as they affect private individuals,
form new classes of torts.—A corporation is
liable like an individual for its torts, and it
is liable for the wrongful acts of its officers,
either where they are expressly authorized to
do the acts, or where they were done bona fide
in pursuance of a general authority. But,
generally speaking, it cannot be held for any
offences by its servants that are properly, in
any case, only personal acts, like malicious
prosecution, slander, or false imprisonment.
But a corporation has been held responsible
for an assault and battery committed by a ser-
vant acting under its authority. Municipal
 corporations are liable in tort for the same
acts that would warrant an action against
individuals, if such acts are done by the au-
thority of the corporation or of a branch or
bureau of its government, authorized to act in
the premises to which the particular act re-
lates. Thus they must answer for nuisances
on their lands, and they are generally held lia-
ble for injuries resulting from the want of care
or skill on the part of a public surveyor, from
the careless performance of street grading,
from neglect to repair streets, sewers, and
drains, or from the fury of a mob. The civil
liability of municipal corporations for injuries
sustained by defects in the highway is gen-
erally determined by express statutes.—For
the various kinds of torts, and of actions for
tort, see ASSAULT, ATTACHMENT, COPYRIGHT,
EXECUTION, LIBEL, MASTER AND SERVANT, NUI-
SANCE, PATENTS, SHERIFF, SLANDER, TRADE
MARK, TRESPASS, and TROVER.

TORTOISE, the popular name of the chelo-
nian reptiles whose habits are wholly or in
part terrestrial and fluviatile, including all the
testudinata except the marine species or turtles —that is, the amyla of Oppel as distinguished from his chelonii. Their general characters have been given under the suborder amyla, according to Prof. Agassiz, comprises the following seven families, not equally related to each other: trionychida or soft tortoises, chelyoida (the matamata), hydraspidae, chelydridae or snappers, cisternoidae or mud tortoises, emydidae or terrapins, and testudinina or land tortoises. Of the very numerous species here included, space will permit the mention of only a few of the typical forms in the above order of families. Duméril and Bibron divide the amyla, according to habitat, into ceriales or land tortoises, corresponding to testudinina, and elodites or marsh tortoises, including all the other families except the trionychida, which form their potamites or river tortoises. Though some pass nearly all their life in the water, none are entirely aquatic, and none can swim unsupported for great distances; when in the water, they usually remain at the bottom, and seldom swim freely except when alarmed or seeking to leave it. Their locomotion is a kind of walking, the weight being about equally distributed on the front and hind limbs, which have nearly the same development, the motions of each pair alternating with each other. The shield or carapace is more symmetrical than among the turtles; the feet are always distinct from the legs, and movable upon them; the toes are either separate and short, or united by a web capable of expansion and contraction; the limbs can generally be withdrawn under the carapace, and the head wholly or partially. The tortoises rank higher in the order than the turtles.—In the trionychida the carapace is flat, thin, and oval, and very incomplete, the ribs united only on the median line, and extending thence to the margin like spokes of a wheel; it is covered with a tough skin, flexible on the margins; neck long and flexible; head pointed, and terminating in a long leathery snout; jaws covered with a horny sheath, and the lips fleshy; feet short, broad, and strong, five-toed and fully webbed, three of the toes with claws; limbs only partially retractile and moving horizontally; skin loose and free about the neck and limbs. The oldest geological deposit in which any of this family has been discovered is the greensand of New Jersey. They are active species, preferring the muddy bottom of shallow water, sometimes lying concealed in the mud with only a part of the head exposed, taking breath from time to time by stretching up their long neck and raising the tip of the snout above the surface; they remain under water more than half an hour at a time, rarely going on land, where their movements are awkward; in the water they move rapidly, striking suddenly at objects by means of their long neck; they prey principally on fish, seizing also frogs, small birds, and young alligators and lizards; the species found in the Nile is very destructive to young crocodiles; they have been known to attack persons bathing. They are very wary, but are frequently caught on mud flats with a live fish; their flesh is highly esteemed. Their eggs are numerous, spherical, and very brittle; they are deposited on sandy shores near the water in April and May, and the young appear in July. The genus trionyx (Wagler), equivalent to cryptopus (Dum. and Bibr.), is peculiar to Asia and Africa, the species of this country formerly referred to it belonging to the genera aspidonectes (Wagler), platypeltis (Fitz.), and amyla (Ag.). The common soft-shelled tor- toise of the northern states (A. spinifer, Ag.) attains a length of 18 in.; it is yellowish brown, beneath white, mottled, streaked, and dotted with black; a blunt keel along the median line slopes uniformly to the sides, and the anterior margin is furnished with spines; it is found from Lake Champlain to Pennsylvania and west to the Missouri and Mississippi rivers; its flesh is very delicate. Other species are found in the southwestern states. Very large species of this family were brought here from western equatorial Africa by Mr. Du Chaillu.—The chelyoida somewhat resemble the preceding family, but the head and neck are more retractile and furnished with numerous membranous fringes and lobes of singular form. There is only the single genus chelys (Dum.), and a single species, the matamata (C. matama- ta, Dum.), attaining a length of 2 or 3 ft.; it inhabits the stagnant waters of tropical South America, feeding on fish; it is captured for its excellent flesh.—The hydraspidae, containing the genera platemys, podocenemys, &c., were united to the chelyoids by J. E. Gray, the two forming the elodites pleurodires of Duméril and Bibron. The neck is long, the head retractile or bent laterally under the shield; in some the skull presents the union of the temporal and parietal bones to form a broad roof over the temporal region, as in marine turtles, combining thus the family characters of the two suborders. Prof. Agassiz thinks that podocenemys will be found to agree more closely with the earlier geological types than with any other, and that the group of pleurodires bears the same relation to other testudinates that the marsupials do to ordinary mammals. The sexual differences are so great that they have been mistaken for specific; the tail of the male is much the longer, and in this sex there are sharp asperities between the joints of the hind legs; the colors are also different. This group is foreign to the United States, and mostly South American, a few being found in Africa and Madagascar. The species described in the article SnapBino Turtle, are thoroughly aquatic, and the lowest of the amyla except the preceding families; they are characterized by their keeled back, serrated margin, broad, flat, and imperfectly retractile head, narrow and cross-like sternum, and large tail.—The cinosternoidae have a long
and narrow body, the carapace rising to behind the middle, and thence descending steeply backward; the whole shield is ossified, covered with large horny scales, and as wide behind as in front, with a tendency of the edges to round up and turn inward; the tail is neither long nor strong enough to bear any of the weight of the body, and in the male ends in a horny nail; legs slender, feet short and round, toes freely movable and webbed, and the whole very flexible; head long behind and short in front of the eyes, pointed, with the small mouth underneath; alveolar ridge sharp, the lower jaw ending in a point; neck long and slender; the plastron is sometimes hinged. In average size they are the smallest of the order, the least being about 4 in. and the largest 9 in. in length; all are American, and no trace of their fossil existence has been discovered; the sexes are very different. They live mostly in water and in the mud, coming out to bask in the sun in places where they can readily drop into the water at the approach of danger; their food is principally animal, and their motions quick, though feeble and awkward; generally timid, they bite fiercely if attacked while feeding, like the insectivora among mammals. The colors are generally dark, sometimes with reddish, greenish, and yellowish tints. They lay three to five eggs, on the shore near the water, in holes dug with their hind feet; they are elongated, with a smooth and shining surface, thick, and brittle. In the common mud tortoise (thermogaster australis, Ag.), the jaws are strong and cutting, and the mouth long and narrow; it is dusky brown above, yellowish dusky or brownish below; chin and throat dirty yellow, with the warts on the latter brighter; it is usually about 3½ in. long, nearly 3 in. wide, and 1¼ in. high. It is found from Pennsylvania to Florida, and west to the Mississippi valley; the anterior and posterior parts of the sternum are movable on the central piece; it abounds in muddy ponds, feeding on small fish and aquatic insects and larvae; it is a pest to anglers, seizing the bait set for better game; it has a slight odor of musk, but less so than the musk tortoise (urticae odorous, Ag.), which ranges from New England to Florida, and west to the Mississippi.—The emydae are most numerous in species, over 60 being described, presenting great differences in size, structure, and habits. The body is ovate, swelling in the centre, the margin with a tendency to spread outward; the carapace is completely ossified and united by sutures, high and irregularly convex in all directions; plastron long and broad, and sometimes hinged; the jaws horny, without lips, and not terminating in long sharp points; head, neck, and limbs completely retractile; nostrils at the end of the snout, which is not prolonged into a proboscis; toes long and webbed, or short and free, according as the habits are aquatic or terrestrial; skin of head, neck, limbs, and tail more or less sealy. They are principally aquatic, though some are terrestrial, the limbs moving horizontally while swimming, and walking being performed on the whole foot (as in plantigrades); they are generally of moderate size, the smallest being 4 in. and the largest (the aquatic) 15 in. in length. The food is both animal and vegetable, consisting of fish, worms, larvae, berries, leaves, and grass; they are most abundant in warm regions. The eggs are laid in holes dug by their hind legs, the terrestrial species laying 2 to 7, and the aquatic 10 to more than 30; the shell is less calcareous and more flexible than is usual; the shape is oblong. Though this family is most numerous in North America, there is not a single species described under the genus emyda by herpetologists which belongs in it; the so-called cistudo Blandingii, corresponding to the emyda of Europe, is the only representative here of Brongniart's genus; the others belong to various genera as established by Agassiz in vol. 1. of his "Contributions to the Natural History of the United States" (1857). The genera trachemys (Ag.), ptychemya (Ag.), deirochelys (Ag.), and malacoclemmys (Gray) have been described under Terrapin. The common painted tortoise (chrysemys picta, Gray) may be known by the yellow borders of the black dorsal scales; the blood-red blotches and lines on the marginal plates, limbs, and under part of tail, and the golden yellow sternum. It is found as far north as New Brunswick, through the eastern and middle states to South Carolina and Georgia; west of the Ohio it is replaced by the C. marginata (Ag.); it is about 6 in. long, 4½ in. wide, and 2½ in. high; it is most abundant in ditches and sluggish waters, spending most of the day basking in the sun; it is very timid, hibernates early, and is one of the first to appear in spring; it feeds on insects, worms, tadpoles, &c., and is very troublesome to anglers; it will survive only a few days out of the water. The speckled or spotted tortoise (nummys guttata, Ag.) is another very common species, distinguished by its yellow dots on a black ground, and its blackish sternum bordered with yellow. It is found from New England to the Carolinas,

Shell of the Painted Tortoise (Chrysemys picta).
east of the Alleghanies; it often comes on land, to feed on worms and orthopterous insects; it is about 5 in. long, 3 in. wide, and 1\(\frac{1}{2}\) in. high. The geographic tortoise (graptemys geographica, Ag.) is so called from the network of reddish brown lines spread irregularly over the dark brown carapace, somewhat resembling the outlines of countries on a map. It is one of the most active and bold of the family, and is found from New York and Pennsylvania to Michigan, Tennessee, and Arkansas; it is over 8 in. long, 6 in. wide, and 3 in. high, with a tail of 2\(\frac{1}{4}\) in. The sculptured tortoise (glyptemys insculpta, Ag.) is very common in the northern states as far south as New Jersey; the carapace is reddish brown, each scale with radiating yellow ridges, often smoothed down in old specimens; marginal plates and sternum yellow, each with a black spot at the posterior angle, and generally with concentric striae; limbs brick-dust color below; it is 8 in. long, 5 in. broad, and about 3 in. high, with a tail of over 2 in.; it passes long periods away from water. Blanding's tortoise (emys melano-gris, Ag.) is the only true species of the genus here; it is black above with numerous yellow spots, sometimes arranged in lines; below dusky yellow, each plate with a large quadrangular dark spot at the outer and posterior angle. It is found from New England westward to Wisconsin, being most abundant on the prairies, and very terrestrial in its habits; it is 8 in. long, 5\(\frac{1}{2}\) in. wide, and 3 in. high, with a tail of 2\(\frac{1}{4}\) in. The box or checkered tortoise (cestudo Virginica, Ag.; O. clausa and Carolina of other authors) has a rough and strong shell, generally of a light brownish color with very numerous bright yellow blotches and lines, more or less radiating, giving somewhat the appearance of tortoise shell; sternum usually yellowish with dark blotches; hind feet plantigrade; plastron with a hinge in the middle, so that the anterior and posterior halves can each be brought in contact with the carapace, and enclose the animal in a perfect box. It is about 6\(\frac{1}{4}\) in. long, 4\(\frac{1}{2}\) in. wide, and 2\(\frac{1}{4}\) in. high; it is found from New England south to the Carolinas, and west to Michigan; it is entirely terrestrial, and a very poor swimmer; it is common in the pine barrens of the southern states, where it is called cooter and pine terrapin by the negroes; it feeds on insects and succulent plants, and is easily domesticated.—In the testudinina or land tortoises the carapace is entirely ossified, very convex in the middle region, but well balanced; the plastron is broad, flat, and solid; openings for protrusion of limbs small and narrow; head, limbs, and tail completely retractile within the shell, and the plastron in some with movable lobes; head small and shielded, nose broad, and eyes far apart; alveolar margin with a sharp edge, and the jaws fitting closely by ridges and furrows; skin everywhere more or less scaly; toes mostly concealed under the skin, as far as the last joints, which are free and covered by flat sharp nails, usually five anterior and four posterior; feet short, stout, and somewhat clubbed; the great intestine is longer and the lungs are larger than in any other testudinina, in relation with the greater convexity of the shell. They are most abundant in warm climates, and are the largest of the order, the great Galápagos tortoise being 3 to 4 ft. long, the African coul (psammobates radiatus, Bl.) 1\(\frac{1}{2}\) ft., the gopher 1 ft., and the common European land tortoise 6 in. (the smallest of the family). Here also belongs the fossil gigantic colossocelys Atlas (Caull. and Falc.), from the Sivalik hills, which must have measured nearly 18 ft. in length; it is found with the great extinct ungulates which it so much resembled in gait and habits. There are no tortoises indigenous to the British islands, though they might easily be naturalized there. Agassiz places all the American testudinina in the genus xenobates. They live entirely on land, and when put into water walk on the bottom; the body is raised on the last joint of the toes, and the gait is firmer, more steady, and less slow than in any other tortoise. Their food consists of succulent plants and fleshy fruits. There are only eight genera, but many species. The gopher tortoise (testudo polyphemus, Daudin) is about 15 in. long, and has a nearly flat shell, the plates marked with concentric striae disappearing in old age; the plastron is thick and firm, projecting beyond the carapace in front, and deeply emarginate behind; the head is short,
thick, and obtuse, covered with plates; the eyes are large, with a dark iris; the jaws covered with horn,
serrate plates; the neck short, and its skin granulated; the fore limbs very large and thick, compressed antero-posteriorly, with five fingers armed with strong nails; along the outer edge of the forearms is a row of projecting horny points; the hind limbs are short, thick, rounded, with four toes armed with strong nails. The general color is brownish yellow, with darker brown tints, the head almost black, the lower parts dirty yellow, and the limbs dusky. It is found in Florida, Alabama, and Georgia, but does not appear to go north of the Savannah river. Like the rodent gophers, they burrow in the ground, preferring such dry and sandy places as the pine barrens, where they exist in troops; they live entirely on vegetable food; they are fond of basking in the sun, though they cannot bear its full summer heat, and cannot endure rain; they become torpid in winter. The adults are very strong, moving with a weight of 200 lbs., and the females are the largest; the flesh and the eggs are esteemed as food. In the European land tortoise (testudo Graco, Linn.) the carapace is oval, somewhat widest and gibbous behind, marbled with black and yellow; plastron pale yellow with a wide blackish band down each side; legs short, and tail ending in a horned tip. It is found in Spain, Italy, Greece, and other countries bordering on the Mediterranean; in England it has been domesticated and known to live more than a century. The Galápagos tortoise (mega-
lolylus Indica, Pictz.: testudo elephantopus, Harlan) is the largest of the order, frequently measuring 12 ft. in circumference; the shell is very convex and of a deep brown color. It is very fond of water, drinking large quantities, and delighting to wallow in the mud like a pachyderm; some live in the mountains and others in the low lands of the Galápagos islands, and the latter in their journeys after water in the elevated regions have worn well beaten paths, which led mariners to the discovery of the springs, often at a great distance from the shore; they drink by immersing the head up to the eyes, and swallowing great mouthfuls, about 10 a minute, according to Darwin; their flesh is excellent and largely used both fresh and salted, and a very clear oil is made from the fat. They feed on succulent plants and vegetables, and in captivity are fond of cabbage, lettuce, and marrows. They were formerly very numerous in these islands, and probably live for centuries. Their gait is very slow, about two miles in 24 hours, though they have been known to travel four miles in the same time. The eggs are laid in October in the sand, and are about 8 in. in circumference; the young are devoured by birds of prey; in Great Britain, where numbers have been kept alive, they go under ground in November and reappear in the middle of April; many have been seen in the Uni-
ted States.—The tortoise shell of commerce is the product of the hawk's bill or imbricated turtle. (See Turr.)

**TORTOISE PLANT.** A plant of the yam family, from the Cape of Good Hope, also called ele-
phant's foot, these two common names being equivalent to its systematic name, *testudinaria elephantipes.* While its habit is strikingly unlike that of the yam (*dioecora*), it is so close to that in flower and fruit that a description of one will answer for both. (See YAM.)

The yam makes an underground, thin-skinned, tuberous root, or rootstock; but in this the same portion is above ground, and very large, while the stem proper is slender; several stems from the same rootstock climb to the height of 20 to 40 ft., throwing off numerous branches, which bear bright green heart-shaped or kidney-shaped leaves. It is often cultivated as a greenhouse climber for its pleasing foliage, and for its curious rootstock; this is hemispherical or nearly globular, and sometimes 3 ft. in diam-

er; its exterior is covered with a thick cork-like substance, which cracks and forms many-
sided protuberances, separated by deep fissures, giving the whole much the appearance of the shell of a large tortoise; the brown color and apparently lifeless character of this mass form a striking contrast with the vigor and lively green of the rest of the plant. The dormant rootstocks as imported from Africa are to all appearance dead, but when placed upon the ground soon throw out small roots from the lower surface, and stems start from the upper surface and grow very rapidly. When not growing, the plant is kept quite dry. It is called in Africa Hottentots' bread, but it is said that the natives do not eat it, though the fleshy interior of the rootstock affords food to baboons and other animals. One or two other species are known, but are not cultivated.

**TORTOLA,** the most important of the Vir-
gin group of West India islands, belonging to
TORTOSA

TORTOSA (Gerona, Spain) is a walled city of Catalonia, S.W. of the city of Tortosa, on the Ebro. Pop. about 20,000. It is on the right bank of the Ebro, 12 mi. long by 2 to 4 m. broad and has a depth of 100 ft. The north much higher than the south on account of the surrounding mountains. Pop. about 20,000. It is a walled city of moderate size, the walls are a little over 4 m. thick, about 12 ft. high and are surrounded by a ditch about 12 ft. deep.

The city is composed of several districts, each with its own church, hospital and public buildings. The walls are flanked by towers and battlements, and the gates are protected by fortified towers.

The city is a center of agriculture, industry, commerce and trade. It is a port of call for ships navigating the Ebro. The city is noted for its beautiful scenery, with rolling hills and picturesque valleys.

The climate is Mediterranean, with hot summers and mild winters. The average annual temperature is 64°F, with a high of 93°F in July and a low of 50°F in January.

TORTURE

Torture is the infliction of pain as a means of extracting information or punishment. It is a form of extra-judicial punishment and is considered a violation of human rights.

The use of torture has been outlawed by international law. However, it is still practiced in some countries, often as a means of coercion or as a response to perceived threats.

Torture can take many forms, including physical, psychological, and sexual. It can be used as a tool of intimidation, punishment, and as a means of obtaining information.

Torture is often used as a method of extracting information from suspects, especially in cases where the suspect is believed to have knowledge of a crime.

The practice of torture is considered a violation of human rights and is opposed by the international community. The United Nations has adopted several resolutions condemning torture and calling for its abolition.
in bringing about its discontinuance. In the United States torture has never been reckoned an adjunct of judicial examination, though there are traces of the belief in its necessity among the lower classes in some of the early colonial enactments. Among the Romans, the scourge was the usual instrument of torture; the *equuleus*, a sort of upright rack, was an invention of the Romans used upon their slaves, to which pincers to tear the flesh, fire, &c., were added. The rack as used in the tower of London was of uncertain origin; it consisted of an open frame of oak under which the prisoner was laid on his back, and his wrists and ankles fastened by ropes to rollers at the end of the frame, which were tightened by means of a ratchet wheel till the whole body was brought to a level with the top of the rollers, and in the "question extraordinary" till the joints were dislocated. The "boot" was the favorite French instrument of torture; in this rings of iron were pressed around the legs, and wooden wedges driven between them and the flesh till the muscles were reduced to jelly. Among other instruments used to test the power of human endurance were the thumbscrew; iron gauntlets; the "little ease," a narrow cell in which the prisoner was confined for several days, and in which the only position possible was one which soon cramped every muscle; the "skevington's daughter" (a corruption of Skevington's daughter), an instrument invented by Sir William Skevington, which so compressed the body as to start the blood from the nostrils, and often also from the hands and feet; the torture by water; and numerous other inventions capable of producing intense suffering. For those forms of punishment which aimed at making the penalties of crime terrible by the intensity of the physical suffering they inflicted, ingenuity seemingly exhausts its powers. Crucifixion, fastening to the cross with cords, and anointing the body with honey that insects might torment the helpless victim, being put up in a cage or in a sack, the culprit by the arms while weights were tied to the feet, the fastening of limbs to trees which were forced into proximity to each other and then suffered to fly apart, pouring melted lead into the ears, immersing one or more limbs or the whole body in boiling oil, suspending over a slow fire, plucking out the hair in masses, slitting the nostrils and lips, putting out the eyes, cropping, cutting off the hands, branding, mutilation, crushing the body with heavy weights, starvation, deprivation of air, confinement in *oubliettes* or bottle-like prisons without ventilation, pulling out the nails, and breaking on the wheel, are a few of the many means by which punishment has been inflicted, often for offences of a secondary grade, within the past 200 years. To the same writers who effected the discontinuance of torture, is due in a great degree also the abolition of these cruel punishments. — See Jardine, "On the Use of Torture in the Criminal Law of England" (8vo, London, 1839); Macaulin, "Introduction to Criminal Trials;" Augustin Nicolas, *Si la torture est un moyen sûr à vérifier les crimes secrets* (12mo, 1681); Reitemauer, *Sur la question chez les Grecs et les Romains;* and Mittermaier, *Das Deutsche Strafverfahren*, vol. i.
general association of Massachusetts appointed a committee of four ministers and four laymen to cooperate with the committee of the general assembly of the Presbyterian church and the general association of Connecticut in devising measures for the promotion of temperance. In 1813 this committee organized the "Massachusetts Society for the Suppression of Intemperance," which in 1833 changed its name to that of the "Massachusetts Temperance Society," under which title it was incorporated in 1845 and still holds a corporate existence. In 1826 the "American Society for the Promotion of Temperance" was formed in Boston, with Marcus Morton as president. Dr. Justin Edwards of Andover, Mass., became the corresponding secretary in 1829, and travelled extensively, preaching total abstinence and organizing state and local societies. The five annual reports of the society written by him are among the best contributions to the literature of this subject. In 1836 the society became by change of name the "American Temperance Union," with the Rev. Dr. John Marsh as secretary. It was then established in Philadelphia, but in October, 1838, was removed to New York. Although total abstinence was publicly advocated as early as 1820, it was not till many years later that any of the temperance organizations insisted upon this requirement. The object of the Massachusetts society, as set forth in its constitution, was "to discourage and suppress the too free use of ardent spirits." Neither the American temperance society nor its auxiliaries opposed the use of wine, cider, or malt liquors. Total abstinence from distilled spirits, except when prescribed as a medicine, and moderation in the use of the less intoxicating drinks, were the only general requirements. Many of the earlier advocates of temperance, including Mathew Carey, encouraged the culture of the grape and the use of wine as a preventive of intemperance. Dr. Marsh, in his "Fifty Years' Tribute to the Cause of Temperance," says: "The first reformers built a brewery in Boston for the accommodation of members of the temperance society." Even the first national temperance convention, which assembled in Philadelphia in May, 1833, and was composed of 400 delegates from 21 states, including a large number of clergymen of all denominations, simply took the ground that "the traffic in ardent spirits as a drink, and the use of it as such, are morally wrong, and ought to be abandoned throughout the world." Nothing was said of total abstinence from other alcoholic beverages. At this convention the "United States Temperance Union" was formed, consisting of the officers of the American temperance society of Boston, 28 state societies, and more than 7,000 minor associations. Its object was, by diffusing information, exciting a moral influence, to extend the principles of temperance throughout the world. In 1833 the Massachusetts society adopted a new constitution with a pledge of total abstinence. In 1836 the state society of Pennsylvania, formed in 1827, adopted the pledge of "total abstinence from all that can intoxicate." Demand was now made in all the states that higher ground should be taken; yet few were prepared to include malt liquors in the pledge, believing that beer was necessary and beneficial. The second national convention was held at Saratoga, N. Y., in 1836, when the name of the United States temperance union was changed to that of the "American Temperance Union," with the design of admitting members from all parts of North America. The convention was attended by 348 delegates from 19 states and territories and from Canada. The most marked feature of the proceedings was the adoption of the principle of total abstinence from all intoxicating drinks as beverages. One of the earliest state societies was that of Connecticut, organized in May, 1829. In the same year state temperance societies were formed in New Hampshire, Vermont, New York, Virginia, and Illinois. In May, 1831, there were 19 state societies, with 2,200 known local societies formed on the plan of total abstinence, and embracing more than 170,000 pledged members. In 1832 the war department abolished the "grog" ration, substituting coffee and sugar. —As early as 1832 the license question began to be agitated, and a strong public opinion against license laws was soon formed. In 1837-8 a bill introduced in the Maine legislature to repeal all license laws of the state, and to forbid the sale of ardent spirits as a beverage in less quantity than 28 gallons, was lost by one vote in the senate. In Tennessee a law was passed repealing all acts licensing tippling houses, and making the retailing of spirits a misdemeanor punishable by fine at the discretion of the courts. In Massachusetts the sale ofspirituous liquors in less quantity than 15 gallons, except by physicians and apothecaries, was forbidden. Laws were also passed in Connecticut, Rhode Island, and New Hampshire, either restricting the sale or leaving it to a vote of the people of each town whether liquor selling should be licensed. The third national convention, composed of 500 delegates, assembled in July, 1841, and resolved "that the license laws are at variance with all true political economy, and one of the chief supports of intemperance." Large conventions in Maine, New Hampshire, and Massachusetts declared against granting licenses, and in favor of providing by fine and imprisonment for the effectual suppression of the traffic. In 1846 New York voted against license by a large majority. Vermont gave a majority of 8,000 against license, and many towns in New Hampshire voted against it. In Rhode Island every town but three, and in Connecticut two third of the towns, voted against the "no license." In Pennsylvania 18 counties voted on the question, and generally against license. In Ohio, Indiana, Michigan, Iowa, and Wis-
but

The agitation of the question of license resulted in a strong public sentiment in favor of prohibition. In March, 1847, the supreme court of the United States unanimously decided that prohibitory laws "were not inconsistent with the constitution of the United States, nor with any acts of congress;" and that it was within the police powers of the states to restrain or prohibit the traffic in intoxicating drinks. Maine was the first state to prohibit by law the sale of strong drinks. A prohibitory law was enacted in that state in 1848, with only ordinary fines for its violation. The "Maine law," drafted by Gen. Neal Dow, provided for the seizure and destruction of liquors held for illegal sale; fine and imprisonment for the illegal manufacture or sale of liquors were prescribed in 1851. This law was repealed in 1856, and a stringent license law substituted; but after an experience of two years of license, with increase of poverty, crime, and public disorder, contrasted with the previous years of prohibition, an enactment was passed and submitted to the people, and prohibition again became the policy of the state, being ratified by a majority of 22,352. Delaware was the second state to enact a prohibitory law, which was submitted to the people and ratified in 1847; but in 1848 it was declared unconstitutional by the supreme court for being so submitted. In May, 1852, Rhode Island passed a prohibitory law, which was declared unconstitutional by Judge Curtis of the United States circuit court. It was amended in January, 1853, and was repealed in 1863. In 1865 a law was passed allowing town councils and boards of aldermen to grant or refuse licenses. In 1874 the license clause was repealed, and prohibition reenacted; but in June, 1875, the prohibitory clause was again repealed. Massachusetts passed a prohibitory law in 1852, which was declared unconstitutional in some of its provisions, and a new law was passed in 1855, which remained till 1868, when it was repealed and license substituted; but the prohibitory law was again enacted in 1869, cider being excepted. In 1870 the law was altered to allow the free sale of lager beer, ale, porter, and strong beer, in every town in the state where the citizens did not vote to prohibit it; but in 1871 the law was again changed so that malt liquors might not be sold in towns without a vote in its favor, cider being still exempt. In 1875 the beer clause was repealed, thus restoring the prohibition of both malt and spirituous liquors; but as apothecaries were permitted to sell, the law of 1855 and 1857 was not fully restored. In 1875 the prohibitory clause of the law was repealed, and license substituted. The Vermont legislature in 1852 passed a prohibitory law, which was ratified by the people in 1853, and still remains. In 1850 Michigan prohibited the sale of liquor by a constitutional provision; and in 1853 a prohibitory law was enacted and ratified by a popular majority of 20,000. In 1854 the law was pronounced unconstitutional by half of the judges of the supreme court, because it had been submitted to the people. The law was reenacted in 1855, and was changed seven times previous to 1875, when the prohibitory law was repealed and a tax law substituted. In 1853 Chief Justice Williams of Connecticut drafted a prohibitory law, which was passed by the legislature, but was vetoed by Governor Seymour. But in 1854 a bill was passed prohibiting the sale of liquors by a vote of 13 to 1 in the senate and 148 to 61 in the house. It was repealed in 1872. A prohibitory law was enacted in Indiana in 1853, with a clause providing for its submission to the people, which the supreme court pronounced unconstitutional. In 1855 another prohibitory law was passed, but it became null because the supreme court voted equally divided as to its constitutionality. In Iowa a prohibitory law was passed by the legislature in 1855, and ratified by the people. This law still exists, with some modifications in regard to fermented liquors. The New York legislature passed a strong prohibitory law in 1854, which was vetoed by Governor Seymour. The next year the law was again passed, and its constitutionality was affirmed by the court of appeals in 1856. In New York city the mayor did not attempt to enforce it. New Hampshire passed a prohibitory law in 1855, which is still in force. Illinois also passed a prohibitory law, with a clause providing for submitting it to a vote of the people, by whom it was defeated.—The fourth national convention assembled in 1851 at Saratoga, and passed resolutions in favor of prohibitory laws, and advised that an appeal should be made to the people in states where the legislature would not enact such a law. The fifth convention, held in 1855, recommended the use of unfermented wine by the churches in the communion, deprecated the use of alcoholic liquors as a medicine, and urged the medical profession "to substitute other articles in the place of alcohol as far as in their judgment it can be wisely done." A committee appointed by this convention organized in 1855 the "National Temperance Society and Publication House," which has its headquarters in New York, and is engaged in the publication and distribution of temperance literature. The sixth convention, at Cleveland, Ohio, in 1866, urged the friends of the cause "to refuse to vote for any candidate who denies the application of the just powers of civil government to the suppression of the liquor traffic." The seventh convention, held at Saratoga in 1873, declared "that the time had arrived to introduce the temperance issue into state and national politics," and "to cooperate with existing party organizations where such will indorse the legislative policy of prohibition and nominate candidates pledged to its support, otherwise to organize and maintain separate independent party action." The eighth
national convention was held in Chicago in 1875. It resolved "to nominate and vote for such candidates only, state and national, as will unqualifiedly increase and sustain the prohibition movement," and "that whenever suitable nominations are not otherwise made, independent prohibition candidates be nominated." Political action was early taken by temperance organizations, many local officers being elected in various states as temperance candidates; and in 1854 the candidate of the temperance party for governor in New York, Myron H. Clark, was supported by the remnant of the whig party, and elected. In 1872 the Hon. James Black of Lancaster, Pa., was nominated for president, and received votes in New Hampshire, Connecticut, New York, Pennsylvania, Ohio, and Michigan.—

**Total Abstinence**

The "Washingtonian Temperance Society" was formed in Baltimore, April 5, 1840, by six men of intemperate habits, who signed a pledge of total abstinence with the determination to urge others to do the same. The number of members rapidly increased, and at the first anniversary of the society more than 1,000 reformed drunkards marched in procession. Similar societies were formed in various parts of the United States, and speakers traveled through many states, advocating the cause. It is estimated that 150,000 decidedly intemperate men signed the pledge and gave up drink. The first division of the "Sons of Temperance" was organized in New York city in 1842, by John W. and Isaac Oliver. The order increased with great rapidity, numerous divisions being organized in every state and territory, and in Canada and Great Britain. The strength of the order reached its maximum in 1850, when there were in the United States, Canada, and England 87 grand divisions and 6,097 subordinate divisions, with a total membership of 238,908. In 1873 there were 42 grand and 1,896 subordinate divisions, with 82,299 members; the number of members in Great Britain was 11,116. The basis of the organization is: 1, a strict adherence to the principles of total abstinence from all intoxicating drinks; 2, the payment of regular dues to form a common fund for cooperative temperance agitation, mutual aid in sickness and distress, and funeral expenses. The "Temple of Honor and Temperance" was organized by prominent sons of temperance, and designed as a higher branch of that order. The first temple was instituted in New York city in 1845; a national temple was organized in 1846. In 1848 all connection with the sons of temperance was severed, and the temple of honor assumed an independent position. In 1855 there were 343 temples, with 13,860 members. In 1874 there were 20 grand temples, with 315 subordinate and 110 inner temples, the total membership being 16,923. The order stands firmly by total abstinence as the only rule of personal duty, and prohibition as the true policy of the state. The "Independent Order of Good Templars" was formed in 1852, on the basis of total abstinence from all intoxicating liquors as a beverage, and the absolute prohibition by law of transportation, and sale of intoxicating liquors for beverages. The society has passwords, signs, grips, and signals. There are four degrees: the subordinate degree, degree of fidelity, degree of charity, and grand lodge degree. Each grand lodge is the head or legislative body of the state or territory where it exists, and is composed of representatives from the subordinate lodges within the jurisdiction. The grand lodges meet annually and elect representatives to form the right worthy grand lodge, whose province is to legislate upon all matters of general interest to the whole order. In 1875 there were 60 grand lodges within the jurisdiction of the order; there are grand lodges in Great Britain, Canada, Australia, and elsewhere, besides subordinate lodges in China, India, Japan, France, Germany, Holland, Portugal, Africa, and the West Indies. The total membership is estimated at 785,000. In England, where the order has its greatest numerical strength, there are 3,618 lodges, with 166,708 members.—Great Britain. The temperance movement in Great Britain was begun by John Dunlop, a justice of the peace for Renfrewshire, who devoted himself to the cause in Scotland in 1823, and in 1829 formed the first temperance society near Glasgow. The first total abstinence society was organized at Dunfermline in 1830. In Ireland the cause was first advocated by the Rev. George Whitemore Carr, who organized a society at New Ross, county Wexford, in 1829. The first total abstinence society was formed at Strabane in 1835. Father Theobald Mathew began his labors at Cork in 1838, and soon extended them not only to all parts of Ireland, but to England and Scotland. The total abstinence society formed by him in 1838 contained 1,900,000 members in 1840. The total abstinence society formed by him in 1838 contained 1,900,000 members in 1840. The total abstinence society now exceeds 1,500,000 members; the total membership in the society in 1841 exceeded 6,500,000,000. The active movement against intemperance in England began in 1880, when the first society was formed at Bradford by Henry Forbes, a merchant. Other societies were organized during the same year at Warrington, Manchester, Liverpool, and Leeds; and in 1881 the "British and Foreign Temperance Society" was formed, with a pledge "to abstain from distilled spirits except for medicinal purposes." This society, which had for its patron the Duke of London, and among its vice presidents bishops, admirals, and other persons of high official rank, held for many years a prominent place in the temperance movement. At first these societies did not oppose the moderate use of wine and malt liquors. The first total abstinence society in England was formed at Preston in 1832.
TOTAL ABSTINENCE

In 1835 it was estimated that 45,000 persons had signed the pledge in England, and that 2,000 drunkards had been reformed. In 1838 the "British Association for the Promotion of Temperance" was formed in Manchester, on the principle of total abstinence, and the "British Teetotal Temperance Society" in London; in 1838 the latter was united with the "New British and Foreign Temperance Society for the Suppression of Intemperance." Weekly meetings were held in various parts of London, with great success. The moderation movement finally died out, and "teetotalism" was firmly established as the best means of suppressing intemperance. Up to 1839 the new British and foreign society had two pledges; in that year the American pledge of total abstinence was adopted. In 1840 the two general societies adopted the principle of total abstinence, and the cause spread rapidly throughout the United Kingdom. At this time about 500,000 members were enrolled in the societies of Great Britain, while the adherents to total abstinence numbered more than 2,000,000. In 1842 the two parent societies in London were dissolved, and the "National Temperance Society" was organized, which recognized all total abstinence societies, of whatever form of pledge. In 1843 Father Mathew visited London, and in six weeks administered the pledge to about 70,000 persons. In August, 1846, a world's temperance convention was held in London, and was attended by 300 delegates, including 25 from North America. The most marked progress was made by the temperance cause from 1851 to 1856. The "London Temperance League" held monthly meetings in Exeter hall, and free lectures were delivered in all parts of the city; 3,000 petitions were sent to parliament, and 30,000 tracts distributed. The "United Kingdom Alliance" was formed in 1853 for the "total and immediate suppression of the traffic in all intoxicating liquors as a beverage." It has since prosecuted its labors with great vigor and success by means of lectures, petitions to parliament, publications, &c. The alliance has given its hearty support to the "permissive bill," which has often been brought forward in parliament in recent years, but without success. The object of the bill is to prohibit the granting of licenses to sell liquor whenever two-thirds of the rate payers of any parish shall by vote so determine. Numerous organizations are now actively engaged in various parts of Great Britain in promoting the cause of temperance. Chief among these are: the "National Temperance League," formed in 1854 by a union of the national temperance society with the London temperance league; the "British Temperance League," whose operations are chiefly in Lancashire and Yorkshire, its headquarters being at Bolton; the Western Temperance League," established in 1857, embracing 281 societies, the operations of which extend to nine English and three Welsh counties; the "North of England Temperance League," with 125 societies in Northumberland, Durham, Cumberland, Westmoreland, and the Cleveland district of Yorkshire; the "Irish Temperance League," and the "Scottish Temperance League," which in 1879 had issued 70,000 volumes and 630,000 tracts, besides a weekly and a monthly periodical. The United Kingdom alliance has its executive council resident in Manchester. England and Wales are divided into districts superintended by resident agents. Its operations also extend to Scotland and Ireland in connection with the "Scottish Temperance and Permissive Bill Association," the "Irish Temperance and Permissive Bill League," and the "Irish Permissive Bill Association." The "National Association for promoting Amendment in the Laws relating to the Liquor Traffic" directs its efforts toward obtaining amendments of license laws. Various enactments have been passed by parliament, and committees of inquiry appointed with the view of diminishing the evils of intemperance. These efforts have been directed toward the restriction of the liquor traffic rather than its prohibition.

TOTILA (properly BADULA), a Gothic king of Italy, died A.D. 552. He was duke of Friuli, and was chosen king in 541, after the surrender of Vitiges to the Byzantine forces at Ravenna. When Belisarius was withdrawn from the service against the Goths, Totila overrun the greater part of Italy, and in 546 entered Rome by the treachery of some Isaurian sentries. He held peaceful possession of the city until compelled to leave it in order to repair the reverses his armies had sustained in Lucania. In his absence Rome was recovered by Belisarius, and in 547 Totila was repulsed in endeavoring to retake it. In 548 Belisarius was recalled to Constantinople, and Rome once more fell into the hands of Totila. In 552 Nares was sent into Italy by the emperor Justinian, and at Tagina in Umbria Totila's forces were defeated, and he was killed.

TOUCAN, a name given to the scannorial birds of the family ramphaatidae, derived from the Brazilian imitation of their note. The family is remarkable for the disproportionate size of the bill, which is very light on account of its spongy texture; it is strengthened internally by a network of thin bony laminae freely supplied with vessels and nerves; it is broad at the base, without a cere, smooth, with the culmen curved, sides compressed, tip hooked, and the sides serrated; the tongue is long and slender; provided with numerous barbs on each side directed forward; the bill is usually adorned with bright colors, which fade after death; the tarsi covered with transverse scales, the quills almost concealed under the large coverts, the tail with ten feathers; claws curved and sharp; toes two before and two behind; orbital region naked; caruncle of two bony pieces, thin and not united below, and sternum with two deep incisions on each side.
behind. They are peculiar to tropical America, living in flocks in the forest, where they make a great chattering as they hop from branch to branch in search of food; they feed principally on pulpy fruits, also on fish, eggs, larvae, and small birds and reptiles; they also saw off the tubular corolla of flowers, picking out the insects with the horny, fringed tongue. When roosting they throw their tail upward and forward, and rest the enormous bill on the back. They are generally hand-some birds, representing in America the horn-bills of Asia and Africa; they are not powerful fliers, and are strictly arboreal, hopping among the branches with such grace and agility as to have suggested for one of them the specific name of Arici. The nest is in holes in trees, and the eggs are two, rounded and white. They post a sentinel while they feed, whose warning cry resembles the word tucano; the skin is bluish, and the flesh eatable though rather tough; they sometimes commit great havoc with fruit, and are often killed for food and for their brilliant feathers; they are very sensitive to cold.—In the toucans proper (ramphastos, Linn.) the bill is higher and wider than the forehead, looking as if too large for the head and belonging to another bird; the nostrils are hidden behind the prominent base; wings short and rounded, with the first four quills graduated and narrowed at the tip, and the fifth the longest; tail short and nearly even; feet short and stout; colors generally black with patches of white, red, and yellow, especially under the chin. The toco toucan (R. toco, Gmel.) is 17 in. long, and the bill is more than half of that length; plumage black with throat and rump white, vent red, bill orange red with black tip; it inhabits Guiana and Brazil. The yellow-breasted toucan (R. tucanus, Linn.) has a yellow throat, with red vent and breast spot, and the rest of the plumage black. There are more than a dozen other species.—In the genus pteroglossus (Illig.), generally called aracaris, the bill is much small-

TOUCAN

er and sometimes not out of proportion to the head, as high as the forehead, with the nostrils prominent at the base; the fourth, fifth, and sixth quills longest; tail long and graduated; the colors are usually green, with red or yellow on the breast. There are more than 30 species, with habits similar to those of the last genus. The aracari toucan (P. aracari, Illig.) is 17 in. long, with a bill of 4 in.; plumage blackish green, with yellowish abdomen, red median abdominal bar and rump; upper mandible with a longitudinal black stripe. The yellow toucan (P. Humboldtii, Gould) is 17 in. long, black and olive with a scarlet rump, and the under surface yellow; it is found on the upper Amazon.—For description and figures of this family, see Gould's "Monograph of the Ramphastidae" (fol., London, 1854).

TOUCH, the modification of the common sensibility of the body, especially seated in the skin, by which through physical contact we obtain an idea of resistance or weight, temperature, size, shape, smoothness or roughness, &c. It is most acute at the tips of the fingers, on the tongue, lips, portions of the mucous membrane, and the nipples, where the sensory papillae are the most numerous, each one receiving one or more nerve fibres. The nerve fibres appear to terminate in what has been called the tactile corpuscle in the interior of the papilla. All the afferent nerves of the general integument apparently minister to the sense of touch, by virtue of their connection with the seat of common sensation in the brain; those of the lower extremities are less concerned in conveying sensations than those of the upper, though they are far more efficient in exciting the reflex action of the spinal cord. The acuteness of touch differs in various parts of the body, generally in proportion to their vascularity; the non-vascular parts, like the hair, nails, and teeth, have no sense of touch, while on the skin the nerves are spread in a minute network. Its relative acuteness has been measured by Weber, by placing the tips of a pair of compasses on the skin, and approximating them until brought within the smallest distance at which they could be felt as distinct points, and with the following results: the point of the tongue, ¼ line; palmar surface of third finger, 1 line; red surface of lips, 2 lines; tip of nose, 3 lines; edge of dorsum of tongue, 4 lines; skin of cheek, palm of hand, and end of great toe, 5 lines; back of hand, 8 to 14 lines; back of foot, 15 lines; over spine, and in middle of arm and thigh, 30 lines. There are considerable variations in this respect in different individuals. The feeling of tickling is most easily excited in parts having a feeble sense of touch, as the arm pits, sides below the ribs, palms, and soles, while the sensitive points of the fingers cannot thus be affected. This sense is exceedingly acute in the flying membrane of the bats and in the whiskers of the carnivora and rodents. It is combined with movement in the human hand, with its power
of pronation and supination, oppossibility of the thumb, and great mobility of the fingers. The power of distinguishing the temperature of foreign bodies is restricted within certain rather narrow limits. We can perceive the temperature of a substance which is moderately warm or cool; but if it be either above or below a certain limit, we fail to judge accurately of its temperature, and receive only a painful sensation. If the foreign body be excessively hot or cold, as in the case of boiling water or frozen mercury, the discrimination of temperature is lost altogether, and the painful sensation is the same in either instance. Thus the touch of a very cold conducting body may be said to burn the fingers, like that of a very hot one. Cold, by retarding the capillary circulation and by its direct sedative influence, deadens the sense of touch; in like manner, pressure upon or disease of the nerve trunks, and various states of the brain receiving the sensory impressions, are accompanied by obtuseness of touch. Prominent among the causes acting on the nervous centres are the influence of toxic and anesthetic agents, obstructed circulation, and chronic inflammations; on the other hand, irritation and acute inflammation in the course of the nerves, at their peripheral terminations, or in the centres, may be accompanied by hyperesthesia or excessive sensitiveness of the surface. Subjective sensations, or those dependent on internal causes, are very common in the sense of touch; those of pleasure and pain, heat and cold, itching and creeping sensations, &c., are familiar examples. Touch may be greatly improved when the other senses are impaired or lost, partly from the greater attention given to the sensations, and the consequent increase of the power of discrimination. Instances of the education of this sense are very remarkable and well known in the blind. In the lower animals it is most acute in the hands, feet, and prehensile tail of monkeys; in the lips and tongue of herbivora; in the snout of the elephant, pig, tapir, and mole; in the flying membrane, ears, and nasal appendages of bats, which can perceive even the vibrations of air; in birds, in the under surface of the toes and their webs, and in the sensitive skin of the mandibles of the duck tribe and some waders; in the under surface of the toes in many lizards, in the extensile tongue of the chameleon and serpents, in the naked skin of batrachians, and in the thumbs of the males of the latter during the reproductive season; in the antennæ and palpi of articulates, in the oral appendages of mollusks, and in the tentacles of radicles.

TOUL (anc. Tullum), a fortified town of French Lorraine, in the department of Meurthe-et-Moselle, on the Moselle, 14 m. W. of Nancy; pop. in 1872, 6,584. It has a celebrated Gothic cathedral, and other notable buildings are the church of St. Genoult and the former episcopal palace, now used as a town hall. Its trade and industry embrace wine, glass, hosiery, and other local products and manufactures.—Originally it belonged to Belgic Gaul, and afterward successively to Austrasia, to local counts, and to Germany as an imperial city under the protectorate of the dukes of Lorraine; and in the middle of the 16th century it was annexed to France. The bishopric, established early in the 5th century, was suppressed during the revolution. In January, 1814, Toul was stormed by the Russians; and in 1870 it was bombarded by the Germans, to whom it surrendered Sept. 23, after a strenuous defence.

TOULMIN, Camilla. See CROSSLAND.

TOULMIN, Joshua, an English clergyman, born in London, May 11, 1740, died in Birmingham, July 28, 1815. He was educated at a dissenting academy, and became pastor of a dissenting congregation in Colyatton, and in 1765 of a Baptist congregation in Taunton, where he was also a bookseller. He subsequently adopted Unitarian opinions, received the degree of D. D. from Harvard college in 1794, and in 1804 was chosen one of the ministers of the Unitarian congregation at Birmingham, formerly presided over by Dr. Priestley, which post he retained till his death. His principal publications are: "Sermons to Youth" (12mo, Honiton, 1770); "Memoirs of Socinns" (1777); "Letter to Dr. John Sturges on the Church Establishment" (1782); "Dissertations on the Internal Evidences of Christianity" (1785); "Review of the Life, Character, and Writings of John Biddle, M.A." (1789); an edition of Neal's "History of the Puritans," with notes and additions (5 vols., 1794-97; 3 vols., 1837); "Biographical Tribute to the Memory of Dr. Priestley" (1804); "Memoirs of the Rev. Samuel Bourne" (1809); and a "Historical View of the State of the Protestant Dissenters in England" (1814). Theophilus Browne edited and published 22 of his posthumous discourses (8vo, Birmingham, 1818).

TOULON, a seaport city of France, in the department of Var, Provence, at the head of a double bay of the Mediterranean, in lat. 43° 7' N., lon. 5° 56' E., 30 m. S. E. of Marseilles; pop. in 1872, 69,127. It stands upon ground which rises gradually from the sea, and is sheltered by a ridge of mountains, extending round the bay. A tongue of land stretches nearly across the entrance of the bay, and, together with all the adjacent points, is strongly fortified. The city has been much enlarged within the last generation, and the new northern quarters are a great improvement upon the old parts of the town. It is especially rich in fountains, trees, and promenades. The cathedral and other old and new churches, the fine town hall, the military and naval schools, as well as the new palace of justice and the new theatre, are all eclipsed by the magnitude of the military port. It is the largest in the Mediterranean and one of the most admirable of the kind, extending over 240 acres, and surrounded by vast buildings, the arsenal, and floating docks, and connected with the supplementary arsenals of Cas-
tigneau and Mourillon; and it contains a bagno for prisoners sentenced to transportation. The adjoining commercial port is bounded by a quay, which is the most active part of Toulon. Ship building is largely carried on, but trade and industry are chiefly supported by the military and naval works, which employ 10,000 men.—Toulon was known as a harbor under the Romans, then called Telo Martius. In the middle ages it suffered from the Saracens. The fortifications were first projected as a defence against pirates. Under Louis XIV. they became celebrated, withstanding in 1707 a combined attack by the English and Dutch fleets and a land army under Prince Eugene; and they were extended under Napoleon III. In 1793 the English gained possession of Toulon, but were besieged by the troops of the convention, and finally driven out (Dec. 19), under the direction of Bonaparte, who first established his reputation on this occasion. In revenge for the previous surrender of the royalist inhabitants to a foreign power, the town was given up to pillage and massacre.  

**TOULOUSE** (anc. Tolosa), a city of France, in Languedoc, capital of the department of Haute-Garonne, on the Garonne, 130 m. S. E. of Bordeaux; pop. in 1872, 134,852. It includes an island in the river, and the suburb of St. Cyprien, where 25,000 workmen resided before its destruction by the floods of 1875. It is more remarkable for historical associations and for its active industry than for external attractions. The square is called after the capitol or town hall, where the once famous floral games are still annually held under the auspices of a literary society. The church of St. Sernin is more remarkable than the cathedral, and is a masterpiece of Romanesque architecture, recently restored by Viollet-Leduc. The church of the Cordeliers, of the 13th century, was destroyed by fire in 1871. Toulouse has one of the richest museums of art, located in a former monastery, and various learned institutions, a public library of 60,000 volumes, an observatory, and an arsenal. The palace of justice was formerly the seat of the Toulouse parliament. The trade with both the Mediterranean and the Atlantic is active. Woollen and cotton goods, cutlery, hardware, and many other articles are manufactured.—Toulouse is of great antiquity. It became the capital of the Visigoths in the 5th century, and subsequently of the duchy of Aquitaine. Local counts or dukes were the rulers from the end of the 8th till late in the 13th century, in the early part of which a crusade was carried on against Counts Raymond VI. and Raymond VII. (See Anto- genses.) Philip III. annexed it to the French crown, under which it remained the capital of Languedoc till the revolution. During the mid-
TOURNAINE, an ancient province of France, now chiefly comprised in the department of Indre-et-Loire. It was originally inhabited by the Turones, a Gallic tribe. At the end of the 5th century Clovis took it from the Visigoths. Having been governed for a time by local counts, it passed in 1044 to the house of Anjou, and with this subsequently under English domination. In 1298 it was taken by the French king Philip Augustus. It was a duchy from 1356 till its final annexation in 1584 to the French crown. Tours was at all times the capital of Touraine. (See Indre-et-Loire.)

TOURCOING, a town of France, in the department of Le Nord, 8 m. N. E. of Lille, within a few miles of the Belgian frontier; pop. in 1872, 43,392. It contains hundreds of manufactories of woollen cloths, cottons, linens, carpets, and other goods. The aggregate annual value of trade and industry is estimated at 170,000,000 francs. A pyramid commemorates the battle of May 18, 1794, in which the army of Pichegru defeated the English.

TOURMALINE, a name applied to a group of rhombohedral double silicates, composed of silica, fluorine, boric acid, alumina, manganic, ferric, and ferrous oxides, magnesia, lime, soda, potash, lithium, and sometimes phosphoric acid. Rammeisberg divides them into magnesium-manganese-iron, iron, iron-manganese, and manganese tourmalines, the last two varieties alone containing lithium. The sesquioxides are alumina and ferric and manganic oxides. The color of tourmalines varies with their composition; the red, called rubellite, are manganese tourmalines, containing lithium and manganese, with little or no iron; the violet blue (called indicolite) and green are iron-manganese tourmalines; and the black, which are schorl, are either iron or magnesium-iron tourmalines. White or colorless tourmalines, which are rare, are called achroite. Sometimes the crystals are red at one extremity and green at the other, or green internally and red externally, or vice versa. Tourmaline is usually found in granite, gneiss, and syenite, in mica, chloritic, and talcose schists, in dolomite, granular limestone, and sometimes sandstone near dikes of igneous rocks (Dana). Rubellite and green tourmaline are found at Yekaterinburg in the Ural mountains; pink crystals in the island of Elba; pale yellowish brown in Carinthia; white in the St. Gothard mountains, the Ural, and Elba. In Massachusetts, at Chesterfield, are red, green, and blue tourmalines, in a granite vein with albite; and at Gothen the blue occurs in great perfection. At Grafton and Orford, N. H., Brattleboro, Vt., and Monroe, Conn., specimens of tourmaline of various colors occur in steatite, mica slate, and other rocks. Tourmalines are found in New York, at Crown Point, in fine brown crystals, and in St. Lawrence, Jefferson, Essex, and other counties; also in other states in numerous localities. In California black crystals, 6 to 8 in. in diameter, occur in foldspars veins in the mountains between San Diego and the Colorado desert. In Canada, superb greenish yellow crystals an inch in diameter occur in limestone at Grand Calumet island. In the town of Paris, Maine, in one of the spurs of "Streaked mountain" called by the mineralogists Mt. Mica, several deposits of beautiful green and red tourmalines of perfect forms were found in 1829 by Elijah L. Hamlin and Ezekiel Jones. Many specimens were sent to various parts of Europe; and some fine ones obtained from Vander Null, an antiquary, are believed to be in the museum at Vienna.—

Tourmalines are not often used in jewelry, although fine rubellites form beautiful gems, and bear a high price. In the grand duke's collection at Florence there was a specimen 11 in. square, with four erect green tourmalines and one prostate, 4, 2, and 3/4 in. long and 1/4 in. to 1/2 in. thick. A magnificent group of pink tourmalines nearly a foot square was given by the king of Burmah to Col. Sykes, while commissioner to his court. The tourmaline appears to have been first brought to Europe from Ceylon by the Dutch about the end of the 17th century, and was exhibited as a curiosity on account of its pyro-electric properties, whenever it was called aschentrecker (Ger. Aschensieher). The tourmaline is a double-refracting crystal, but has the peculiar property of polarizing light. It has not the power like Iceland spar of separating and transmitting both the ordinary and the extraordinary ray; but when the plate is cut with its faces parallel to the optic axis of the crystal, and exposed to a ray of light, the ordinary ray passes through, while the extraordinary ray is absorbed. (See Light, vol. x., pp. 446 and 449, and Thermo-Electricity.)—See "Diamonds and Precious Stones," by Harry Emanuel (London, 1867; New York, 1873); "The Tourmaline," by A. C. Hamlin, M. D. (Boston, 1877); and Dana's "Mineralogy."
With the institution of chivalry and knighthood, however, the tournament lost many of its objectionable features; and as an incentive to martial exploits and to a generous emulation in all knightly offices, it began during the period of the crusades to be tolerated, and eventually was encouraged in most countries of Christendom. The church, which had prohibited persons from engaging in tournaments on pain of excommunication, and had denied Christian burial to such as lost their lives in them, finally relaxed its opposition, and until the latter part of the 15th century the sport continued in full activity. It thenceforth became gradually transformed into a court pageant, often of the most magnificent and costly description; but the death of Henry II. of France of a wound received at a tournament in 1559 occasioned its abolition in all parts of Europe, although for nearly a century later it continued to be occasionally revived at court festivities. The decay of chivalry, the introduction of firearms, and the gradual disuse of defensive armor, together with the rise of the commercial spirit and the new civilization thereby extended over the world, were the real causes of its decline. Whatever may have been the nature of the combats in tournaments at the origin of the practice, they soon became for the most part encounters between mounted adversaries (whence the derivation of the term, as illustrative of the agility required by the combatants in turning or managing their horses), who were knights or at least candidates for knighthood, as esquires or pages. A joust was, properly speaking, a combat between two knights, while the tournament included several jousts, or an encounter of several knights on a side.—In the course of time numerous regulations, having the authority of a code of laws, prescribed the manner in which tournaments should be conducted; and, except where national pride or rivalry, or personal enmity, inflamed its combatants, no serious result was likely to happen. They were generally held at the invitation of some prince upon the birth or nuptials of royal persons, during royal progresses, or at high court festivals, and heralds were sent into the neighboring kingdoms to invite the knights to be present. These frequently came from distant countries, attended by splendid retinues; and on the appointed day the galleries encircling the lists, or level enclosed space in which the knights contended, were gay with banners and costly draperies and crowded with spectators, conspicuous among whom were the ladies, whose approving smiles were the rewards most esteemed by the victors. In the flourishing period of tournaments two kinds of arms were employed, those made expressly for the purpose, consisting of lances with the points blunted or covered with pieces of wood, called rockets, and swords blunted or rebated; and those ordinarily used in warfare, termed armes à outrance, which in many cases were not permitted by the judges of the tournament. The blows, whether of lance or sword, were required to be directed at the head and breast, and no combatant was permitted to strike an adversary after he had raised his visor, or to wound his horse. Each knight in attendance was obliged to prove his noble birth and rank, which were originally proclaimed by the heralds with sound of trumpet; whence the word blazonry, signifying the art of deciphering the heraldic devices on a coat of arms, from the German Blasen, to blow. At a later period the emblazoned shields of the knights, suspended at the barriers or entrance of the lists, sufficed to indicate their rank and family. If upon the acclamation of any lady present the bravery or loyalty of a knight was impeached, he was excluded by the heralds from the contest. The heralds having proclaimed the laws of the tournament, at the sound of the trumpet the whole body of knights, each with his attendant squire, entered the lists in a glittering cavalcade, distinguishable only by their emblazoned shields or by the favors of their mistresses suspended from their crests, after which the martial exercises of the tournament began. At the word of the heralds, Laissez-aller, the opposing combatants rode at each other in full career, striving to direct their lances fairly upon the helmet or shield of their adversaries, that one being adjudged the victor who bore the longest spears "as they ought to be broken," who held his seat the longest, and who showed most endurance in keeping his visor closed. Sometimes dismounted knights encountered each other with swords or axes. The prizes were announced by the judges, selected from the older knights, but were awarded by ladies.—A favorable form of the tournament was the so-called passage of arms, in which a party of knights, assuming the office of challengers, offered combat to all who dared oppose them. Of this, as also of the mêlée or encounter of bodies of knights attended by their splendid description, is given in Scott's "Ivanhoe." The later tournaments were comparatively harmless.

TOURNAY, or Tournal (Flem. Doorwick), a town of Belgium, in the province of Hainault, on both banks of the Scheldt, 45 m. S. W. of Brussels; pop. in 1870, 31,003. It has seven suburbs, fine streets and quays, a gymnasiu, an episcopal seminary, an art academy, and many churches, including a cathedral with five towers and fine paintings. The church of St. Brice contains the tomb of Childeric I., and the "golden bees," supposed to have belonged to his royal robes, which Napoleon substituted for the fleurs de lis of the Bourbon vestments. Carpets, woollen cloths, bosiery, and linens are manufactured.—Under the Romans Tourna was included in Gallia Belgica under the name of Turnacum or Tornaeum. In the 5th and 6th centuries it was a residence of the Merovingian dynasty. It afterward successively belonged to Flanders and France. In 1526 it was annexed to the Spanish Netherlands, and,
TOURNÉFORT, Joseph Pitton de, a French botanist, born in Aix, June 5, 1656, died in Paris near the close of 1708. After extensive studies and explorations he became in 1689 professor at the jardín des plantes, and was admitted to the academy of sciences in 1692. In 1700 he was sent by Louis XIV. on a scientific expedition to the Levant. He returned in 1702, and was subsequently professor of medicine in the collège de France. Linnaeus has preserved several of his classifications. His works include Éléments de botanique (3 vols., Paris, 1694; new ed. of his Latin translation, with A. de Jussieu's additions, including his corollarium or classification of his vast collections, 3 vols., Lyons, 1719; English translation, 2 vols., London, 1719–30); Histoire des plantes qui naissent aux environs de Paris, avec leurs usages dans la médecine (1698; enlarged ed. by Jussieu, 2 vols., 1725; English translation by Martyn, 2 vols., London, 1732); and Voyage du Levant (2 vols., 1717; English, 3 vols., 1741).

TOURS (anc. Civitas Turonum et Caserodunum), a city of France, capital of the department of Indre-et-Loire, chiefly on a tongue of land between the Loire and the Cher, 120 m. S. W. of Paris; pop. in 1872, 42,368. The bridge over the Loire is one of the finest in France. A broad street traverses the town, and contains a marble statue of Descartes, who was born near Tours. Only two towers remain of the celebrated cathedral of St. Martin of Tours, destroyed in 1793. The palace of the resident archbishop is of uncommon beauty. The town hall has a large public library and valuable manuscripts. Cloth, carpets, silks, and many other articles are manufactured.—Tours was the capital of the ancient tribe of Turones, under the Roman emperors of the latest period of Gallia Lugdunensis III., and lastly of Touraine. A number of important councils were held here, and the states general of France were repeatedly assembled here in the 15th and 16th centuries. The silk industry first arose here, and was of vast extent until the rise of Lyons. The town had a population of nearly 80,000 at the time of the revocation of the edict of Nantes, which ruined its prosperity. Several members of the government of the national defence, including Gambetta, had their seat in Tours during the siege of Paris, till Dec. 10, 1870, when they removed to Bordeaux. The Germans finally occupied Tours, Jan. 19, 1871.

TOURVILLE, Anne Hilarion de Coteuil, count de, a French admiral, born Nov. 24, 1642, died in Paris, May 28, 1701. After brilliant exploits against the pirates of N. Africa, which won for him from Venice the title of protector of commerce, Louis XIV. appointed him in 1667 naval commander. In 1674 he decided the victory of Agosta, and in 1677, off Palermo, he nearly destroyed the allied squadrons of Spain and Holland. After various other achievements he became in 1689 vice admiral of the Levant. In 1690, operating against the English and Dutch off Beachy Head, he pursued the former to the month of the Thames, where he destroyed many of their ships and transports. In 1691, as commander of the ocean fleet, he enabled the French troops to reach Ireland in aid of James II. In 1692, by positive order from Louis XIV., at the head of 44 ships, he engaged off the fort of La Hogue, on the E. coast of Cotentin, the English admiral Russell, whose forces were nearly double, and, after 12 hours of determined resistance, was defeated, but escaped to port with the remains of his fleet. In 1693 he was appointed marshal, and in the same year he captured 27 Dutch and English ships off Cape St. Vincent and destroyed 59. He retired after the peace of Ryswick in 1697.

TOUSSAINT, François Dominique, surnamed l'Ourverte, a Haytian general, born near Cap François in 1743, died in the dungeon of Jouy, France, April 27, 1803. His parents were both slaves, and of pure negro blood. He was a coachman, and afterward held a post of trust in connection with the sugar manufactory of the estate to which he belonged. He had learned to read and write from a fellow slave, and after his promotion he read considerably. He remained apparently contented with his lot till 1791, when the mulattoes appealed to the negroes for help in enforcing their rights; and even then, though many of the blacks rose in insurrection, Toussaint incurred the hostility of his race by remaining quiet. But after securing the escape of the director of the estate and his family, he joined the negro army. Toussaint, at first employed in a medical capacity, was soon appointed a brigadier general. When news came of the beheading of Louis XVI. the black leaders accepted the aid of Spain, and repelled the offers of the French convention. Toussaint soon captured the entire army of Brandebourg, the general of the whites, without bloodshed, and occupied several important military posts, among them Gonâives. The English, having in 1793 invaded the island, took Port-au-Prince, while the French, the Spaniards, the mulattoes, and the blacks were all contending with each other. At this juncture Toussaint, who was already in effect the commander-in-chief of the black forces, became convinced that the only hope for Hayti lay in declaring for France, whose national legislature, while making Hayti an integral part of France, had proclaimed also the freedom of the slaves. He therefore declared his fealty to the repub-
lic, and applied himself so energetically to bring all parties to the same conclusion that Laveaux, the French commander, exclaimed: *Mais cet homme fait d'ordres!* and from that time he received his surname of "L'Ouvertur." He formed a junction with Laveaux, and, though the Spanish and English forces united against him, he drove the English from nearly all their strong positions, took 26 Spanish batteries in four days, and, maintaining a long line of defences against the allied enemy, who possessed twice his force, rescued Laveaux, and finally closed the campaign by receiving the capitulation of the entire English force besieged at St. Marc (1797), and the abandonment of the effort by the Spanish to conquer the W. portion of the island. Toussaint, who had been appointed commander-in-chief of St. Domingo in 1796 by Sonthonax, the French commissioner, soon restored order and industry to the island, though opposed to Hédouville, the new commissioner. Hédouville, finding himself without influence, fled to France to make complaint of the negro chieftain, who sent to the directory a statement of the true position of affairs. The French directory justified Toussaint and censured Hédouville. But the latter, on the eve of leaving Hayti, had sown the seeds of discord between Rigaud, the mulatto leader, and Toussaint, and, by finally settling the former from his obligations to the latter, had prepared the foundations of a new civil war; and for nearly the whole of the year 1799 the war between the blacks and the mixed race raged fiercely. Toussaint captured Jaquel, subdued the mulatto insurrection, and on Nov. 26, 1800, assumed the government, amenable for his administration to the French directory alone; and in January, 1801, the whole island became subject to his sway. He invited the steward of his old master's estate and other well disposed white colonists back to the island. He assumed great state in his public appearance, being richly attired and surrounded by a guard of 1,500 to 1,800 men, all in brilliant uniforms and admirably mounted; but in private life he was plain and temperate. At the very beginning of his administration Toussaint selected an administrative council of nine, of whom eight were white proprietors and one a mulatto. A constitution was drawn up by the council, in which he was named president for life, and free trade was established. This constitution he sent with a letter to Bonaparte, then first consul, whose reply was: "He is a revoluted slave whom we must punish; the honor of France is outraged." An act was passed reversing the French colonies to their condition previous to 1789. In a subsequent decree by Bonaparte St. Domingo or Hayti was excepted—an exception, as the event proved, intended to be only temporary. Gen. Leclerc, the husband of Pauline, Bonaparte's sister, was sent out with a force of 30,000 men and 66 war vessels. The expedition arrived on the coast of Hayti in January, 1802. Among those in command in it were Rigaud, Pétion, and Boyer, all enemies of Toussaint. Without a declaration of war, his forces met those of Leclerc, with his aide CapFrançois with his force, and Christophe, who was in command there, rather than surrender, burned the city. Finding unexpected resistance at all points, Leclerc sent Toussaint's sons, who had been educated in France, and whom he had brought with him, to their father, with a letter from Bonaparte and another from himself, couched in terms of mingled flattery and menace. The negotiation was ineffectual. Leclerc then declared Toussaint and his generals outlaws, and a sanguinary conflict ensued, in which one third of the French troops were killed or wounded; and though they possessed the seaports, yet the blacks from their mountain fastnesses were destroying them in detail. Finding it impossible to conquer the island in this way, Leclerc sought to win over the negro generals, and succeeded with Christophe and those under him, including Dessalines. He next made his propositions to Toussaint, offering as conditions of peace to respect the liberty of the people, and confirming this by the most solemn oaths to leave the government of the island in Toussaint's hands, and to employ the officers of his army according to their rank, while for himself he would only hold the office of delegate from France by Toussaint's side. Toussaint accepted his offers, and a treaty of peace was concluded May 1. He avowed however his own determination to leave public life, and retired to his estate near Ennery. But Leclerc had determined upon his destruction. At his direction Gen. Brunet on June 7 sent him an apparently cordial letter, asking for an interview of an hour in relation to some arrangements for providing for the black troops, inviting him to bring his wife with him, and closing with assuring him of the sincerity of his friendship. Toussaint went to Gonaives, and after a short conversation Brunet left the room, when an armed force entered and seized Toussaint, and at midnight put him on board a French frigate, with his family. On their arrival at Brest he was separated from his family, whom he was never allowed to see again. On Aug. 17 he reached Paris under guard, and was at once confined in the Temple, whence he was transferred, without trial and without any explanation of the cause of his arrest, to the dungeons of the castle of Joux, in the department of Doubs. Here, deprived of all society, subjected to the intense cold with insufficient clothing, and with too little food to sustain life, he appealed repeatedly to Batthyány for a trial; and as well as his failing strength would allow, he began his defence, which was transmitted to Bonaparte, but elicited no reply. Finally the governor of the castle went away for four days and left Toussaint without food or drink. On his return he was dead, and the rats had gnawed his feet. An autopsy was
TOWHEE

held, and his death was said to have been caused by apoplexy.—Lives of Toussaint have been written, among others, by Saint-Rémy (Paris, 1880), the Rev. John R. Beard, D. D. (London, 1858), Hannah Lee (Boston, 1854), C. W. Elliott (New York, 1850), and J. Redpath (Boston, 1863).

TOWHEE. See Chewink.

TOWN (Ang. Sax. tun, from tyinan, to enclose), originally an enclosure of the farm and farm house by a hedge, and finally of a collection of houses. Towns began to exist as municipalities in Germany in the time of the emperor Henry the Fowler (919-936), who caused all the important villages to be surrounded with walls or earthworks and ditches, as a defense against the Huns. Certain of the landless free-men were compelled to reside in these towns, while others were attracted by the privileges he conferred. These were in the nature of charters or contracts with the inhabitants, and had reference to various subjects. The germ of the town thus planted grew vigorously. The princes and bishops of the empire created towns on their own fiefs and benefices, and granted charters. For several hundred years thereafter municipal charters were granted in Europe at the political, military, or financial convenience of the ruling powers. In Spain the Christian kings created towns and granted municipal charters on the frontier, as the territory was slowly reconquered from the Moors. In England charters were granted liberally by King John, to enlist the common people on his side in his contests with the barons; and in France by Louis the Fat for similar reasons. Sometimes municipalities were chartered as a means of increasing or more conveniently collecting the king's revenue. In Holland the municipal system embraced nearly all the territory and population. In Germany leagues of the free towns were formed, either for common defense or for commercial purposes. Of the former, the Swabian league and the league of the Rhine were the most important; while of the latter, the league of the Hanse towns, or the Hansatic league, was the most remarkable and most powerful confederation of municipalities that ever existed. (See HANSEATIC LEAGUE.) From various causes the self-governing feature of the towns of continental Europe has been almost entirely obliterated.—The system of town government has existed in New England since the settlement of the colonies, and in substantially the same form as at present, except that classes of town officers have been largely increased in number, and their various duties more particularly prescribed. Here it still prevails in its purest form; in New York and a few other states it exists in a modified form; with two or three exceptions, it is not found in the southern states. In New England it is the most important political division of the state. Excluding unorganized portions of Maine, New Hampshire, and Vermont, and certain incorporated cities which have superseded towns, the entire territory and population are under town government. In 1870 there were in New England 1,424 towns, with an average area of 84 sq. m., and an average population of 2,450, or, excluding cities and towns having over 10,000 inhabitants, 1,700. The town is a political and corporate body created by the legislature. Its rights, duties, and liabilities are defined by law, and it is responsible for any act or omission in violation of the law to the person injured or to the state. It can be fined in the same manner as an individual. Except in Massachusetts and Maine, where representation is by districts, it is entitled to an independent representation in the lower branch of the legislature. It elects its own executive officers, supports schools, maintains roads and bridges, supports paupers, restrains lunatics, maintains a local police, protects the public health against infectious diseases, collects through its own officers not only its self-imposed taxes for local purposes, but also the state taxes and those levied by county officers, and generally administers its own public affairs. The town officers are usually elected, annually and in the spring. The chief ones are a town clerk, three, five, seven, or nine selectmen, three or more assessors with sometimes assistant assessors, three or more overseers of the poor, a treasurer, one or more surveyors of highways, three or more members of school committee, and constables, who are required to collect taxes unless collectors are chosen. The most important officers are the selectmen, who transact the general public business of the town. Usually one of them, called the first selectman, appointed by the body from their own number or elected to that position by the freemen of the town, acts as the agent and general executive officer, but in many important matters he consults the other selectmen. The most important business, such as that relating to taxes, and establishing roads, bridges, &c., is transacted by the voters of the town in town meeting, which is the general legislative body of the town. The county in New England is an unimportant subdivision of the state, and exists mainly for judicial purposes. Even the state does comparatively little public business, and the towns raise by taxation and expend at least eight times the amount of money that the state requires for its purposes.—In marked contrast to the town system as it exists in New England is the county system, which prevails in California, Delaware, Nebraska, Nevada, and Oregon, and in all the southern states excepting North Carolina, Virginia, and West Virginia. In these states the county is the important political subdivision of the state, while the town or township, where it exists, is little more than a nominal territorial division, without political power. The county is created by the legislature, and is responsible to the state for its share of the state taxation. Excluding
the unorganized parts of the state, the average area of the counties in these states in 1870 was 1,040 sq. m., and their average population 11,236; or excluding also the partly organized and settled states of the Pacific slope, their average area was 794 sq. m., and their average population 11,515 or about 15 inhabitants to the square mile. The affairs of the county are administered by its own officers chosen by the people of the county or appointed by other county officers. These are usually the court of county commissioners, assessor, treasurer, collector, superintendent of education, appraisers of roads, and superintendents of roads, besides certain judicial officers. In the middle, western, and northwestern states, excepting those above mentioned, and in North Carolina, Virginia, and West Virginia, a union of the town and county systems, which has been called the "compromise system," prevails. In these states the political power, which in New England is vested in the town and in the southern states in the county, is divided between the two. The county is the political unit; it is a body politic with the usual corporate powers; but it is subdivided into towns or townships, which possess considerable political rights. Besides the county officers, there are town officers usually elected annually by the people of the town. They are clothed with minor political powers, but their action in more important matters is subject to revision by the higher county officers. In New York the powers of the county are exercised by a board of supervisors in which the towns of the county are represented as equal political communities. The supervisor who represents the town in the county board has other town duties, and is thus both an officer of the town and of the county. This is also the case in Illinois, Michigan, New Jersey, Virginia, West Virginia, and Wisconsin. In Indiana, Iowa, Kansas, Minnesota, North Carolina, Ohio, and Pennsylvania, the affairs of the county are usually managed by a board of three commissioners, who are elected from the body of the county and have no town duties whatever. In New York and the more eastern of the states where the mixed system prevails, the town in political importance approaches more nearly to that of New England; but in some parts of the west the township (this word being there more common than town) is a mere geographical division embracing 36 sq. m., and has very limited political functions. Town is often used popularly in the west to denote a small municipality, as a village. In none of the states outside of New England do the towns, or townships, as such, send representatives to the legislature. Other forms of municipalities have been created by the different states. Boroughs and villages are corporations with peculiar powers and privileges, such as have reference to special objects and are not granted to towns by general laws. In England there are municipal and parliamentary boroughs, the former being a town (some, as Liverpool, of the largest size) having a municipal government, and the latter a town or district (sometimes including several municipal boroughs) that sends a member or members to parliament; while in the United States a borough is a municipal corporation that is usually expected to become a city at some future time, having powers less extensive than those of a city and different from those of a town. In the extent and variety of its powers the city is the most important municipality. In England a city is any town that either is or has been the see of a bishop and has a cathedral; but in the United States the distinction between a town and a city usually refers to size and always to the form of municipal government. The governing power of cities is usually vested in a mayor and council, composed of one or two boards; but the details of the government vary greatly. Probably no two cities can be found whose charters or governments are precisely alike. — See Elliott's "New England History" (Boston, 1857); Haines's "Township Organization" (Chicago, 1865); "The Origin, Organization, and Influence of the Towns of New England," by Joel Parker (Cambridge, 1867); and the article on "The Minor Political Divisions of the United States," by S. A. Galpin, in the "Statistical Atlas of the United States" (1874). Town manuals have also been published in New York and most of the New England states.

TOWNLEY, Charles, an English collector of works of ancient art, born in Lancashire, Oct. 1, 1737, died in Westminster, Jan. 3, 1805. He received his education on the continent, and during a residence in Rome between 1765 and 1773 he devoted his fortune largely to the purchase of ancient marbles, terra cottas, bronzes, gems, &c., aided by the advice and experience of Winckelmann and others. After his return to England, he added to his collection by means of agents at Rome, and by purchasing that of Nollekens. After his death his collection of marbles was purchased by the nation for £20,000, and in 1814 his bronzes, coins, and gems became the public property at a cost of £28,200. All are now incorporated with the general collection of Graeco-Roman remains in the British museum.

TOWNS, a N.E. county of Georgia, bordering on North Carolina, and drained by the head streams of the Hiwassee river; area, about 250 sq. m.; pop. in 1870, 2,780, of whom 155 were colored. The surface is hilly and mountainous, and the soil generally fertile. The chief productions in 1870 were 5,090 bushels of wheat, 5,359 of rye, 61,990 of Indian corn, and 8,927 of oats. There were 458 horses, 1,975 cattle, 2,075 sheep, and 4,155 swine reported, Hiwassee.

TOWNSEND, J. Charles, second viscount, an English statesman, born in 1674, died at Rainham, Norfolk, June 21, 1738. He succeeded to his title at ten years of age, and soon after
TOWNSHEND

taking his seat in the house of peers attached himself to the whigs. In 1706 he was appointed one of the commissioners to treat for the union with Scotland, and in 1707 captain of the yeomen of the queen's guard; and in 1709, in the capacity of ambassador extraordinary to the United Provinces, he negotiated the barrier treaty. The accession of George I. having brought the whigs into power, Townshend was appointed one of the principal secretaries of state, and took the lead in the administration until the summer of 1716, when, owing to the intrigues of his colleagues, Lord Sunderland and Gen. Stanhope, he was dismissed. To break the ignominy of his fall, he was offered the lord-lieutenancy of Ireland, which he indignantly declined; but the king, fearing the public displeasure, induced him to accept it. The growing influence of Sunderland and Stanhope with the king rendered the position uncomfortable, and, with his colleagues and brother-in-law Walpole, he retired from office in April, 1717. After remaining several years in opposition, he was in 1730 appointed resident of the council, and on the reconstruction of the ministry in 1721 he resumed his old position of secretary of state, Walpole becoming first lord of the treasury and chancellor of the exchequer. Finally, displeased with Walpole's growing ascendency and disputing upon questions of policy, Townshend resigned, May 15, 1730.

II. Charles, an English statesman, grandson of the preceding, born Aug. 28, 1725, died Sept. 4, 1767. He entered parliament in 1747, and in 1753 brought himself into notice by a speech of great power and eloquence on the marriage bill. In 1754 he was appointed a lord of the admiralty, and in the first administration of Pitt he was treasurer of the chamber, which office in 1761 he exchanged for that of secretary of war. During the ministry of the earl of Bute he remained out of office, but in that of George Grenville succeeding (1763), he was appointed first lord of trade and the plantations. He zealously supported Grenville's stamp act, introduced in 1765, in a speech which elicited from Col. Barré in reply one of the most memorable efforts of parliamentary eloquence; but during the Rockingham administration, in which he held the office of paymaster of the forces, he advocated the repeal of the act. On the formation of the second Pitt administration in 1776, he became chancellor of the exchequer, and, with a vigilance which gained him the name of the weathercock, advocated the necessity of a tax upon American ports. On June 2, 1776, he introduced into the house of commons the celebrated resolutions imposing duties upon paper, tea, and other articles imported into the American colonies, which eventually led to their revolt and independence. The illness of Pitt rendered necessary a reconstruction of the cabinet, and Townshend was generally understood to have been selected to form a new ministry, when he suddenly died.

TOWNSHIP. See Town, and Surveying.

TOXICODENDRON. See SUMACH.

TOXICOLOGY. See Poison.

TOXODON (Gr. τόξον, a bow, and δόντι, a tooth), a name applied by Owen to a genus of extinct mammals of the order of ungulates, with affinities to edentates and rodents. The first species, named by Owen the T. Platanus, was found in a miocene clay in South America, about 120 m. N. W. of Montevideo; it was established on a cranium 2 1/4 ft. long, elongated, with a flattened occiput, small cerebral cavity, remarkably strong and widely expanded zygomatid arches, and transverse glenoid cavity; the upper molars were seven on each side, implanted with the convexity outward, the opposite of what occurs in rodents; they were long, arched, without roots, the enamel forming an elongated prismatic ground tube; upper incisors four, the external the largest, like those of rodents in structure, and worn away in the same chisel shape; in the lower jaw were seven molars on a side, and six incisors ranged in a semicircle; the name was derived from the curve of the outer upper incisors. It was large, low on the legs, with the aspect and habits of a pachyderm. It shows an affinity to the stena (like the manatees) in the flattened occiput, small brain cavity, and nasal passages widely opened above, but differs in the size of the frontal sinuses and in the incisors; it seems to have formed a connecting link between the rodents and the ungulates. It was probably aquatic to a certain extent.——See "Fossil Mammals of the Voyage of the Beagle," described and figured by Prof. Owen (4to, London, 1840).

TRACHEOTOMY (Gr. τραχεία, the windpipe, and τεμάκ, to cut), a surgical operation by which the trachea or windpipe is opened. Trachotomy may be performed with propriety in cases wherein admission of air into the lungs is obstructed either by disease or by a foreign body; and it has sometimes been tried with success to facilitate the inflation of the lungs in cases of suspended animation. The operation is not free from danger, and in the first class of cases, though giving marked temporary relief, it does nothing toward curing the disease itself. It consists in first making an incision in the median line of the throat, either below or above the thyroid gland, and dissecting down to the trachea, cautiously pushing aside the sternothyroid muscles and vessels lying in the vicinity, till the trachea is exposed. When the bleeding has ceased, the trachea is opened by a vertical incision, and a portion of one or more of its rings removed; through the opening thus made a silver canula is introduced, which when obstructed by mucus may be removed, cleansed, and again inserted. If the obstruction to respiration is removed, the canula may be withdrawn and the orifice allowed to heal; but if not, the canula must continue to be worn. If the operation is performed to aid in restoring animation or to remove a foreign body, no canula need be inserted, and
the wound should be closed so soon as the object is effected.

**TRACHYTE** (Gr. τραχύς, rough), a rock of volcanic origin, named from the roughness of its surface. It consists chiefly of glassy feldspar, sometimes associated with hornblende and chloritic minerals. When these minerals predominate, the rock passes into the varieties of trap called basalt, greenstone, dolerite, &c.

**TRACT AND PUBLICATION SOCIETIES.** The printing of short religious treatises and narratives for cheap or gratuitous distribution was very early practised. Indeed, prior to the introduction of printing, Wycliffe circulated his views by means of brief essays, which were transcribed and passed from hand to hand. Strype testifies to the circulation of some of Tyndale's tracts about 1550. In the 17th century there were associations for printing and promoting the sale of religious works. In 1701 the "Society for Promoting Christian Knowledge," consisting of members of the church of England, was founded to promote charity schools in all parts of England and Wales, and to disperse both at home and abroad Bibles and tracts of religion. In 1742 John Wesley began the publication and distribution of tracts and books on a large scale, and in 1782 he and Dr. Coke organized the "Society for the Distribution of Tracts among the Poor." In 1750 the "Society for Promoting Religious Knowledge among the Poor" was organized in London, and was the first publishing society in which members of different religious denominations were united. In 1755 societies were established at Edinburgh and Glasgow for similar objects, and for several years circulated many religious publications; but eventually they as well as the London society declined. In 1795 Miss Hannah More commenced at Bath a monthly series of short religious tales which she named "Cheap Repository," of which 2,000,000 copies were sold the first year. In it was published the widely popular story of "The Shepherd of Salisbury Plain." Mrs. Rebecca Wilkinson, of Clapham, Surrey, also wrote and published many small books and tracts. The "Philanthropic Society" printed for her in the course of a few years, commencing with 1792, 440,250 copies of books and tracts.—In 1793 the "Religious Tract Society," or as it is now called the "Religious Tract and Book Society of Scotland," was founded in Edinburgh by the Rev. John Campbell, a missionary to Africa. In 1835 this society adopted the colportage system of the American tract society, to which it has since given a large part of its effort. In that year it sent out three colporteurs; in 1875 it sent out 294 in Scotland and 20 in the north of England. In the year ending March 31, 1875, its circulation was 2,855,000, including 55,000 copies of the Scriptures and 190,000 other bound volumes, besides 300,000 hymn books, 1,240,000 periodicals, and 1,140,000 tracts. The "Religious Tract Society" of London was founded in May, 1799. It had its origin in the labors of the Rev. George Burder of Coventry, who had begun printing tracts on his own account in 1781, of a more directly religious character than those of Miss More. He continued their occasional issue in connection with some friends for several years and then convened a meeting of ministers by whom the society was established under its present name. Among them were the Rev. Messrs. Rowland Hill, William Newman, Matthew Wilks, and Joseph Hughes, for many years its secretary. Its entire receipts the first year were £467 7s. 4d., of which £203 10s. 8d. were from contributions, &c., and £268 16s. 6d. from sales. In 1849, when the society celebrated its jubilee, they had risen to £50,081 15s. 6d., of which £4,939 2s. 6d. were from contributions, &c., and £44,063 16s. 6d. from sales. The total receipts of 50 years from contributions and legacies, up to 1849, were £152,552 3s., from sales £1,023,215 13s. 1d., making with other items £2,092,242 13s. 1d. By the expenditure of this sum the society had published 5,148 different works in 110 languages and dialects, of which it had issued over 500,000,000 copies. It now keeps on its catalogue about 10,000 different publications. It issued during the year ending March 31, 1875, 308 new volumes and 167 new tracts. The total circulation from the home deposits during the year was 46,580,867, including about 23,000,000 tracts. The issues in foreign deposits in Europe, India, China, Africa, and elsewhere were about 10,000,000 more. The entire number of issues since the formation of the society was about 1,556,000, 000, of 13,023 different publications in 129 different languages and dialects. Its grants of books, tracts, &c., for the year amounted to £38,326 7s. 7d. This society owns no presses or bindery. It maintains three depositories in London, one at Brighton, one at Manchester, and others in the principal cities of continental Europe, in Constantinople, Beyrout, and different cities of India, China, and Japan; and there are auxiliary and cooperating societies in Great Britain, Canada, and Australia. During the year it made grants of books and tracts to the colporteurs in the north of England from the religious tract and book society of Scotland, and a grant amounting to £400 to the negroes of the southern United States. There are several other societies in Great Britain for the circulation and distribution of religious books and tracts, each of the principal religious denominations having one or more.—The most important of the tract societies of continental Europe is the Hamburg tract society, organized in 1816, which issued from April 1, 1872, to Nov. 1, 1874, 2,048,000 copies of its publications in German, Danish, and Lettish. It has issued since its organization 27,000,000 tracts in seven languages. The Paris tract society has issued 665,300 publications. The Toulouse book society has issued 137,129 vol-
The evangelical society of Geneva, organized in 1831, expended in 1874 $15,000, and has issued in all 385,000 volumes and 3,000,000 tracts. The Belgian evangelical society issued 1,380 volumes and 302,000 tracts in 1874. The British American book and tract society was organized at Halifax in 1867, and has given its effort largely to colportage. In 1874 it employed 28 colporteurs at an expense of $44,029. Its total expenditure has been $169,188. — The first religious publication society in the United States was the "Methodist Book Concern," originally established in Philadelphia, which issued its first publication in 1789. It was removed to New York in 1804, and for 29 years had its depository in Crosby street. In 1822 the agents established a bindery, and in 1824 added a printing office. In 1833 it was removed to No. 200 Mulberry street, and in February, 1836, its premises were destroyed by fire, and a loss of $250,000 incurred. A new building was immediately erected on the same site, which is still occupied by the printing office and bindery. In 1869 a building for a sales house and offices was purchased in Broadway at the corner of 11th street. The book concern has a depository in Cincinnati, which publishes periodicals and a few books; it has also depositories publishing denominational journals, and keeping full supplies of its books, at Boston, Pittsburgh, Chicago, St. Louis, and San Francisco; and the ministers of the denomination are agents for the sale and circulation of its journals and tracts. Its publications consist of books, periodicals, and tracts. The book concern is conducted strictly as a business house, and makes no donations. In 1874 the Methodist Episcopal tract society made donations of tracts, purchased from the book concern, to the value of $15,000, besides contributing more than $3,000 for the publications of missionary presses in foreign lands. In 1844 the division of the Methodist church led to the organization of a book concern connected with the Methodist church, South, at Nashville, Tenn., which eventually received $200,000 of the capital of the book concern as the share of the church south. — The Rev. Dr. John Stanford published tracts in New York in 1756. In 1803 the Massachusetts "Society for Promoting Christian Knowledge" was formed by the Rev. Drs. Tappan, Holmes, and Morse, Lieutenant Governor Phillips, and others. This seems to have been the earliest undenominational tract society organized in America. Subsequently numerous local societies sprung into existence, of which the "Religious Tract Society" of New York, founded in 1813, and the "New England Tract Society" at Andover, in 1814, seem to have been the most efficient. The latter grew rapidly, and in 1823 changed its name to the "American Tract Society," and shortly thereafter its location to Boston, greatly enlarging its operations. In 1825 this society had 205 auxiliaries, had issued 177 general tracts and 19 of a series for the young, had published in all over 500,000 copies, and had commenced the publication of an almanac and a monthly journal. In the spring of 1825 the "American Tract Society" was organized in New York, and was intended to unite the local societies then in existence as far as possible as auxiliaries. The Boston society became a branch of it. This union continued till May, 1859, when, in consequence of the dissatisfaction of a considerable number of the members in New England and elsewhere at the hesitation of the American tract society in New York to publish tracts or treatises on the subject of slavery, the two societies resumed their independent organizations. In 1870 the total sales of the society at Boston amounted to $103,027.88, and the expenses of the charitable department to $7,970.96. In 1871 it simplified its plan of operation by contracting with a publishing house to print, bind, and sell its tracts, periodicals, and books. This arrangement proved efficient and economical, and enabled the society, while carrying forward its usual work, to clear off, before May, 1875, a debt of $22,493.27 incurred previous to 1871. This plan is still pursued. The American tract society in New York, owning a large building in Nassau and Spruce streets called the "Tract House," manufactures its publications, and has become one of the largest of the national benevolent societies of the country. At first only English tracts were printed, 915 the first year; the third year one volume, and tracts in Spanish, French, and German. Every succeeding year the list was enlarged, until at the end of 50 years (1875) its catalogue contained 1,133 volumes and 3,497 smaller publications. In 1848 was commenced the "American Messenger," a monthly family paper; in 1847 the "Rotachefter," a German paper; in 1852 the "Child's Paper," an illustrated juvenile; in 1871 the "Morning Light," an illustrated monthly for beginners, the "Illustrated Christian Weekly," and the Volksfreund, a similar weekly in German. 

The average daily issue from the tract house is 54,000 copies of publications, of which 4,000 are volumes; and the entire issue from the beginning has been 358,718,338 copies, of 8,328,141,551 pages, of which 341,638,312 copies were tracts averaging about 8 pages each, and 27,035,026 volumes, averaging about 208 pages; 36,807,806 tracts and 2,608,884 volumes were in foreign languages. The society has also expended in printing and stationery of foreign lands $916,667.90. The entire receipts from April, 1825, to April, 1875, were $13,597,589.63, of which $8,957,219.50 were from sales, $312,274.69 from rents, and $4,382,095.44 from donations and legacies. In 1842 the society commenced its colportage system, which it has maintained up to the present time. The colporteur, as the term is employed by the society, is an itinerant missionary, who distributes its publications.
tions either by sale, partial sale, or gift, as may seem best in each case, from the desire to do good, and also engages as opportunity offers in the more direct missionary labors of preaching, prayer, and religious conversation; his expenses are partly defrayed by the society, and partly by the sales of books. Through this agency, for the 34 years from its establishment in 1842 to 1875, 10,503,696 volumes were sold and 2,780,066 given away.—The different religious denominations have each also their tract or publication societies, of which the most important particulars are given in the following table:

TRACTARIANISM, a movement within the church of England, so called from a series of papers entitled “Tracts for the Times,” published at Oxford from 1833 to 1841. It may be traced to the agitation of Roman Catholic emancipation in parliament, and particularly to the suppression of the sees of the Irish bishops who voted against the reform bill in the house of lords in 1831. An address depreciating change, and urging a revival of the ancient discipline, was presented to the archbishop of Canterbury, signed by 7,000 clergymen; in the following May the king alluded to the movement in his birthday speech; and meetings were held throughout the country in behalf of the maintenance of the church. The sentiments now advocated had been already expressed by the Rev. John Keble in his “Christian Year” (1827), and by the Rev. Hugh James Rose in the “British Magazine.” In July, 1833, a conference was held at Hadleigh, which led to the publication of the “Tracts for the Times.” These were 90 in number, and consisted of extracts from the writings of the anti-Nicene fathers and some later ecclesiastical authorities, and original works by E. B. Pusey, John Keble, Isaac Williams, John Henry Newman, and others. They advocated the doctrines of apostolical succession, baptismal regeneration, the real presence, priestly absolution, the authority of the church, and the value of tradition. The movement culminated in the publication of tract No. 90, which maintained the compatibility of the thirty-nine articles with the doctrines of the Roman Catholic church. This was condemned by the bebdomadal board of Oxford university in 1841, and its author, Dr. Newman, in 1843 resigned his vicarage of St. Mary’s, Oxford, and in 1848 entered the Roman Catholic church. In 1843 Dr. Pusey was suspended from the office of university preacher on account of a sermon on the eucharist. The tracarian movement has resulted in the development of high church and ritualistic views, the restoration and building of numerous churches, and the secession of many members of the church of England, including some clergymen of distinction, to the Roman Catholic church.—See Perceval, “Collection of Papers” (1842); W. Palmer, “Narrative of Events” (1843); and F. Oakley, “Historical Notes on the Tractarian Movement” (1865).

TRACTORS, Metallic. See Perkins, Elisha.

TRACY. See Destutt de Tracy.

TRADE MARK, the name, symbol, form, or device used by a manufacturer or merchant to distinguish the merchandise which he produces or sells from that of others, in order that such merchandise may be known as his, and that he may secure the profits arising from its reputation for superiority. Trade marks have long been protected by law, on the general principles of equity, in nearly all civilized countries; but statutes for this purpose are of recent origin. The object of such laws is not only to secure to the individual the fruits of his skill, industry, and enterprise, but also to protect the public against frauds. In the United States trade marks are protected by the statute of 1870, which is the first one passed by congress for this purpose. It does not interfere with the common law protection, which is open to every person independently of the statute. It provides that any person or firm domiciled in the United States, or any corporation created by the law of the United States or of any state, may, by complying with the requirements of the act, obtain protection for any lawful trade mark to which he or it is entitled, for the term of 30 years, with the privilege of a renewed term for the same period. Every applicant must record in the patent office his name, residence, and place of business; the class of merchandise, and the particular description of goods comprised in such class to which the trade mark has been or is intended to be applied; a description of the mark, with facsimiles thereof and its mode of use; and the length of time, if any, during which it has been used.
He must also pay a fee of $25, and file a sworn declaration that he is entitled to the exclusive use of the mark, and that the description and facsimiles presented are true representations. If, on examination in the patent office, such symbol is found to have the requisites of a valid trade mark, it is registered, and the owner becomes entitled to legal and equitable remedies against its violation.—Property in a trade mark is acquired by the original application to some species of merchandise of a device or symbol not in actual use to designate articles of the same kind or class. If such symbol have the essential qualities of a lawful trade mark, the owner becomes entitled to its exclusive use within the limits prescribed by law. But whoever first adopts a mark acquires a right to its exclusive use only in connection with the particular class of merchandise to which he has applied it. His right to use it as a mark on iron does not prevent its lawful use by another on cloth. The mark must also be put into actual use before it may be claimed exclusively by any person; protection begins from the time of such use, without regard to whether the mark has gained a reputation. No person will be protected in the use of a trade mark which is not truthful, and is used with the design of deceiving the public, or which is employed in any unlawful business, or upon any injurious article. —One of the most important requisites of a valid trade mark is that it shall, either by itself or by association, point distinctively to the origin or ownership of the article to which it is applied. By its individuality, it must associate the merchandise with the producer or the place of production, so that the purchaser may know that all articles bearing the same mark are genuine and of the same quality and from the same source. The mark thus becomes equivalent to the owner's commercial signature.—No person has a right to the exclusive use of a mark which is of such a character that others may employ it with equal truth. A generic name of an article, or one merely descriptive, or representing the kind, quality, ingredients, or characteristics of the article, may not be used as a valid trade mark. "Parchment deed," "beeswax oil," "superior white wheat," "descended codfish," are not valid as trade marks, because they are the proper descriptive appellations of the articles. Geographical names used in their proper sense cannot become lawful trade marks. All coal mined in the Lackawanna valley, or all wheat grown in California, may be sold as "Lackawanna coal" or "California wheat," by whomever produced. But if the phrase is used as an arbitrary symbol, and is not intended to represent that the merchandise is produced in the region bearing the name, and is so understood by the public, it may be monopolized as a mark for any class of goods. "Damascus blades," applied to scythes made in the United States, is a valid trade mark.—It is not clearly settled how far a person's own name will constitute a valid trade mark independently of the statute. In general all persons of the same name have an equal right to any honest use of such name. But if one person has acquired a valuable reputation for his own name in connection with a particular kind of merchandise, a court of equity might restrain another person of the same name from using it as a trade mark for the same class of goods, if his intent were clearly to deceive the public and to injure the person who had first so employed it. The statute of 1870 prohibits the registration of any proposed trade mark "which is merely the name of a person, firm, or corporation only, unless accompanied by a mark sufficient to distinguish it from the same name when used by other persons;" except that any lawful trade mark in use when the act was passed may be registered. Names of persons, living or dead, other than the owner of the trade mark, may be monopolized as arbitrary. Symbols for any class of goods, as "Bismarck collar," pseudonyms or imaginary names, &c., will also be protected. Mere initials or numerals do not generally constitute valid trade marks, but may become so in special cases. The title of a book, newspaper, magazine, or other publication may have the essential characteristics of a trade mark; but in such cases protection has usually been granted on the ground of fraud committed by the person who has unlawfully appropriated such title, or one closely resembling it.—Property in a trade mark is invaded when a person falsely uses such mark or a colorable imitation of it, with the intention or effect of falsely representing his own goods as those of another. The usual remedy of the injured person is by an injunction restraining the wrong doer from a further use of the name, or by an action at law for damages. Generally an injunction will be granted by a court of equity only when the petitioner's legal title is clear. If the lawful owner have suffered damages, he may proceed in equity for the profits made by the wrong doer, or he may sue at law for the loss he has sustained. The good will of a trade is a species of property analogous to that in trade marks.—The statute of 1870 provides for extending protection to the trade marks of aliens resident in any foreign country which by treaty or convention affords similar privileges to citizens of the United States. Treaties and conventions for this purpose have been concluded with France, Belgium, Germany, the Austro-Hungarian empire, and Russia. The principal countries of Europe have passed laws for the protection of trade marks, and in some it is obligatory upon manufacturers to affix marks to their products.

TRADES UNION, an association of workmen for concerted action upon questions of wages, hours of labor, and other conditions of employment, and for mutual relief. Apart from the medieval craft guilds, which included employers (see Guild), combinations of workmen to ob-
tain increased wages have occasionally appeared for several centuries; but until a comparatively recent date they were everywhere the object of severe legal penalties. Toward the close of the last century the formation of workmen’s societies received a new impulse from the introduction of machinery, which, by concentrating the leading industries in large establishments, gradually reduced many small masters to the position of laborers, and vastly increased the difficulty of rising from the working to the employing class. In England unions had been formed among the wool-combers, cotton spinners, weavers, calico printers, scissors grinders, and men of other trades, before the beginning of this century. New laws prohibiting such combinations were enacted in 1799 and 1800, but were evaded in various ways; and in 1824 a committee of the House of Commons reported that these laws had only produced irritation, distrust, and violence. They were repealed, and an act was passed to protect combinations of workmen or employers from prosecution for conspiracy under the common law. Later acts were still more favorable to the unions, providing for their registration and enabling them to hold real estate. At the beginning of 1876 the number of members enrolled in the trades unions of the United Kingdom was estimated at 1,200,000, of which number more than one fourth is comprised in the 14 societies named in the following table:

The following societies comprised in 1875 a membership of 258,550:

- Miners’ national union | 146,000
- South Yorkshire miners’ association | 25,000
- East Lancashire power-loom weavers | 16,000
- Federal union of agricultural laborers | 80,000
- Kent and Sussex agricultural laborers’ union | 10,000
- General union of carpenters and joiners | 9,700
- Operative bricklayers’ accident and burial society | 7,850
- United Kingdom society of coach builders | 7,000
- North Wales quarriers’ union | 7,880

The 23 societies named above comprise all having not less than 7,000 members which were represented in the national trades union congress at Liverpool in January, 1875, or in that held in Glasgow in October of the same year, besides a few that were not represented in either. Their aggregate membership is 570,700, or nearly half of the total estimated membership of the trades unions of the kingdom.—Trade societies comprise those organized for trade purposes alone, such as mutual support in strikes, and those which are also mutual benefit associations, the latter class now comprising nearly all of the stronger organizations, in which the expenditures for benefits are usually much greater than those incurred for strikes. But on the other hand, the amalgamated association of miners paid £80,000 within one year (1874-75) to assist branches on strike in South Staffordshire. By the periodical publication of reports showing the state of trade in various towns and districts, some of the unions render valuable service; and another useful device is that of keeping in each of the larger towns a “vacant book,” in which the names of men out of employment and employers in want of men are registered. The qualifications for membership generally include good health, sound physical constitution, ability as a workman, steady habits, and good moral character; and (except in societies of unskilled laborers) the candidate must have served a regular apprenticeship to his trade. The minimum limit of age for admission to full membership is usually 21 years; the maximum varies from 35 to 50 years. A prime object of these organizations is to obtain better wages, shorter time, or more agreeable conditions of employment. They discontinue long engagements at a predetermined rate of wages, oppose the practice of working beyond the customary hours, object to working in the same establishment with non-unionists, and usually seek to establish in each town or district a minimum rate of wages. In the skilled trades they insist upon apprenticeship, and seek to regulate the proportion between apprentices and workmen, defending their action on the ground that it is the workman, and not the employer, who instructs the apprentice. In the various trades connected with building and engineering the members of the unions generally refuse to work under piece masters or sub-contractors. The objection to piece work is, that it is desired by...
the employers only for the purpose of exciting among the men a spirit of rivalry, which in their opinion would result in a reduction of wages or an increase in the hours of labor. In the mining trade, when the output of coal has been in excess of the demand, they have sometimes insisted on diminishing production, in order that the price might not fall so low as to entail a reduction of wages. Some unions have endeavored to fix a limit to the amount of work which each man might do.—One of the best results of free association among the workmen of the United Kingdom is the mental culture which it has promoted. The members of trades unions generally believe that wages have been considerably raised through their agency, and they usually assume that this advantage to the workmen has been gained by cutting down the profits of the employers. Some employers deny that the unions have affected wages at all, while others complain that they have affected them to an injurious degree. Among political economists, some strenuously maintain that wages can only be determined by the law of supply and demand; others admit that combination may have raised the rate of wages in particular trades, but contend that it has thereby raised the price of the products of those trades in the same proportion, and thus increased the cost of living to all classes, including large masses of workmen, who, without receiving any increase in their own wages, are compelled as purchasers of commodities to contribute to the increase received by their more fortunate fellows. On the other hand, Mr. W. T. Thornton, in his well known work on labor published in 1869, argues that the efforts of the trades unions have raised the wages of laborers in general, and estimates the addition thus made to the aggregate earnings of the working men of the United Kingdom at £9,000,000 per annum.—A trades union congress, composed of delegates from different unions and local federations, has been held annually since 1869. Thus far these congresses have confined their attention to objects which had a direct relation to the interests of the working classes, such as providing for the proper ventilation of mines, and reducing the hours of labor for women and children. Toward the adoption of such measures they have materially contributed, and the passage of the labor laws of 1875 is mainly attributable to the exertions of their committee. A federation for defensive purposes, called the United Kingdom alliance of organized trades, has existed for several years, but does not embrace any of the larger unions. There is also a workman's international league (distinct from the revolutionary international workingmen's association), having for its object concert of action between English and foreign workmen in certain trades wherein the keenness of international competition tends to depress wages.

—A national federation of associated employers of labor was formed in August, 1873. The scope of its operations was limited to parliamentary legislation, the collection and distribution of information upon industrial questions, and the endeavor to secure unity of action among employers. The masters in the principal trades have long had associations for the specific purpose of resisting those of the men. In case of a strike against one of their members, they assist him in obtaining other workmen, supply him with funds or credit, undertake or guarantee his contracts, and in other ways help him to dispense with his workmen until they accept his terms. A "lockout" is a retaliatory measure on the part of employers, to deprive workmen on strike of assistance from others by throwing the latter out of employment. The occurrence of strikes and lockouts has often been attended with riotous demonstrations and destruction of life and property. The principal strikes since the repeal of the combination laws were as follows:

At the end of 1875 a strike occurred at the Erith iron works, which threatened to become general, the workmen resisting and the employers insisting upon piece work.—Members of the amalgamated society of engineers who were engaged in the unsuccessful strike of 1861 emigrated the same year to Australia, and established a branch at Sydney. Trades unions have since become general in Australia, and have enabled workmen not only to make their own terms with employers, but to exert a powerful influence upon legislation, especially in defeating appropriations to promote immigration of laborers. They have a trades and labor council comprising 23 societies and 3,000 members, with a permanent committee on parliamentary representation. In this colony eight hours as a rule constitute a working day, and wages vary from 1s. to 2s. (24 to 48 cts. gold) an hour. Trades unions also exist to some extent in New Zealand and other British colonies. There is an association known as the "Canada Labor Union," composed of delegates from the local trades unions, the object of which is to influence legislation in the interest of the working class. There are no trades unions in Canada of national (or rather of colonial) extent, except those which are connected with organizations in the United States.—Trades unions after the
English model (\textit{Gewerkschaften}) began to appear in Germany in 1868. The laws prohibiting combination had been repealed in Prussia two years before, and a law passed permitting employers and workmen (excepting agricultural laborers) to arrange terms in their own way, provided they abstained from physical compulsion, insults, and defamation. A similar law was passed by the parliament of the North German confederation in 1869. The same year Dr. Max Hirsch formed a plan to unite the working classes of Germany into one confederation under a central direction. The local branches of all the trades within certain limits elect some central branch (if in a large town) or the branches of some central place, and commit to such branch or branches the election of a general council, which exercises the chief executive power, while the legislative power is committed to an assembly of branch delegates. These local or district federations are united in a national federation, with a legislative assembly composed of their several delegates, and a central executive committee elected by the assembly. There is also an officer known as the union attorney, who, besides being the chief business manager of the confederation, has the special task of disseminating its principles. Unlike the English trades unions, which sprang from small affiliations spontaneously formed by the working men, the system of the German \textit{Gewerkschaften} originated with a member of the professional class, and existed in its completeness as an idea before the local unions had come into being. The number of members embraced in the German unions is therefore not as great as might be expected, in view of their elaborate organization. In 1869 it was stated at 20,000; comprised in 267 local societies existing in 145 towns, and representing the following trades: miners, masons and stone cutters, potters, carpenters, shipwrights, cabinet makers, shoe and harness makers, tailors, weavers, painters and lithographers, gold and silver smiths, machine builders, and metal workers. Besides these, the confederation included societies of factory operatives and other workpeople belonging to no special trade. By 1873 the number of trades had increased from 13 to 18, and the number of branches from 267 to 350; but the membership had fallen off to the extent of nearly 10,000, which was attributed in part to the war with France, and in part to the discouragement which followed the failure of the great strike of 1869 among the miners at Waidenburg in Silesia, which had been supported by the confederation. The increase of membership in 1873 and 1874 was about 2,000. There are large numbers of German trades unions devoted to the socialist doctrines of Lassalle, who hold aloof from the confederation organized by Hirsch, and stigmatize its leaders as “harmony apostles.” The growth of trades unions among the socialist workmen is greatly checked by the action of the police, who break up large numbers of such societies every year, for interference in politics. —In France the legal position of the working class with respect to the right of combination is but indistinctly defined. In 1864 the law upon this subject was so modified as to make coalition no longer a crime, and to give to workmen the right of striking as well as that of holding public meetings. But the law of 1791, which prohibits societies composed of persons of the same trade or profession, was still in force. As the authorities had long tolerated associations formed in contravention of the law, the workmen now organized “societies of resistance,” similar to those trades unions which are organized for trade purposes alone. Many of these were afterward affiliated with the international association. (See International Association.) In 1868 the government intimated that the various trades in Paris would be permitted to organize under the direction of syndical chambers, on condition of abstaining from politics. In 1875 there were about 100 such syndicates among the employers, and about 70 among the workmen. The latter were refused the privilege of forming a central committee, while the employers’ syndicates have both a central committee and a newspaper organ.—In Belgium trades unions have become prominent within a few years past, and have made several vigorous strikes at the manufacturing centres. Switzerland has flourishing trades unions, which resemble the English societies, but several related trades are usually represented in one organization. They embrace both trade and benefit purposes, and take part in politics. The strikes among the Swiss unions from 1865 to 1873 inclusive varied from a few days to several months. In a fair proportion of cases the objects of the workmen were attained. In Italy trades unions have existed since about 1865, and several strikes have occurred. The strictness of the combination laws has depended a good deal on the pleasure of the tribunals charged with their execution. Coalition to raise or lower wages is made criminal only when entered into “unjustly or abusively,” or “without reasonable cause.” There are trades unions in other European countries, but they exercise little influence on industrial relations, and nowhere on the continent are these organizations so powerful as in the United Kingdom. While the laws of the continental countries repress combinations to raise wages, they encourage provident and mutual aid societies. —Though the working men of the United States have enjoyed unrestricted liberty of combination, the trades unions of this country do not compare with those of the United Kingdom in membership, resources, or discipline, nor in the extent to which they have combined beneficial objects with trade purposes. The following table comprises the principal unions with a national organization; all of these, except the miners’ union, have branches in Canada: 836 TRADES UNION

The miners' union comprises organizations which have existed for years in different states, of which the strongest was that of the anthracite miners of Pennsylvania. The membership of the national union is now distributed as follows: Pennsylvania, 20,840; Ohio, 4,734; Illinois, 8,122; Indiana, 2,135; Indian territory, 57; Iowa, 272; Colorado, 243; Wyoming, 544; Maryland, 481; Missouri, 547; Kansas, 123; Tennessee, 129; West Virginia, 178. The society of the "United Sons of Vulcan" comprises iron puddlers and iron boilers. The local unions are called "forges." In addition to the above there are the bricklayers' national union, the united order of American plasterers, the house painters, the hat finishers' association, the knights of St. Crispin (shoemakers), the order of morocco dressers, the journeymen horse shoers' union, the society of locomotive firemen, the mule spinners of the cotton factories, and the weavers, who in May, 1875, amalgamated their local unions into one association. There are also many local societies, some of which, especially among those in the larger cities, are of considerable importance. The financial panic of 1873 was followed by a large reduction in the membership of many of the unions. In New York city the aggregate membership in 1873 was 44,950; in 1874, 35,765. In 1871 the knights of St. Crispin had about 300 branches and 70,000 members; now they scarcely have a general organization, though many of the branches survive with a reduced membership. In the national trades organizations of the United States, legislative power is confined to an assembly of delegates, to which each local union sends a member bearing a stated relation to its membership, and the action of these bodies is generally final. The principal exceptions are in the tailors' union and the iron moulder's union, in both of which questions are decided by a majority of the unions, and not as in England by a majority of individual voters. The assemblies of delegates elect the executive officers, usually for a term of one year. The qualifications for membership in the skilled trades usually include apprenticeship. In the typographical union the period required is four years. This union admits pressmen, and also charters local unions of pressmen. The iron moulder's union admits brass moulders on the same conditions as iron moulders, one of which conditions is the ability to earn the average rate of wages prevailing in the locality where the candidate is employed. The locomotive engineers require that the candidate shall be a white man, not less than 21 years of age, able to read and write, of temperate habits and good moral character, and possessing at least one year's experience as an engineer. The contributions in the American societies are generally small. Those of the tailors' union are but 10 cts. a month. Among the miners there is a strike fund, to which the contributions are 25 cts. a month. In several unions the initiation fees, and charges for new charters, travelling cards, &c., constitute the only sources of income for general purposes. In the Brotherhood of locomotive engineers, the iron moulders' union, and some others, the benefit features, so largely developed in the English societies, appear to a limited extent. In most of the states the trades unions need legislation for the better security of their funds. The subject of a national law for this purpose, and also of legislation for the better protection of life in mining and other dangerous occupations, has been neglected. Nearly all of the societies above named declared themselves opposed to strikes except as a last resort, and several of them require their members to make an effort to settle disputes by arbitration, before applying to the society at large for authority to strike. A tendency toward federation has manifested itself among the trades unions of the United States, as in the organization of the workingmen's assembly of the state of New York, which however had but a brief existence. In February, 1876, an amalgamated association of iron workers was formed, embracing societies previously existing in different branches of the iron trade. The national labor union, organized at Baltimore in 1866, although assuming to represent the working men of the country, found comparatively little support among the trades unions, and gradually took the form of a political party. A national industrial congress was formed at Cleveland, O., in July, 1873. Besides an exchange of views between the representatives of the different industries, its objects included united action for legislation. Most of the large societies and many of the local unions were represented.—See Lemer, Études sur les associations ouvrières (Paris, 1857); Brentano, Die Arbeitsgilden der Gegenwart (Leipsic, 1871 et seq.); the count de Paris, Les associations ouvrières en Angleterre (French and English, 1869); Nadaud, Histoire des classes ouvrières en Angleterre (Paris, 1872); Leroy-Beaulieu, La question ouvrière au XIXe siècle (Paris, 1870); Bamberger, Die Arbeitsfrage (Stuttgart, 1878); and Mazaroz, Les chaînes de l'escalade moderne (Paris, 1876).

TRADE WINDS, the prevailing N. E. and S. E. winds, in the northern and southern hemispheres respectively, that blow from the par-
TRAFALGAR

allels 30° N. and S. toward the equator. They are atmospheric currents moving toward the equator to fill the spaces left by the airs that have become heated and passed up to the more elevated portions of the atmosphere in the belt of the equatorial calms. These currents, moving continually toward larger parallels of latitude, do not at once acquire the increasing eastwardly movement of the portions of the earth’s surface revolving beneath, and the lagging occasioned by the earth slipping away under them produces a deviation from a direct meridional movement as respects the surface of the earth, and an apparent progress of the currents toward the west. Beyond the limits stated above these currents merge into the regions of variable winds and calms. (See Meteorology, and Rain.) The trade winds have been known to Europeans since the end of the 14th century; to them Columbus owed his prosperous voyages to America, and they constitute a most important factor in the navigation of the ocean. The limits within which the trades prevail vary from month to month with the varying position of the sun, the range being about ten degrees. In general the trade wind is not accompanied by clouds, and the air is comparatively dry.—See Maury’s, Fitzroy’s, and Andran’s trade-wind charts, the admiralty wind charts, and Coffin’s “Winds of the Globe,” to be published in 1876 by the Smithsonian institution; also Ferrel’s “Motions of Fluids and Solids” (New York, 1860).

TRAFALGAR (anc. Promontorium Junonia), a cape of Spain, on the S. W. coast, at the N. W. entrance of the strait of Gibraltar, in lat. 36° 10′ N., lon. 6° 1′ W., about 28 m. S. E. of Cadiz. It is memorable for the naval battle fought near it, Oct. 21, 1805, between the English under Nelson and the combined fleets of France and Spain. (See Nelson, Horatio.)

TRAGOPAN, a name given by Cuvier to the birds of the pheasant family comprised in the genus ceriornis (Swains.). The bill resembles that of the common fowl; the wings are ample and very concave, with the fourth to the seventh quills the longest; tail rounded, and its coverts ample; tarsi stout and armed with a small spur, anterior toes united at the base by membrane, and the claws long and curved. There are three or four species, inhabitants of the gloomy and thick pine forests of the high mountains of central Asia; they are solitary and shy, and discoverable only by their shrill whistle; the plumage is very brilliant, being red, varied with black, blue, and golden, and with white eye-like spots. The best known species is the horned pheasant (C. satyra, Swains.), of the size of a large domestic fowl; the males have the sides of the head naked, and in the spring behind each eye a long reddish and bluish horn directed obliquely backward, and under the throat long, naked, bluish, expanse wattles; the feathers are lengthened and disunited on the crown, purplish black, becoming crimson on the occiput; back of neck and bare skin in front surrounded by deep black; wings and back brown with an eyed white spot at the end of each feather.

Horbed Pheasant (Ceriornis satyra).

rest of plumage deep red with small spots of white; the female and young are brownish, and have neither the horns nor the wattles; the males do not attain the full beauty of their plumage till the third year. The food consists of grains, roots, insects, and larvae. There are also the golden-breasted and black-headed tragopans, similar to the preceding.

TRAGES, Hieronymus, the Latin name of a German botanist, whose real name was Bock, born at Heidersbach in 1498, died at Hornbach in 1555. He was successively head of a school in Zweibrücken and superintendent of the ducal garden, Protestant pastor at Hornbach, and physician of the count of Nassau in Saarbrücken. He published Neues Kräuterbuch vom Unterschiede, Wirkung und Nahmen der Kräuter, so im Deutschland wachsen (fol., Strasburg, 1551; Latin translation by Kyber, 1552). This was the first attempt in modern times toward the classification of plants.

TRAILING ARBUTUS. See ARBUTUS.

TRAJAN (Marcus Ulpius Trajanus), a Roman emperor, born in Italic, near Seville, Spain, Sept. 18, A. D. 52, died in Selinus (afterward called Tranjopolis), Cilicia, in August, 117. He was the son of Trajanus, an officer in the imperial service, and early embraced the profession of arms. He served as a military tribune in the wars of the East, before 86 was made praetor, and in 91 became consul along with M. Atilius Glabrio. Afterward he went to Spain, and was sent by Domitian to Germany to command the troops on the lower Rhine. When at the close of 97 Nerva adopted him and chose him as his successor, the selection met with general acquiescence, although no previous emperor had been born out of Italy. His title after his elevation
to the imperial dignity was Imperator Caesar Nerva Traj anus Augustus. In January, 98, Trajan, who was then encamped at Cologne, succeeded to the throne; but for many months he did not go to Rome, being engaged in war on the frontiers of the Rhine and the Danube. He entered Rome amid the acclamations of the people, and soon received, for his efforts to ameliorate the condition of the poor and to improve the judicature, the title of Pater Patriae, and the new designation of Optimus. In 100 the younger Pliny, who was his warm personal friend, pronounced his panegyric upon him. In 101 Trajan crossed the Danube, defeated Decebalus, the Dacian monarch, took many of his strong posts and his capital Sarmizegetusa, and, having compelled him to sue for peace, returned to Rome in triumph with the title of Dacicus. In 104 Decebalus broke his treaty, refused to comply with the emperor’s demand that he should surrender himself, and when Trajan marched against him first attempted to poison his enemy. The conquest of Dacia was now determined upon, and an immense bridge was built across the Danube, over which the Roman army passed into that country. This bridge was the largest work of the kind ever built by the ancients, and, according to Dion Cassius, consisted of 20 piers, 150 ft. high, 60 ft. wide, 170 ft. apart, and united by wooden arches; it was probably in the neighborhood of the modern town of Tchernets in W. Wallachia. Decebalus was defeated at all points, and in despair killed himself (106); Dacia was reduced to the condition of a Roman province, and fortified posts were built and colonists settled in it (107). When the emperor returned to Rome, he exhibited to the people games which lasted 123 days, and in which 11,000 animals were killed and 10,000 gladiators fought. In the following years he carried on a campaign against the Parthians and Armenians, and was engaged in numerous military expeditions, the history of which is almost altogether lost. In the spring of 115 he marched against the Parthians, having previously received the submission of Armenia and the princes of the neighboring countries. He crossed the Tigris on a bridge of boats, subdued the country beyond that river, and returned to Antioch the same year. In 116 he again marched to the Tigris, and sailed down that stream to the Persian gulf, but was recalled by a general uprising in the provinces which he had reduced. Arriving at Ctesiphon, he gave the Parthians a king whom they quickly expelled. After the siege of Atres in Mesopotamia he fell sick, and, leaving his successor Hadrian in command in Syria, started for Italy, but died on the way. His ashes were carried to Rome in a golden urn, and placed under the column bearing his name, which he had erected in honor of his Dacian victories.—For many generations afterward Trajan’s reign was looked upon as the most brilliant in the imperial annals. The Roman arms were carried further than ever before or after, and rarely suffered defeat. Besides the conquests in Dacia and beyond the Euphrates, Arabia Petraea was made subject to the empire by A. Cornelius Palma, the governor of Syria. Nor were his works for the internal improvement of his dominions less important. He constructed an artificial harbor at Centum Cellae (now Civitá Vecchia), built the port of Ancona, made several great roads in various parts of the empire, one of which was across the Pontine marshes, and erected magnificent bridges. He founded several libraries in Rome, one of which, called Ulpia Bibliotheca, was very celebrated; built a theatre in the Campus Martius, and also the Forum Trajanum, his great work, in the centre of which was the column of Trajan, erected in 112. It has been alleged that he was intemperate and licentious. Many writers doubt the magnitude of the persecution of the Christians which is said to have taken place during his reign. His correspondence with the younger Pliny, governor of Bithynia and Pontus, concerning the treatment of Christians, displays an unusual consideration for justice and humanity. In his reply to Pliny he says: “You have adopted the right course, my friend, with regard to the Christians; for no universal rule, to be applied in all cases, can be fixed in this matter. They should not be searched for; but when accused and convicted, they should be punished; yet if any one denies that he has been a Christian, and proves it by action, namely, by worshipping our gods, he is to be pardoned upon his repentance, even though suspicion may still cleave to him from his antecedents. But anonymous accusations must not be admitted in any criminal process; it sets a bad example and is contrary to our age.”

TRALL, RUSSELL TAECHER, an American physician, born in Vernon, Tolland co., Conn., Aug. 5, 1812. His parents removed to western New York in his childhood. He studied medicine, and for some time practised the profession in accordance with the standard system. In 1840 he removed to New York, where in 1845 he opened a water-cure establishment; and in 1853 he established a medical school for pupils of both sexes, called the “New York Hygeio-Therapeutic College,” since removed to Florence, N. J. He has edited the “Hydropathic Review” and other periodicals devoted to hydropathy and temperance, and has published “Hydropathic Encyclopædia” (New York, 1852); “Hydropathic Cook Book” (1854); “Prize Essay on Tobacco” (1854); “Uterine Diseases and Displacements among the Christian Women, and the Treatment for Sexual Abuses”; “The Alcoholic Controversy”; “The Complete Gymnasmum” (1857); “Diseases of the Throat and Lungs” (1861); “Handbook of Hygienic Practice” (1865); “The True Temperance Platform” (1864); “Sexual Physiology” (1866); “Water Cure for the Million” (1867); “Digestion and Dyspepsia” (1874); “The Human Voice” (1874); and “Popular Physiology” (1875).
TRANI, a town of S. Italy, on the Adriatic, in the province and 27 m. W. N. W. of the city of Bari; pop. in 1872, 24,388. It is the seat of an archbishop, and has an ancient and celebrated cathedral with one of the loftiest towers in Italy. The harbor was formerly very deep, but is now accessible only to small vessels. The trade is chiefly in oil, wine, grain, almonds, and figs.

TRANQUEBAR, a town of British India, in the district of Tanjore, Madras, on an island at the mouth of the river Cavery, 147 m. S. by W. of Madras; pop. about 25,000. There are Lutheran churches, a Roman Catholic chapel, and several schools. Tranquebar has some manufactures of cotton cloth, oil, and soap. It belonged to the Danes, but was ceded to the British in 1845.

TRANSCEAUSIA. See CAUCASUS.

TRANSCENDENTIAL (Latin transcendere, to go beyond), in metaphysics, a term applied in general to ideas and doctrines that are not suggested or limited by experience. In the scholastic philosophy, transcendens and transcendentalis designated anything that was not predicamentalis, that is, anything that rose above, was not comprehended in, and could not be defined by, either of the ten summa genera or categories of Aristotle. Thus, being was transcendental, and only some category of being was predicamental. Kant gave new and distinct significations to transcendens and transcendentalis. The former designated what is wholly beyond experience, is conceivable neither a priori nor a posteriori, and thus lies beyond every category of thought. The latter designated a priori conceptions and judgments, which are necessary and universal, and which transcend the sphere, while affording the conditions, of the contingent knowledge furnished by experience. Thus by the transcendental, formal, or critical philosophy of Kant is meant his system of the principles of the pure reason, which occupies itself not with the objects or matter of knowledge, but with the subjective ideas or forms, as time, space, substance, and causality, through which objects are represented to us as phenomena. Objects in themselves (Dinge an sich) he deemed transcendental.

TRANSCENDENFREE, in mathematics, transcendental quantities are those which cannot be expressed by a finite number of algebraic terms, but are represented by means either of logarithms, or variable exponents, or some of the trigonometrical functions. Transcendental curves, as the logarithmic spiral, are those whose equation is transcendental, i. e., expresses a relation between transcendental quantities.

TRANSFUSION OF BLOOD, the operation of introducing into the vascular system of one animal blood taken from the vessels of another. This operation was suggested and described by Libavius early in the 17th century, but it was first successfully practised by Richard Lower in England in 1665. Some years previously it had been ascertained by Robert Boyle that various medicinal substances might be injected directly into the blood vessels of the living dog, with the result of producing their specific effect upon the animal system, as if they had been introduced by the stomach. Lower's experiments were also performed upon the dog, by connecting, by means of a tube, the carotid artery of one animal with the jugular vein of another, the vein of the second dog being allowed to remain open above the point of connection. Thus the blood lost by the second dog was supplied by that coming from the carotid artery of the first. The consequence was that the animal into whose vessels the blood was introduced in this way by transfusion remained uninjured, while the other died of exhaustion from hemorrhage. These experiments encouraged the idea of performing a similar operation upon the human subject. This was first done in France in 1666 by Denys and Emeerts. They believed that the operation might result in the cure of chronic diseases by introducing into the veins of the patient healthy blood from a foreign source; and accordingly they transfused the blood of a sheep for this purpose into a man. The first results were said to have been so favorable as to excite the most extravagant anticipations, and to create great enthusiasm in the minds of the medical profession in favor of the operation. But these promises were not fulfilled, and as several instances occurred soon afterward where the operation was followed by bad consequences, there was a corresponding reaction against it, and in 1668 the parliament of Paris forbade its repetition except by special consent of the faculty. In 1818 the operation of transfusion was again taken up by Dr. Blundell of London, who carefully experimented upon it as applied to its original and legitimate object, namely, the restoration of life after exhausting hemorrhage. He performed 23 experiments upon dogs, and established by them the following facts: 1, that dogs, when exhausted by hemorrhage, may be resuscitated, even after momentary stoppage of the respiration, by injecting the blood of other dogs; 2, that human blood injected into a dog, in sufficient quantity to supply the loss caused by abundant hemorrhage, produces a temporary reanimation, but does not save life, as the dog dies some hours afterward; 3, that the transfusion of blood, whether arterial or venous, will be successful if the two animals belong to the same species; 4, that the blood used in transfusion need not be conveyed directly from the vascular system of one animal to that of the other, but may be received into a cup and passed through a syringe, without being thereby rendered unfit for the purposes of life. The operation was thus placed upon its proper footing, and one of the important conditions for its success brought into notice; namely, that the blood used for transfusion should belong to an animal of the same or at least a kindred species. This explained in great measure the
bad results of the earlier operations, in which the blood of the sheep had been introduced into the veins of the human subject. This fact was still further elaborated by subsequent experimenters. If the animals used for experiment belong to different classes, as where the blood of a quadruped is introduced into the veins of a bird, or that of a bird into the veins of a quadruped, even in small quantity, it appears to have an actually poisonous effect, and death follows in a very short time. If the animals belong to the same class, but are not of the same genus, as where the blood of the cow or the sheep is introduced into the vessels of the cat or the rabbit, or human blood into those of the dog, there is a temporary reanimation, but noxious effects afterward follow, and death occurs at the end of some days. These noxious results appear to be due in great measure to the presence of the fibrine of the blood; for if this be removed by heating the fresh blood before its injection, they do not follow, or at least are much less strongly marked. Nevertheless, the blood of animals belonging to a different class, even when defibrinated, though no longer actually poisonous, does not resuscitate or preserve the animal experimented on from the effects of hemorrhage. To secure this beneficial effect, the animals must be within certain limits of consanguinity. If the blood be used fresh, they must belong to the same species; and if it be defibrinated, they must still belong to the same genus. Furthermore, it is found that the red globules of the blood are essential to its vivifying influence. The fibrine may be removed without injury, and in some cases, as above mentioned, even with benefit. But the injection of serum alone, that is, blood deprived of both fibrine and globules, is useless as a means of preserving life.—With these improvements the operation of transfusion has been successfully applied to the human subject. After an abundant hemorrhage there is frequently an interval, often of several hours, during which, although the hemorrhage may have ceased, the patient is evidently sinking, and other means of restoration are of no avail. It is to such cases that the operation of transfusion is adapted. Bérard has recorded 14 instances of this kind, most of them cases of hemorrhage after delivery, in which the life of the patient was saved by this means. There are certain rules which it is important to observe: 1. In transfusion in the human subject, it is of course human blood that should be used, supplied by a healthy, vigorous person. 2. But a small quantity, namely, from two to four ounces, should be injected at a time. This amount is generally sufficient; if not, the injection may be repeated after an interval. All that is required by the transfusion is to restore the patient to consciousness and bring him into such a condition that he can take and appropriate nourishment and stimulus. 3. If the injection be made by a syringe, great care should be taken that the blood be not allowed to fall below its natural temperature of 100° F., and especially that no bubbles of air become entangled with it and thus introduced into the veins. 4. The injection should be made slowly, and terminated as soon as the requisite effect has been produced. 5. The delay should not be so great as to incur the risk of the blood becoming coagulated, either in the syringe or within the veins of the patient.

**TRANSIT**, in astronomy, the passage of a planet across the disk of the sun, or of a satellite across the disk of its primary; also, the passage of a heavenly body across the meridian of the place of observation, sometimes called its culmination. Of the planets, only Mercury and Venus, having orbits within the orbit of the earth, can present this phenomenon. The transits of Venus are employed for the determination of the sun's distance; they recur at alternate intervals of 8 and 105½, and 8 and 131½ years. The earliest transit of the sun's disk of which we have an account is that of Venus in 1639, predicted and observed by Jeremiah Horrox, an amateur astronomer of Lancashire, England. The transits of the last century, in the years 1761 and 1789, were observed with great care, expeditions having been equipped for the purpose by the chief European states. But the results then obtained were not so trustworthy as had been anticipated. Two methods of observation were relied on, both depending on time, though not in the same way. It had been suggested by Halley, early in the century, that instead of observing the position of Venus on the sun's face at any assigned instant (for the purpose of thence determining her relative parallactic displacement and so her distance), the observers should note the interval of time occupied by the planet in completing her transit. As the effect of parallax would be to cause her to traverse different chords, as seen by observers at northern and at southern stations, there would result a difference in the duration of transit, the amount of which would enable astronomers to deduce the sun's distance. Delisle, when the transit of 1761 was approaching, discovered that there would be on that occasion disadvantages in applying Halley's proposed method, which requires that both the beginning and end of the transit should be seen; and he proposed another method, requiring only that one or other of these phases should be noted. According to this plan, two observers were both to note the beginning (or else both to note the end), one observing the phase where it occurred as early as possible, and the other observing it where it occurred as late as possible; then, by noting the difference of time between their two observations, they would be able to estimate the sun's distance. Halley's method was manifestly the easier, since each observer had to note the duration between two phenomena both of which were observed by him, and the difference be-
between the two durations thus noted could be determined at once; whereas in Delisle’s method each observer had to determine the absolute time of a single phenomenon, and a comparison between their results could only be effected satisfactorily if these results could be referred to some common standard time of reference, as Greenwich or Paris time. But in the actual application of both methods another difficulty obtruded itself into notice. It was found that the moment when Venus was in internal contact, either at ingress or egress, could not be determined, as Halley had hoped, within a single second, or indeed within several seconds. Accordingly doubt had long rested on the determination of the sun’s distance obtained from the observations made in 1761 and 1769. In fact, from the first, the results were found to be widely discordant according to the manner in which the observations were interpreted. The values of the sun’s distance deduced from the transit of 1761 ranged from 77,846,000 m. to 98,133,000 m.; those deduced from the transit of 1769, though not ranging quite so widely, yet differed by more than 4,000,000 m., the greatest being as before 96,168,000 m., the least 92,049,650 m. Strangely enough, all this was forgotten when (after Encke had published his result from the combination of both series of observations, viz., 95,285,000 m.) a long period had elapsed during which the text books and ephemerides had published the same value for this important element. Accordingly, much surprise was expressed when other methods of observation showed that this value so long received was too great by three or four million miles, the true value appearing to be nearer 92,000,000 m. Although this surprise was by no means justified by the facts of the case, yet it was natural that much attention should be attracted to the transits of 1874 (Dec. 8) and 1882. Accordingly great preparations were made for the observation of the earlier transit, the United States in particular taking a distinguished part in the work. It has been estimated that nearly $1,000,000 must have been expended on the various expeditions. Stations were occupied in Siberia, China, Japan, the Hawaiian islands, northern India, Persia, Turkestan, and Egypt in the northern hemisphere, and at a number of islands in the Indian and Southern oceans, from Kerguelen on the east to Chatham island and New Caledonia on the west, Australia, Tasmania, and New Zealand being also occupied in force. Various successful attended the observers, but on the whole the results obtained were excellent. Delisle’s method and Halley’s, the heliometric method, and photography were applied at many of the most important stations; and though bad weather prevailed at other stations, the object of the expeditions was achieved. So far as can be judged at present, the sun’s distance indicated by these observations is about 92,000,000 m. The next transit of Venus will occur Dec. 6, 1882, and is looked forward to with great interest for verifying these determinations.—The transits of Mercury are much more frequent than those of Venus, in consequence of the former planet being nearer the sun, and having thus a narrower orbit and a shorter year; but they are not available for the determination of the solar parallax. The transit of stars is employed in the determination of longitude. (See Longitude.) The precise relative situation of the heavenly bodies in respect to their right ascension is determined by comparing their exact times of transit. For the means by which these times are ascertained see Transit Circle.

**TRANSIT ENGINEERS.** See Theodolite.

**TRANSIT CIRCLE,** an astronomical instrument for determining the absolute positions of the heavenly bodies. As these positions are given by two independent elements, the right ascension and declination, corresponding to geographical longitude and latitude, so this instrument is a combination of two independent constructions, each giving its share to the name of the whole, and each furnishing its corresponding element by independent and yet simultaneous observation. The transit circle now forms an essential part of the equipment of every well constituted observatory. The two constructions which have here combined their powers are the transit instrument and the meridian or vertical circle. The former consists of a telescope whose tube is composed of two slightly conical portions firmly secured at their bases to opposite sides of a hollow central cube, from two other opposite sides of which proceed also equal cones of more massive make, generally indeed cast in the same piece with the cube, and forming an axis at right angles with the telescope. At or near the extremities of this axis are two perfectly cylindrical, highly finished pivots of hardened steel, corresponding in position to sockets resting upon stone columns which, based firmly in the ground,
TRANSIT CIRCLE

exactly east and west of each other, and rising to a convenient height, support the instrument so that the telescope revolves freely between them in the plane of the meridian. This gives the simple transit instrument, by which and its necessary accompaniment, the clock, is observed the time of meridian passage (the transit) of the star whose place is to be determined. If now we attach firmly to the axis a finely graduated circle which will revolve with the telescope, we shall be enabled, by means of its divisions, to measure also the precise altitude of the star at the same instant of culmination; and thus the transit circle will give, by the first observation, the desired right ascension, and by the second, the desired declination of the object. This combination is entirely of modern date. Transit instruments and meridian arcs and circles have been used ever since the days of Roemer and Picard, but the first real conjunction of the two dates from the close of the first quarter of the present century.—The sockets of the transit circle receive the pivots and determine the position of the instrument. They are not formed, as might be supposed, of circular "boxes" accurately fitting the pivots, but are simply solid little pieces of gun metal, cut away at the upper surface by two planes inclined to each other like the sides of the letter V, from which letter they take their technical and convenient name. In these V's the pivots revolve smoothly and truly, touching the inclined sides at but two points, and consequently without the lateral play which it would be impossible to avoid in circular boxes, however truly ground. Again, the stone piers upon which the instrument rests, even though wrought into perfect symmetry and equality in every respect, and though posted in such a manner as to furnish no apprehension of relative change, will yet continually manifest such change, sometimes under the influence of varying temperature from day to night and night to day, but more frequently from causes even more irregular and less known than this. In order therefore to be able to keep the axis of the instrument duly east and west and truly horizontal, the V's are not permanently bedded in the stone, but are so held by strong plates of the same material, themselves permanently fastened, as to allow of small changes of position, one in a horizontal and the other in a vertical direction. Passing next to the telescope, we notice that the narrower ends of the tapering tubes are terminated by flat rings of precisely the same dimensions, upon which are fitted caps containing, one the object glass and the other the eye tube with its mechanisms. These caps are exactly of equal weight, and, partially entering the ends of the tube, their centres of gravity fall truly in the line of junction with the telescope. Thus the instrument is not only perfectly counterpoised, but also, the caps being convertible, the object glass and eye tube may be and should be periodically interchanged, in order to eliminate from an average result the effect of a possible flexure of the tube. The object glass presents nothing worthy of especial remark. The construction of the eye piece is peculiar. The term "eye piece" is generally, though incorrectly, applied to the whole mechanism at the eye end of the telescope, which consists of a small tube sliding in the end cap, and carrying not only the eye piece proper, which is of the form known as Ramsden's (see Telescope), but also a conveniently shaped box containing two thin metallic plates. These plates, called diaphragms, are made with central openings, across which are stretched the threads used to mark the star's position in or its progress through the field. One of these diaphragms is used for the observation of transits, and is securely held in place by fine "antagonist" adjusting screws. Across its opening and precisely through the exact distance field is stretched vertically a most delicate thread of spider's web, which, as the instrument revolves, represents to the observer's eye the meridian as a visible line across which the heavenly bodies are seen to pass at the moment of culmination. In order to gain more accuracy in this observation (for the instant of transit is required to be known within a small fraction of a second), other threads are also introduced parallel with the central one and symmetrically disposed on either side of it, so that, by noting the time of crossing each and taking the average, a very great degree of accuracy is attained. Ordinarily the transit diaphragm contains either five or seven threads, all at equal intervals; but for special purposes their number and arrangement are adapted to the circumstances. With a telegraphic method of registry, as practised with the large transit instrument of the Washington observatory, five different sets or tallies, with five threads in each, are sometimes used. Across the same diaphragm is stretched horizontally another fixed thread, by which the observer, in placing the telescope so that the star shall traverse the centre of the field, may conveniently know whether or not the telescope is correctly focused. The second diaphragm, carrying only a single horizontal thread, is movable in a vertical direction between truly fitting guides, and by means of a finely wrought micrometer screw. As the first plate belongs to the transit portion of the twofold construction, so this one belongs to and co-operates with the circle, and the office of the screw which carries it is to measure the exact distance of the star, as it traverses the field, either from the fixed horizontal thread, or from some other definite starting point, which may be represented upon the scale of the screw without being necessarily visible. Attached to the screw and revolving with it is a small disk or "head," whose edge is divided into 100 equal parts, so as to measure very accurately the fractions of a revolution, while the whole number of turns necessary to carry the thread to any part of the field is registered upon a convenient scale usually placed within the eye.
piece and visible with the threads themselves. In order to render thread and scale visible by night, various contrivances are used, the most common of which is to introduce a flat oval ring with whitened surface into the central cube, and with its plane inclined at an angle of 45° with the axis, so that, receiving light thrown in through an orifice in the pivots, it will reflect sufficient into the field to show the threads as black lines upon a bright ground. Sometimes also the illumination is thrown upon the threads themselves, when they appear as bright lines upon a dark ground; and in the great transit circle at Greenwich a very ingenious combination of prisms enables the observer to produce either effect at pleasure.—Upon each half of the axis, between the cube and the pivots, is a circle whose diameter is usually from one third to one half the length of the telescope. These circles with their several radii and cross bars are generally cast each in a single piece, to insure greater firmness and avoid unequal tensions. But the six-foot circles of the Greenwich instrument just mentioned, weighing about 600 lbs. each, are made of two castings, the rim in one, and the whole system of radii and braces in another, the two being afterward firmly bolted together at 12 equidistant points. Upon a narrow band of silver inserted near the circumference of the circles are cut the graduations required for the special office of each; one, used only for pointing the telescope in any given direction, is divided so as to read with a vernier to single minutes, which is abundantly sufficient; the other circle, intended for the exact measurement of angles, is divided with the most scrupulous accuracy into arcs of two, three, or five minutes, as the case may be, and once fixed upon the axis, should never during observations be handled or subjected to unequal pressure or strain of any sort. Assuming now that these division marks are truly cut, we next look for the means of subdividing the small arcs into seconds and fractions of seconds, and find this accomplished by a system of "reading microscopes." These are microscopes of the ordinary compound construction, but each provided with a micrometer screw carrying, as in the German instruments, a pair of close parallel threads between which the image of the division under consideration can be placed with great accuracy, or, as in Troughton's form, two threads crossing each other at a very acute angle, which may be bisected by the division. The microscopes are so made that one revolution of the screw is equal to a minute, and the micrometer head is divided into 60 equal parts, each of which therefore represents a second. There are usually four of these microscopes placed 90 degrees apart; but sometimes as many as six are used for greater certainty, both from the greater number of readings and from the probable reduction of the systematic errors of the primary division. The proper method of supporting these microscopes to insure their perfect stability has been a subject of much study. A favorite plan has been to place them on the periphery of another smaller circle which rests, accurately fitting, upon the axis itself, but is prevented from revolving with it by a small projecting bar caught below between two screws attached to the pier. Experience, however, seems to have decided in favor of securing firmly and independently upon the pier itself, near the V-plate, a solid block of marble to which the threads are attached by a long square frame at whose corners the microscopes are attached by adjusting screws. The microscopes are thus entirely disconnected from the circle; and although every new adjustment of the axis will show itself in their record of the graduations, yet this produces no effect whatever upon the mean of readings of opposite microscopes. In the Greenwich instrument, whose piers are broader than the circles themselves, the microscopes are very long, and are passed through the pier itself, converging from the rim of the circle until their eye pieces are collected within a very small space, where the observer reads them with convenience and ease. The graduated limb is bevilled to suit this arrangement, and from another point near the observer a small gas-burner radiates light through other openings in the pier in such a manner as to illuminate uniformly the field of each microscope; a matter of very high practical importance.—To bring the instrument into its proper place in the meridian, it is necessary that the middle vertical thread of the fixed diaphragm be placed truly in the optical axis of the telescope, which is the central line of the cone of rays converging from the object glass. This may be effected by turning the axis itself to a very distant fixed object, noting the exact position of this middle thread with reference to the images in the field, and then reversing the instrument, when the thread will probably occupy a different position, whereupon it must be brought by the adjusting screws of the diaphragm to a point midway between the first and second places, and the operation repeated until no change appears upon reversal. Next, by means of a spirit level and the vertical adjusting screws of one of the V-plates, the axis of the instrument is rendered truly horizontal; and finally, the approximate sidereal time being known, the telescope is directed to some star, also known, very near the pole of the heavens, and the axis moved by the horizontal adjusting screws of the other V-plate, until at the right moment the star and thread coincide exactly. The three errors thus corrected are denominated the errors in collimation, level, and azimuth respectively. And now, by help of stellar observations under properly varied circumstances, we are able not only to determine with great precision the small outstanding values of these errors, which by no means remain constant for any length of time, but also to judge the clock that aided us, and finally the
very places of the stars that have served as our guides. The errors of instrument and clock having been thus determined, it is possible, by the aid of formulas and methods which have been so thoroughly developed and systematized as to be applicable with the greatest facility, to obtain by a single observation of any new object its right ascension within a very small fraction of a second of time. — But, as we have intimated, the chief value of the instrument consists in its power of furnishing at the same culmination not only the right ascension but also the declination of the object, and it accomplishes the latter most simply in the following manner. While the observer is noting the progress of the star across the transit threads, he at the same time, by a delicate movement of the telescope in altitude, places it so that the star appears to run along the fixed horizontal thread; and then, the transit observation having been completed, he reads, even to the fraction of a second, from the circle microscopes the precise point corresponding to the apparent altitude of the star. Or, a still more accurate determination is obtained by placing the telescope so that the star will traverse the field at a little distance above or below the fixed thread; and there is ordinarily time enough to bring the movable thread several times into coincidence with the star's image by means of the micrometer screw, always noting its indications and afterward taking the mean of all. The small distance from the fixed thread, as thus measured, must of course be duly applied as a correction to the readings of the microscopes, and thus we derive one extremity of the desired arc, and then proceed to find the other. In order to know the star's declination, we must first have its altitude above the horizon. This can sometimes be obtained by a double observation of the star's image, first as reflected from a quicksilver surface, and then as seen directly, in which case the arc included between these two directions is obviously equal to twice the altitude of the star; but this course is not always applicable. We have however a reader and exquisitely beautiful method of obtaining with very great accuracy the direction of the vertical line, from which we can count the star's zenith distance. The telescope being turned so as to look directly downward, we place immediately beneath it a vessel of quicksilver; and if then, by means of a small plate of thin glass held at an angle of 45°, we reflect a strong light down the telescope, it will be reflected back by the quicksilver, and, looking through the glass from above, we shall see not only the threads in the eye piece, but also the reflected image of each; and by moving the instrument carefully until the fixed horizontal thread coincides with its own image, we shall have the telescope mathematically vertical, and may read from the circle the corresponding second point of the desired arc, whereby we obtain the apparent altitude, and thence, correcting for refraction, the true altitude, and finally the desired declination.—A few words must be added respecting the use of transit instruments in the prime vertical, that is, so placed that the great circle described by the collimation axis is in the prime vertical. Bessel first suggested this method of mounting a transit instrument, for the purpose of determining with special accuracy the latitude of the place of observation. It is manifest that any star which has a north declination less than l, where l is the latitude, crosses the prime vertical at equal altitudes on the eastern and western quadrants. If the interval in time between these passages be noted as = 2ω, it is manifest from the right-angled spherical triangle having for its angles the pole, the zenith, and the star's place in either quadrant of the prime vertical, that tan ω = tan δ sec α. This method of determining the latitude has a great advantage in the readiness with which instrumental errors may be got rid of, by using the instrument alternately in opposite positions as respects the rotation axis. The adjustments for a transit instrument in the prime vertical relate, like those of the meridional transit instrument, to the three points, collimation, level, and azimuth. In collimation the adjustment resembles that of the ordinary transit instrument. The instrument is brought nearly into the prime vertical by directing it to a star of small northern declination at the calculated time of the star's passage of the prime vertical. When this has been done, the rotation axis must be carefully levelled, and a fresh adjustment made by means of another star. For the small adjustment thus rendered necessary provision is made by allowing one of the V's a small motion in azimuth. Another method is to have the instrument provided with a graduated horizontal circle, and then, having adjusted it in the meridian, to revolve it through 90° in azimuth. When the rotation axis is in the meridian but inclined to the horizon, a correction can be readily made for this inclination, because the great circle described by the collimation axis crosses the horizon at the true east and west points, but passes slightly to the north or to the south of the true zenith; and the latitude found by means of the instrument corresponds to the latitude of the point where the great circle thus swept out crosses the meridian. Thus the only required consideration of the level correction is that this correction should be applied directly to the latitude found from the instrument used as if correctly adjusted. But if the rotation axis is neither in the meridian nor level, or if the middle thread is not in the collimation axis, the correction is less simple. (See Chauvenet's "Spherical and Practical Astronomy," vol. ii., p. 242.)

TRANSISTANTION. See Lord's Supper.
TRANSIAL REPUBLIC. See Boxes.
TRANSYLVANIA (Hun. Erdely; Ger. Siebenbürgen), a grand duchy of the Austro-Hun-
garian monarchy, now forming part of the lands of the Hungarian crown, bounded W. and N. by Hungary proper, N. E. and E. by the Bukowina and Roumania, and S. by Roumania. It is situated between lat. 43° 12' and 47° 42' N., and lon. 22° 24' and 26° 30' E.; area, according to the last changes of the frontiers, 21,216 sq. m.; pop. in 1870, 2,115,024. Capital, Klausenburg. The country is surrounded on all sides by mountains belonging to the Carpathian system, and the surface is much diversified, being traversed by several mountain ranges, between which there are numerous fine valleys and plains. The principal chain extends along the E. and S. frontiers, and sends out many offsets. The range which forms the N. W. boundary toward Hungary is properly designated as the Transylvanian Ore mountains. The most elevated points lie near the S. boundary, in the so-called Transylvanian Alps, where Mt. Negoi has a height of more than 8,000 ft. Above the sea, and oft, the climate is very little lower. The Tomòs, Red Tower, and Vulcan passes lead through this range. The whole drainage belongs to the basin of the Danube, the chief rivers being the Aluta (Hun. Olt), the Maros with its tributaries the Great and Little Kokel (Kákkáló), the Bistritz (Dese terca), the Szamos, and the Kôrös. There are several lakes.—The climate varies greatly according to elevation. In the valleys the heat of summer is very great, but in the more elevated districts the winter temperature is remarkably severe and so long continued as to cause serious injury to vegetation. Gold is found in most of the streams in greater or less quantities; a number of gold mines are worked, and are said to be very productive. Silver mines are also worked, and there is one of quicksilver. Copper, lead, iron, antimony, arsenic, tin, coal, alum, bitumen, saltpetre, and salt are all found; together with crystals and valuable pebbles, including garnets, chrysolites, amethysts, chalcedonies, agates, carnelians, and jaspers. A bed of rock salt extends in a belt 60 to 80 m. wide through the whole country, from which great quantities are extracted, as well as from numerous springs. In the more elevated parts vegetation is scanty, but lower down luxuriant forests make their appearance, which yield many kinds of valuable timber. The valleys and plains are particularly fertile, and, although agriculture is in a backward state, yield good crops of various kinds of grain, pulse, maize, hemp, flax, tobacco, saffron, and madder; and the vine and fruits are very generally cultivated. Great numbers of horses, horned cattle, buffaloes, sheep, and pigs are reared, large herds of the last named being fed in the forests. Game is abundant, and the rivers are well supplied with fish. The manufactures consist principally of coarse linen and woollen goods, native silk, different kinds of metals, paper, gunpowder, leather, porcelain and earthenware, glass, stannary, candle, soap, furniture, and numerous articles in wood.—The population is composed of various races, including Magyars or Hungarians proper, Szeklers, Saxons, Roumans or Wallachs, Ruthenians, gypsies, Armenians, Greeks, Jews, and Bulgarians. The Roumans are by far the most numerous, being about three fifths of the whole. The gypsies number about 88,000. The religions most numerously professed are the non-united and united Greek (chiefly by the Ruthenians and Roumans), Roman Catholic (by the Magyars), Calvinist (by the Magyars), Lutheran (by the Saxons), and Unitarian (by the Szeklers). The Magyars and Saxons have the best schools; those belonging to some of the others are of a very inferior character. The first Transylvanian university was opened at Klausenburg in 1872. The Szeklers, or properly Szekelys, who are believed by some to be descendants of the Huns, and by others of the Petchenegs and other tribes kindred to the Magyars, use a dialect little different from the language of the latter, this being also spoken by the Bulgarians and Armenians. Many of the Szeklers are descendants of German settlers from Flanders, the lower Rhine, the Hartz, and Thuringia, who established themselves in Transylvania especially about the middle of the 12th century, where they are unmixed with other races, and speak their own language, the German. They formerly enjoyed various privileges, based chiefly on a charter granted them by King Andrew II. in 1224, and more equality of rights than the other races. Together with the Magyars and Szeklers they formed the constitutionally ruling people, but now all nationalities enjoy equal rights. The country is therefore divided into the lands of the Hungarians (chiefly in the northwest and west), of the Szeklers (in the east), and of the Saxons (in the south and northeast). The land of the Hungarians is subdivided into the counties or comitats (megyék) of Klausenburg (Kolozs), Doboka, Inner Szolnock, Thorda, Kokelburg (Kakuló), Upper Weissenberg (Féjérédvár), Lower Weissenberg, and Hunyad, and the districts of Fogaras and Nászd; the land of the Szeklers into the seats (székék) of Aranyos, Maros, Udvarhely, Csiék, and Három-Szek; and the land of the Saxons into the seats (Stühle) of Hermannstadt, Broos, Mühleneck, Reissmarkt, Mediasch, Schässburg, Gross-Schenk, Leck, and Raps, and the districts of Kronstadt and Bistritz. Besides the capital, the most important towns are Hermannstadt, Kronstadt, Vásárvely-on-the-Maros, Bistritz, and the fortress Carlsburg. The constitution of Transylvania before the revolution of 1848–9, during which it was re-united with Hungary, resembled that of the latter country, but was more complicated, owing to numerous reserved privileges. It was abolished by the Austrians in 1849, and restored in 1861, though not in its full vigor. In 1867 Transylvania was again fully united with Hungary, and its separate diet abolished.—Transylvania was the Roman empire belonged to Dacia, was subsequently overrun by the Huns, Goths, Gepidae, Lombards, Bulgarians, etc.
TRANSLYVANIA

rarians, Avars, Fetchenogs, and other tribes, and in the 10th and 11th centuries conquered by the Hungarians, who ruled it by waywodes, for a time disputing its possession with the Cumans. Having shared the fate of Hungary for centuries, it became an independent principality during the Turkish-Austrian wars in the early part of the 16th century, and was ruled among others by the Zápolyas, the Báthoris, Bocskay, Bethlen, the Rákóczeys, and the Apafis, until it was finally annexed to Austria in 1713. (See Hungary, vol. ix., pp. 57-61, Báthori, Bethlen, Rákócze, and Zápolya.) The antagonism between the Roumans and Magyars, which in 1848 led to a bloody rising of the former, has not entirely subsided, and more or less secret agitations in favor of a union of Transylvania with Romania, the united countries to form a strong Dacian realm, not unfrequently alarm the Hungarian government. The Saxons, too, hold themselves in opposition to the leadership of the Hungarians. On the E. and S. frontiers the people down to a late date held their land under the tenure of protecting the country against foreign aggression in these directions, the hardy and warlike Szeklers in the east constituting the principal strength of this military frontier department. — See "Transylvania, its Products and its People," by Charles Boner (London, 1865), and Voyage aux régions minières de la Transylvanie occidentale, by Élie Rocus (Paris, 1873).

TRANSLYVANIA, a S. W. county of North Carolina, bordering on South Carolina; area, about 475 sq. m.; pop. in 1870, 3,536, of whom 309 were colored. It contains the sources of the French Broad river, and is almost entirely surrounded and occupied by mountains. The soil of the valleys is fertile and well adapted to stock raising. The chief products in 1870 were 12,476 bushels of rye, 55,633 of Indian corn, 8,142 of Irish and 3,101 of sweet potatoes, 18,844 lbs. of wool, 6,301 of tobacco, and 24,129 of butter. There were 504 horses, 1,178 milk cows, 2,712 other cattle, 4,731 sheep, and 6,490 swine. Capital, Brevard.

TRANSLYVANIA UNIVERSITY. See Lexington, Ky.

TRAP (Swe. trappa, a stair), a class of volcanic rocks, so named because of the stair-like appearance they often present. There are several kinds of trap rocks, distinguished by their chemical composition and physical character. They are composed mainly of feldspar and hornblende, in varying proportions and states of aggregation, with sometimes augite, chlorosite, and other minerals in smaller quantities. The most important among the trap rocks are the basalts, amygdaloids, greenstones, and dolerites. They are therefore chiefly divided into felstone traps and hornblende traps, the principal variety of the latter being greenstone. Hypersthene rock is made up of Labradorite feldspar and hypersthene, a variety of hornblende; it is abundant in the isle of Skye.

TRAPPAN. I. A province of Sicily, comprising the W. extremity of the island, bounded E. by Palermo and Girgenti, and on the other sides by the Mediterranean; area, 1,214 sq. m.; pop. in 1872, 296,988. The coast line is irregular, and there are several bays, the largest of which is the gulf of Castellammare. The most important of the numerous islands off the W. coast are the three anciently called Agates, viz., Favigonna, Levanzo, and Marittimo. The surface of Trapani is traversed by several offsets from the Madonanf mountains. The soil is generally fertile. II. A city (anc. Drepanum or Drepana), capital of the province, on a peninsula which extends into the Mediterranean, 40 m. W. S. W. of Palermo; pop. in 1872, 33,634. It has a small harbor protected by a fort. The churches are exceedingly numerous, and there is a lyceum, a gymnasium, and an archeological museum endowed in 1876 by Cavaliere Depoli. The salt works and fisheries are of some importance. — Drepanum was founded by Hamilcar during the first Punic war, about 260 B. C., who transferred hither the inhabitants of the neighboring Eryx; and it remained one of the chief strongholds of the Carthaginians throughout this war. Off its port they gained a great naval victory under Adherbal in 249, destroying nearly the whole Roman fleet; and it was in attempting to raise its siege by the Roman consul Catulus in 241, that their ships under Hanno suffered off the island of Favigonna (anc. Bégina) the defeat which ended the war.

TRAPEZUS. See Trebizond.

TRAPPISTS, a branch of the Cistercian order famed for the austere reform inaugurated by De Rancé, abbot of La Trappe. (See Rancé.) This monastery is near Mortagne, in the French department of Orne. It was founded in 1140 by Rotrou II., count of Perche, who gave it to a colony of Benedictine monks from Savigny. In 1148 St. Bernard affiliated it to Clairvaux, and its inmates became famous for piety. During the incessant wars between the French and the English, the monks were frequently plundered and dispersed, till toward the close of the 15th century their long enforced absence from the monastery gradually weakened the habits of regular observance, and reduced their numbers to less than 20. Francis I. gave the ruined abbey in commendam to Cardinal du Bellay; and thenceforward all religious fervor and discipline were at an end. In the beginning of the reign of Louis XIV. only seven monks remained, whose licentious habits caused them to be called "the brigands of La Trappe." On July 13, 1664, De Rancé was consecrated abbot of La Trappe in the cathedral of Séez, by Oliver Plunket, archbishop of Armagh. The old monks who did not wish to adopt the severe life inaugurated by the abbey were allowed to depart, and were pensioned out of De Rancé's patrimony; and, after much opposition from the other Cistercian monasteries, and six years
of patient waiting, the mild firmness of the reformer and his exemplary life attracted a small number of followers. The chief centre of the reform, after La Trappe, was the Cistercian monastery of Tamié, near Faverges, in Upper Savoy. It adopted De Rancé's rule in 1677, was suppressed during the French revolu-
tion, and, after various vicissitudes, was again taken possession of, Oct. 15, 1861, by a colony of Trappists from Grâce-Dieu, near Bea-
sançon. The reform was approved by Ino-
cent XI., but under certain restrictions. The monastic rule is noted for its severity. The members rise in the morning at 2 o'clock, and devote 12 hours a day to devotional exercises, and several hours to hard labor, mostly in the field. No worldly conversation is allowed; when meeting, they salute each other with the solemn \textit{Memento mori} ("Remember death"). Their scanty food consists of water and vege-
tables; meat, wine, and beer are entirely for-
bidden. They sleep on a board, with a pillow of straw; and they never undress, not even in case of sickness. Hospitality is earnestly re-
commended; but it is also enjoined on the members to observe, in the exercise of hos-
pitality, as much as possible the customary silence of the order and the simplicity of its mode of life. In 1789 the Trappists possessed, besides La Trappe and Tamié, only one monas-
tery in Tuscany and one in western Germany. When they were suppressed in France, Dom Augustin Lestrange, who is regarded as the second founder of the order, opened an establish-
ment at Fribourg in Switzerland, to which some of the monks repaired. The members of the other extinguished monasteries wan-
dered through Europe for about 20 years, without finding a permanent abode. In 1817 the French government authorized the reopening of La Trappe, and the order soon counted several flourishing establishments. It was es-
pecially prosperous under the administration of the superior general Geramb (after 1825), one of the few Trappists who have won a repu-
tation for authorship. In 1828, and again in 1830, the suppression of all the French estab-
ishments of the order was decreed by the government, but in neither case was the de-
cree executed. Since 1870 the Trappists have ceased to exist legally in Italy and Switzer-
land, and in 1874 they were suppressed in the German empire. In 1803 a colony of Trap-
ists led by Lestrange himself settled at Pigeon Hill, near Conewago, Pa.; in the autumn of 1805 they removed to Kentucky, thence to Florissant near St. Louis in 1808, and in 1809 to a farm 6 m. N. on the Illinois shore of the Mis-
sissippi. In 1813 they went to Tracadie in Nova Scotia, where they still exist. In 1848 Trappists from La Meilleraye in France settled at Gethsemane, Ky., 14 m. S. E. of Bardst-
town; a second establishment (now New Me-
lerray abbey) has since been founded in Iowa, 13 m. from Dubuque. Both of these have been raised to the rank of abbeys, the abbeys wearing the mitre.—An offshoot of the order of Trap-
pists is the congregation of "Trappist Preach-
ers," founded about 1845 by the abbé Muard, at Avallon, France, which connects home mis-
sionary labors with the observance of a Trap-
pist mode of life.—The first convent of Trap-
pist nuns was founded in 1892 in France.
fauna of Travancore corresponds closely with that of Malabar. The mineral resources are as yet undeveloped; but salt is made, and there are known to be deposits of iron. There are but few manufactures.—Travancore is a Hindoo principality, and Hindoos constitute the largest and most influential part of the population, but the aboriginal element has been largely won over to Christianity. This element is most prominently represented by the Shannah tribe, among whom three English missionary societies have labored for many years, until as many as 90,000 of them are Christians living in Tinnevelli and Travancore. In North Travancore there are said to be 250,000 Roman Catholic converts, under one of the vicariates of southern India which originated in the Madura mission. There is a college of high standing at Trivandrum, affiliated with the Madras university, to which it sent 28 students in 1871. In 1872-3 there were 16 other schools, at which English was taught to 806 pupils, 29 vernacular schools, and 188 village schools. The rajah maintains an astronomical observatory under the direction of a European astronomer. Many excellent roads and other public works have been constructed, and Travancore is one of the best governed and most prosperous native states in India. In 1872-3 the total revenue of the government was £957,577, including £165,992 proceeds of the land tax and £130,421 from customs, while the total expenditure was but £549,365.—About the middle of the 18th century the many chieftains under whom Travancore was formerly parcelled out were subjugated by an ancestor of the present rajah, who ruled till 1799, and who adhered to the British in the war with Tippoo Sultan. In 1795 he entered into a subsidiary alliance with the Bombay government. The subsidy has been increased to £80,000 per annum, and the state is now supervised through the government of Madras. According to the fundamental Hindoo law of Travancore, the succession to the throne descends only through the female line. The sister of the present rajah, Rama Wurma, died in 1857, and as it was apparent that the line would otherwise become extinct, the British authorities guaranteed him the right of adoption.

TRAVERSE, a W. county of Minnesota, separated from Dakota by the Bois de Sioux or Sioux Wood river and Lake Traverse; area, about 575 sq. m.; pop. in 1870, 13. It is drained by Mustinka river and other affluentsof Lake Traverse. The surface consists chiefly of rolling prairies. The St. Paul and Pacific railroad crosses the N. E. corner.

TRAVIS, a central county of Texas, intersected by the Colorado river; area, about 1,000 sq. m.; pop. in 1870, 13,153, of whom 4,547 were colored. The surface is moderately hilly, and the soil very fertile. There is considerable timber. Steamboats ascend the river to Austin, which is also the terminus of a branch of the Houston and Texas Central railroad.

The chief productions in 1870 were 498,710 bushels of Indian corn, 88,210 of sweet potatoes, 56,792 lbs. of butter, and 16,769 bales of cotton. There were 5,884 horses, 1,397 mules and asses, 8,952 milch cows, 8,991 working oxen, 30,765 other cattle, 12,018 sheep, and 25,854 swine; 6 manufactories of carriages, 8 of saddlery and harness, 1 of bricks, 2 breweries, and 2 saw mills. Capital, Austin, which is also the capital of the state.

TREASURE, Danie1, an American inventor, born in Ipswich, Mass., in 1791, died in Cambridge, Feb. 27, 1872. While still young he invented a machine for making wood screws. In 1818 he produced a printing press of a new construction, and went to England in 1819. He there conceived the construction of a power press, which was completed the year after his return, and was widely used. In 1822, in connection with Dr. John Ware, he established and conducted the "Boston Journal of Philosophy and the Arts." In 1826 he devised the system of turnouts upon single-track railroads. In 1829 he completed the first successful machine for spinning hemp for cordage. Works capable of spinning 1,000 tons in a year were erected in Boston in 1831; and in 1836 he furnished to the Charlestown navy yard machines for spinning the hemp and cordage for the navy. His circular hackle or lapper has been generally adopted in spinning hemp for coarse cloth. In 1834 he became Rumford professor of technology in Harvard college, and held this post till 1845. He devised a method of making cannon of wrought iron and steel, and executed a contract with the government for 12 six-pounders. But his first plan being found too expensive, he improved and simplified it, and described his new method in a memoir before the American academy in 1835. He secured his invention by patent in the United States and in England, and published an account of it in 1856. It is certain that 18 years before the Armstrong gun was produced in England Treadwell had made his; and that some years after his English patent had been published Sir William Armstrong produced his gun, formed upon the same plan, and adding thereto riding and breech loading.

TREASON, in general terms, any act of hostility against a state, committed by one who owes allegiance to it. There is one important difference in what may be called the form or manifestation of this crime, which seems to constitute a difference in its essence, and has led to some confusion of thought as to the crime itself, and as to the laws or proceedings for its prevention. This difference is between the crime as it may be committed against a monarch or against a republic. Where the power and majesty of a state are embodied in a personal sovereign, there treason against him is treason against the state; but where the state is not thus impersonated, the treason must be against the state itself, and cannot be committed against any person. The crimen
TREASON

lews majestatis, in all the ages of republican Rome, was regarded as a crime against the state, and not against its magistrates, excepting as they represented the state. The simple word majestas was often used as meaning this offence, although the whole expression of it was: crimen levis, imminutus, diminutus, or minutas majestatis. At a later period, when the emperors, having first accumulated in their persons the higher magistracies of the republic, gradually and yet rapidly became despotic and irresponsible while the language of the law remained almost unchanged for a considerable time, the crime itself came to be regarded as primarily a crime against the personal sovereign, and derivatively against the state. In Rome, as afterward in England, the power of the sovereigns to enlarge the scope of this crime, and accuse whom they would of it, was enormously abused. But in both of these states it always remained, and in all civilized countries it must always remain, the highest of crimes, and more deserving of the severest punishment than any other; and for these reasons it needs to be most carefully limited, and to be guarded not only as to its extent, but as to the proof by which it may be established. The constitution of the United States (art. iii., sec. 3) declares that "treason against the United States shall consist only in levying war against them, or in adhering to their enemies, giving them aid and comfort." This cannot be regarded as a definition of treason so much as a limitation of it, and a declaration of what portion of the offences which had been at different times included within its meaning should be regarded as so included by our law. The word treason is used as a customary law term of well known significance; and indeed, in the most important cases which have arisen in the United States, it would seem that this provision of the constitution has but exchanged the burden of defining treason for that of defining the levying war against a state and adhering to its enemies,—In order to show the true meaning of the word treason, we must go back to the Roman civil law, which on this point had an important influence on the English law. In the early days of Rome, the word perduellio (from perduellus, which is defined by Gaius as hostis) was used almost as a synonyme of majestas, and indicates the idea of hostility to the state as belonging to it. Although commonly spoken of as the equivalent of treason, majestas certainly had a wider extent of meaning and operation than treason ever had in its extreme abuse in England. Cicero says (using the word majestas here in its original sense): Majestas est in imperii atque in nominis populi Romani dignitate. Elsewhere, for the purpose of defining the criminal offence of lewa majestas, he says: Majestatem minuere est de dignitate, aut amplitudine, aut potestate populi, aut cornu quibus populus potestatem dedit aliquid derogare; and in this wide sense majestas was applied to any maladministration in office of any magistrate. It became afterward much more like treason as it was in the worst periods of English history; and the abuse of it may be illustrated by some of the provisions of imperial law about the statues of the emperors. By some of these it was declared that to repair their statues when going to decay, or to injure one accidentally and unintentionally, or even to sell one if it had not been consecrated, was not a crime against the majesty of the state; but to melt one down after it had been consecrated constituted this offence. The earliest punishment of the crime was perpetual interdiction from fire and water; the later, death, to persons of low condition by wild beasts or burning, to those of higher rank by the ordinary method of execution.—We find treason recognized and punished as a crime from the beginning of the common law; and always the cause of the crime was some act of hostility against the government by one who owed it allegiance. But during many ages the criminal law of England was unwritten, and lay in the determinations of judges who were removable at the king's pleasure, and who were often so corrupt that public justice was perverted into an instrument of remorseless tyranny. In the reign of Edward IV, an unfortunate punster, who kept an inn in London with the sign of the crown, said he would make his son heir of the crown; and for this offence he was hanged, drawn, and quartered. In the same reign an owner of deer, one of which was killed by the king while hunting, said he wished the horns of the deer were in the king's stomach; and for this he was put to death. But at a later period, when Russell and Sidney were slain through the instrumentality of a judicial trial for treason, this atrocious wickedness assumes at least a more dignified appearance. Indeed, during the whole of English history until the time of Cromwell, treason always had, in a greater or less degree, the character of a political offence. At many periods the leading men of the age fell victims to it. Hence has arisen a feeling of compassion for the sufferers, and of doubt as to their guilt, which has had an important influence on the public estimation of the crime in that country, and to some extent in this. Another reason for some laxity of thought and feeling concerning this crime, is the extreme uncertainty of the earlier law as to its definition and limits. Thus, Glanvil expressly identified it with the crimen levis majestatis; Bracton includes within it the counterfeiting not merely of the king's seal, but of the king's money; and by a very current phrase it was supposed to embrace all "encroaching of (encroachment upon) royal power." So early as the 25th year of Edward III, an attempt was made to remedy this uncertainty by a statute defining treason, which was for the time an excellent law, although quite too wide in its scope. Among the principal offences here called treason were compassing the death of
TREASON

851

the king, queen, or prince, or levying war against the king, or adhering to the king's enemies; but all these offences were to be proved by some overt act. In some of the subsequent reigns this excellent provision was evaded by construction, or the statute was disregarded, or new ones made. Thus, by the 32d of Henry VIII., it was made high treason to accept, take, judge, or believe the king's marriage with Anne of Cleves as legal and valid. But the leading provisions of the statute of Edward III. are still the law of England, and the reasonable construction of its language by the courts of England has been generally followed by the courts of the United States in construing the provisions of our own constitutions and laws. By the 1st of Edward VI. the provision was introduced which we have copied, requiring, for the conviction of one charged with treason, two sufficient and lawful witnesses; but this provision was in many instances shamefully pervaded. Thus when only one living witness could be found who would testify to Alvernon Sidney's treason, Jeffreys decided that garbled extracts from his writings might be read as the other witness, and on this testimony he was convicted and executed; and no greater dishonor rests on the name of Bacon than that he assisted his master, King James, in corrupting the judges of the king's bench into a willingness to convict of treason one Peacham, a parish priest, on the evidence of a sermon which he had never delivered, and which was found by searching his study. Out of the many civil conflicts and commotions in England, and especially the wars of the roses, grew one rule, still in force, and resting on the soundest justice and reason. During those ages of constant disturbance, when there were frequently more persons than one who claimed the crown, and, so far as they could, exercised royal authority, almost every person incurred the danger of treason, in case the claimant to whom he adhered was defeated; and for this cause, or on this pretence, multitudes of men of every rank perished on the scaffold. But from the obvious absurdity of exacting from every individual a sound, or rather a fortunate judgment as to the obscure and complicated grounds on which the claim to sovereignty often rested, it became and still remains a well settled rule, that no one incurs the guilt of treason by adherence to a king or government de facto, although that king or government has but the right of a successful rebel, and loses it all by a subsequent defeat.—In considering the crime of treason in the United States, we must remember that there may be treason against the United States, and also treason against any one of the states. Looking first to treason against the United States, the foundation of the law itself, and of our knowledge of it, must be the clause in the constitution already quoted; and as there is no common law of the United States, this clause would have remained inoperative but for the act of congress of 1790, chap. 38, sec. 1, whereby it was enacted, "that if any person or persons owing allegiance to the United States of America shall levy war against them, or shall adhere to their enemies, giving them aid and comfort within the United States or elsewhere, and shall be thereof convicted, on confession in open court, or on the testimony of two witnesses to the same overt act of the treason whereof he or they shall stand indicted, such person or persons shall stand adjudged guilty of treason against the United States, and shall suffer death." When the courts came to the construction and application of that act, they very properly made use of the principles and the jurisprudence of the common law; and they could do this the better, because the clause of the constitution is substantially the same as a provision of the statute of Edward III., and the best ability of England had been carefully employed about that statute. For a judicial exposition of that clause and that statute, we must look to the trial of Buhls and of Bollman and Swartwout (4 Cranch, pp. 75 to 137), although these are not the only cases in which the same subject has been considered.—The first question is: What is a levying of war against the United States, within the meaning of the statute? In the first place, the levying of war must be actual; it must be carried out into some practical operation and effect. No intention, and no extent or thoroughness of preparation or of conspiracy for war, constitutes the crime of treason until the war actually begins. Some kind of force or violence, it is said, must be used. But it would seem that this force may be what the law would call constructive force; and it may be very slight; for it certainly need not be sufficient to accomplish either the general purpose of the war, or the particular effect proposed. But, if there be any overt act of war, then every one aiding and abetting this act of war, however remotely, does himself levy war and commit treason. It must be difficult to determine always what this rule requires. Thus, Marshall declares that if an army be actually raised for the avowed purpose of carrying on war against the United States, and subverting their government, the point must be weighed very deliberately before a judge would venture to decide that an overt act of levying war had not been committed by a commissary or purchaser who never saw the army, but who, knowing its object and leading himself with the rebels, supplied that army with provisions; or by a recruiting officer, holding a commission in the rebel service, who, though never in camp, executed a particular duty required of him. Hence it would follow, that if there be an act of levying war against the United States, persons may be participators of that act, and of the crime which it constitutes, although they reside as far as possible from its actual locality. The prevailing rule of the criminal law, that there may be principals and accessories to a
crime, has no application whatever to treason. We are warranted by the language of Chief Justice Marshall in saying, that if a rebellion were so extensive as to spread through every state in the Union, every individual concerned in it is not legally present at every overt act committed in that rebellion; nor can it be said that even the commander-in-chief of the rebel army, or the head of the organized rebellion, is legally present at every such overt act. But while a man may be actually absent, yet if he have counseled or procured the treasonable act, he is a principal traitor, not because he is legally present, but because in treason all are principals. This question of locality has yet another importance. A person charged with this crime can be tried only within the state or judicial district in which it is committed, and the alleged criminal has indeed a strict right to be tried by a jury within that state or district. A wide extent may be given to this rule, by the doctrine that in treason all are principals, as above stated; but it can apply only to those persons who would, in the locality in which they reside, be either principals or accessories if there could be accessories to this crime. For if a person commits his own act of treason in a certain locality, and is not connected with any one committed elsewhere, and as to be, in this way, a principal in the act, he can be tried only within his locality; and if the judicial tribunals of the United States cannot or will not perform their proper functions within that state or judicial district, he cannot be tried anywhere. It is certain, too, that the overt act which is alleged to be a treasonable act, must have been done with "a treasonable purpose." We have on this point high authority for saying, that if the object of the act be to prevent by force the execution of any public law of the United States, that is a treasonable purpose, for it aims at overthrowing the government as one of its laws. So, if the purpose be to overthrow the government at one place, large or small, that is a treasonable purpose.—What, then, is adhering to an enemy, or, in the language of the constitution, giving him aid and comfort? It is perhaps impossible so to define these words as to make their meaning any plainer. But, again on high authority, this meaning may be illustrated thus: If a conspiracy to levy war against the United States be in actual operation anywhere within it, any citizen, residing anywhere else and at whatever distance, if he supply the rebels with arms or any munitions of war, with provisions to be used in support of the war or of the rebels while carrying it on, or money, or intelligence or information, and even if none of these things reach the rebels, he becomes a traitor in the place where he resides. So it would come under this branch of treason, if forts, castles, or ships of war were delivered to the enemy, or if the accused had joined the enemy's forces, though no battles or conflicts take place. The same principles would undoubtedly apply, whether the treason charged were committed against the United States or against any one of the states, qualified only by any special provisions of the constitution or law of that state.—As all treason consists of hostility against a state by one who owes it allegiance, so only one who owes this duty, in some way, may be a traitor. But it is held that this modified allegiance may be that of an alien residing in this country and enjoying the protection and advantages of its government. The allegiance of an alien, however, or the possibility of his becoming a traitor, ends with his residence in this country; while the duty of allegiance goes with a citizen wherever he goes; and wherever he may be, he becomes a traitor by hostility against the government in violation of this duty.—We have seen that no one can be convicted of treason except on the evidence of two witnesses; but with this exception, the trial for treason is conducted in all respects like any other criminal trial for a capital offence. If convicted, the traitor may be sentenced to death by the ordinary means of execution; but by act of congress of July 17, 1862, the punishment in the discretion of the court may be imprisonment for not less than five years and a fine of not less than $10,000. We have no remnant of that ferocious cruelty which was considered necessary in barbarous ages, and in statutes often outlived them. Until the 50th year of George III. the convict of treason forfeited his property to the crown, was drawn on a hurdle to the gallows, there hanged, then cut down, disembowelled, and his entrails burned before life was extinct; and the body was then beheaded and quartered.

TREASURE TROVE (literally, found treasure), a term applied to money, coin, plate, or other forms of the precious metals, found hidden, for which no owner or depositor can be discovered. By the laws of England such property becomes vested in the sovereign, if it appears to have been concealed with the intention of claiming it. In all other cases, as where circumstances show that the treasure was intended to be abandoned, it belongs to the finder, who by a special order in council is also entitled to the commercial value of ancient coins and other objects of antiquarian interest, under whatever circumstances they may be found. The civil law formerly gave the treasure trove to the finder; or if found on another man's land, it was divided between them; but the practice in continental Europe has in modern times been similar to that in England.

TREBBI A (anc. Trebio), a small river of N. Italy, rising in the Liguren Alps, about 15 m. N. E. of Genoa, and emptying into the Po 3 m. above Piacenza. On its banks the Romans under T. Sempronius were defeated by Hannibal in 218 B. C., and the French under Macdonald by Suvaroff, June 17-19, 1799.

TREBIGNE, or Trebinie, a town and formerly the capital of Herzegovina, European Turkey,
Trebizond. 853

Trebizond, about 8 m. from the frontier of Montenegro, and 15 m. N. E. of Ragusa; pop., less than 5,000. A Roman Catholic bishop resides here, and there are several churches and mosques. It is defended by a square fort with four towers. Trebigne and its vicinity were the theatre of war with the Turks during the insurrection of 1875–6. Under the early kings of Servia it was of much greater importance.

Trebizond. I. A vilayet of Asiatic Turkey, extending, in a generally narrow strip from 20 to 80 m. wide, about 360 m. along the S. coast of the Black sea, between lon. 35° 40' and 42° E., bounded N. by the Russian division of Transcaucasia, E. by Erzerum, S. by Erzerum and Sivas, and W. by Kastamuni; area, about 15,000 sq. m.; pop. estimated at 940,000. The scenery on the coast is remarkably beautiful. The mountains rise immediately from the sea to the height of from 6,000 to 8,000 ft. in the east (in single peaks much higher), and nearly 5,000 ft. in the west, and are clothed with every variety of vegetation, from grass to dense forests. The country is generally well wooded and mountainous, and has but little arable land. The principal rivers are the Tchoruk, which enters the sea near the E. frontier, and the Yessil Irmak and Kizil Irmak, the lower courses of which drain the W. part of the province. The climate is temperate but variable, being subject to cold winds from the Black sea, bearing rain and fog. The province is decidedly healthful. There are numerous fertile valleys and well cultivated tracts, but the country does not produce sufficient grain for home consumption. The inhabitants are described as bold and hardy. In many districts they are isolated cottagers, there being few villages. There are 56,000 Christians in the province, of whom two thirds belong to the Greek church, and the rest are Armenians. The chief towns, besides the capital, are Tireboli (anc. Tripolis), Keresun (Cerasus), Rizah (Rhizus), Batum (Bathye), and Samsun. The vilayet embraces the main parts of ancient Pontus, extending both E. and W. beyond its limits. II. A city (anc. Trapezus), capital of the vilayet, sometimes called Tarabazan, on the S. E. shore of the Black sea, in lat. 41° 1' N., lon. 39° 45' E., 560 m. due E. of Constantinople; pop., about 40,000. It is the first Turkish commercial port on the Black sea, and the entrepot of an extensive trade with the interior provinces and Persia. A peninsula separates the harbor into two ports, of which the eastern affords shelter and anchorage for the largest vessels. There is a lighthouse here and another at Platana, a roadstead about 6 m. W. of Trebizond. Four steamship lines connect the city with the principal ports of Turkey and southern Russia. Grain, from Russia and the Danube, is the chief article of import; the exports produced in the province itself include flax, nuts, butter, beans, linseed, fruits, tobacco, rice, wine, olive oil, fish oil, beeswax, and timber. The overland trade with Persia is valued at more than $6,500,000 per annum, and gives employment to 60,000 pack horses, 6,000 asses, 2,000 camels, and 3,000 oxen. Tobacco, silk, raisins, and carpets are exported from Persia for shipment at Trebizond, whence are imported cotton and woollen goods, tea, sugar, glass ware, hardware, and European manufactured goods of many kinds. The inland traffic with Anatolia, on the west, represents a value of more than $2,500,000; the exports through Trebizond comprising grain, potatoes, fruits, skins, wax, honey, and chestnuts. The city consists of an old and a new town, the former surrounded by walls and towers enclosing the citadel, which stands upon the flat top of a steep rock. The modern town is mainly without these walls on the E. side. Trebizond is well paved and drained, but the houses generally are neither commodious nor comfortable. There are 40 mosques, 18 Mohammadan schools, and 16 churches, of which 9 are Greek, 4 Armenian, 1 Catholic Armenian, 1 Latin, and 1 Presbyterian.—Trapezus was
founded by a colony from Sinope, and was a flourishing town when Xenophon arrived there on his retreat from Cunaxa. It became subject to the Romans by conquest from Mithridates. The emperor Trajan constructed a mole to improve the port, and made it the capital of eastern or Cappadocian Pontus. During the reign of Gallienus it was plundered and nearly destroyed by the Goths, but in the time of Justinian it had completely recovered, and was made the capital of a province which included Pontus and some part of Armenia. In 1204 it became the seat of an independent branch of the Comnenus family (see Alexis, and Byzantine Empire), under whom the territory was called the empire of Trebizond. It continued subject to this line of rulers until it was conquered by the Turks in 1461.

**TREDGOLD, Thomas**, an English engineer, born at Brandon, near Durham, Aug. 32, 1788, died in London, Jan. 28, 1829. In 1808 he went to Scotland, where he worked five years as a journeyman carpenter and joiner, studying arduously in spare hours. In 1813 he went to London, and entered the service of William Atkinson, architect to the ordinance, and in 1823 commenced as civil engineer on his own account. He published "Elementary Principles of Carpentry" (4to, London, 1820); "A Practical Essay on the Strength of Cast Iron and other Metals" (8vo, 1821); "The Principles of Warming and Ventilating Public Buildings, Dwelling Houses," &c. (2d. ed., 1824); "A Practical Treatise on Railroads and Carriages" (1825); "Remarks on Steam Navigation, and its Protection, Regulation, and Encouragement" (1825); and "The Steam Engine, comprising an Account of its Invention and progressive Improvement, with an Investigation of its Principles" (4to, 1827), a later edition of which (1830-33) is in 4 vols. 4to, with 226 steel plates and 164 woodcuts.

**TREE FROG**, the name of the batrachian reptiles of the family *hyladæ*, distinguished from common frogs (*ranida*) by having the ends of the fingers and toes dilated into flattened disks or suckers, which enable them to lead an arboreal life. They are more elegant, smaller, brighter, and more active than the *ranida*, and are lively during the day; they feed on insects; they climb like the geckos among lizards, and by the same mechanism; the lower surface of the disks is endowed with a viscid secretion, by means of which they can walk with the body suspended from the under parts of leaves and other smooth bodies; the skin is mostly smooth upon the back, but on the abdomen and inside of legs thickly studded with small warts or tubercles. They possess to a remarkable degree the faculty of changing color, which enables them to elude their numerous enemies. They are very clamorous, and particularly noisy at the approach of rain; in winter they bury themselves in the mud at the bottom of pools; they breed in the spring, depositing their eggs in the water. They are frequently called tree toads, and their French name is *rainettes*. The species are numerous, especially in America; only one is found in Europe, and that also occurs in N. Africa and Asia.—The common tree frog of North America (*hyla versicolor, Le Conte*) resembles a toad in form, but is more flattened; body short and warty above, the color varying from pale ash to dark brown, with several large irregular blotches of greenish brown, white and granulated below, and abdomen yellowish near the thighs; the colors vary at the will of the animal. The head is short and rounded, the mouth large, with teeth on upper jaw and vomer; eyes large and brilliant, the iris bright golden; there are four fingers and five toes, both ending in viscous pellets, the former distinct, but the latter webbed for four fifths of their length. It is about 2 in. long, and is found abundantly in the northern and middle states, and as far west as the Mississippi; it is generally seen on decaying trees and about old fences of wood or stone, overgrown with mosses and lichens, the color of which it so nearly resembles that it is very difficult to detect; it is very noisy in spring and summer toward evening, especially in cloudy weather; the secretion of the skin is copious and very acrid. This species is replaced in the southern states by the green tree frog (*H. viridis, Laur.; calamita Carolinensis, Penn.*), which is bright green above, yellowish white below, with a straw-colored lateral line extending from the upper jaw over the shoulder and along the side. The tree frog of Europe (*H. arborea, Linn.*) much resembles the green species of North America, and the latter was considered by Laurenti a variety of his *H. viridis*; it is spread throughout Europe, except in Great Britain.—In the genus *aeris* (Dum. and Bib.) the locomotive disks are less developed and the limbs more slender than in *hyla*, and there are teeth on the palate instead of the
The A. gryllus (Dum. and Bibr.), or Savannah cricket, occurring from New England to the gulf of Mexico, is about 1½ in. long, with an elongated pointed head, a triangular dusky spot between the orbits; body ashy above, with a green and sometimes reddish dorsal line, and three oblong black spots margined with white on the sides. It may easily be domesticated; it makes immense leaps; it is intermediate between the ranidæ and hylæa, having the aquatic habits of the former and the method of watching for its prey of the latter; in consequence of the smallness of the disks it cannot adhere to the under surface of smooth bodies.—The flying tree frog of Borneo (rhacophorus), according to Mr. Wallace, has its very long toes fully webbed to their extremity, so that by expanding these webs and inflating its body, it is able to use them as a parachute or sailing membrane in its descent from high trees. The frog is 4 in. long, deep green above, yellow below; the webs of all the feet cover a surface of 12 sq. in.; at the ends of the toes are the usual disks for adhesion. This is the only aerial batrachian known.

**TREE SORREL**, or properly Sorrel Tree, a North American tree of the heath family (Ericaceæ), formerly known as Andromeda arborea; when later botanists subdivided Linnaeus's genus Andromeda, this was placed by itself in a new genus, oxydendrum (Gr. ὤξυς, sour, and δένδρον, a tree), a name which recognizes the marked acid character of the foliage; it is also known as sour-wood. The only species, O. arboreum, is found from Ohio and Pennsylvania southward, especially along the mountains, where it is met with as a large shrub, or in favorable localities it forms a tree 40 or even 60 ft. high. Its leaves are deciduous, serrate on the margins, with slender petioles, and being pointed at each end they have much the appearance of those of the peach. The flowers, which appear in June and July, and even later, are in long one-sided racemes which are clustered at the ends of the branches; the corolla is ovate with five teeth, white, and in size and arrangement upon the stem bear some resemblance to flowers. The wood of the tree is of little value; the leaves are pleasantly sour, and are chewed by hunters to allay thirst. The tree is hardy north of its natural localities, and endures the climate of Boston. As an ornamental tree it possesses many merits, not the least of which is that of flowering when only a few feet high; when it is 10 or 15 ft. high it forms a spreading head, to which its fine spray gives a very light appearance, and when covered with its abundant clusters of delicate white flowers, it is a truly beautiful object; in autumn the foliage takes on a pleasing dark crimson color.

**TREFOIL.** See Clover.

**TREGELLES, Samuel Prideaux**, an English scholar, born in Falmouth, Jan. 30, 1813, died in Plymouth, April 24, 1875. His parents were Quakers, but he himself became connected with the Plymouth Brethren. He was educated at Falmouth grammar school, was employed in the iron works at Neath Abbey, Glamorganshire, and in 1836 became private tutor in Falmouth. He devoted himself to the study of the Scriptures in the originals and the old versions, especially the Syriac, and edited “The Englishman's Greek Concordance to the New Testament” (8vo, 1839); “The English Hexapla,” with a historical account of the English versions of the Scriptures (1841); “The Englishman's Hebrew and Chaldee Concordance to the Old Testament” (2 vols., 1845); and “Hebrew Student's Manual,” comprising Hebrew reading lessons, and the book of Psalms with interlinear translations (1845); and he translated, with additions and corrections, Gesenius's “Hebrew and Chaldee Lexicon to the Old Testament” (4to, 1847). Dr. Tregelles visited the continent several times for the purpose of collating the principal un-
cian manuscripts of the Scriptures in the libraries. At Rome he was allowed to see the Vatican manuscript, but was not permitted to collate it. His greatest work is "The Greek New Testament, edited from ancient Authorities, with the Various Readings of all the ancient Manuscripts, ancient Versions, and earlier Ecclesiastical Writers, together with the Latin Version of Jerome" (6 parts, 1857–72). His other publications are: "The Book of Revelation, translated from the ancient Greek Text" (1845); "The Jansenists, their Rise, Persecution by the Jesuits, Existing Remnant," &c. (1851); "Defence of the Authenticity of the Book of Daniel" (1859); "Account of the Printed Text of the Greek Testament" (1854); "Codex Zacynthius," a Greek palimpsest, containing portions of St. Luke's Gospel (1861); and "Canon Muratorianus," the earliest catalogue of the books of the New Testament (4to, 1868). He contributed to Smith's "Dictionary of the Bible." He received the degree of LL. D. from St. Andrews university in 1856.

TREGO, a W. county of Kansas, intersected by the Saline and Smoky Hill rivers; area, 900 sq. m.; pop. in 1870, 166. It is traversed by the Kansas Pacific railroad. The surface is rolling and the soil rich. It is unorganized.

TREMPEALEAU, a W. county of Wisconsin, bounded S. W. by the Mississippi river, intersected by Trempealeau Mountain river, and drained also by Black and Buffalo rivers; area, 684 sq. m.; pop. in 1875, 14,992. The surface is level and the soil fertile. The chief productions in 1870 were 516,194 bushels of wheat, 141,275 of Indian corn, 241,408 of oats, 17,558 of barley, 47,099 of potatoes, 37,242 lbs. of wool, 341,043 of butter, and 18,794 tons of hay. There were 2,754 horses, 3,537 milch cows, 6,328 other cattle, 9,536 sheep, and 2,906 swine. Capital, Galesville.

TRENCH, Richard Chenevix, a British clergyman, born in Dublin, Sept. 9, 1807. He graduated at Cambridge in 1829, and after spending some years in travel took orders in 1833, and became curate to Hugh James Rose at Hadleigh, Suffolk, and in 1855 incumbent of Cudridge, a chapelry in the parish of Bishop's Waltham, Hants. In 1840 he was appointed curate to Archdeacon Wilberforce at Alverstoke, near Gosport, and in 1844 rector of Itchenstoke. Dr. Wilberforce, being made bishop of Oxford in 1845, appointed Mr. Trench his examining chaplain. During this and the following year he was Hulsean lecturer at Cambridge. From 1846 to 1858 he was theological professor in King's college, London. In 1856 he was made dean of Westminster, and on Jan. 1, 1864, he succeeded Dr. Whately as archbishop of Dublin. He has published the following poetical works: "Justin Martyr, and other Poems" (London, 1835; 5th ed., 1862); "Sabbation, Honor Neale, and other Poems" (1838); "Poems from Eastern Sources," and "Genoveva" (1842; 2d ed., 1851); "Elegiac Poems" (1846); and "Alma"

(1854). His theological publications include "Notes on the Parables" (1841; 11th ed., revised, 1870); "The Sermon on the Mount, illustrated from St. Augustine" (London, 1844; 3d ed., 1869); two volumes of Hulsean lectures, "The Fitness of Holy Scripture for unfoldling the Scriptural Life of Men" (Cambridge, 1845), and "Christ the Desire of all Nations" (1846); "Notes on the Miracles" (1846; 9th ed., 1870); "Sacred Latin Poetry" (1849; new ed., 1864); "The Star of the Wise Men" (1850); "Sermons preached in Westminster Abbey" (1860); "Commentary on the Epistles to the Seven Churches in Asia" (1861; 8d ed., 1866); "Studies on the Gospels" (1867); "Shipwrecks of Faith," three sermons (1867); and "Sermons preached for the most part in Ireland" (1873). Among his philological works are: "The Study of Words" (1851; 15th ed., 1874); "The Lessons in Proverbs" (1853; 6th ed., 1869); "Synonymes of the New Testament" (1854; 2d series, 1863; 7th ed., enlarged, 1871); "English, Past and Present" (1855; 5th ed., 1870); "On some Deficiencies in our English Dictionaries" (1857); "On the Authorized Version of the New Testament" (1858); and "A select Glossary of English Words used formerly in Senses different from their present" (1859; 4th ed., 1865). He has also published "Calderon, his Life and Genius, with Specimens of his Plays" (8vo, 1856; 2d ed., 1865); "Gustavus Adolphus, with other Lectures on the Thirty Years' War" (1865; 2d ed., 1866); and "Plutarch, his Life, his Parallel Lives, and his Morals" (2d ed., 1874); and he has edited "The Remains of the late Mrs. Richard Trench," his mother (1862), and a "Household Book of English Poetry" (1866).
and his life has been written by Hübner, under the title of Franz von der Trenck, darge stellt von einem Upparteischen, mit einer Vor rede von Schubart (8 vols., Stuttgart, 1788).

II. Friedrich von der, baron, a German adventurer, cousin of the preceding, born in Königs berg, Feb. 16, 1726, guillotined in Paris, July 23, 1794. He was admitted in 1742 into the body guard of Frederick the Great, and when only 18 years old was selected to instruct the Silesian cavalry. In the campaign of 1744 he served with distinction, acting as the adjutant of Frederick, with whom he became a favorite. In his memoirs he says he offended the king by an amour with the princess Amelia, but the story is apparently without foundation. In 1746 he again distinguished himself; but having corresponded with his cousin Baron Franz, then in the Austrian service, he was arrested and imprisoned in the fortress of Glatz for more than a year. After several desperate efforts he escaped and went to Vienna, where he got into much trouble and fought several duels. After the peace he was received with much favor at Moscow. His cousin left him his estate, on condition that he should become a Catholic and should serve only the house of Austria. To secure this he went to Vienna in 1750, but after three years of waiting he received only 63,000 florins. By the Austrian court he was made captain of cavalry. In March, 1754, he made a journey to Danzig to settle some family affairs, and was there apprehended by the Prussian authorities, carried to Berlin and thence to Magdeburg, where he was confined in a dungeon in the citadel. He made several desperate efforts to escape, but failed in all of them, and after ten years' imprisonment, during which he was more and more heavily loaded with irons, he was finally released by order of Frederick in December, 1763, and carried to Prague. Disappointed of preferment at the Austrian court, he retired to Aix-la-Chapelle, married there in 1765, and lived for several years in peace, occupying himself with literary pursuits. In 1767 he appeared his poem Der macedonische Held, which gave him considerable reputation in Germany. He also engaged in the wine trade. From 1774 to 1777 his time was spent chiefly in travelling through England and France. Subsequently he retired to his estate at Zwerbach, spent several years in agricultural pursuits, and published a collection of his works and a history of his life. After the death of Frederick in 1786 the confiscation of his estates was annulled, and he was permitted to return to his native country. During the French revolution he went to Paris, where he was arrested by the committee of public safety and put to death on the charge of being a secret emissary of the king of Prussia. His autobiography is very interesting, and has still considerable circulation, though it is certain that Trenck was a braggart and a liar, and has immensely exaggerated his adventures.

TRENCK

TRENDELENBURG, Friedrich Adolf, a German philosopher, born at Eutin, near Lubeck, Nov. 30, 1802, died in Berlin, Jan. 24, 1872. In 1826 he graduated in Berlin, where he was private tutor till 1833, and subsequently professor at the university, of which he was three times rector. He was also for over 20 years secretary to the historico-philosophical section of the Berlin academy. He was a follower of Aristotle and an opponent of Hegel. His works include Elementa Logicae Aristotelicæ (Berlin, 1837; 6th ed., 1868); Logische Untersuchungen (1840; 3d ed., 1870); Geschichte der Kategorienlehre (1846); Historische Beiträge zur Philosophie (2d and 3d vols., 1856–67); Naturrecht auf dem Grunde der Ethik (1860; 2d ed., 1868); Lücken im Völkerrecht (1870); Kuno Fischer und sein Kant (1869), which led to Fischer's Anti-Trendelenburg (1870); and Kleine Schriften (2 vols., 1871).—See Bonitz, Zur Erinnerung an Friedrich Adolf Trendelenburg (Berlin, 1872).

TRENT, a river of England, which rises in Staffordshire, 4 m. N. of Burslem, flows through the central part of the country, and near Burton-on-Stather, Lincolnshire, joins the Ouse to form the estuary called the Humber. Its course is first S. E., then N. E., and finally N. Its total length is about 150 m., of which 25 m., as far as Gainsborough, is navigable for vessels of 200 tons, and 117 m., reaching to Burton-on-Trent, for barges of 25 tons. Its chief tributaries on the right are the Sow, Tame, Soar, and Devon, and on the left the Blyth, Dove, and Derwent; and it is connected with other navigable waters by canals. Stoke and Nottingham are situated on its banks.

TRENT (Ital. Trento; Ger. Trient; and Tridentum), a city of Tyrol, Austria, on the left bank of the Adige, 83 m. S. by W. of Innsbruck; pop. in 1870, 17,073. It is in a beautiful valley, surrounded on the east by mountains, and is Italian in its architecture. It has a cathedral built entirely of marble in the Byzantine style. In the church of Sta. Maria Maggiore, of red marble, are the traits of the members of the council of Trent, which was held in that building. The extensive castle is generally the residence of the local prince-bishop. Silk is the principal manufacture; wine is largely produced; and there is an active transit trade. —The ancient Tridentum was a town of the Rhetians, and subsequently became a Roman colony. Under the old German empire it was a free imperial city, ruled by prince-bishops. In 1802 it passed under the domination of Austria.

TRENT, COUNCIL of (concilium Tridentinum), the 19th eumenical council, according to the Roman Catholic church. The first occasion for an eumenical council in the 16th century was furnished by Luther, who on Nov. 28, 1518, appealed from the bull of Leo X. to a general council, and was supported by the Protestant princes. The Catholic sovereigns also desired that a council should be convened.
Three popes, Leo X., Adrian VI., and Clement VII., died before the demands of the Germans were complied with. At length Paul III., after failing in attempts (1556–8) to convene a council at Mantua, and next at Vicenza, convoked it for Nov. 1, 1542, to assemble at Trent; but on account of the war between the emperor Charles V. and Francis I. of France he again put off the day of opening to March 16, 1545, and the actual opening did not take place until Dec. 13, 1545. The objects of the council were to effect a reformation of the church, to define more explicitly the impugned doctrines of the church, and, if possible, to induce the Protestants to return to the old faith. At the second session (Jan. 7, 1546) the council fixed the mode of transacting business. The discussions and deliberations were to take place in private congregations; subsequently general congregations were to draft the resolutions, which finally were to be promulgated in public sessions as decrees. In the third session (Feb. 4) the Nicene creed was read and declared to be the basis of the further proceedings. In the fourth session (April 8) tradition was declared to be equally with the Bible a rule of faith; the Apocrypha of the Old Testament were included in the Biblical canon; the Vulgate was proclaimed to be the authentic version of the Bible, and the church its only legitimate interpreter. In the three following sessions (June 17, 1546; Jan. 13 and March 8, 1547), the Catholic doctrines of original sin, justification, and the sacraments were defined, and an anathema pronounced upon all who rejected these doctrines. In the eighth session (March 11), 38 of the 56 bishops present, together with the papal legate, determined, on the ground of being exposed at Trent to the plague, to adjourn to Bologna, notwithstanding the decided opposition of the emperor, at whose request 18 German and Spanish bishops remained at Trent. At Bologna, where 6 archbishops, 32 bishops, and 4 generals of religious orders were present, the 9th and 10th sessions were held (April 21 and June 2); but, at the express order of the pope, who had some apprehensions of a schism, no decrees were promulgated, except decrees of prorogation. As Charles V. could not be prevailed upon to recognize the council of Bologna, the council was indefinitely prorogued by a bull of Pope Paul III., dated Sept. 17, 1549. The pope died in November, 1549, and on May 1, 1551, the council was reopened at Trent. The order of Julius III. France protested against the continuation, and all the French bishops and theologians withdrew. In the succeeding transactions the Jesuits Laynez and Salmeron, who were sent to the council as papal theologians, took a leading part. There appeared also representatives from the Protestant princes of Württemberg and Brandenburg, and even Melanchthon was summoned there by order of the elector Maurice of Saxony; but it was found impossible to effect a reunion, and soon the outbreak of a new war of the Protestant princes against the emperor caused the assembled fathers (April 28, 1552) to suspend their deliberations. During this period, extending from the 11th to the 16th session, the doctrines of the eucharist, confession, and extreme unction, and two reformatory decrees on the jurisdiction of the bishops, were promulgated. Paul IV. was anxious to assemble the council at Rome, but Pius IV. consented to its reopening at Trent, which took place on Jan. 18, 1562, through the cardinal legate Prince Ercole Gonzaga of Mantua. The representatives of Charles IX. of France and the emperor Ferdinand I. wished to conciliate the Protestants by granting the cup to the laity, and the duke of Bavaria demanded the abolition of celibacy. The former question was referred to the pope; the latter was unanimously rejected. On Nov. 13 the cardinal of Lorraine arrived, with 14 bishops, 3 abbots, and 18 theologians from France, and presented in the name of his nation 84 reformatory articles, but subsequently abandoned their advocacy. On the question whether episcopal jurisdiction proceeds immediately from Christ, or mediatel y only and through the pope, no decree was arrived at; it being simply declared that "bishops established by the Holy Ghost, to rule the church of God." Decrees were adopted ordering an index of prohibited books to be made, and defining the doctrines of the mass, ordination, the hierarchy, marriage, celibacy, purgatory, the veneration of saints, relics, and images, monastic vows, indulgences, and fasting and abstinence. Several "reformatory" decrees were also passed, the most important of which enjoined the establishment of theological seminaries. The close of the council was hastened by a serious sickness of the pope, and his fear that his death might lead to a schism. It took place on Dec. 4, 1563, at its 28th and last session. The decrees were signed by 255 members, consisting of 4 legates, 2 other cardinals, 3 patriarchs, 25 archbishops, 168 bishops, 39 representatives of absent bishops, 7 abbots, and 7 generals of religious orders. An authentic copy was also signed by the ambassadors of the secular governments, with the exception of the ambassador of Spain, who was without instruction, and the ambassador of France, who was absent. The decrees were confirmed by the pope, with the unanimous consent of the cardinals, in the consistory of Jan. 26, 1564; but the pope reserved to himself the right of explaining obscure or contrived points. The council was accepted unconditionally by most of the Italian states, by Portugal, Poland, and the German emperor; with a reservation of the royal prerogatives by Spain, Naples, and the Netherlands; with some exceptions by Switzerland and Hungary; and only so far as respects doctrines by France.—The "Canons and Decrees" of the council were printed by Aldus Manutius (Rome, 1564). The "Catechism," an authorized summary of the faith drawn up.
by order of the council, appeared at Rome in 1566, and the collection of documents relating to its history was edited by Le Plat (7 vols. 4to, Louvain, 1781). The first complete history of the council was written by Paolo Sarpi (London, 1619; English translation by Brent, London, 1676), in a spirit of decided opposition to the papal court. Against him wrote Cardinal Sforza-Pallavicino (2 vols., Rome, 1656–7). A work on the discrepancies of both has been published by Dr. Brischar (2 vols., Tübingen, 1843). Mendham's "Memoirs of the Council of Trent" (London, 1884) contains extracts from 25 volumes of manuscripts collected in Italy by Lord Guilford. See also Waterworth's history of the council prefixed to his translation of its canons and decrees (London, 1848), and Étude historique sur le concile de Trente, by L. Maynier (part i., Paris, 1874). Important "Documents relating to the History of the Council of Trent" have been published from Austrian archives by Tiekel (Vienna, 1873). The long expected publication of the original acts of the council, by Augustin Theiner, prefect of the Vatican council, took place in 1874 (Acta genuina Soe. Ecumenici Concilii Tridentini, Agræm); the work is believed to give, not the minutes of the council as they were taken down by the secretary, but a careful revision. 

TRENTE ET UN. See Rouge Et Noir. 
TRENTON, a city and the capital of New Jersey and of Mercer co., on the left bank of the Delaware river at the confluence of Assunpink creek, and at the head of steamboat navigation, 28 m. N. E. of Philadelphia, and 55 m. S. W. of New York; lat. 40° 14' N., lon. 74° 46' 30" W.; pop. in 1860, 17,228; in 1870, 22,874, of whom 5,019 were foreigners; in 1875, 25,031. The city is regularly laid out, and lighted with gas. Assunpink creek divides it into nearly equal parts, Trenton and South Trenton. Water is raised from the Delaware to a reservoir N. of the city. The capitol is a handsome stone building, recently enlarged, 240 ft. by 120, stuccoed in imitation of granite. The county court house is in South Trenton. There is also a good city hall. Trenton contains one of the state lunatic asylums, founded in 1848, and having accommodation for 600 patients; the state normal school, established in 1855, and having extensive buildings; the state penitentiary, and the state arsenal. There is now (1876) in course of construction by the United States government a large and handsome building, of Ohio sandstone, intended for the post office and United States courts and offices, to cost $500,000. The soldiers' children's home and the state industrial school for girls are near by. There are two bridges over the Delaware opposite the city, one 1,100 ft. long, built about 1810, and recently reconstructed of iron, and the other about 1,300 ft. long, completed in 1860. The Delaware and Raritan canal passes through the city, forming a water communication with Philadelphia and New York, and, by its navigable feeder, with Lambertville and New Hope, about 18 m. N. Trenton is connected with Philadelphia and New York by the Pennsylvania railroad, and is the point of junction with the Belvidere Delaware railroad, which runs to the Water Gap and connects with the coal regions of Pennsylvania. The manufacture of crockery is the most important industry, Trenton surpassing all other places in the country in this respect. There are 18 potteries, producing white granite and brown ware to the value of about $3,000,000 annually. The city also contains iron foundries, breweries, paper mills, woolen mills, rolling mills, rubber works, zinc works, and manufactories of engines and boilers, wire, terra cotta, bolting and hose, edge tools, soap, carriages, nails, saws, scales, &c. There are two national banks with a joint capital of $1,000,000, a state bank with $500,000 capital, three savings banks, and two insurance companies with a joint capital of $700,000. The city is governed by a mayor and a common council of three members from each of the seven wards. It has street railroads and an efficient fire department. The principal charitable institutions are a home for widows, a children's home, and the hospital of St. Francis. There
are a high school and 11 other public schools, with about 50 teachers and an average attendance of about 2,000 pupils, besides academies and Roman Catholic schools. The state library contains 20,539 volumes, the law library 15,000, and the public library about 5,000. Six daily, one semi-weekly (German), and six weekly newspapers are published. There are 34 churches, viz.: 4 Baptist, 3 Episcopal, 1 Evangelical Lutheran, 2 Friends', 1 Jewish, 1 Lutheran, 1 Messiah, 12 Methodist, 6 Presbyterian, and 5 Roman Catholic.—The first settlement in the vicinity was made about 1690, and was named in 1790 in honor of Col. William Trent, speaker of the house of assembly. It was selected as the capital of New Jersey in 1790, and incorporated as a city in 1792. On the night preceding Dec. 26, 1776, Gen. Washington crossed the Delaware river at McConkey's ferry, and attacked the Hessians, who were encamped in Trenton, surprising and routing them completely, taking about 1,000 prisoners, 6 brass field pieces, 1,200 stand of arms, and the standards of an entire brigade. The Hessians numbered about 1,800, and 17 were killed in the skirmish, while the Americans lost not a man in the fight, although two were frozen to death in re-crossing the river. The force of the enemy in the vicinity being superior to Washington's, he returned to his camp on the other side of the Delaware on the night of the 26th.

**TRENTON FALLS**, a village of Oneida co., New York, on West Canada creek and the Utica and Black River railroad, 18 m. N. E. of Utica; pop. in 1870, 128. It is named from the falls in its neighborhood, six in number, occupying at intervals a ravine 2 m. long, with an aggregate descent of 312 ft. The cascades are exceedingly beautiful, and the rocky walls in some places are 150 ft. high.

**TRENITSCHIN** (Hung. Tremeń, a N. W. county of Hungary, bordering on Moravia, Austrian Silesia, and W. Galicia; area, 1,784 sq. m.; pop. in 1870, 248,626, nearly all Slovaks and Roman Catholics. It is traversed by two branches of the Carpathian mountains, and watered by the Waag and its affluents. Its chief products are corn, fruit, flax, and hemp; and it has famous mineral springs. The capital, Trenitschin, on the left bank of the Waag, is remarkable for the springs in its vicinity, and for its castle, one of the oldest and strongest in Hungary, situated on a rocky eminence; pop. in 1870, 3,449.

**TREPAN** and **Trephe** (Gr. ῥυπαν, to perforare), two surgical instruments used for removing portions of bone from the skull or other parts of the bony structure. The first was an instrument like a gimlet, to which was attached a crown or cylinder with saw teeth on its lower edge, and which was worked by a rotatory motion till it perforated the bone. Several sizes of these cylinders were furnished. The trepher is of later invention. It has a cylindrical saw, but no gimlet. A sharp steel point called a centre pin, which can be pressed into the bone until the saw has made a groove for itself, passes down the centre of the instrument, and is removable by the operator as soon as the groove is made. The cutting is accomplished, not as in the trepan by a rotatory movement, but by semi-rotation, as in boring with an awl. The method of trephining is as follows: A crucial incision is made down to the bone, and the periosteum being dissected up, the trephine is applied, the centre pin being removed as soon as the track of the instrument is fixed, and the instrument itself raised every few strokes in order to see that it is not cutting through on either side, upon the tissues below. The greatest danger is when the circular piece is nearly separated; and some operators raise the cut portion by means of the elevator, rather than permit the instrument to divide it completely. The spicula of bone which may remain around the orifice are carefully removed by means of forces. Trephining has been considered as indicated when there is a fracture of a portion of the skull, from a fall or blow with a blunt instrument, in order to elevate the depressed portion; in some cases of concussion, where there is reason to believe that the inner table of the skull is fractured at the opposite side of the head, and is producing irritation of the brain; in cases where extravasation of blood has taken place under the meninges of the brain from injuries or disease, or where purulent matter has accumulated under the meninges; in cases affecting the bones of the skull, the sternum or breast bone, or the tibia; and in some cases of a collection of purulent matter under the sternum. During the middle ages, in the "heroic" period of surgical practice, trephining was one of the most common operations of surgery. Of late years the operation is but seldom practised. Hey's saw, with a shaft and handle like a common steel fork, and having a plate of steel 1½ in. in breadth and perhaps 1½ in. long attached to it, one edge of which is a straight and the other a convex saw, has almost entirely superseded the trepher for most of those injuries of the skull which were formerly thought to require its use. By this instrument the depressed portion is itself removed, instead of that which was not fractured, and the injuries to the skull can be remedied with far less loss of bony structure than under the old system.

**TRESPASS** (Prov. Fr. trespasser, from trespasser, to pass beyond, and passer, to go), in law, as usually defined, a wrongful act, committed with some kind of violence, and injurious to the person, property, or rights of another. Its literal meaning is precisely the same as trespassion; it is a step beyond the limits of law or right. In the old law Latin the word *transgressio* was used where trespass is used in English. Formerly the two words were employed in writing and conversation with the same meaning, but now trespass is commonly used
TRESSES

TREVES 861

only in the legal sense, and is an important law term. Familiar examples of trespass are assault and battery, forcible entry into a house or upon lands, breaking open a door, and tearing down a fence. Such acts are in law trespasses *vi et armis*, or, in the English phrase now used in indictments and declarations, trespasses with force and arms. Early in the history of the law a very slight degree of violence was sufficient to constitute this offence; and soon afterward the law held that it might be committed in some cases without any actual force whatever, implying by construction the force necessary to make it a trespass *vi et armis* if the act were unlawful. Thus, for example, a peaceable entry into a house or land, with intent to take possession and oust the true owner, was regarded as a trespass *vi et armis*. Soon after there grew up a large and very important class of trespasses, where there was neither actual nor constructive force. The courts in fact invented a form of action, by means of which remedies might be given for a great number of injuries, to which the law of trespass with force and arms could not be made applicable by any construction. This new legal trespass was called, in the law Latin in use when the action was first employed, *transgressio super eumum*, and is now called a trespass on the case. In the days of special pleading it had become very difficult to determine whether the action by which redress was sought for in certain injuries should be trespass or trespass on the case; and if the plaintiff mistook his form of action, he wholly failed. But by recent statutes, with the rules of court and the amended practice, if a mistake be made it may be corrected without delay and without cost. Trespass with force and arms (or trespass alone, for the latter clause is often omitted) lies when the injury complained of is itself the wrong done by the defendant; while trespass on the case lies when the injury was consequential upon the wrong done, and flowed from it indirectly. For example, trespass on the case lies for an injury sustained by the plaintiff from the defendant's sale to him of unwholesome food, as meat or wine, especially where it was the business of the defendant to sell these things. So for an injury caused by the want of skill of any person in the exercise of his profession, as a physician or lawyer. There is yet another nice and very important distinction in the law of trespass. A man may begin by doing a right thing in a right way, and then so change his course as to do a wrong thing, or a right thing in a wrong way. In some of these cases such a person thus subsequently trespassing is regarded by the law as a trespasser *ab initio*, or as having been a trespasser through the whole of his conduct. Thus, if, in the execution of a legal process, he does something which is distinctly illegal, the law considers that he began to act with intent to do an illegal thing, and that all of his conduct was tainted by this intention and was therefore illegal. The doctrine is applied only where the wrong was done while in the exercise of a strictly legal right, which the injured party had no right to resist, and seems to be confined by the best authorities to the cases of an officer of the law acting under a legal warrant, and a guest at an inn.

TREVES (Ger. *Trier*), a town of Rhenish Prussia, on the right bank of the Moselle, 57 m. S. W. of Coblenz; pop. in 1871, 21,448. It is a decayed place, noted for its ultramontanism and for a cathedral which exhibits the development of the Romanesque style from the earliest period down to its completion in the 12th century, and contains remarkable altars, tombs, missals, and reliques. (See *Der Dom zu Trier*, by Wilnowsky, Treves, 1875.) Among the reliques is the so-called "holy coat," which pilgrims revere as the seamless garment of the Saviour, and believe to have been deposited in the church by the empress Helena, the alleged founder of the building. The great agitation which resulted in 1844 from the multitudes (estimated at more than 1,000,000) flocking to this shrine was the main origin of the German Catholic denomination. Adjoining the cathedral is the *Liebfrauenkirche* of the 18th century, one of the earliest and finest specimens of pure Gothic. The university, founded in 1472, was superseded in 1798 by a gymnasium, which contains a city library of 100,000 volumes. In the old electoral palace are the barracks. The Roman antiquities, more numerous here than anywhere else in Germany, include part of the bridge over the Moselle, an amphitheatre, baths, and the colossal quadrangle known as *porta nigra*, the most conspicuous of all. The chief articles of trade are fruit, wine, timber, stones, and woollen and other manufactures.—Treves was originally occupied by the Treveri, a Celtic tribe of Belgic Gaul, and under the Romans became the capital of a province under the name of Augusta Trevirorum. In the 4th century the town was improved by Constantine
the Great. Under the Franks it was included in the kingdom of Austrasia, and afterward belonged alternately to Lorraine and Germany, till in the 10th century it was permanently annexed to the latter country. Subsequently, under the rule of archbishops, it became with its territory the second German electorate, divided into an upper and lower see, the latter connected with the episcopal capital at Coblenz. The city of Treves was invested with sovereign rights from 1580 till its occupation by the French in 1794. The whole electorate was in 1797 incorporated with France. In 1814 Treves was annexed to Prussia. The suppression of the priests' seminary, Dec. 31, 1873, and the subsequent imprisonment of the bishop, produced disturbances which were quelled in March, 1874.

TREVIRANS. I. Gottfried Reinhold, a German naturalist, born in Bremen, Feb. 4, 1776, died there, Feb. 16, 1837. He studied medicine at Göttingen, and after practising at Bremen became in 1797 professor of mathematics in the lyceum of that city. His works include Physiologische Fragmente (2 vols., Hanover, 1797-98); Physiologie der lebenden Natur (6 vols., Göttingen, 1802-29); Erschei-
nungen und Gesetze des organischen Lebens (2 vols., Bremen, 1831-2); and with his brother Vermischte Schriften anatomischen und physiologischen Inhalts (4 vols., Göttingen and Bremen, 1816-21).

II. Ludolf Christian, a German botanist, brother of the preceding, born in Bremen, Sept. 10, 1779, died in Bonn, May 6, 1864. He became professor of medicine at Berlin in 1807, of botany and natural history at Rostock in 1812, professor of botany and director of the botanical garden at Breslau in 1816, and afterward at Bonn. He is chiefly known by his Physiologie der Gewächse (2 vols., Bonn, 1835-9).

TREVISO. L. An E. province of Italy, in Venetia, bordering on the gulf of Venice; area, 941 sq. m.; pop. in 1879, 352,538. It is level, excepting in the north, and is one of the most fertile regions of that part of Italy. The main river is the Piave. The chief products are hemp, flax, grain, wine, and timber. It is divided into the districts of Treviso, Ceneda, Castelfranco, Oderzo, Asolo, Valdobbiadene, Montebelluno, and Conegliano. II. A fortified city (anc. Tarvisium), capital of the prov-
ence, on the Sile, 15 m. N. W. of Venice; pop. in 1872, 28,291. It is the seat of a bishop, and has an unfinished cathedral, with works by Titian and Paul Veronese, a large Gothic church, a celebrated palace of justice, a lyceum, gymnasium, seminary, and academy of science. In the 13th century it was captured and op-
presed by Ezzelino da Romano; in the 14th it was successively ruled by Francesco della Scala of Verona, by Venice, Austria, and Padua, and was with its territory in the possession of Venice from 1388 till the occupation of the town in 1797 by the French under Mortier, who in 1807 received the title of duke of Tre-
viso. It afterward belonged to Austria. In March, 1848, it was taken by the revolutionists, but the Austrians regained it on June 24, after a second bombardment. In 1866 it became part of the kingdom of Italy.

TRIBONIANUS, a Roman jurist, died A. D. 545. Under Justinian he occupied the offices of quaestor sacri palatii, of magister officiorum, of praetorian prefect, and of consil. He is described as a man of great natural abilities and learning, but avaricious and corrupt. In 528 he was one of the ten commissioners selected by the emperor to form his first Codex, and in 550 was placed at the head of the committee to compile the Pandects or digest of Roman laws, which was finished and promul-
gated in 553. He at the same time, with two others, compiled the four books of the Insti-
tutes of Justinian, published in 553; and the second Codex of that emperor, published in 554, was the work of Tribonianus and four other jurists. (See Civil Law.)

TRIBUNE (Lat. tribunus), originally, a Ro-
am officer who presided over one of the three tribes, Ramenses, Ticineses, and Laceses. In the long course of Roman history the name came to be applied to various officers with widely different powers and duties. As originally constituted, the Roman legion consisted of 300 cavalry and 3,000 infantry; over the cavalry presided an officer called tribunus cele-
um, and over each 1,000 of the infantry a tribunus militum. The tribunus celerum dis-
appeared with the overthrow of the monarchy. The office of the tribunum militum continued through the whole course of Roman history, but the manner of their appointment, their num-
ber, and their powers and duties were often changed. "Tribunes of the soldiers, with consu-
lar power," were first chosen in 444; and in succeeding years sometimes consuls and some-
times tribunes with consular power were chosen. In 287 the office was abolished, and there-
after only consuls were chosen. The name "tribune of the Servian tribes" is applied by historians to the administrative chiefs of the local tribes which were gradually added to the Roman commonwealth; it is supposed by Nie-
buhr and others that the tribunes of the trea-
sury of later times were similar to them. The "tribunes of the people" were the most im-
portant of all the officers bearing the name. They were first appointed after the secession of the community to the Mons Sacrorum, in 494. They were empowered to protect the plebeians against the usurpations of the patrician magis-
trates, and their persons were declared sacred and inviolable. They appear to have been originally two in number, and to have been elected for one year by the comitia of the cen-
turies. In 471, by the Publilian law, the elec-
tion was given to the comitia of the tribes. About the same time the number was increased to five, and from 457 B. C. until the end of
the empire ten tribunes were annually elected. None but plebeians were eligible for the office; so that if a patrician were desirous of filling it, he was obliged to renounce his own order. The early incumbents of the office exercised authority within the city limits and over one mile of adjacent territory; the doors of their houses were ordered to be open day and night, and all persons taking refuge there were assured of protection. For similar reasons they were forbidden to absent themselves from the city for a whole day. Although their lawful power was originally merely auxilium, or the right to afford protection, they assumed within a few years the right to convocate the senate, and in 434, after a long struggle, secured the appointment of the three commissioners whose labors led to the codification of the laws of the twelve tables. During the second decennvirate the tribunate was suspended, but with the overthrow of that oligarchy it was restored with augmented powers; and as the tribes now included patricians and their clients as well as plebeians, the tribunes became the protectors of all classes of citizens. They now also acquired the right to be present at the deliberations of the senate, and to take part in its discussions, although not allowed to pass within the doors of the senate house; and hence they gradually assumed the privilege of intercession against any action taken by a magistrate, and by the interposition of their veto were enabled to annul any decree of the senate or stop any law, without cause or reason assigned. On the other hand, they sometimes interfered to compel the consuls to comply with decrees of the senate. About 132 B.C. they became senators by virtue of their office. They also assumed the right of commanding their siatores or attendants to seize a refractory magistrate, and imprison him, or even to hurl him from the Tarpeian rock. They possessed the exclusive power of proposing plebiscita to the comitia of the tribes; and after these had obtained by the Hortensian law, 286 B.C., the binding force of laws, the tribunes became a magistracy for the whole Roman people, in opposition to the senate and the oligarchical elements in general, although they had nothing to do with the administration of the government. Subsequent to 394 B.C. the veto of a single tribune sufficed to render a resolution of his colleagues void; and it was not until Tiberius Gracchus introduced the practice of appealing to the people to remove a tribune who obstinately adhered to his veto, that the harmonious working of the system was restored. During the latter period of the republic Sulla, in his reform of the constitution on an aristocratic basis, gave the tribunes merely the jus auxiliarum which they originally possessed. Pompey restored them to their former power, but under the empire, their privileges became much restricted, although until the 4th century they continued to have the right of intercession against decrees of the senate and on be-

half of oppressed individuals. The emperors, though patricians, found it necessary to be tribunes, and the tribunicius potestas, conferred by the senate upon Augustus and his successors, was considered an essential part of the imperial dignity. After Diocletian there was an officer called tribunus eolupitatum, who was the superintendent of public amusements.

TRICHINOPOLY, or Trichinapalli, a town of British India, capital of a district of the same name in Madras, on the right bank of the river Caverry, in lat. 10° 47' N., long. 78° 48' E., 190 m. S. S. W. of the city of Madras, with which it is connected by rail; pop. about 30,000. The fort of Trichinopoly is built on a granite rock about 600 feet high. Outside the densely populated native town, which was formerly enclosed within the walls of the fortress, are extensive barracks, hospitals, public rooms, a church and Roman Catholic chapel, and the tomb of Bishop Heber, who died here. The surrounding country is fertile and populous; and the island of Seringham, which is here formed by the Caverry, is famous for the size and wealth of the Hindoo pagodas upon it. Trichinopoly is the southernmost station of British troops in India, and was occupied by 169 European infantry in 1872-3. Cotton cloths, hardware, harneses, cheroots, indigo, and jewelry are manufactured and exported to different parts of India and Mauritius.—Trichinopoly, after the death of its last rajah in 1732, fell under the sway of the nawabs of Arcot, and subsequently changed hands several times, figuring conspicuously in the contests of the French and English for supremacy in India. It finally came under English government with the rest of the Carnatic in 1801.

TRICEPIS, Spiridion, a Greek historian, born in Missolonghi in 1791, died in Athens, Feb. 24, 1873. He held important offices at Athens after the Greek revolution, which he had promoted, and was minister at London at various periods, lastly from 1850 till King Otho's downfall in 1862. He was a friend of Lord Byron, on whose death he pronounced one of his most celebrated orations. His chief work is Τοργάδα τῆς Ἐλληνικῆς Ερωτημάτως ("History of the Greek Revolution," 4 vols., London, 1852-7; 2d ed., 1862).

TREB. See TREVES.

TRIESTE (Ger. Triest). I. A district of Cisleithian Austria, forming a part of the Littorale, and bordering on the Adriatic, Görz, and Istria; area, 36 sq. m.; pop. about 183,000, of whom more than one half are Slovenes, more than one third Italians, 8 per cent. Germans, and 43 per cent. Jews. II. A city (anc. Terracina), capital of the district, and the principal seaport of Austria, beautifully situated at the head of the gulf of Trieste, or N. E. coast of the Adriatic, 70 m. E. N. E. of Venice and 210 m. S. W. of Vienna; pop. in 1870, including

795 VOL XV.—55
The museum is now protecting a statue that was removed from the city of Trieste. The museum is one of the largest organizations of the kind in the world. Trieste is Italian in appearance and in language, though much German is spoken. There are Greek and English merchants. The constant arrival and departure of steamers make the port very lively; but the increase of commerce and population is of comparatively recent origin. In 1758 the population was only 6,000. In 1873 the arrivals of vessels numbered 8,046, chiefly Italian and Austrian, and the departures 8,319, with a respective tonnage of 898,487 and 909,402. The imports, chiefly coal, grain, iron, and oil, amounted to 140,164,000 florins, and the exports, mainly grain, flour, timber, and staves, to 92,377,000 florins. This was a decline from previous years, due to the competition of Hamburg; and the sanguine expecta-

tions of increasing the importance of Trieste in the India trade have been rather damped since the opening of the Suez canal. Its status as a free port is limited by the government monopoly of gunpowder, salt, and tobacco, and by an excise upon wine, spirits, and other articles. A breakwater for protecting the port was begun in 1865, and an abortive attempt was made in 1874 to fill up the malarious part of the canale grande, originally intended to supplement the port and the roads.—Tergeste was originally settled either by the Carnians or Istrians. The earliest historical mention of it as a Roman town dates from 51 B.C. Augustus laid the foundation of its prosperity. It was under the dominion of the Ostrogoths, and afterward of the Greek emperors, till the period of the Lombard invasion. Subsequently Trieste became independent under its bishop, who bore the title of count, and who gradually sold to the inhabitants the privileges of a free city. Long wars ensued with the patriarchate of Aquileia, which claimed the allegiance of the bishops of Trieste, and in these wars Venice and Genoa also took part. The peace of Turin in 1851 acknowledged Trieste as an independent city, and the next year the citizens voluntarily submitted to the house of Austria. Charles VI. declared it a free city in 1719, and Maria Theresa made it a free port in 1750. It was taken by the French in 1797 and 1806. From 1809 to 1814 it belonged to the French province of Illyria, and subsequently to the Austrian kingdom of that name till 1849, when the so-called kingdom was dissolved. In reward for its fidelity to Austria during the revolutionary period of 1848–9, when the port was blockaded by an Italian squadron, the city and district were invested on Oct. 2, 1849, with the privi-
leges of local self-government; and by the constitution of Dec. 21, 1867, they were made a constituent part of the Littoral province.

TRIGG, a S. W. county of Kentucky, bordering on Tennessee, bounded W. by the Tennessee river and drained by the Cumberland river; area, 530 sq. m.; pop. in 1870, 13,686, of whom 3,806 were colored. The surface is hilly and the soil fertile in parts. Horses, cattle, mules, and swine are exported in great numbers. Iron, bituminous coal, and limestone are found. The chief productions in 1870 were 92,371 bushels of wheat, 519,820 of Indian corn, 16,114 of oats, 18,832 of sweet potatoes, 3,614,363 lbs. of tobacco, 18,442 of wool, 83,308 of butter, and 534 tons of hay. There were 2,673 horses, 1,908 mules and asses, 2,440 milch cows, 3,311 other cattle, 9,439 sheep, and 24,258 swine; 4 flour mills, 1 manufactory of pig iron, 4 tanneries, 4 currying establishments, and 3 saw mills. Capital, Cadiz.

TRIGONOMETRY (Gr. tri'gono, a triangle, and metri', to measure), the branch of mathematics which treats of the measurement of triangles. The practical object in nearly all applications of the science is to measure indirectly some height or some distance the direct measurement of which would be inconvenient or impossible. The labors of the civil engineer and the astronomer consist in great part in a constant application of the principles of trigonometry, and the best treatises on the subject, like that of Prof. Peirce, include also treatises on surveying, navigation, and spherical astronomy. Trigonometry is divided into plane and spherical, the former treating of plane triangles, the latter of spherical triangles. In surveying and ordinary engineering operations plane trigonometry is mostly employed; in the higher problems of navigation, in engineering operations conducted on a grand scale, as in the coast survey, and in astronomy, spherical trigonometry is indispensable. But the general principles are the same in both branches. As spherical trigonometry consists essentially in an extension of the principles of plane trigonometry, we shall confine our attention to the latter. In every plane triangle there are six elements to be considered, three sides and three angles. The angles depend upon the proportions of the sides, and conversely the proportions of the sides depend upon the angles. If we know the three angles, we can find the ratio which any one side bears to each of the others, but we cannot find the length of any one of them; hence it is necessary for the complete determination of all the elements of a triangle, that we should know the length of at least one side. In calculating the unknown elements of a triangle certain ratios are employed, called "trigonometrical functions," which depend upon the angles. One quantity is said to be a function of another when its value depends upon the value of the other. The ordinary method of measuring angles is explained under ANGLE.—There are

two methods of explaining the trigonometrical functions. The one, which may be called the ancient method, is presented in nearly all the text books in use before the middle of the present century; the other or modern method is followed in the best text books of recent date, and is fast superseding the former. In the old system the trigonometrical functions are lines, in the new system they are abstract numbers expressing the ratios of lines. A brief explanation of the modern system will enable the general reader to form an idea of the nature and objects of the science. Draw two lines, OA, OB, fig. 1, forming an angle at C. At any point in either line, say at P in the line OB, erect a perpendicular to OB, intersecting OA in D. It matters not where in the line OB the point P is; so long as the angle at C remains unchanged, the proportions of the lines CD, CP, and PD will remain the same. In the figure the angle at C is intended to be an angle of 30°; and with this angle, if CD is an inch, PD will be half an inch, and if CD is ten miles, PD will be five miles; in other words, with an angle of 30°, PD is always half of CD. The number \( \frac{1}{2} \) is called the "sine" of 30°, or \( \frac{PD}{CD} = \frac{1}{2} \) = sine of 30°. If the angle C be altered, the ratio \( \frac{PD}{CD} \) will change, and hence the sine is said to be a function of the angle. But the sine does not vary directly as the angle. When the angle is a right angle or 90°, the lines CD and PD fall together and become one line, and their ratio is 1, or the sine of 90° = 1; and although the angle is three times 30°, the sine is only twice the sine of 30°. The ratio of CP to CD, or \( \frac{CP}{CD} \), is called the "cosine" of the angle at C. The cosine of 30° is the decimal fraction 0.866 very nearly. The ratio of the sine to the cosine, or of the line PD to CP, is called the "tangent" of the angle at C. The tangent of 30° is \( \frac{1}{2} \), divided by \( \frac{1}{2} \), or, in decimals correct to three places, 0.577. The sine and cosine are never greater than 1, and hence in all cases except where the line CD coincides with one of the other lines, the sine and cosine are fractions. The tangent may have any value. Thus the sine of 89° 3' is 0.99986, and the cosine is 0.01658; both are fractions less than 1, but the former contains the latter more than 60 times,
and the tangent of 89° 3' is 60·3658. The reciprocals of the sine, cosine, and tangent (that is, \(\csc\), \(\sec\), and \(\cot\), respectively) are called respectively the cosecant, secant, and cotangent of the angle at C. If the cosine be subtracted from 1, the remainder is called the "versed sine;" and if the sine be subtracted from 1, the remainder is called the "versed sine." In practice these names are always abbreviated. Instead of "sine of 30" it is always written \(\sin 30^\circ\), and, putting C for the angle, the abbreviations are as follows: \(\sin C\), \(\cos C\), \(\tan C\), \(\csc C\), \(\sec C\), \(\cot C\), \(\csc C\), \(\sec C\), and \(\cot C\). These terms all indicate numbers depending on the value of the angle, and are called the "trigonometrical functions." The value of these functions has been calculated for all possible angles which our most delicate instruments enable us to measure, and these values are recorded in tables, so that, any angle being given, the functions can be found, or any function being given, the angle can be found, by simply looking in the tables. The numbers employed in trigonometry, especially where great accuracy is required, often contain so many digits that the labor of calculation would be intolerable were it not for the use of logarithms. The tables generally used in practice contain, not the actual values of the functions, but the logarithms of those values. Tables of the actual values are also published, and they can be easily found, if wanted, from their logarithmic values by means of a table of the logarithms of numbers. A single example of the use made of these functions will show how measurements can be made which without them would be inconvenient or impossible. Suppose a person at B, fig. 2, on the bank of a river, on the opposite side of which is a lofty hill, whose highest peak H he can see with his telescope. He wishes to know the perpendicular height of the peak (H X) above the plain C B. Supposing him to be provided with the proper instruments for measuring angles, he takes a sight at the peak H and finds that the angle of elevation X B H is 28° 41'. Subtracting this from 180°, he finds the angle H B C = 151° 19'. Next he measures back from the river say 1,000 ft. to C, and then takes another sight at the peak and finds that the angle H C X is 18° 4'. The rest is matter of calculation and looking in the tables. The angles are quickly and easily measured, and the only physical labor of any consequence is the carrying his instruments from B to C and measuring the distance of 1,000 ft. between them. Any other distance than 1,000 ft. would have answered the purpose; but, for reasons which it is not necessary to explain in detail, it will have to be longer. Go and insure accuracy to have the distance BC as near as a rough guess will give to B H. Geometry tells us that if from the angle H B X = 28° 41' we subtract the angle H C B = 18° 4', we shall get the angle C H B, between the two lines of sight. We thus find C H B = 10° 37'. The text books on trigonometry show that in every triangle the sines of any two angles are to each other as the sides opposite the angles. Looking in a table of natural sines (that is, of the actual values, and not the logarithms), we find the sine of 10° 37' is the decimal fraction 0·18424, and the sine of 18° 4' is 0·30102. The side opposite the angle C H B we have measured, and hence we have the proportion, or "sum in the rule of three:" as 0·18424 is to 0·30102, so is 1,000 to B H, the side opposite the angle H C B. Making the calculations, which are much more easily made by means of logarithms, we get 1685·28 ft. as the distance from B to H. We now apply the same process to the triangle B H X. The angle B H X is a right angle, and its sine is 1. The sine of 28° 41' is 0·47997; hence, as 1 is to 0·47997, so is 1685·28 to H X, the height which we wished to find; making the calculations, we find it to be 807·92 ft., or, taking the nearest foot, we say the peak is 808 ft. high. We have only made use of the sines; but all the other functions may come into play, according to the nature of the problem.—The great mathematicians of modern times have shown how trigonometry can be treated as a branch of pure algebra, and all its formulas developed without any reference to triangles. They have also shown how in this abstract form it can be applied to geometry, and a perfectly intelligible explanation given to what are called imaginary or impossible quantities. Treated in this manner, it constitutes the connecting link between the mathematical sciences of the present and those higher but as yet undeveloped branches of the mathematics of the future that have been referred to in the article GEOMETRY, and the foundations of which have been laid in the "Quaternions" of Hamilton, the Ausdehnungslehre of Grassmann, and the "Linear Associative Algebra" of Peirce.—Among the multitude of works on the science, the following are of special excellence: A. De Morgan, "Trigonometry and Double Algebra" (London, 1849); J. Todhunter, "Plane Trigonometry" (4th ed., London, 1869) and "Spherical Trigonometry" (3d ed., 1871); L. Mack, "Goniometrie et Trigonometrie" (4th ed., Paris, 1858); and C. Briot and A. Bouquet, "Leçons nouvelles de trigonométrie" (4th ed., Paris, 1862). (For the application of trigonometry to surveying, see COAST SURVEY, and SURVEYING.)

**Trillium** (Lat. *trilis*, triple, the parts being in threes), a genus of North American plants,
TRILLIUM

now placed in a suborder of the lily family. They are perennial herbs with a short tuber-like rootstock, from which rises a simple, naked stem, usually less than a foot high, bearing at its summit a whorl of three ovate or rhomboid, netted-veined leaves, above which is a terminal flower, usually large, succeeded by an ovate, purple or red, three-celled berry. The trilliums, of which there are about a dozen species, are among the most striking of our spring flowers; their symmetrical structure and the beauty of the flowers in most species are interesting and attractive; they grow in rich moist woods or bogs, some extending from Canada to Georgia, one being peculiar to the far southern states, and two or three to the Pacific coast. The plants have received various common names, among which are three-leaved nightshade, wakerobin, birthroot, birthroot, and Indian balm. The great-flowered trillium (T. grandiflorum) is the showiest species; its pure white flowers, often 3 in. across, and becoming rose-colored with age, are erect and raised above the leaves on a peduncle 2 to 3 in. long. The purple trillium (T. erectum) has rather smaller, dull purple flowers. The red-fruited species (T. erythrocarpum) has its white petals marked at the base with pink or purple stripes. The nodding trillium hides its flowers beneath the leaves by the recurving of its stalk. T. sessile often has its leaves blotched with two shades of green; and the related T. discolor, the southern species, has very ornamental foliage from being variegated with green and brown or purple. All flourish well in the garden, T. grandi-florum being especially ornamental; large numbers of its tubers are sent to Europe, to be sold by the bulb dealers. The roots of trillium contain an acid principle analogous to senegeine and saponine, as well as a volatile oil, resin, and tannic acid. They are astringent, and are said to be tonic and expectorant.

TRILLOBITE

(Gr. τρις, three, and λόβος, lobe), the name of a group of fossil crustaceans, so called from the three lobes into which the body is divided. They do not correspond exactly to any living group, but, according to Burmeister ("Organization of Trilobites," Ray society's publications, 4to, London, 1846), were a peculiar family of crustaceans, nearly allied to the existing phyllopoda (likeopus and branchipus), and forming a connecting link between these and the entomostracan pacelifoda (like ar-ygulus, callichinus, and other parasites called fish lice); they come nearest to phyllopods, especially in the double large eyes, undeveloped antennae, and soft membranous feet, and nearest of all to branchipus; a marked resemblance in the form of the limbus (king crab, or common horseshoe of our coasts), especially the larva, is also observed to that of many species of trilobites. (See KING CRAB.) The general form of the animal is oval, divided into three well defined regions, the head or bucker, the thorax, and the abdomen or py-gidium, the last two composed of semicircular plates or segments, varying in number, by whose movements the animal could roll itself into a ball like the common wood louse and pill bug (oniscus and armadillo). Each of these three divisions presents three lobes limited by two longitudinal depressions; the head is generally the largest and considerably the widest, varying from one fourth to one half the total length, semicircular, with a border often ornamented with granulations, depressions, and spines; the middle portion is the glabella, the grooves which mark its lateral limit corresponding, according to Barrande, to the insertion of the jaws or first pair of feet; the different pieces are united by distinct sutures, which are important zoological characters. Eyes have been denied to some genera; some had eyes when young, but lost them when old; others had two well formed, compound, faceted, prominent eyes, which are often perfectly preserved in the fossil state; they are sometimes larger than half the length of the head, the greatest diameter being almost always the longitudinal; they had no simple eyes. Traces of a mouth have been distinguished in a few; no traces of antennae have been found, and they were probably short and feebly developed. The number of the thoracic segments varies in different genera and at different stages of growth, but is constant in adults of the same species; the terminal portions on the sides are the pleurae, and are curved backward and sometimes very long; traces of nine pairs of feet have been discovered, and they were doubtless soft, membranous, and leaf-shaped, as in phyllopoda. The pygidium was made up of segments like those of the thorax, but consolidated to form a posterior bucker; it was usually semicircular, less long than wide, developed inversely to the thorax, and largest in the more recent genera. The shell had a thinner horny membrane cover-
ing it, becoming more delicate toward the median line; between the two is found in the fossils a stony layer measuring their distance from each other; the lower surface was soft and membranous; the skin was undoubtedly cast as in other articulate and, and Wahlenberg has suggested that some supposed new species may have been founded on their cast shells. They have been divided into three families, according to the nature of their covering: 1, eurypterida; without shell, including the single genus eurypterus (De Kay); 2, eurytherida, with bivalve, bean-shaped shell, including the single genus eurythera (Lam.); and 3, trilobite, with a shell having as many rings as there are joints to the body, containing many genera and species, and divided into two large groups, one with the power of rolling into a ball, like calymene, and the other with no such power, as in oogyria. According to Burmeister, the trilobites moved only by swimming, just below the surface of the water, with the back downward, rolling into a ball when danger threatened from above; and did not creep upon the bottom; they lived in shallow water, near the coast, associating in immense numbers, chiefly of the same species; while only six or eight species occur in a given stratum, the number of individuals was very great; their food consisted of small aquatic animals and their spawn; they underwent progressive metamorphoses, and varied considerably according to age; their metamorphoses are given at length by Barrande, who makes four distinct types, according to the serial development of the different parts.—Trilobites are among the oldest of the articulatea; though none are now living, during the palaeozoic period they were very abundant, and are not the only representatives of their class. They have been most studied in Bohemia, and by M. Barrande. None are found above the carboniferous rocks, and only two or three in them. Barrande's primordial fauna, or the lower Silurian, has one genus but no species passing to his second fauna or middle Silurian, and this has many genera but no species common to it and the third fauna or upper Silurian, which in turn has several genera passing to the Devonian fauna—the whole series affording remarkable proofs of the limitations of faunas in time; the distribution of particular genera and species in space was also very circumscribed, probably on account of their feeble locomotive powers. In America several trilobites, especially paradozides and its allied genera, have been met with in slates formerly classed among the metamorphic rocks, as the P. Harlani (Green), found in Brantree, Mass., in 1856, by Prof. W. B. Rogers, and this and other trilobites found in Canada and Newfoundland.—The trilobites have long attracted much interest, as well on account of the great numbers in which they have been found in many localities, as from their singular conformation, and the perfect state in which their forms are preserved. The eye is very beautiful, and its perfection in many of the stony fossils, especially some brought from the Hartz mountains, and from the upper Silurian limestone of Dudley, England, is very remarkable; the facets or lenses, sometimes nearly 400 in number, are like those observed in the eye of the dragon fly and butterfly, and as in these insects are arranged around a conical tube through which the visual rays enter from almost every direction; in the asaphus caudatus each eye has a range of nearly three fourths of a circle, and both together command a panoramic view. The structure of the eye also indicates the prevalence in those ancient periods of the same conditions of the waters and the atmosphere, as regards their adaptation to the organs of vision, as now obtain.—The geographical range of trilobites is very extensive; these fossils are met with at most distant points, both of the southern and northern hemispheres; they are found all over northern Europe, and in numerous localities in North America, in the Andes of Bolivia, and at the Cape of Good Hope. Trenton For. N. Y., has afforded, in the limestone known by its name, fine specimens of the species calymene Blumenbachii (Brong.). Lebanon, Ohio, is another interesting locality. In Adams co., Ohio, Dr. Locke procured an iotels, to which he gave the specific name megistos, that measured more than 20 in. in length and 12 in. in width; the I. gigas and paradozides Harlani have been found more than 12 in. long. (See “American Journal of Science,” 1871, p. 228, and 1872, p. 268.) TRIMBLE, a N. county of Kentucky, bordering on the Ohio river; area, 150 sq. m.; pop. in 1930, 5,077, of whom 456 were colored. The surface is generally hilly and the soil fertile. The chief productions in 1870 were 31,848 bushels of wheat, 209,060 of Indian corn, 38,216 of oats, 12,647 of potatoes, 658,465 lbs. of tobacco, 10,676 of wool, 24,370 of butter, and 1,268 tons of hay. There were 1,906 horses, 1,064 milk cows, 1,882 other cattle, 3,043 sheep, and 6,512 swine. Capital, Bedford.

TRINCOMALEE, a town of Ceylon, in the N. E. part of the island, in lat. 8° 34' N., lon. 81° 12'; pop. about 20,000. It stands on the N. side of the entrance to a capacious and se-
TRINIDAD

care harbor at the foot of well wooded hills and two heights crowned by forts, besides which the port is defended by numerous fortifications which extend for about a mile along the shore. The inner harbor is landlocked, and has the advantage over all other harbors of India of being accessible to all descriptions of ships during both monsoons. The inhabitants are mostly of Tamil origin, from the S. E. coast of India. The trade is of little importance, but precious stones are found in the neighborhood in considerable quantities. - The Portuguese were the first European nation to form a settlement at Trincomalee. They were expelled by the Dutch, who were in turn driven out by the British in 1782; but an insufficient garrison having been left for its defence, it was captured by the French, who restored it to the Dutch. In 1795 the British again captured it after a siege of three weeks, and it has since remained in their possession.

TRINIDAD, one of the British West India islands, at the mouth of the gulf of Paria, off the N. E. coast of Venezuela, opposite the N. mouth of the Orinoco, between lat. 10° and 11° N. and lon. 61° and 62° W.; length N. and S. about 50 m., average breadth 35 m.; area, 1,755 sq. m.; pop. in 1871, 109,693. Its N. W. and S. W. extremities are within 7 and 13 m. respectively of the continent. There is excellent anchorage between the island and the mainland, and there are several good harbors. It is crossed by three ranges of hills from W. to E., extending through the centre, and bordering the S. and N. coasts, the northern range attaining an elevation of 5,000 ft. There are level and undulating tracts in the valleys, but in some places the surface is considerably broken, and it is drained by rivers with numerous tributaries. Much of Trinidad appears to have been formed by the mud deposited by the Orinoco. The mountains consist of clay and mica slate; and quartz, pyrites, arsenic, alum, sulphate of copper, graphite, and sulphur are found. In a volcanic district on the W. coast there is a celebrated asphalt lake. (See Asphaltum, and Bitumen.) At Port of Spain, the capital, the temperature ranges between 74° and 86° in summer, and 70° and 81° in winter. The annual fall of rain is 65 inches; the island is beyond the range of hurricanes. The soil is fertile, and the elevated parts are covered with dense forests. The chief productions are sugar cane, coffee, and cacao; and cotton, indigo, tobacco, nutmegs, cinnamon, and cloves are raised. The indigenous animals are two species of small deer, the opossum, armadillo, porcupine, ant bear, sloth, muskrat, tiger cat, two species of lizards, and numerous monkeys. Fish are abundant. The settlements are chiefly on the N. W. coast and in the adjacent valley. A considerable trade is carried on with the United States in lumber and provisions. Trinidad is a crown colony, under a governor with executive and legislative councils. - The island was discovered by Columbus in July, 1498, occupied by the Spaniards in the 16th century, captured by the French in 1674, but soon restored, and taken by the British in 1797.

TRINITY (Gr. τριάντα, Lat. trinitas), a term of Christian theology denoting the coexistence in the Godhead of three persons, distinguished from each other as the Father, the Son, and the Holy Ghost or Holy Spirit. The doctrine of the Trinity is held by the Roman Catholic church, and by most of the Protestant and eastern churches. The doctrine is, contended, is contained in all its constitutive elements in the Scriptures, and was gradually drawn up into a systematic statement as the necessity occurred of preserving or vindicating it in its integrity and purity. Supplementary to the ecclesiastical form of the dogma itself are certain theological explanations, throwing on it a fuller light, derived from the teachings of early councils, the writings of the great church fathers, or the accepted scientific language of the schools. These regard the mode of origination of the second and third persons, the relations existing between the persons in the Trinity, and their distinctive characteristics and appellations. While the word Trinity is not to be found in the Bible, and while no passage can be adduced from the Old Testament in which the doctrine of the Trinity or its equivalent is distinctly and explicitly formulated, many texts have been quoted even by the earliest Christian writers which point to the existence of some form of plurality in the Godhead. These texts, however, being susceptible of various interpretations, are not produced as proving peremptorily the doctrine of a Trinity, but as foreshadowing the clear and distinct revelation believed to have been made in the New Testament. From it two large classes of texts are quoted as arguments for establishing the doctrine; those in which Father, Son, and Holy Spirit are mentioned in connection, and those in which these three subjects are mentioned separately, and in which their nature and mutual relation are more particularly described. The disputes about the tri-personality of the Godhead date from the apostolic age, and were occasioned chiefly by the prevalence of the Hellenistic and Gnostic theosophies. Theophilus, bishop of Antioch in the 2d century, used the word τριάντα, and its equivalent trinitas was first employed by Tertullian in the 3d century. During the ante-Nicene period there was uninterrupted controversy about this doctrine, principally in the East, and many opinions were proscribed by the church as heretical. Among them were those of the Ebionites, who regarded Jesus as a mere man; of the Sabellians, according to whom the Father, the Son, and the Holy Ghost were only the different forms in which the one God reveals himself to men; of the Arians, who taught that the Son was not coeternal with the Father, but created by him before the world, and therefore subordinate and in-
TRINITY COLLEGE

TRINITY. I. An E. county of Texas, bounded N. E. by the Neches and S. W. by the Trinity river, and drained by several creeks; area, 945 sq. m.; pop. in 1870, 4,141, of whom 1,084 were colored. The surface is nearly level, and the soil fertile. The Houston and Great Northern railroad passes through the W. part. The chief productions in 1870 were 94,240 bushels of Indian corn, 31,083 of sweet potatoes, 48,200 lbs. of butter, and 2,205 bales of cotton. There were 1,018 horses, 4,872 milch cows, 10,051 other cattle, 1,283 sheep, and 12,648 swine. Capital, Summer. II. A N. W. county of California, bounded E. by the Coast range, intersected by the Trinity, and drained by tributaries of Eel river; area, 1,500 sq. m.; pop. in 1870, 3,213, of whom 1,099 were Chinese. The surface is generally hilly and in the E. part mountainous, Mt. Linn, the highest peak of the range, lying in the S. E. corner. There are extensive forests of fir, pine, and oak. Gold mining is prosecuted to a considerable extent, and other valuable minerals are found. The chief productions in 1870 were 9,898 bushels of wheat, 6,585 of potatoes, and 1,017 tons of hay. There were 185 horses, 428 milch cows, 1,983 other cattle, 371 swine, and 5 saw mills. Capital, Weaverville.

TRINITY. I. A river of Texas, formed by the West fork and Elm fork, which rise near the N. boundary of the state, and, after a course of about 150 m. each, unite in Dallas co., whence the main stream flows in a tortuous but generally S. E. direction to the N. extremity of Galveston bay, about 35 m. from Galveston city. Its whole course lies through a valley of great fertility, occupied in part by extensive plantations of cotton, cotton, rice, and sugar. The length of the main stream is about 550 m., of which about 250 m. is navigable. II. A river of California, rising in Trinity co., and flowing S. S. E., then S. W., and finally N. W. into the Klamath river, in lat. 41° 20' N. It is celebrated for its rich gold mines.

TRINITY COLLEGE, an institution of learning in Hartford, Conn., under the control of the Protestant Episcopal church, chartered in 1823 and opened in 1824. Until 1845 its name was Washington college. Its presidents have been: 1824–31, the Rt. Rev. Thomas C. Brownell, D. D., bishop of Connecticut; 1831–7, the Rev. N. S. Wheaton, D. D.; 1837–48, the Rev. Silas Totten, D. D.; 1848–58, the Rev. John Williams, D. D.; 1858–60, the Rev. Daniel R. Goodwin, D. D.; 1861–74, Samuel Eliot; 1864–6, the Rt. Rev. J. B. Kerfoot, D. D.; 1867–74, the Rev. Abner Jackson, D. D. Dr. Jackson was succeeded by the Rev. T. R. Pynchon, D. D., who still holds the office (1876). In 1872 the college grounds were sold for $600,000, to be used as a site for the new state capitol. Soon afterward the college purchased 78 acres within the city limits, a mile south of the old location. There is now in process of erection here an imposing college structure, in the form of a quadrangle 350 ft. by 376 ft., enclosing three courts containing an aggregate of about four acres. It is in the early English style of architecture, with gateways and a noble tower and spire 240 ft. high. It will comprise dormitories for 300 students, recita-
TRIPOLI

removed to the new site in 1877. The whole number of the alumni of Trinity college is 1,063, of whom 262 have been ordained to the

TRIPOLI (called by the natives Tarabul). I. A country of N. Africa, forming one of the Barbary states, and a dependency of the Turk- ish empire, bounded N. by the Mediterranean, E. by Barca, S. by Fezzan and the desert of Sahara, and W. by the Sahara and Tunis between lat. 28° and 35° 15' N., and lon. 10° and 20° E.; extreme length about 650 m., breadth from 130 to nearly 300 m.; area estimated at 125,000 sq. m.; pop. estimated at from 500,000 to 750,000. Including Barca and Fezzan, which are dependent states, the area of Tripoli is more than double that above given, and the population probably twice as large. Though the sea coast extends upward of 600 m., there is only one good harbor, that of Tripoli, in its entire length. In its E. part, between Cape Mesrurata and the town of Benghazi in Barca, there is a vast indentation called by the ancients Syratis Major, now the gulf of Sidra. (See Swettis.) A marshy tract 100 m. in length and varying in breadth from 2 to 40 m. extends parallel to the S. W. shore of the gulf. The western portion of the Tripolitan coast is low and sandy; but in the east it becomes higher, and has many rocky points that afford shelter to small craft, with good anchorage in some places. The soil is exceedingly porous, and most of the streams flow only during the rainy season. The interior of the country is imperfectly known. The N. E. part contains extensive tracts of barren sand, and partakes of the nature of the desert; but the S. part is

ministry. In 1875-'6 there were, besides the president, 8 professors, 3 other instructors, and 2 lecturers; the total number of students was 88. The course of instruction, in which all the studies are prescribe, occupies four years. Students may take special courses in studies pertaining to science, and on their completion receive the degree of bachelor of science. Besides 37 scholarships entitling the holders to free tuition, there are several which yield to needy students annual incomes ranging from $100 to $300. Nearly all of them are designed to aid students preparing for the ministry in the Protestant Episcopal church. The college has property amounting in 1875 to $1,068,296, a library of 18,000 volumes, exclusive of pamphlets and duplicates, and a valuable cabinet. Excluding $16,000 received from the state, the funds of the college have been contributed by individuals. A theological school was organized in 1851, and was continued for about three years, when the Berkeley divinity school at Middletown was established to take its place.

TRIPANG. See Sea Cucumber.

TRIPOLI, an earthy substance, originally procured from Tripoli in Africa, used as a polishing material, of fine sharp grain, yellowish gray or whitish, burning white. It consists almost entirely of silica, and when examined by the microscope is found to be composed of the exuviae or skeletons of infusoria, the families of which are readily recognized. Specimen of it from Bilin and Franzensbad in Bohemia, Santafiora in Tuscany, and Mauritius have been examined by Ehrenberg. The sub-

New Buildings of Trinity College, Hartford.
TRIPOLI

traversed by the Black mountains, descending in terraces which enclose fertile tracts. In the west two ranges of mountains, offsets of the Atlas, run nearly parallel with the sea, the N. range about 20 m. from the coast, and the S. 30 m. further inland. The former has a general height of about 2,000 ft., and is visible from the sea. These mountains are of volcanic origin, and many of the summits terminate in conical peaks. The space between the ranges contains many tracts of elevated table land, with a fertile soil produced by the decomposition of lava and basalt. Salt and sulphur are the only minerals obtained. Some of this land is carefully cultivated and irrigated. Abundant crops of grain are raised, and on the sides of the hills vines, olives, figs, almonds, and other fruits grow luxuriantly. There are extensive natural pastures upon which cattle are reared in great numbers. But the most fertile part of Tripoli is the country which surrounds the capital. This tract, about 5 m. broad, extends about 16 m. along the shore, and produces heavy crops of wheat, barley, millet, and maize. Dates and olives are grown, together with all the fruits of a temperate climate. The country S. of the plateaus contains many fertile productive land, and consists mainly of sand and gravel plains. The water, which is found only by digging from 100 to 200 ft., is bitter and brackish. In the few spots where grain can be raised there are villages, the inhabitants of which live in constant dread of the desert tribes. Rain falls abundantly in the N. part of the country from November to March, but during the rest of the year months often pass without a single shower, although there are copious dews in the summer, and the heat becomes very great, especially when the sirocco blows. In winter the weather is exceedingly variable, and frosts occur, while the temperature during the day often exceeds 70°. The horses of Tripoli are of a superior breed, and cattle are numerous on the table lands. Camels are extensively used as beasts of burden, and sheep and poultry are exported. Of wild animals the most common are wolves, foxes, hyenas, jackals, gazelles, antelopes, rabbits, hares, hedgehogs, and jerboas. Ostriches frequent the borders of the deserts, and most of the common birds of southern Europe are found. Bees are kept in large numbers, and the locusts which frequently visit the country in enormous swarms are utilized for food. Tripoli contains numerous remains of antiquity, including ruins of Roman temples, theatres, and aqueducts. Many of these ruins have been buried deeply in the sand, but they can still be traced in the city of Tripoli and at other places. Coins, gems, and intaglios have been found in considerable numbers. —The population comprises Arabs, Moors, Turks, Mamelukes, Jews, and negro slaves. The Arabs form the greater part of the population in the country districts. The towns, of which Tri-

poli, Lebda, and Misurata or Misratah are situated on the coast, are peopled mostly by Moors, Jews, and negro slaves. Some of the Arabs have fixed homes and reside in villages, but many of them are nomadic. —There are some manufactures of woollen goods, and cloth for tents is made of goats' hair. The trade of Tripoli is considerable. The exports by sea consist chiefly of wool, cattle, hides, gold dust, ostrich feathers, ivory, gum, dried fruits, saffron, senna, drugs, barilla, and sheep's fat; and the chief imports are clothes, spices, sugar, coffee, spirits, arms, cutlery, and hardware. In 1874 the exports to Great Britain were valued at £125,311, and the imports from that country at £238,257. Caravans arrive from the interior of Africa twice a year, and bring slaves, gold dust, and tropical commodities, which are exchanged for European goods. —The government of Tripoli is a pure despotism. The country in the wider sense is de-

nominated a vilayet or province of Turkey, and its ruler is known as the bey. He is a pasha generally selected by the sultan from among the Turkish officers resident at the capital. In former times the revenue was chiefly derived from the prices taken by corsairs, and the sale of captured Europeans into slavery; but since these sources were cut off, a system of monopolies has been adopted. The bey of Fezzan and the sheikhs of Barca and some neighboring tribes pay tribute, and taxes are imposed on land, on Jews and merchants, and on exports and imports. A considerable number of Jews and Christians reside in Tripoli, but the dominant religion is Mohammedan. The temperance enjoined by the prophet is not practised. Wino shops are kept open, and receive the sanction of the government by paying a heavy license fee. Education is neglected, and the people are ignorant. The capital was conquered by the Romans from the Carthaginians, and became a part of the Roman province of Afri-

can under the name of Regio Syrtica. Its pres-

cent appellation appears to have originated in a federation of three cities, Sabrata or Abro-
tonum, Lea, and Leptis Magna (the present Lebda), whence the region was called Tripoli-
tana. It was conquered by the Vandals in the 5th century, and by the Mohammedans short-
lly after the death of Mohammed. After the division of the eastern caliphate Tripoli became an independent state. The capital was taken by Roger II. of Sicily in 1146, and retaken by the Carthaginians, and became a part of the Roman province of Afri-

can under the name of Regio Syrtica. Its pres-

cent appellation appears to have originated in a federation of three cities, Sabrata or Abro-
tonum, Lea, and Leptis Magna (the present Lebda), whence the region was called Tripoli-

TRIPOLI

system of piratical plunder which was continued for centuries. The Christian nations and their commerce were the objects of attack, and all prisoners taken were sold into slavery. The capital was bombarded by a French fleet in 1688, when the pasha professed submission to Louis XIV. A controversy with the United States grew out of the practice of piracy, and after several conflicts in 1801-3, in which Commodores Preble and Decatur chiefly distinguished themselves (see Preble, and Decatur), the latter in 1815 enforced reparation for injuries inflicted by the Tripolitans upon American commerce. In 1816 a similar mission was undertaken by a British force, which compelled the bey to renounce piracy and agree to treat all future prisoners according to the usages of civilized nations. Though Tripoli is a dependency of the Ottoman empire, the bey enters into treaties with foreign powers without consulting any superior. In early times beys were appointed from Constantinople and supported by a Turkish garrison, but a Moorish chief, Hamed Karamauli, rebelled successfully in 1713 and established himself as bey. His descendants continued to rule the country till 1833, when the last bey of the line was compulsorily removed on account of his excessive oppressions, and the Porte has since resumed its authority. The chiefs of the interior acknowledge but slight allegiance, and maintain amicable relations with the bey chiefly because the commerce carried on through the capital is advantageous to them; and the Arabs sometimes resort to open hostilities. II. A city (anc. Eea), the capital, situated upon a rocky promontory on the Mediterranean, about 600 m. S. E. of Algiers, and 800 m. S. of the Sicilian coast, in lat. 32° 54' N., lon. 18° 11' E.; pop. about 24,000. The land defences are a castle and wall flanked by bastions, and seaward there are strong batteries. The harbor no-

![Port of Tripoli](image)

where exceeds five or six fathoms in depth, but the roadstead affords deep anchorage. The streets are narrow and uneven, and the houses low and irregular. They are nearly all one story high, without exterior windows, built of stones and mud, and whitewashed. Tripoli contains six handsome mosques and many others. The roof of the great mosque is formed by small cupolas, supported by 16 marble columns. There are Christian places of worship, a Franciscan convent, and several synagogues; and all religions are tolerated within the limits of the city. The pasha's residence is an immense building of very irregular appearance, constructed at different times. There are numerous caravansaries, two bazaars, and many fine public baths. Woollen goods (particularly carpets), leather, and potash are manufactured. A great part of the trade of the state, as well as that of the interior of Africa, centres at Tripoli. The merchants are principally Jews, who trade under monopolies granted by the government. There is frequent steam communication with the ports of Europe. The foreign commerce is chiefly with Malta, Marseilles, Leghorn, Trieste, and the Levant; and the land trade is carried on by means of caravans with all the surrounding countries and as far as Morocco, Timbuctoo, and Mecca. The city contains several remains of antiquity, the most remarkable of which is a triumphal arch of marble, erected in A. D. 164 to the Roman emperor Marcus Aurelius and his colleague Lucius Verus; the inscription is perfect, although the sculptures are greatly defaced.

TRIPOLI, Tarabulus, or Tarabulus (anc. Tripolis), a seaport town of Syria, on the Mediterranean, in lat. 34° 26' N., lon. 35° 49' E., 40 m. N. N. E. of Beyrut, and 70 m. N. W. of Damascus; pop. about 16,000, one half Greek Catholics. It stands at the foot of an offset of Mt. Lebanon, on a small triangular plain, with the sea at a little distance on the N. and S. sides. A hill on the south is crowned by an old castle; and the town is divided into two parts by the Naher Kadisha. The harbor, at El Mina, about 14 m. to the northwest, is small, shallow, and unsafe. There are several mosques, which are generally fine buildings, most of them formerly Christian churches. It is one of the nearest towns in Syria, and is surrounded by many fine gardens and groves of orange and
other fruit trees; but the ground in the neighborhood is marshy, and the climate is unhealthful at certain seasons. It exports silk, wool, cotton, tobacco, wax, oil, cochineal, galls, soap, and especially sponges, the fishery of which occupies a large number of the inhabitants. The direct imports into Tripoli in 1869 were valued at $61,050, and in 1872 at $154,000; the direct exports, $292,425 in 1869, and $623,958 in 1872. The commerce is chiefly in the hands of Greeks. French steamers touch here four times a month. It is the sea of a Greek bishop, and the residence of several consuls.

—Tripolis was an important maritime town of Phoenicia, and derived its name from being the colony of the three cities of Tyre, Sidon, and Aradus, each holding a separate quarter of it. Having been taken by the crusaders, it was in 1109 erected into a county for Raymond of Toulouse.

TRIPOLITZA, or Tripolis, a town of Greece, in the Morea, capital of the nomarchy of Arcadia, 22 m. S. W. of Argos; pop. of the demus in 1870, 11,477. It is in a plain about 2,000 ft. above the sea, and owes its name to its being the most representative of the three cities of Mantinea, Tegea, and Pallantium, which occupied the same plain. Before the revolution it was the residence of a Turkish pasha and capital of the Morea, and had 20,000 inhabitants. The Greeks took it in 1821 and put the inhabitants to the sword; 8,000 male Turks perished, besides women and children. In revenge, Ibrahim Pasha in 1826 destroyed every house in the place. It has been partially rebuilt. The ruins of Mantinea may be seen at Paleopolis, about 6 m. N., and of Tegea at Pliali, nearly the same distance S.

TRIPP, a S. county of Dakota, bordering on Nebraska, recently formed and not included in the census of 1870; area, about 1,500 sq. m. It is intersected in the south by the Koya Paha, and watered in the north by Dog's Ears creek, an affluent of White river. In the S. part is Turtle hill, 2,340 ft. high. It consists mostly of undulating prairies.

TRIPTOLEMUS, in Greek mythology, a son of Celeus, king of Attica, and Neera, also called Metanira or Polymnia (according to another account, of Oceanus and Ge). He was born at Eleusis, and while still young was cured of a dangerous illness by Ceres, who had been hospitably entertained by his father, and attempted to render his brother Demophon (according to others, himself) immortal by burning out whatever particles of mortality he had derived from his parents. (See Ceres.) The goddess taught him agriculture, and gave him her dragon chariot, in which he rode over the earth, spreading knowledge of the art. He afterward reigned at Eleusis, and was the hero of the Eleusinian mysteries.

TRIQUETI, Henri de, baron, a French sculptor, born at Conflans in 1802, died in Paris in May, 1874. His earliest works consisted of genre and historical paintings, but in 1851 he exhibited a fine group of "The Death of Charles the Bold," and henceforth devoted himself to sculpture. His works include "Petrarch reading his Poetry to Laura," "Sir Thomas More preparing to die," "Dante in the Elysian Fields," and many busts and bass reliefs.

TRISMEGISTUS. See Hermes Trismegistus.

TRISTAN DA CUNHA, a cluster of three volcanic islands in the S. Atlantic. Tristan, the largest island, lies in lat. 37° 39' S., lon. 12° 19' W., about 1,500 m. S. by W. of St. Helena; area, about 40 sq. m. It is nearly circular, and rises abruptly on the N. side to an elevation of 1,000 ft. From the summit of the cliffs the land rises to a conical peak 8,926 ft. high. The surface consists of abrupt ridges covered with bushes, with deep ravines and chasms between. The summit is a crater about 500 yards in diameter, filled with water. On the N. W. side of the island is a narrow plain 100 to 150 ft. above the sea, with an excellent soil in a high state of cultivation. Near the N. extremity of this plain is a settlement which in 1870 contained 60 inhabitants, 35 of whom were children under 10 years. Nearly all are native born, the descendants of Europeans and Hottentots, with fine physique and dark skin, and are intelligent and hospitable. They have no government, disputes being settled by fisticuffs, with by-standers to secure fair play. They own a small vessel, which runs to Cape Town to exchange seal skins and oil for clothing, groceries, &c. Seals, sea lions, sea elephants, and whales frequent the group, and sea birds and edible fish abound. Heavy masses of kelp surround the shores. There are no large trees, but an abundance of shrubbery, which with sea weed and drift wood furnishes ample supplies of fuel. There is an abundance of excellent water. The climate is equable and healthy. The temperature rarely rises above 70° F. or falls below the freezing point. The only anchorage is off the N. W. point, and is very insecure. Inaccessible island lies 17¾ m. S. W., and Nightingale 20 m. S. W. of Tristan. The former is elliptical, 4 m. in length and 2 m. in breadth, and rises abruptly about 500 ft., the surface being flat and barren. Nightingale island is round, about 1½ m. in diameter, and 200 ft. in height. Both are uninhabited. —The group was discovered by the Portuguese navigator Tristan da Cunha in 1506, and explored by the Dutch in 1648, and by the French in 1767. Tristan was inhabited by John Putten, an American whaling master, with his crew, from August, 1790, to April, 1791, to collect seal skins. During the captivity of Napoleon at St. Helena it was occupied by British troops from Cape Town. The present inhabitants are chiefly descendants of one of these, a corporal named Glass.

TRITON, in Greek and Roman mythology, a marine deity, the son of Poseidon or Neptune and Amphitrite or Celeno. He had the form of a man above and that of a fish below, and bore a conch-shell trumpet.
TRITON. I. The proper name of the tailed batrachians of the old genus triton (Laur.), generally called newts or water salamanders; they all belong to the northern hemisphere, and their species are most numerous in North America. The tail is depressed and adapted for swimming in most, though many are not strictly aquatic, but pass much of their life on the land, some visiting the water only during the breeding season; indeed, the distinction into terrestrial and aquatic species is very indefinite, species with either of these habits being found in one genus. In the breeding season, in the spring, the males acquire a fin-like fringe along the back and tail and membranous appendages to the toes; the species are difficult to distinguish on account of the varieties of sex, age, and season. Reproduction takes place by means of eggs, which are fecundated before they are deposited, and the young resemble tadpoles in form and gills. The most carefully studied species is the crested triton or water newt of Great Britain (T. palustris, Plem.), about 6 in. long, of which the tail is about two fifths; this species will suffice for the generic description. The body is naked, but covered with wart-like tubercles, and with glandular pores behind and over eyes and along sides; toes without nails, four anterior and five posterior; the dorsal and caudal crests separate; tongue slightly free on sides, and more free and pointed behind; palate with a double longitudinal series of teeth; no parotids nor glands along the back. The smooth-skinned species, without lateral pores and with a continuous dorsal and caudal crest, have been noticed under Eft. The head is flattened, nose rounded, gape large, teeth numerous and small, and the neck hardly distinct from the head and body. It is common in ponds and ditches, and one of the most aquatic of the family, swimming by means of the tail, the legs being turned back against the body; the legs are used as balancers in the water, and for a slow and feeble creeping on land; the skin comes off in shreds in the water, and is swallowed. The eggs are deposited on the leaves of aquatic plants, which are folded around them, one egg to each leaf; the parents resume a terrestrial existence in a few weeks, but the young, born in June or July, remain, according to Bell, without much change till the following spring, when they acquire legs and leave the water. In the water they are voracious, feeding on aquatic animals, insects and larva, the tadpoles of the frog, and even those of their own species. They are noted for their tenacity of life under mutilation and exposure to severe cold, and for the power of reproducing lost parts. They are blackish or light brown above with darker round spots, and bright reddish orange below with round black spots, and the sides dotted with white.—The many-spotted triton of the Atlantic states (T. dora, Harlan; genus notophthalmus, Raf.) is about 4 in. long, of which the tail is half; it is olive or greenish brown above, with a row of circular vermilion spots on each side, and below orange studded with small black dots; eyes prominent, with flame-colored iris; posterior limbs twice as large as anterior; it is eminently aquatic, and dies soon out of water from the drying of the skin; it is torpid only in the severest weather; it is found from Maine to Georgia, forming a very lively and interesting animal for the fresh-water aquarium, and easily obtained. Several other species occur on the Atlantic coast.

II. A genus of gastropod mollusks of the murex family, having a conical and elongated shell, spirally convoluted. The T. variegatum (Lam.), 12 to 16 in. long, from the Indian seas, is the well known sea conch or trumpet of the god Triton; this species, as well as the T. australis (Lam.), is used by the Polynesians as a horn.

TRIUMPH (Lat. triumphus, related to Gr. θρίαμβος, a hymn sung in a procession in honor of Bacchus), generally, a solemn procession to celebrate a victory. The ancient Romans made the triumph a stimulus to martial exploits, and the highest military honor that could be obtained by a general, who entered the city in a chariot drawn by four horses, preceded by his captives and spoils and followed by his army, with which escort he passed along the Via Sacra, and ascending to the capitol sacrificed a bull to Jupiter. A triumph was granted by the senate to a general who had gained important successes, if he had already held one of the great offices of state; if the victory had been gained under his auspices and with his
TRIUMVIRATE and but no diction capitales tioned Antony, description of an manders-in-chief under at stowed anonymously at the presence of the enemy; and if the war had been actually concluded so as to permit of the army’s withdrawal from the conquered country. Sometimes the comitia of the tribes bestowed triumphs, and generals even triumphed in defiance of the senate and the people. Naval triumphs were also granted in some cases. After the overthrow of the republic, the emperors, in virtue of their authority as commanders-in-chief of the armies of the state, claimed the exclusive right of celebrating triumphs; and until A. D. 554, when Belisarius entered Constantinople in triumph after the overthrow of the Vandal kingdom in Africa, no subject had for more than five centuries enjoyed that distinction. This was the 350th triumph in Roman history, and the last ever celebrated. A lesser kind of triumph, called an ovation (ovatio) from the practice of sacrificing a sheep (ovis) instead of a bull, was granted to a general whose success did not entail him to a full triumph.

TRIUMVIRATE, an office filled coordinate by three persons. Several magistrates of this description were recognized in the Roman government, of which the most important was that for the regulation of public affairs—triumviri raipublicae constituentes. Though magistrates with this title are thought to have been appointed as early as 360 B.C., there is no certain mention of them till toward the close of the republic. The coalition between Julius Caesar, Pompey, and Crassus, in 60 B.C., is often called the first triumvirate, but they were never invested with any office under that title. The second triumvirate of Octavius, Antony, and Lepidus (43) was the first sanctioned by the people. The office was bestowed on them for five years, and after the expiration of that term for five years more. Administration by triumvirs was apparently much favored by Roman legislators. The triumviri capitales had charge of the prisons and jurisdiction in minor cases; the triumviri nocturni had charge of the police at night. Mazzini, Armellini, and Saffi formed in February, 1849, a triumvirate at Rome, with the entire executive power placed in their hands.

TROGLODYTES (Gr. τρωγλοδύτης, from τρόγλη, a cave, and δύνα, to enter), the name given by the ancients to tribes of men who lived in caves. Several such are mentioned by ancient writers as inhabiting parts of Ethiopia, Upper Egypt, the borders of the Red sea, Abyssinia, Mauritania, and the northern part of the Caucasus. The most celebrated were those of southern Egypt and Ethiopia, where a large district was called Regio Trogloodytica. They are represented as depending upon cattle for their livelihood, and living in the most debased condition. In part of Arabia the mountainous regions encompassing the wadys are filled with caves, which are occupied as permanent habitations by half savage tribes of Bedouins; and it is probable that these belong to military resources, which gave emprise to the emperor. It was only after his selection by Pulikao for the organization of troops at the camp of Châlons that Napoleon reluctantly consented (Aug. 17, 1870) to his being made governor and chief commander of Paris. As such Trochu ordered the expulsion of the German residents, numbering about 50,000. On the establishment of the republican government (Sept. 4) he was placed at its head. In repeated proclamations he promised the rescue of the besieged city; and when its capitulation was unavoidable, he resigned the command in favor of Gen. Vinoy (Jan. 20, 1871), though remaining at the head of the government. He attempted to defend his administration in the assembly at Bordeaux and Versailles, of the latter of which he was a member till the spring of 1872, when he retired in consequence of the unsatisfactory issue of a libel suit against the Figaro newspaper, which had attacked his course. In 1873 he left the army with a pension, and he has since been engaged at Tours in writing a military work.

TROEZNEN, or Trozene, one of the oldest cities of ancient Greece, in the Peloponnesus, in a territory named from it Trozzenia, forming the head of the district of Argolis. It was founded probably by the Ionians, and according to Homer was subject at the time of the Trojan war to Argos, from which it afterward received a Doric colony. Subsequently it became a prominent maritime city, founded Halicarnassus and Myndus in Caria, and probably Pæstum in Magna Graecia, and was conspicuous in the wars with Persia, its harbor being the rendezvous of the Grecian fleet after the sea fight at Artemision. During the Peloponnesian, Corinthian, and other wars, it adhered to the side of Sparta. After the establishment of the Macedonian rule over Greece it was in the hands of the king of Macedon, and continued to be of importance until the time of Pansanius, who describes its public buildings in detail; but after this period we have no account of its history. The ruins of the ancient city lie near the village of Damala, and consist principally of Hellenic foundations with Frankish or Byzantine superstructures.

TROGLODITES (Gr. τρωγλοδύτης, from τρόγλη, a cave, and δύνα, to enter), the name given by the ancients to tribes of men who lived in caves. Several such are mentioned by ancient writers as inhabiting parts of Ethiopia, Upper Egypt, the borders of the Red sea, Abyssinia, Mauritania, and the northern part of the Caucasus. The most celebrated were those of southern Egypt and Ethiopia, where a large district was called Regio Trogloodytica. They are represented as depending upon cattle for their livelihood, and living in the most debased condition. In part of Arabia the mountainous regions encompassing the wadys are filled with caves, which are occupied as permanent habitations by half savage tribes of Bedouins; and it is probable that these belong
to the same race as the troglobytic population of Ptolemy and other Greek geographers. In the early history of the Christian church the name was also applied to certain heretics, who, rejected by all parties, held their meetings in caves. In natural history, Linnaeus placed the chimpanzee under the genus *Homo* with the specific name of *troglodytes*, next to *homo sapiens*; and this is the *troglodytes* niger of Geoffroy and the *sinia troglodytes* of Blumenbach. The term is now applied to a genus which includes the chimpanzee and the gorilla, and also to a genus of the *troglodytinae* or wren family of birds.

**Trogon**, and **Courouet**, names given to the scamporial birds of the family *trogonidae*, the second name being derived from their peculiar melancholy cry. The bill is short, strong, curved, broader than high, triangular seen from above, with the margins and tip usually serrated, the base provided with tufts of bristles, and the gape wide; wings moderate and rounded; tarsi short and weak, more or less feathered; toes of unequal length, and arranged in two pairs, the inner being turned backward. There are about 40 species in the tropical regions of both hemispheres, but especially numerous in South America; they frequent thick and damp forests, feeding on insects, fruits, and berries; they are most active in morning and evening. A few live in the islands of the Indian archipelago, and one genus in Africa. The American may be distinguished from the old world species by their barred tail. Though the neck and feet seem too short for the bulky body, the plumage is usually beautiful, often with metallic brilliancy. The eggs, two to four, are laid in the holes of rotten trees, and several broods are raised in a year. The species vary in size from a thrush to a magpie; it is rare to obtain good specimens, as they frequent the highest trees of the thickest forests, and when shot lose many of the soft and delicate feathers by the fall to the ground; the skin is very tender, and renders the operation of skinning so difficult that the natives dry the body with the feathers on. —In the genus *trogon* (Mahr.) the first quill is short and the fourth the longest. The red-bellied trogon (*T. curru-cui*, Linn.) is about a foot long, green above, red below, with the throat black, and the covert and tail striped with the same; it is a native of Mexico. The peacock or splendid trogon (*Calurus resplendens*, Swain. *T. pacorinus*, Temm.) has the edges of the bill smooth, the wing coverts long and curved, and the upper tail coverts greatly prolonged, entirely concealing the tail; it is larger than the last named, and the middle tail coverts are 3 to 3½ ft. in length; it is of a beautiful bronzed and golden green above and on the throat, and scarlet below; it is found in Mexico and Central America. The feathers of this and the preceding species are much prized for ornaments.

**Trollope, Edward**, an English author, born April 15, 1817. He graduated at Christ Church, Oxford, in 1839, and became rector of Leasingham, Lincolnshire, in 1843, prebend of Lincoln in 1861, and archdeacon of Stow in 1867. He has published several archeological and architectural works, the principal of which are: "Illustrations of Ancient Art" (1853); "Labyrinths, Ancient and Medieval," and "Manual of Sepulchral Memorials" (1858); "Monastic Gate Houses" (1860); "Life of Hereward" (1861); "Norman Sculptures of Lincoln Cathedral" (1866); and "The Norman and Early English Styles of Gothic Architecture" (1869).

**Trollope, J. Frances** (Milton), an English novelist, born at Heckfield, Hampshire, about 1780, died in Florence, Italy, Oct. 6, 1868. She was the daughter of the Rev. William Milton, and in 1809 married Anthony Trollope, barrister at law. In 1829 she visited the United States, where she remained three years, residing chiefly in Cincinnati; and on her return she published "Domestic Manners of the Americans" (2 vols., Svo, London, 1832), in which the endearing and ridiculous phases of American character and habits were depicted. She afterward produced so large a number of novels and accounts of travels as to render her the most voluminous English authoress of the times. Her first work on America was fol-
lowed by a novel entitled "The Refugee in America" (1832), and in 1836 by "The Adventures of Jonathan Jefferson Whitleaw." About 1844 she went to Florence, where she resided till her death. Among her books of travel are: "Belgium and Western Germany in 1833" (2 vols., 1834); "Paris and the Parisians in 1835" (3 vols., 1836); "Vienna and the Austrians" (2 vols., 1838); "A Visit to Italy" (2 vols., 1842); and "Travels and Travelers" (2 vols., 1846). Some of her best novels are: "The Vicar of Wrexford" (1837); "The Romance of Vienna" (1838); "The Widow Barnaby" (1839); "Life and Adventures of Michael Armstrong, a Factory Boy" (1840); "The Widow Married," a sequel to "The Widow Barnaby" (1840); "One Fault" (1840); "Charles Chesterfield, or the Adventures of a Youth of Genius" (1841); "Town and Country" (1847); "Lottery of Marriage" (1849); "Petticoat Government" (1850); "Yeung Heires" (1853); "Life and Adventures of a Clever Woman" (1854); and "Fashionable Life" (1856). H. Thomas Adolphus, an English author, son of the preceding, born April 29, 1810. He has resided for many years in Florence and Rome, and has published "A Summer in Brittany" (2 vols. 8vo, 1840); "A Summer in Western France" (1841); "Impressions of a Wanderer in Italy" (1859); "The Girlhood of Catharine de'Medici" (1856); "A Decade of Italian Women" (1859); "Tuscany in 1849 and 1859" (1859); "Filippo Strozzi" (1860); "Paul V. the Pope and Paul the Friar" (1860); "La Beata" (1861); "Marietta" (1862); "A Lenten Journey in Umbria and the Marches of Ancona" (1862); "Ginilio Malatesta" (1863); "Beppo the Conscript" (1864); "Lindisfarne Chase" (1864); "A History of the Commonwealth of Florence, from the Earliest Independence of the Commune to the Fall of the Republic in 1531" (4 vols. 8vo, 1865); "Gemma" (1866); "Artingdale Castle" (1867); "Dream Numbers" (1868); "Leonora Casaloni" (1869); "The Garstangs of Garstang Grange" (1869); "A Siren" (1870); and "Durnton Abbey" (1871). III. Anthony, an English novelist, brother of the preceding, born in 1815. From 1834 to November, 1867, he was connected with the British postal service, and he has been frequently sent abroad to establish postal conventions. He has visited the United States several times, the West Indies, Australia in 1871 and again in 1875, and other countries. In 1869 he was an unsuccessful liberal candidate for parliament for Beverley. For some time he was editor of the "St. Paul's" magazine, in which and in other periodicals several of his stories originally appeared serially. His works are: "The Macdermots of Ballydoran" (1847); "The Kellys and the O'Kellys" (1848); "A Visit to Vienna" (1850); "The Warden" (1855); "Barchester Towers," "The Three Clerks" (1857); "Doctor Thorne" (1858); "The Bertrams," "The West Indies and the Spanish Main" (1859); "Castle Richmond" (1860); "Framley Parsonage" (1861); "Tales of All Countries" (1861); 2d series, 1863); "Orley Farm," "The Struggles of Brown, Jones, and Robinson," "North America" (1862); "Rachel Ray" (1863); "The Small House at Allington," "The Belton Estate," "Hunting Sketches" (1864); "Can You Forgive Her?" "Miss Mackenzie" (1865); "Clergymen of the Church of England," "Travelling Sketches" (1866); "The Claverings," "The Last Chronicle of Barset," "Lotta Schmidt, and other Stories" (1867); "Phineas Finn, the Irish Member," "He Knew he was Right" (1869); "Sir Harry Hotspur of Humblethwaite," "The Vicar of Bullhampton" (1870); "Ralph the Heir" (1871); "The Golden Lion of Grapnère" (1872); "Phineas Redux," "Australia and New Zealand" (1873); "The Way we Live now," "Lady Anna" (1874); and "The Prime Minister" (1875).
